BODY CODE PLATE

DESCRIPTION

The Body Code Plate (Fig. 1) is located in the engine compartment on the radiator closure panel crossmember. There are seven lines of information on the body code plate. Lines 4, 5, 6, and 7 are not used to define service information. Information reads from left to right, starting with line 3 in the center of the plate to line 1 at the bottom of the plate.

Market Code
- C = Canada
- B = International
- M = Mexico
- U = United States

DIGIT 6

Open Space

DIGITS 7 THROUGH 23

Vehicle Identification Number
- Refer to Vehicle Identification Number (VIN) paragraph for proper breakdown of VIN code.

IF TWO BODY CODE PLATES ARE REQUIRED

The last code shown on either plate will be followed by END. When two plates are required, the last code space on the first plate will indicate (CTD)

When a second plate is required, the first four spaces of each line will not be used due to overlap of the plates.

FASTENER IDENTIFICATION

DESCRIPTION

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 9.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts (Fig. 2) and (Fig. 3).

HOW TO DETERMINE BOLT STRENGTH

	Mark	Class
Hexagon head bolt	 Bolt head No. 4 — 4T 5 — 5T 6 — 6T 7 — 7T 8 — 8T 9 — 9T 10 — 10T 11 — 11T	
	 No mark	4T
Hexagon flange bolt w/washer hexagon bolt	 No mark	4T
Hexagon head bolt	 Two protruding lines	5T
Hexagon flange bolt w/washer hexagon bolt	 Two protruding lines	6T
Hexagon head bolt	 Three protruding lines	7T
Hexagon head bolt	 Four protruding lines	8T

	Mark	Class
Stud bolt		4T
		6T
Welded bolt		4T

95IN-4

Fig. 3 FASTENER STRENGTH

FASTENER USAGE

DESCRIPTION

DESCRIPTION - FASTENER USAGE

WARNING: USE OF AN INCORRECT FASTENER MAY RESULT IN COMPONENT DAMAGE OR PERSONAL INJURY.

Fasteners and torque specifications references in this Service Manual are identified in metric and SAE format.

During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

DESCRIPTION - THREADED HOLE REPAIR

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

INTERNATIONAL SYMBOLS

DESCRIPTION

The graphic symbols illustrated in the following International Control and Display Symbols Chart (Fig. 4) are used to identify various instrument controls. The symbols correspond to the controls and displays that are located on the instrument panel.

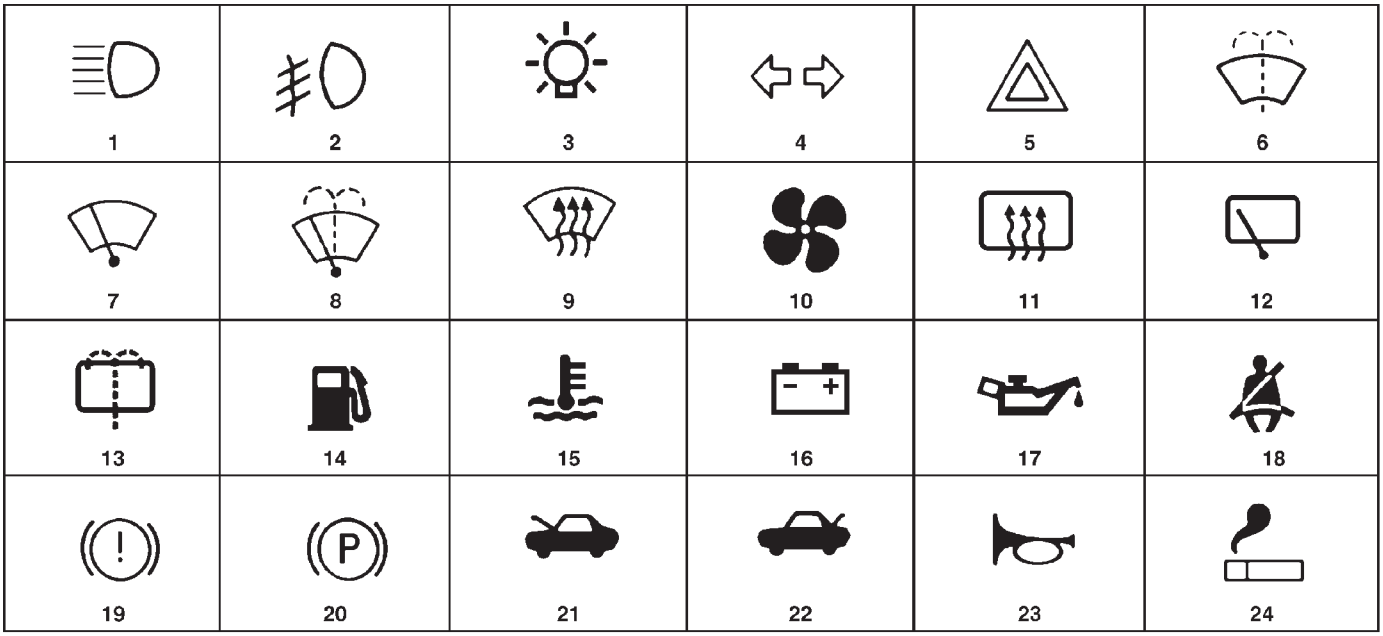

Fig. 4 INTERNATIONAL CONTROL AND DISPLAY SYMBOLS

1	High Beam	13	Rear Window Washer
2	Fog Lamps	14	Fuel
3	Headlamp, Parking Lamps, Panel Lamps	15	Engine Coolant Temperature
4	Turn Warning	16	Battery Charging Condition
5	Hazard Warning	17	Engine Oil
6	Windshield Washer	18	Seat Belt
7	Windshield Wiper	19	Brake Failure
8	Windshield Wiper and Washer	20	Parking Brake
9	Windscreen Demisting and Defrosting	21	Front Hood
10	Ventilating Fan	22	Rear hood (Decklid)
11	Rear Window Defogger	23	Horn
12	Rear Window Wiper	24	Lighter

METRIC SYSTEM

DESCRIPTION

The metric system is based on quantities of one, ten, one hundred, one thousand and one million.

The following chart will assist in converting metric units to equivalent English and SAE units, or vise versa.

CONVERSION FORMULAS AND EQUIVALENT VALUES

MULTIPLY	BY	TO GET	MULTIPLY	BY	TO GET
in-lbs	x 0.11298	= Newton Meters (N·m)	N·m	x 8.851	= in-lbs
ft-lbs	x 1.3558	= Newton Meters (N·m)	N·m	x 0.7376	= ft-lbs
Inches Hg (60° F)	x 3.377	= Kilopascals (kPa)	kPa	x 0.2961	= Inches Hg
psi	x 6.895	= Kilopascals (kPa)	kPa	x 0.145	= psi
Inches	x 25.4	= Millimeters (mm)	mm	x 0.03937	= Inches
Feet	x 0.3048	= Meters (M)	M	x 3.281	= Feet
Yards	x 0.9144	= Meters	M	x 1.0936	= Yards
mph	x 1.6093	= Kilometers/Hr. (Km/h)	Km/h	x 0.6214	= mph
Feet/Sec	x 0.3048	= Meters/Sec (M/S)	M/S	x 3.281	= Feet/Sec
mph	x 0.4470	= Meters/Sec (M/S)	M/S	x 2.237	= mph
Kilometers/Hr. (Km/h)	x 0.27778	= Meters/Sec (M/S)	M/S	x 3.600	Kilometers/Hr. (Km/h)

COMMON METRIC EQUIVALENTS

1 inch = 25 Millimeters	1 Cubic Inch = 16 Cubic Centimeters
1 Foot = 0.3 Meter	1 Cubic Foot = 0.03 Cubic Meter
1 Yard = 0.9 Meter	1 Cubic Yard = 0.8 Cubic Meter
1 Mile = 1.6 Kilometers	

Refer to the Metric Conversion Chart to convert torque values listed in metric Newton- meters (N·m). Also, use the chart to convert between millimeters (mm) and inches (in.) (Fig. 5).

Fig. 6 TORQUE SPECIFICATIONS

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

The Vehicle Identification Number (VIN) can be viewed through the windshield at the upper left corner of the instrument panel, near the left windshield pillar (Fig. 7). The VIN consists of 17 characters in a combination of letters and numbers that provide specific information about the vehicle. Refer to VIN Code Breakdown Chart for decoding information.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the vehicle identification number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

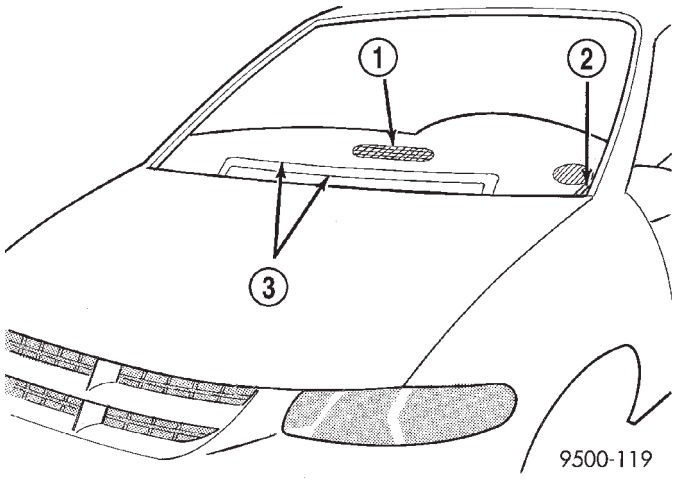

Fig. 7 VEHICLE IDENTIFICATION NUMBER (VIN)

VEHICLE SAFETY CERTIFICATION LABEL

DESCRIPTION

A vehicle safety certification label is attached to the rear shutface of the driver's door (Fig. 8). This label indicates date of manufacture (month and year), Gross Vehicle Weight Rating (GVWR), Gross Axle Weight Rating (GAWR) front, Gross Axle Weight Rating (GAWR) rear and the Vehicle Identification Number (VIN). The Month, Day and Hour of manufacture is also included.

All communications or inquiries regarding the vehicle should include the Month-Day-Hour and Vehicle Identification Number.

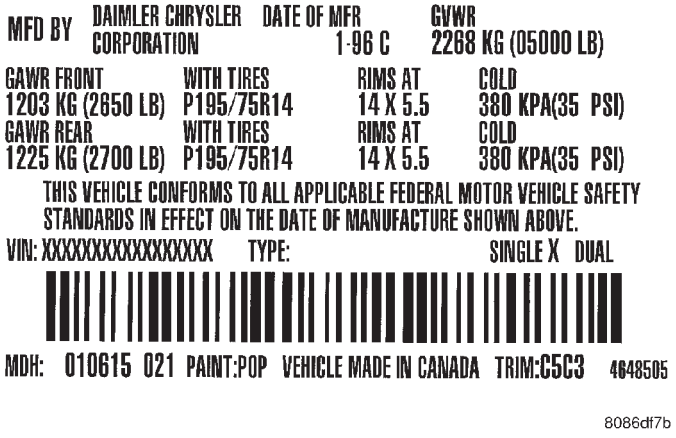

Fig. 8 VEHICLE SAFETY CERTIFICATION LABEL - TYPICAL

E-MARK LABEL

DESCRIPTION

An E-mark Label (Fig. 9) is located on the rear shut face of the driver's door. The label contains the following information:

- Date of Manufacture
- Month-Day-Hour (MDH)
- Vehicle Identification Number (VIN)
- Country Codes
- Regulation Number
- Regulation Amendment Number
- Approval Number

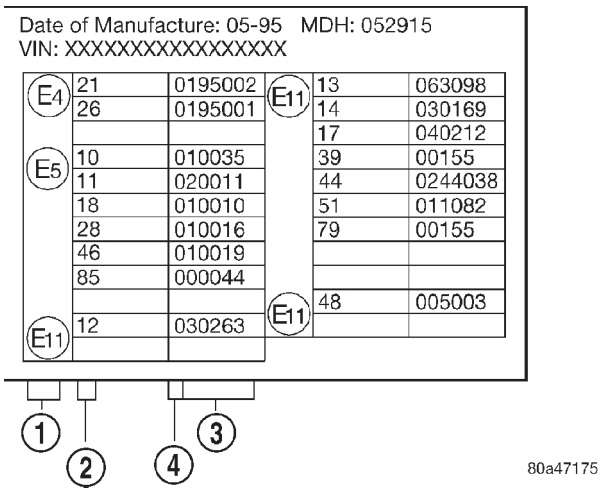

Fig. 9 E-Mark Label

1 - COUNTRY CODE
2 - REGULATION NUMBER
3 - APPROVAL NUMBER
4 - AMENDMENT NUMBER

VECI LABEL

DESCRIPTION

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

MANUFACTURER PLATE

DESCRIPTION

The Manufacturer Plate (Fig. 10) is located in the engine compartment on the passenger side rear corner of the hood. The plate contains five lines of information:

1. Vehicle Identification Number (VIN)
2. Gross Vehicle Mass (GVM)
3. Gross Train Mass (GTM)
4. Gross Front Axle Rating (GFAR)
5. Gross Rear Axle Rating (GRAR)

INTERNATIONAL SYMBOLS

DESCRIPTION

DaimlerChrysler Corporation uses international symbols to identify engine compartment lubricant and fluid inspection and fill locations (Fig. 1).

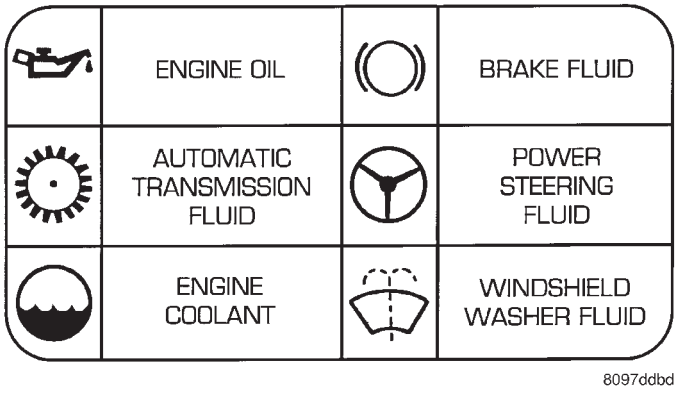

Fig. 1 INTERNATIONAL SYMBOLS

FLUID TYPES

DESCRIPTION

DESCRIPTION - ENGINE OIL AND LUBRICANTS

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. MOPAR® provides engine oils, that meet or exceed this requirement.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 2).

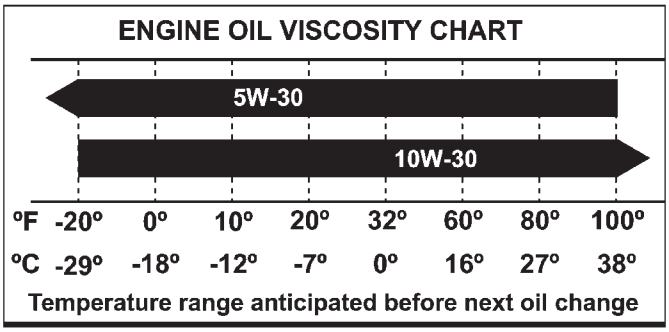

Fig. 2 TEMPERATURE/ENGINE OIL VISCOSITY

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans (Fig. 3).

This symbol means that the oil has been certified by the American Petroleum Institute (API). DiamlerChrysler only recommend API Certified engine oils. Use Mopar® engine oil or equivalent.

Fig. 3 API SYMBOL

FLUID TYPES (Continued)

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

LUBRICANTS AND GREASES

Lubricating grease is rated for quality and usage by the NLGI. All approved products have the NLGI symbol (Fig. 4) on the label. At the bottom of the NLGI symbol is the usage and quality identification letters. Wheel bearing lubricant is identified by the letter “G”. Chassis lubricant is identified by the letter “L”. The letter following the usage letter indicates the quality of the lubricant. The following symbols indicate the highest quality.

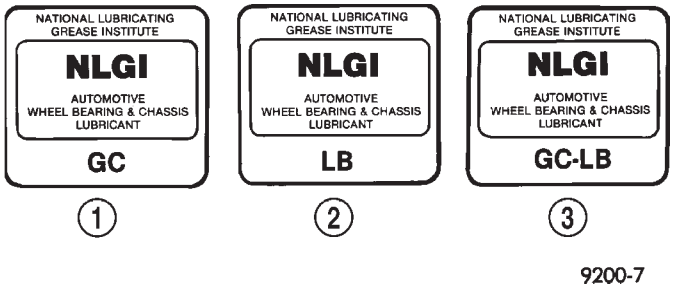

Fig. 4 NLGI SYMBOL

1 - WHEEL BEARINGS
2 - CHASSIS LUBRICATION
3 - CHASSIS AND WHEEL BEARINGS

SPECIALIZED LUBRICANTS AND OILS

Some maintenance or repair procedures may require the use of specialized lubricants or oils. Consult the appropriate sections in this manual for the correct application of these lubricants.

DESCRIPTION - ENGINE COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

DESCRIPTION - FLEXIBLE FUEL ENGINE OIL

The information in this section is for Flexible Fuel Vehicles (FFV) only. These vehicles can be identified by the unique Fuel Filler Door Label that states Ethanol (E-85) or Unleaded Gasoline Only. This section only covers those subjects that are unique to these vehicles. Please refer to the other sections of this manual for information on features that are common between Flexible Fuel and gasoline only powered vehicles.

ETHANOL FUEL (E-85)

E-85 is a mixture of approximately 85% fuel ethanol and 15% unleaded gasoline.

FLUID TYPES (Continued)

WARNING: Ethanol vapors are extremely flammable and could cause serious personal injury. Never have any smoking materials lit in or near the vehicle when removing the fuel filler tube cap (gas cap) or filling the tank. Do not use E-85 as a cleaning agent and never use it near an open flame.

FUEL REQUIREMENTS

The vehicle will operate on both unleaded gasoline with an octane rating of 87, or E-85 fuel, or any mixture of these two.

For best results, a refueling pattern that alternates between E-85 and unleaded gasoline should be avoided. When you do switch fuels, it is recommended that

- you do not switch when the fuel gauge indicates less than 1/4 full
- you do not add less than 5 gallons when refueling
- you operate the vehicle immediately after refueling for a period of at least 5 minutes

Observing these precautions will avoid possible hard starting and/or significant deterioration in driveability during warm up.

FFV STARTING

The characteristics of E-85 fuel make it unsuitable for use when ambient temperatures fall below 0°F. In the range of 0°F to 32°F, you may experience an increase in the time it takes for your engine to start, and a deterioration in driveability (sags and/or hesitations) until the engine is fully warmed up.

Engine Operating on E-85 Fuel

If vehicle operates on E-85 fuel either full or part-time, use only Mopar® Flexible Fuel 5W-30 engine oil or an equivalent that meets DaimlerChrysler Standard MS-9214. Equivalent commercial Flexible Fuel engine oils may be labeled as Multi-Fuel, Variable Fuel, Flexible Fuel, etc. These engine oils may be satisfactory if they meet the DaimlerChrysler Standard.

SAE 5W-30 engine oil is preferred for use in Flexible Fuel engines.

CAUTION: If Flexible Fuel engine oil is not used when using E-85 fuel, engine wear or damage may result.

CRUISING RANGE

Because E-85 fuel contains less energy per gallon than gasoline, you will experience an increase in fuel consumption. You can expect your MPG and your driving range to decrease by about 30% compared to gasoline operation.

DESCRIPTION - AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to the maintenance schedules for the recommended maintenance (fluid/filter change) intervals for this transaxle.

NOTE: All transaxles have a common transmission and differential sump. Filling the transaxle accommodates the differential as well.

TRANSMISSION FLUID

Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602) is required in the 41TE automatic and T850 manual transaxles. Substitute fluids can induce torque converter clutch shudder.

Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602) when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition or the need for a fluid change.**

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used.** The use of transmission “sealers” should also be avoided, since they may adversely affect the integrity of transmission seals.

DESCRIPTION - FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

FLUID TYPES (Continued)

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as "reformulated" gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly support the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasoline free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.

FLUID TYPES (Continued)

- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

DESCRIPTION - FUEL REQUIREMENTS - DIESEL ENGINE

WARNING: DO NOT USE ALCOHOL OR GASOLINE AS A FUEL BLENDING AGENT. THEY CAN BE UNSTABLE UNDER CERTAIN CONDITIONS AND HAZARDOUS OR EXPLOSIVE WHEN MIXED WITH DIESEL FUEL.

Use good quality diesel fuel from a reputable supplier. For most year-round service, number 2 diesel fuel meeting ASTM specification D-975 will provide good performance. If the vehicle is exposed to extreme cold (below -18°C/0°F) or is required to operate at colder than normal conditions for prolonged periods, use climatize No. 2 diesel fuel or dilute the No. 2 diesel fuel with 50% No. 1 diesel fuel. This will provide better protection from fuel gelling or wax plugging of the fuel filters.

Diesel fuel is seldom completely free of water. To prevent fuel system trouble, including fuel line freezing in winter, drain the accumulated water from the fuel/water separator using the fuel/water separator drain provided. If you buy good quality fuel and follow the cold weather advice above, fuel conditioners should not be required in your vehicle. If available in your area, a high cetane “premium” diesel fuel may offer improved cold starting and warm up performance.

DESCRIPTION - ENGINE OIL - DIESEL ENGINES

Use only Diesel Engine Oil meeting standard **MIL-2104C** or API Classification **CD or higher** or **CCML D4, D5**.

SAE VISCOSITY GRADE

CAUTION: Low viscosity oils must have the proper API quality or the CCMC G5 designation.

To assure of properly formulated engine oils, it is recommended that SAE Grade 10W-40 engine oils that meet Chrysler material standard MS-6395, be used. European Grade 10W-40 oils are also acceptable.

Oils of the SAE 5W-40 or 8W-80 grade number are preferred when minimum temperatures consistently fall below -12°C.

FLUID FILL/CHECK LOCATIONS

DESCRIPTION

The fluid check/fill point locations are located in each applicable service manual section.

LUBRICATION POINTS

DESCRIPTION

Lubrication point locations are located in each applicable Sections.

MAINTENANCE SCHEDULES

DESCRIPTION

″Maintenance Schedule Information not included in this section, is located in the appropriate Owner’s Manual.″

HOISTING

STANDARD PROCEDURE - HOISTING

Refer to Owner’s Manual provided with vehicle for proper emergency jacking procedures.

WARNING: THE HOISTING AND JACK LIFTING POINTS PROVIDED ARE FOR A COMPLETE VEHICLE. WHEN THE ENGINE OR REAR SUSPENSION IS REMOVED FROM A VEHICLE, THE CENTER OF GRAVITY IS ALTERED MAKING SOME HOISTING CONDITIONS UNSTABLE. PROPERLY SUPPORT OR SECURE VEHICLE TO HOISTING DEVICE WHEN THESE CONDITIONS EXIST.

CAUTION: Do not position hoisting device on any suspension component, including the front suspension crossmember, the rear leaf springs, and the rear axle. Do not hoist on the front and rear bumpers, the lower liftgate crossmember, the lower radiator crossmember, the down standing flanges on the sill or the front engine mount.

FOR PROPER HOIST PLACEMENT REFER TO (Fig. 5).

HOISTING (Continued)

The hoisting points are identified by S.A.E. inverted triangle hoisting symbols (Fig. 5). The front hoisting points are at the bottom of the font rail below the hoisting symbol approximately 250 mm behind the front suspension crossmember. When using outboard lift hoists, verify that the hoist lift pads have been properly adjusted to eliminate contact between the hoist arm and the down standing flange on the sill. The rear hoisting points are the leaf spring front mounting brackets. The hoist pad must be positioned to pick up the flanges on the bracket, not the leaf spring.

When servicing the leaf springs or the leaf spring mounting brackets, special provisions are required to support the rear of the vehicle. Position the rear hoist pads under the horizontal surface on the bottom of the sill, inboard adjacent to the flange and centered fore/aft between the jacking indicator tabs on the lower flange. **DO NOT HOIST ON THE FLANGE.** Place a soft pad between the hoist and the painted surface on the sill to avoid scratching the finish.

JUMP STARTING

STANDARD PROCEDURE - JUMP STARTING

WARNING: REVIEW ALL SAFETY PRECAUTIONS AND WARNINGS. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

WARNING: DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT.

WARNING: DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS BRIGHT COLOR.

WARNING: DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE.

WARNING: DO NOT USE OPEN FLAME NEAR BATTERY

WARNING: REMOVE METALLIC JEWELRY WORN ON HANDS OR WRISTS TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.

WARNING: WHEN USING A HIGH OUTPUT BOOSTING DEVICE, DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS.

WARNING: REFER TO INSTRUCTIONS PROVIDED WITH DEVICE BEING USED.

CAUTION: DO NOT ATTEMPT TO PUSH OR TOW THE VEHICLE TO START IT. THE VEHICLE CANNOT BE STARTED THIS WAY. PUSHING WITH ANOTHER VEHICLE MAY DAMAGE THE TRANSAXLE OR THE REAR OF THE VEHICLE.

(1) Raise hood on disabled vehicle and visually inspect engine compartment for:

- Battery cable clamp condition, clean if necessary.
- Frozen battery.
- Clear or bright color test indicator, if equipped.
- Generator drive belt condition and tension.
- Fuel fumes or leakage, correct if necessary.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.

JUMP STARTING (Continued)

(2) When using another vehicle as a booster source, park the booster vehicle within cable reach. Turn off all accessories, set the parking brake, place the automatic transmission in PARK or the manual transmission in NEUTRAL and turn the ignition OFF.

(3) On disabled vehicle, place gear selector in park or neutral and set park brake. Turn off all accessories.

(4) Connect jumper cables to booster battery. RED clamp to positive terminal (+). BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. Review all warnings in this procedure.

(5) On disabled vehicle, connect RED jumper cable clamp to positive (+) terminal. Connect BLACK jumper cable clamp to engine ground as close to the ground cable attaching point as possible (Fig. 6). (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

(6) Start the engine in the vehicle which has the booster battery, let the engine idle a few minutes, then start the engine in the vehicle with the discharged battery.

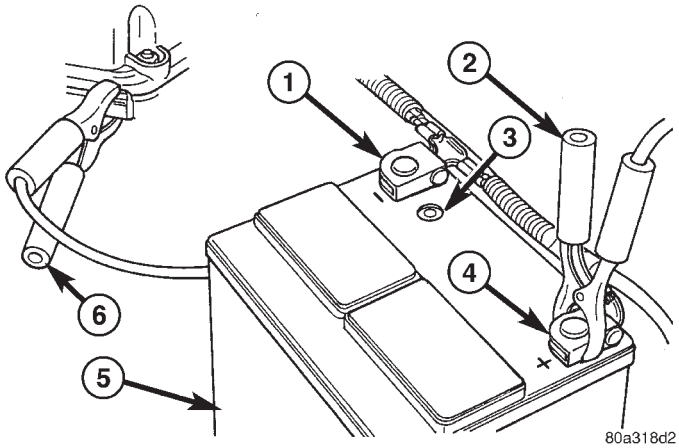

Fig. 6 JUMPER CABLE CLAMP CONNECTIONS

1 - BATTERY NEGATIVE TERMINAL
2 - POSITIVE JUMPER CABLE
3 - TEST INDICATOR (IF EQUIPPED)
4 - BATTERY POSITIVE TERMINAL
5 - BATTERY
6 - NEGATIVE JUMPER CABLE

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter may overheat and could fail.

(7) If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 minutes), before cranking again.

DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.
- When using a Booster vehicle, disconnect BLACK cable clamp from battery negative terminal. Disconnect RED cable clamp from battery positive terminal.
- Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

TOWING

STANDARD PROCEDURE - TOWING

WARNINGS AND CAUTIONS

WARNING: DO NOT ALLOW TOWING ATTACHMENT DEVICES TO CONTACT THE FUEL TANK OR LINES, FUEL LEAK CAN RESULT.
DO NOT LIFT OR TOW VEHICLE BY FRONT OR REAR BUMPER.
DO NOT GO UNDER A LIFTED VEHICLE IF NOT SUPPORTED PROPERLY ON SAFETY STANDS.
DO NOT ALLOW PASSENGERS TO RIDE IN A TOWED VEHICLE.
USE A SAFETY CHAIN THAT IS INDEPENDENT FROM THE TOWING ATTACHMENT DEVICE.

CAUTION: Do not damage brake lines, exhaust system, shock absorbers, sway bars, or any other under vehicle components when attaching towing device to vehicle.
Do not secure vehicle to towing device by the use of front or rear suspension or steering components.
Remove or secure loose or protruding objects from a damaged vehicle before towing.
Refer to state and local rules and regulations before towing a vehicle.
Do not allow weight of towed vehicle to bear on lower fascia, air dams, or spoilers.

RECOMMENDED TOWING EQUIPMENT

To avoid damage to bumper fascia and air dams use:

- FWD vehicles, use of a flat bed towing device or a wheel lift is recommended (Fig. 7).
- AWD vehicles, a flat bed towing device or a wheel lift and towing dolly is recommended (Fig. 7).

When using a wheel lift towing device, be sure the disabled vehicle has at least 100 mm (4 in.) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed 15 degrees.

TOWING (Continued)

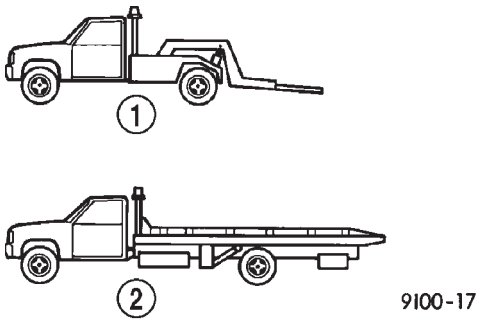

Fig. 7 RECOMMENDED TOWING

1 - WHEEL LIFT
2 - FLAT BED

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until the lifted wheels are a minimum 100 mm (4 in.) from the ground. Be sure there is at least 100 mm (4 in.) clearance between the tail pipe and the ground. If necessary, remove the wheels from the front end of the vehicle and lower the front end closer to the ground, to increase the ground clearance at the rear of the vehicle. Install lug nuts on wheel attaching studs to retain brake drums or rotors.

LOCKED VEHICLE TOWING

When a locked vehicle must be towed with the front wheels on the ground, use a towing dolly or flat bed hauler.

FLAT TOWING WITH TOW BAR

- Three speed automatic transaxle vehicles can be flat towed at speeds not to exceed 40 km/h (25 mph) for not more than 25 km (15 miles). The steering column must be unlocked and gear selector in neutral.
- Four speed electronic automatic transaxle vehicles can be flat towed at speeds not to exceed 72 km/h (44 mph) for not more than 160 km (100 miles). The steering column must be unlocked and gear selector in neutral.
- AWD models should not be flat towed. For additional information, refer to **RECOMMENDED TOWING EQUIPMENT** in this section.

FLAT BED TOWING TIE DOWNS

CAUTION: Do not tie vehicle down by attaching chains or cables to suspension components or engine mounts, damage to vehicle can result.

The vehicle can be tied to a flat bed device using the two pair of front slots on the bottom surface of the rails, behind the front wheels. The two pair of rear slots on the bottom of the rail between the bumper extension bolts and on the bottom of the rail just rearward of the jounce bumper. Vehicles equipped with a rear sway bar have brackets at this location.

TOWING – FRONT WHEEL LIFT

If the vehicle is being towed from the front, whenever possible ensure at least 10 inches road clearance to the tires.

TOWING – REAR WHEEL LIFT

If a vehicle cannot be towed with the front wheels lifted, the rear wheels can be lifted provided the following guide lines are observed.

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

- On AWD vehicles, all four wheels must be free to rotate. Use towing dollies at unlifted end of vehicle.
- Unlock steering column and secure steering wheel in straight ahead position with a clamp device designed for towing.
- Three speed automatic transaxle vehicles can be flat towed at speeds not to exceed 40 km/h (25 mph) for not more than 25 km (15 miles). The steering column must be unlocked and gear selector in neutral.
- Four speed electronic automatic transaxle vehicles can be flat towed at speeds not to exceed 72 km/h (44 mph) for not more than 160 km (100 miles). The steering column must be unlocked and gear selector in neutral.

FRONT SUSPENSION

DESCRIPTION - FRONT SUSPENSION

This vehicle has a MacPherson Strut type front suspension (Fig. 1).

OPERATION - FRONT SUSPENSION

The front suspension allows each wheel on a vehicle to adapt to different road surfaces and conditions without greatly affecting the opposite wheel and the ability to control the vehicle. Each side of the front suspension is allowed to pivot so the vehicle can be steered in the direction preferred.

A strut assembly is used in place of the front suspension upper control arm and upper ball joint. When a vehicle strikes a bump, the force is transferred through the hub, bearing, and knuckle, into the strut assembly to absorb the force and dampen it. The top of the strut is mounted directly to the strut tower of the vehicle. During steering maneuvers, the strut assembly (through a pivot bearing in the upper strut mount) and steering knuckle (through the lower ball joint) turn as an assembly.

STANDARD PROCEDURE - LUBRICATION

There are no serviceable lubrication points on the front suspension. The ball joints are sealed-for-life and require no maintenance. The lower ball joints have special grease fitting caps that prevent normal grease gun attachment. This has been done to eliminate the possibility of over-filling, damaging the non-vented seal. Do not attempt to remove the special grease fitting cap and replace it with a normal grease zirc fitting.

CAUTION: No attempt should be made to replace the ball joint grease fitting cap with a normal zirc fitting or fill the ball joint with grease. Damage to the grease seal can result.

REMOVAL - STABILIZER BAR CUSHION

(1) Raise Vehicle. Refer to Hoisting in Lubrication and Maintenance.

(2) Remove the 2 bolts fastening the emission leak detection pump to the cradle crossmember reinforcement.

(3) Move the leak detection pump to the side allowing access to the stabilizer bar cushion retainers.

(4) Remove the nut and bolt securing each stabilizer bar cushion retainer to the cradle crossmember (Fig. 2) and remove the retainers.

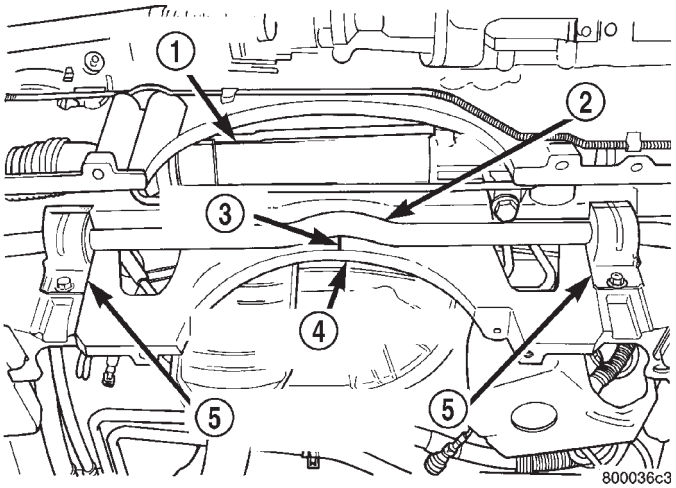

Fig. 2 Front Stabilizer Bar Cushion Retainers

1 - STEERING GEAR
2 - STABILIZER BAR
3 - RAISED BEAD
4 - FRONT CRADLE CROSSMEMBER
5 - RETAINERS

(5) Remove each stabilizer bar cushion from the stabilizer bar by opening the slit in the cushion and peeling it off the stabilizer bar.

INSTALLATION - STABILIZER BAR CUSHION

(1) Install each new cushion on stabilizer bar by spreading cushion at slit and forcing it onto stabilizer bar.

NOTE: Cushions must be installed on stabilizer bar so the square corner of the bushing will be down and slit in cushion will be facing the rear of the vehicle when the stabilizer bar is installed (Fig. 3).

(2) Place stabilizer bar into mounted position with cushions properly aligned.

(3) Hook each retainer into cradle crossmember mounting hole and over cushion.

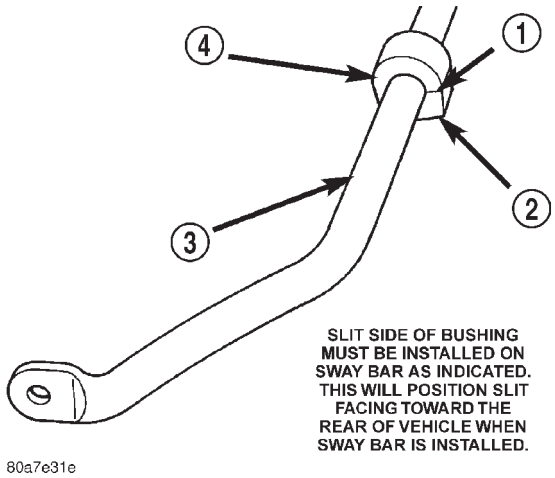

Fig. 3 Correctly Installed Stabilizer Bar Cushion

1 - SLIT IN SWAY BAR BUSHING.
2 - SQUARE CORNER
3 - SWAY BAR
4 - SWAY BAR ISOLATOR BUSHING

(4) Install each mounting bolt from rear of cradle crossmember through retainer. Install the two nuts and tighten to 68 N·m (50 ft. lbs.) torque.

(5) Reattach emission leak detection pump to cradle crossmember reinforcement with two mounting bolts.

(6) Lower the vehicle.

HUB / BEARING

DESCRIPTION

The front wheel bearing and front wheel hub of this vehicle are a hub and bearing unit type assembly (Unit III). This unit combines the front wheel mounting hub (flange) and the front wheel bearing into a sealed one-piece unit. The hub and bearing is mounted to the center of the steering knuckle (Fig. 1). It is retained by four mounting bolts accessible from the inboard side of the steering knuckle. The hub flange has five wheel mounting studs.

The wheel mounting studs used to mount the tire and wheel to the vehicle are the only replaceable components of the hub and bearing assembly. Otherwise, the hub and bearing is serviced only as a complete assembly.

OPERATION

The hub and bearing has internal bearings that allow the hub to rotate with the driveshaft, along with the tire and wheel. The five wheel mounting studs mount the tire and wheel, and brake rotor to the vehicle.

HUB / BEARING (Continued)

DIAGNOSIS AND TESTING - HUB AND BEARING

The condition of the front hub and bearing assembly is diagnosed using the inspection and testing procedure detailed below.

The bearing contained in the Unit III front hub/bearing assembly will produce noise and vibration when worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine the location of a worn or damaged bearing.

Find a smooth level road surface and bring the vehicle up to a constant speed. When vehicle is at a constant speed, swerve the vehicle back and forth from the left and to the right. This will load and unload the bearings and change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at speeds above 105 km/h (65 mph).

REMOVAL

NOTE: Replacement of the Unit III front hub/bearing assembly can be normally done without having to remove the steering knuckle from the vehicle. In the event that the hub/bearing is frozen in the steering knuckle and cannot be removed by hand, it will have to be pressed out of the steering knuckle. The steering knuckle will require removal from the vehicle to allow the hub/bearing assembly to be pressed out of the steering knuckle. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL)

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove wheel lug nuts, and front tire and wheel assembly.

(3) Remove the cotter pin, nut lock and spring washer from the stub axle (Fig. 4).

(4) With aid of a helper applying the brakes to keep the front hub from turning, remove the hub nut (Fig. 4).

(5) Remove disc brake caliper and adapter as an assembly from knuckle as shown (Fig. 5). Hang assembly out of the way using a bungee cord or wire. **Do not allow caliper hang by brake hose.**

(6) Remove brake rotor from hub and bearing (Fig. 5).

(7) Push in on end of driveshaft stub shaft, pushing its splines out of the hub splines.

(8) Remove the four hub and bearing mounting bolts from the rear of steering knuckle (Fig. 6). **Use care not to come in contact with and damage the ABS tone wheel on the driveshaft stub shaft upon bolt removal.**

(9) Remove the hub and bearing assembly from the steering knuckle.

HUB / BEARING (Continued)

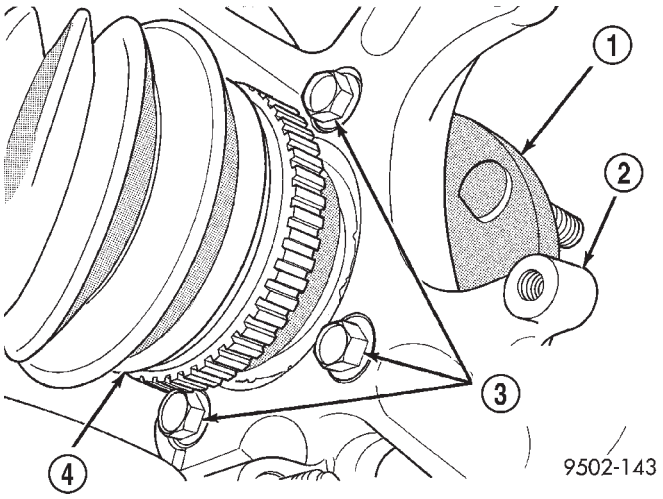

Fig. 6 Hub And Bearing Mounting Bolts

1 - HUB
2 - STEERING KNUCKLE
3 - MOUNTING BOLTS (4)
4 - DRIVESHAFT

INSTALLATION

CAUTION: Hub and bearing assembly mounting surfaces on the steering knuckle and stub axle (Fig. 7) must be smooth and completely free of foreign material or nicks prior to installing hub and bearing assembly.

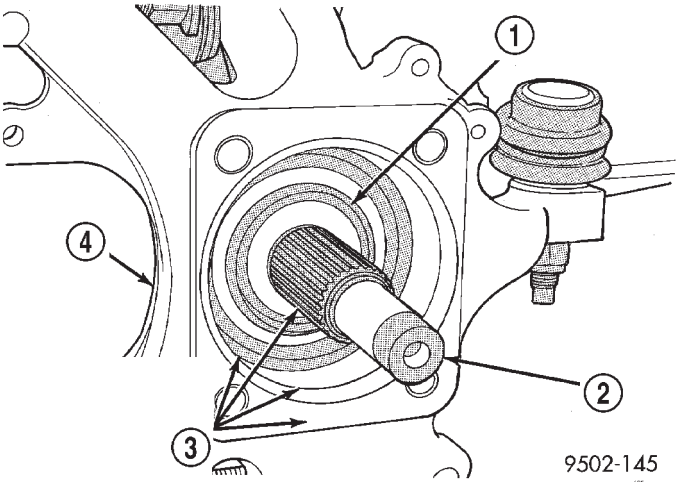

Fig. 7 Mounting Surfaces (Typical)

1 - BEARING SEAL
2 - STUB AXLE
3 - THESE SURFACES MUST BE CLEAN AND FREE OF NICKS BEFORE INSTALLING BEARING ASSEMBLY
4 - STEERING KNUCKLE

CAUTION: When installing hub and bearing into steering knuckle, be careful not to damage the bearing seal (Fig. 7) on the outer C/V joint.

(1) Install hub and bearing onto stub axle and into steering knuckle until squarely seated on the face of the steering knuckle.

(2) Install the 4 hub and bearing mounting bolts from the rear of the knuckle. Equally tighten all 4 mounting bolts in a criss-cross pattern until hub/bearing assembly is squarely seated against front of steering knuckle. Tighten mounting bolts to a torque of 65 N·m (45 ft. lbs.)

(3) Install the brake rotor on the hub and bearing (Fig. 5).

(4) Install brake caliper and adapter assembly back over brake rotor and align with mounting holes on steering knuckle (Fig. 5). Install the mounting bolts and tighten to 169 N·m (125 ft. lbs.) torque.

(5) Install the hub nut on the end of the stub axle (Fig. 4). With aid of a helper applying the brakes to keep the front hub from turning, tighten the hub nut to Install the mounting bolts and tighten to 244 N·m (180 ft. lbs.) torque.

(6) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(7) Lower vehicle to the ground.

(8) Check the front wheel alignment toe setting and reset if not within specifications. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

KNUCKLE

DESCRIPTION

The steering knuckle is a single **aluminum** casting with legs machined for attachment of the strut assembly, steering linkage, disc brake caliper adapter, lower control arm ball joint and steering linkage (Fig. 1). The hub and bearing assembly is mounted in the center of the steering knuckle using 4 bolts. The driveshaft's constant velocity (C/V) stub axle is splined through the center of the hub and bearing and is held in place using a nut, nut lock and cotter pin.

Service replacement of the front hub and bearing assembly can be done with the steering knuckle remaining on the vehicle.

OPERATION

The steering knuckle pivots with the strut assembly between the lower ball joint and the pivot bearing in the strut assembly. The steering gear outer tie rod end connects to the trailing end of each knuckle, allowing the vehicle to be steered.

KNUCKLE (Continued)

The center of the knuckle supports the hub and bearing and axle shaft.

REMOVAL - STEERING KNUCKLE

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the wheel and tire assembly from the vehicle.

(3) Remove the cotter pin, nut lock and spring washer from the end of the stub axle and hub nut (Fig. 8).

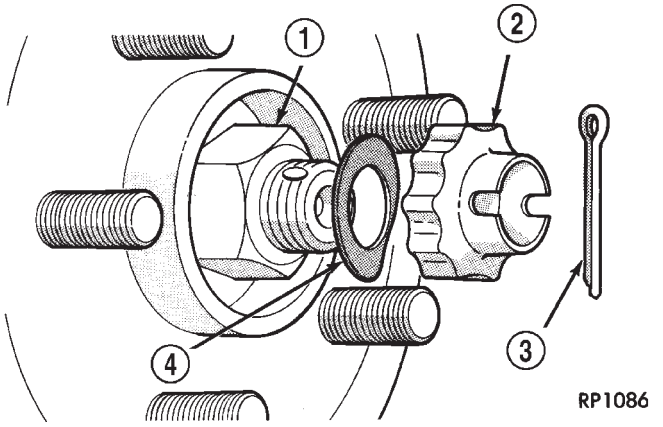

Fig. 8 Hub Nut

1 - HUB NUT
2 - NUT LOCK
3 - COTTER PIN
4 - SPRING WASHER

(4) Have a helper apply the vehicle's brakes to keep hub from turning, **loosen and remove** the hub nut (Fig. 8).

(5) Remove disc brake caliper and adapter as an assembly from knuckle as shown (Fig. 9). Hang assembly out of the way using a bungee cord or wire (Fig. 10). **Do not allow caliper to hang by brake hose.**

(6) Remove nut attaching outer tie rod end to steering knuckle by holding the tie rod end stud while loosening and removing nut with a wrench (Fig. 11).

(7) Remove tie rod end from steering knuckle using Remover, Special Tool C-3894–A (Fig. 12).

(8) If equipped with antilock brakes, remove the front wheel speed sensor from the steering knuckle (Fig. 13).

(9) Remove the two steering knuckle-to-strut clevis bracket attaching bolts.

(10) Tip the knuckle outward and remove the driveshaft stub axle from the hub and bearing. Suspend driveshaft straight outward using a bungee cord or wire (Fig. 10). **Do not allow driveshaft to hang by inner joint.**

3 - STEERING KNUCKLE

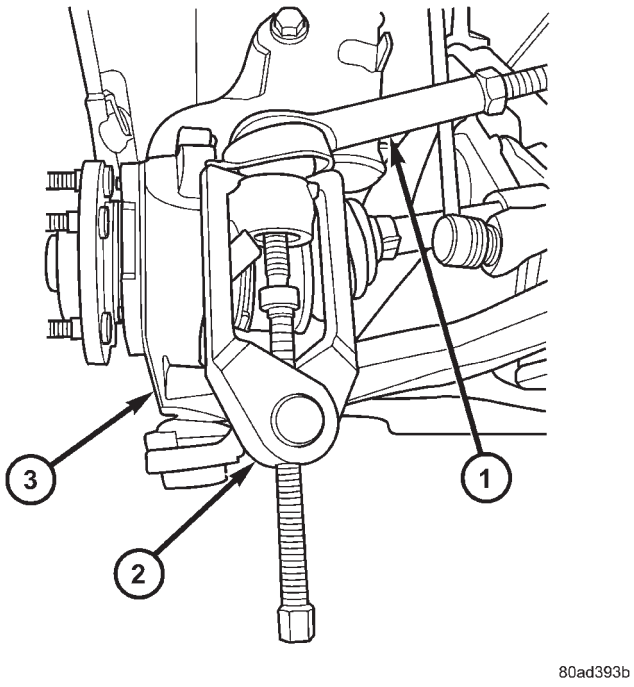

Fig. 12 Tie Rod Removal With Tool C-3894-A

1 - OUTER TIE ROD
2 - SPECIAL TOOL C-3894-A
3 - STEERING KNUCKLE

(11) Remove ball joint nut using a power impact wrench. Because the tapered stud is held sufficiently in the knuckle at this time, it is not necessary to hold the stud stationary to remove the nut.

(12) Reinstall the ball joint nut until the top of the nut is even with the top of the ball joint stud. This will keep the stud from distorting while the stud is released from the knuckle in the following step.

CAUTION: Do not remove ball joint stud from steering knuckle using a hammer. Damage to the Aluminum knuckle, ball joint or control arm will result.

(13) Release ball joint stud from steering knuckle using Remover, Special Tool C-4150A, as shown (Fig. 14). To ease Remover installation and use, it may help to rotate the knuckle around so the inside of the knuckle faces outward.

(14) Remove the nut from the top of the ball joint stud.

(15) Remove the steering knuckle from the vehicle.

(16) If the hub and bearing needs to be transferred, remove the four bolts attaching the hub and bearing to the knuckle, then remove the hub and bearing.

INSPECTION - STEERING KNUCKLE

Inspect the knuckle for the following:

- Cracks or breaks
- Dents or damage
- Stress marks indicating a bend

The front suspension knuckle is not a repairable component of the vehicles front suspension. If bent, broken or damaged in any way, do not attempt to straighten or repair the steering knuckle. It must be replaced.

KNUCKLE (Continued)

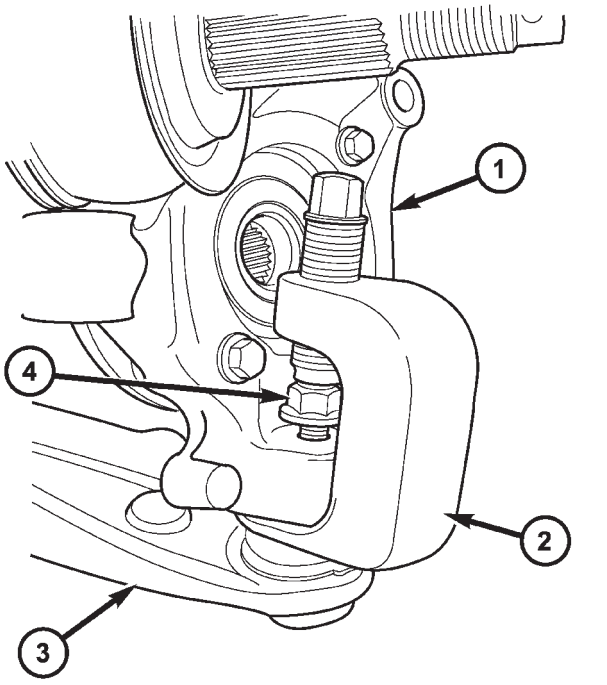

Fig. 14 Using C-4150A To Release Ball Joint

1 - ALUMINUM KNUCKLE
2 - SPECIAL TOOL C-4150A
3 - LOWER CONTROL ARM
4 - NUT INSTALLED ON BALL JOINT STEM

If inspection leads to the hub and bearing, (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - DIAGNOSIS AND TESTING)

INSTALLATION - STEERING KNUCKLE

(1) If the hub and bearing needs to be installed in the knuckle, place the hub and bearing squarely into the center hole of the steering knuckle aligning the threaded mounting holes of the hub and bearing with the mounting holes in the steering knuckle. Install the four mounting bolts and tighten them to a torque of 65 N·m (45 ft. lbs.).

CAUTION: Before installing the knuckle on the ball joint stud, wipe the ball joint stud and knuckle contact area free of any grease or debris, otherwise damage to the knuckle can occur. Use a clean shop cloth with Mopar® Brake Parts Cleaner applied to it for proper cleaning. Do not spray the stud directly.

(2) Place the knuckle on the ball joint stud.

(3) Install a NEW steering knuckle to ball joint stud nut. Tighten the nut by holding ball joint stud with hex wrench while turning nut with a wrench (Fig. 15). Using a crowsfoot wrench on a torque wrench, tighten the nut to a torque of 108 N·m (80 ft. lbs.).

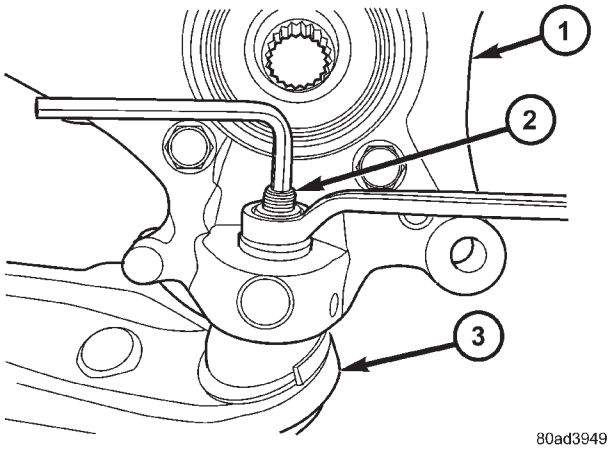

Fig. 15 Ball Joint Nut Installation

1 - KNUCKLE
2 - BALL JOINT STUD
3 - LOWER CONTROL ARM

(4) Slide driveshaft stub axle into hub and bearing assembly.

CAUTION: The steering knuckle to strut assembly attaching bolts are serrated and must not be turned during installation. Install nuts while holding bolts stationary in the steering knuckle.

CAUTION: If the vehicle being serviced is equipped with eccentric strut assembly attaching bolts, the eccentric bolt must be installed in the bottom (slotted) hole on the strut clevis bracket (Fig. 16).

NOTE: The strut clevis-to-steering knuckle bolts are installed differently on each side. Left hand side bolts are to be installed from vehicle rear to front. Right side bolts are to be installed from vehicle front to rear.

(5) Install steering knuckle in clevis bracket of strut damper assembly. Install the strut clevis-to-steering knuckle attaching bolts. Tighten both bolts to a torque of 81 N·m (60 ft. lbs.) plus an additional 1/4 (90°) turn.

(6) Install tie rod end into knuckle steering arm. Start nut onto stud of tie rod end. While holding stud of tie rod end stationary using a socket (Fig. 11), tighten tie rod end to steering knuckle attaching nut. Tighten the tie rod end nut to a torque of 75 N·m (55 ft. lbs.).

KNUCKLE (Continued)

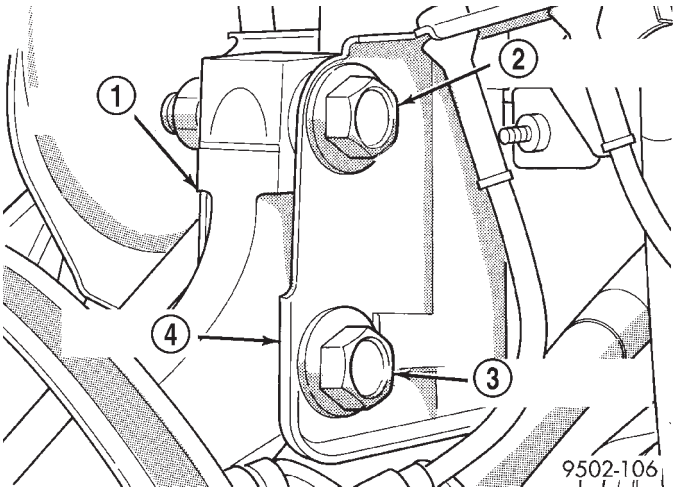

Fig. 16 Correctly Installed Eccentric Attaching Bolt

1 - STEERING KNUCKLE
2 - FLANGED BOLT IN TOP HOLE
3 - CAM BOLT IN BOTTOM HOLE
4 - STRUT CLEVIS BRACKET

(7) If equipped with antilock brakes, install wheel speed sensor and mounting bolt on steering knuckle (Fig. 13). Tighten the speed sensor bolt to a torque of 7 N·m (60 in. lbs.).

(8) Install brake rotor on hub and bearing (Fig. 9).

(9) Install disc brake caliper and adapter assembly on steering knuckle. Install adapter amounting bolts and tighten to 169 N·m (125 ft. lbs.).

(10) Clean any debris from the threads of the outer C/V joint stub axle.

(11) Install the washer and hub nut on stub axle.

(12) Have a helper apply the vehicle's brakes to keep hub from turning, then tighten hub nut to a torque of 244 N·m (180 ft. lbs.).

(13) Install the spring wave washer on the end of the stub axle.

(14) Install the hub nut lock, and a **new** cotter pin (Fig. 8). Wrap cotter pin prongs tightly around the hub nut lock.

(15) Install wheel and tire assembly. Install and tighten the wheel mounting nuts in proper sequence until all nuts are torqued to half the required specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(16) Lower vehicle.

(17) Set front wheel alignment camber and toe as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

LOWER BALL JOINT

DESCRIPTION

The ball joint is an integral part of the lower control arm (Fig. 1). The ball joint has a tapered stud that is pressed into the aluminum knuckle. The ball joint stud is threaded on the end for a retainer nut.

The ball joint has a non-vented seal boot. The seal boot has an integrated heat shield.

The ball joint used in the lower control arm of this vehicle is a sealed-for-life ball joint and requires no maintenance lubrication. The ball joint has been lubricated-for-life during the manufacturing process. A special fitting cap is installed on the fill port. This cap must not be removed and replaced with a common zirc fitting. The special cap is there to eliminate the possibility of lubrication latter during the ball joints life, thus damaging the non-vented seal boot.

NOTE: The ball joint does not require any type of additional lubrication for the life of the vehicle. No attempt should be made to ever add any lubrication to the lower ball joint.

OPERATION

The ball joint is a pivotal joint on the lower control arm that allows the knuckle to move up and down, and turn with ease.

DIAGNOSIS AND TESTING - LOWER BALL JOINT

With the weight of the vehicle resting on the road wheels, grasp the special fitting cap on the bottom of the ball joint and with no mechanical assistance or added force, attempt to rotate the grease fitting.

If the ball joint is worn, the grease fitting will rotate easily. If movement is noted, replacement of the control arm is recommended.

LOWER BALL JOINT SEAL BOOT

DESCRIPTION - EXPORT

The lower ball joint seal boot is a two piece unit. It consists of the seal boot, plus a separate shield that is located in a groove at the top of the seal boot.

NOTE: The seal boot should only be replaced if damaged during vehicle service. The entire lower control arm should be replaced if the joint has been contaminated.

LOWER BALL JOINT SEAL BOOT (Continued)

REMOVAL

REMOVAL - BALL JOINT SEAL BOOT

(1) Remove steering knuckle from vehicle. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL)

(2) Using a screw driver or other suitable tool, pry the seal boot off of the ball joint (Fig. 17)

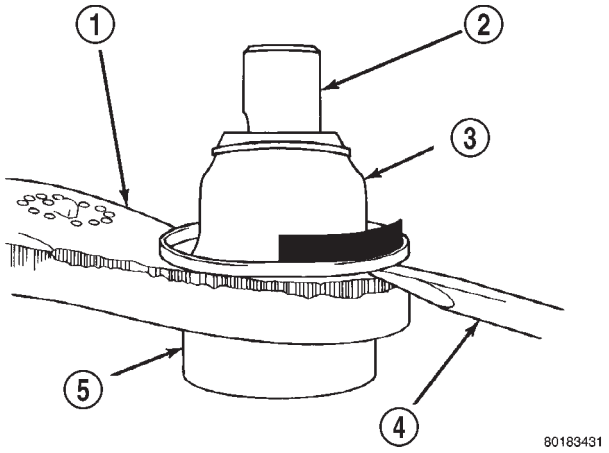

Fig. 17 Ball Joint Seal Boot Removal (Typical)

1 - LOWER CONTROL ARM
2 - BALL JOINT STUD
3 - SEAL BOOT
4 - SCREW DRIVER
5 - BALL JOINT ASSEMBLY

(3) Inspect the ball joint for evidence of dirt or water intrusion and wipe clean as necessary. If dirt or water intrusion is extreme and joint cannot be properly cleaned, the lower control arm will need to be replaced. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL)

REMOVAL - EXPORT

(1) Remove steering knuckle from vehicle. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL)

(2) Remove shield from seal boot by gently pulling on it.

(3) Using a screw driver or other suitable tool, pry seal boot off lower ball joint.

INSTALLATION

INSTALLATION - BALL JOINT SEAL BOOT

(1) Place a liberal dab of Mopar® Wheel Bearing Grease around the base of the ball joint stem at the socket.

(2) Install a **NEW** seal boot by hand as far as possible on the ball joint. Installation of the seal boot is to be with the shield positioned as shown (Fig. 18).

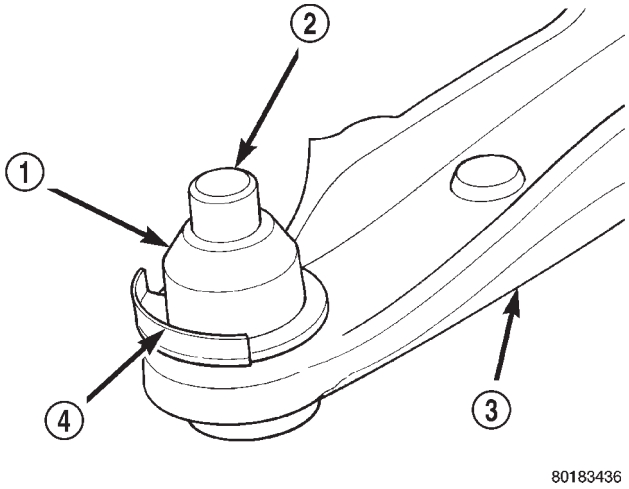

Fig. 18 Ball Joint Seal Boot Installed Position (Typical)

1 - BALL JOINT SEAL BOOT
2 - BALL JOINT STUD
3 - LOWER CONTROL ARM
4 - SHIELD

CAUTION: Do not use an arbor press to install the sealing boot on the ball joint. Damage to the sealing boot will occur if excessive pressure is applied to the sealing boot when it is being installed.

(3) Place Installer, Special Tool 6758, over seal boot and squarely align it with bottom edge of seal boot (Fig. 19). Apply hand pressure (or gently tap with a hammer) to Special Tool 6758 until seal boot is pressed squarely against top surface of lower control arm.

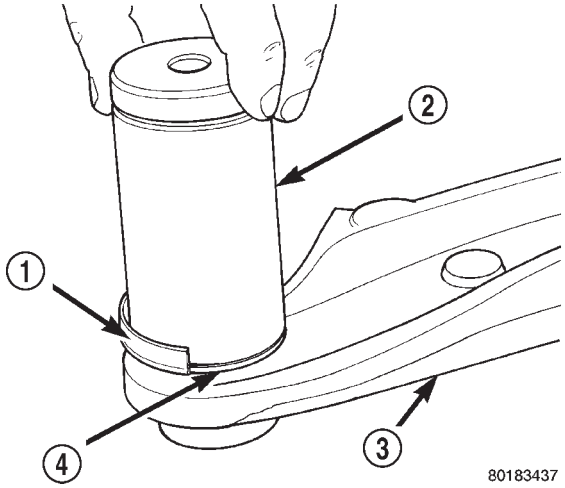

Fig. 19 Installing Ball Joint Seal Boot

1 - SHIELD
2 - SPECIAL TOOL 6758
3 - LOWER CONTROL ARM
4 - BALL JOINT SEAL BOOT

LOWER BALL JOINT SEAL BOOT (Continued)

(4) Wipe any grease off the ball joint stem using a clean shop towel with Mopar® Brake Parts Cleaner applied to it.

CAUTION: Do not attempt to install a normal grease zirc in the ball joint an lubricate the joint through the zirc fitting.

(5) Reinstall steering knuckle on vehicle. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - INSTALLATION)

INSTALLATION - EXPORT

(1) Place a liberal dab of Mopar® Wheel Bearing Grease around the base of the ball joint stem at the socket.

(2) Install a **NEW** seal boot by hand as far as possible on the ball joint.

CAUTION: Do not use an arbor press to install the sealing boot on the ball joint. Damage to the sealing boot will occur if excessive pressure is applied to the sealing boot when it is being installed.

(3) Place Installer, Special Tool 6758, over seal boot and squarely align it with bottom edge of seal boot (Fig. 20). Apply hand pressure to Special Tool 6758 until seal boot is pressed squarely against top surface of lower control arm.

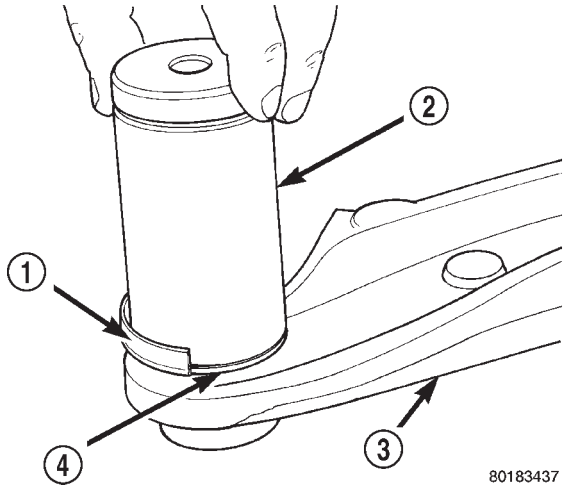

Fig. 20 Installing Ball Joint Seal Boot (Typical)

1 - SHIELD (NOT ON RG VEHICLE)
2 - SPECIAL TOOL 6758
3 - LOWER CONTROL ARM
4 - BALL JOINT SEAL BOOT

(4) Wipe any grease off the ball joint stem.

(5) Place the shield over the top of the seal boot and stretch it into the groove at the top of the seal boot.

CAUTION: Do not attempt to install a normal grease zirc in the ball joint and lubricate the joint through the zirc fitting.

(6) Reinstall steering knuckle on vehicle. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - INSTALLATION)

LOWER CONTROL ARM

DESCRIPTION

The lower control arm is mounted to the front suspension crossmember using a pivot bolt through the center of the front pivot bushing, and the front suspension cradle crossmember reinforcement traps the rear bushing in the crossmember (Fig. 1).

The lower control arm is an iron casting with two rubber bushings and a ball joint. The lower control arm front bushing is the spool type and is pressed into the lower control arm. The standard (Low-line) lower control arm rear bushing is a push-on bushing that is pushed over a stem on the rear of the lower control arm. The optional (High-line, Premium, Sport) lower control arm rear bushing is a hydro-bushing that is pressed on. It has liquid filled voids that provide more effective dampening than the standard bushing. Vehicles with rear hydro-bushings utilize a different lower control arm than vehicles with standard bushings. They have a straight slightly tapered round stem where the hydro-bushing is mounted whereas the standard arm has a straight stem with a squared knob on the end to retain the bushing.

The lower control arm ball joint is pressed into the outer end of the arm. The ball joint has a tapered stud and retainer nut for fastening it to the steering knuckle.

OPERATION

The lower control arm supports the lower end of the steering knuckle and allows for the up and down movement of the suspension during the jounce and rebound travel. The lower control arm ball joint connects the arm to the steering knuckle.

REMOVAL - LOWER CONTROL ARM

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove wheel and tire assembly.

(3) Remove the steering knuckle. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL)

(4) Remove the bolts fastening the power steering cooler to the front suspension cradle crossmember reinforcement (Fig. 21).

LOWER CONTROL ARM (Continued)

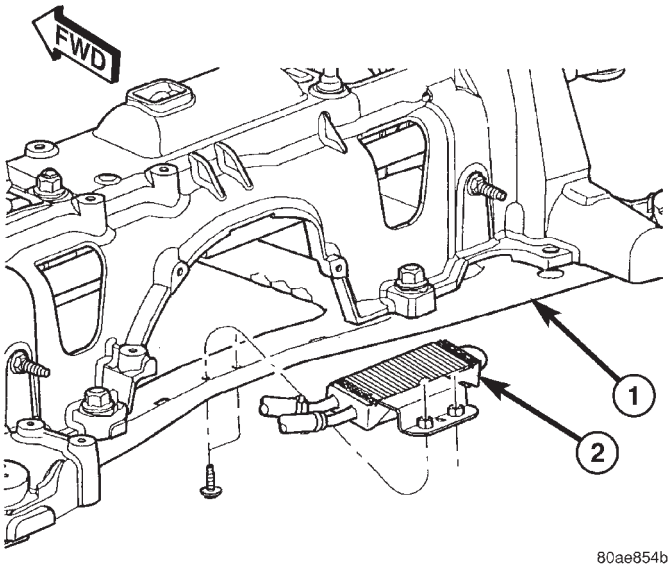

Fig. 21 Power Steering Cooler

1 - CRADLE CROSSMEMBER REINFORCEMENT
2 - POWER STEERING COOLER

(5) Remove the lower control arm rear bushing retainer bolts located on each side of each lower control arm rear bushing.

NOTE: The bolts fastening the cradle crossmember reinforcement are of three different thread sizes. Note the location of the various sizes.

(6) Remove the bolts attaching the cradle crossmember reinforcement to the front suspension cradle crossmember (Fig. 22). Remove the 2 bolts fastening the reinforcement and rear of cradle crossmember to the body of the vehicle. Remove the reinforcement.

(7) Remove the pivot bolt attaching the front bushing of the lower control arm to the front suspension cradle crossmember.

(8) Remove the lower control arm.

DISASSEMBLY

DISASSEMBLY - LOWER CONTROL ARM (REAR BUSHING - STANDARD)

(1) Remove the lower control arm from the front suspension cradle. (Refer to 2 - SUSPENSION/ FRONT/LOWER CONTROL ARM - REMOVAL)

(2) Mount the lower control arm in a vise **without** using excessive clamping force.

(3) Using a sharp knife (such as a razor), slit the bushing lengthwise (Fig. 23) to allow its removal from the lower control arm (Fig. 23).

(4) Remove the bushing from the lower control arm.

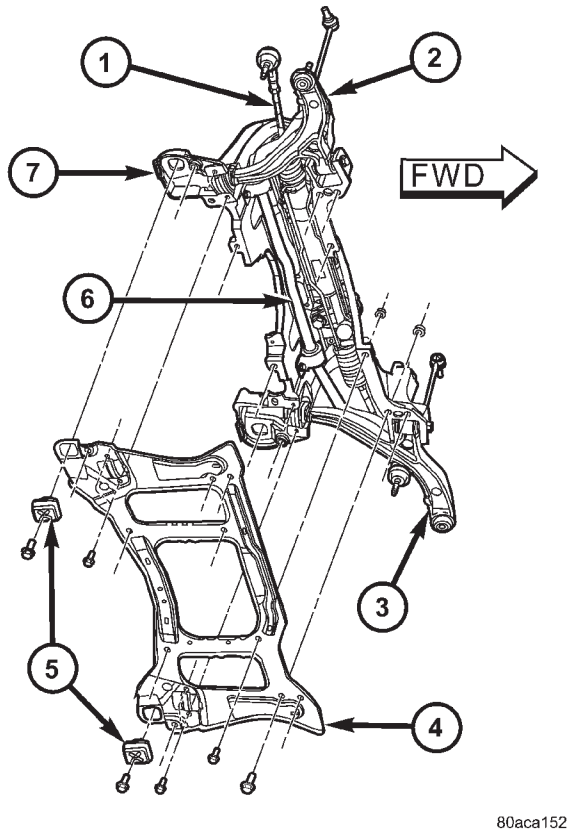

Fig. 22 Cradle Crossmember Reinforcement Attachment

1 - STEERING GEAR
2 - RIGHT LOWER CONTROL ARM
3 - LEFT LOWER CONTROL ARM
4 - CRADLE CROSSMEMBER REINFORCEMENT
5 - REAR CRADLE CROSSMEMBER ISOLATOR BUSHING
6 - STABILIZER BAR
7 - CRADLE CROSSMEMBER

DISASSEMBLY - LOWER CONTROL ARM (REAR BUSHING - HYDRO)

(1) Remove the lower control arm from the front suspension cradle. (Refer to 2 - SUSPENSION/ FRONT/LOWER CONTROL ARM - REMOVAL)

(2) Mount the lower control arm in a vise **without** using excessive clamping force.

(3) Install Remover, Special Tool 8460, on hydro-bushing as shown (Fig. 24). Removal Pin, Special Tool 8460–3, must extend though hole in center of bushing rear.

(4) Tighten forcing screw of Bridge (Special Tool 8460–1), removing bushing from lower control arm.

LOWER CONTROL ARM (Continued)

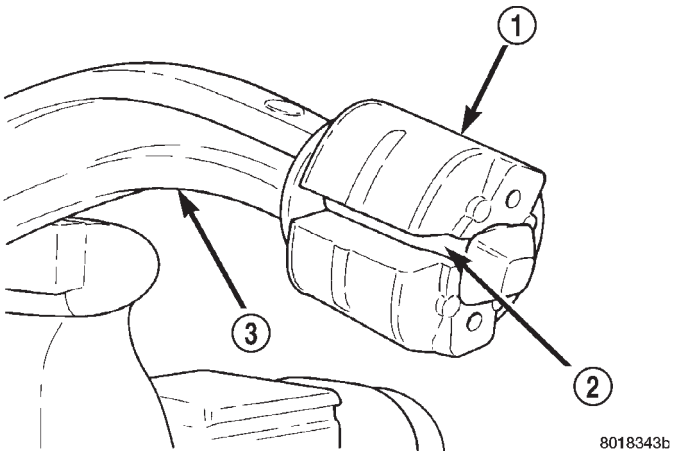

Fig. 23 Slit Lower Control Arm Rear Bushing

1 - REAR BUSHING
2 - SLIT CUT IN BUSHING
3 - LOWER CONTROL ARM

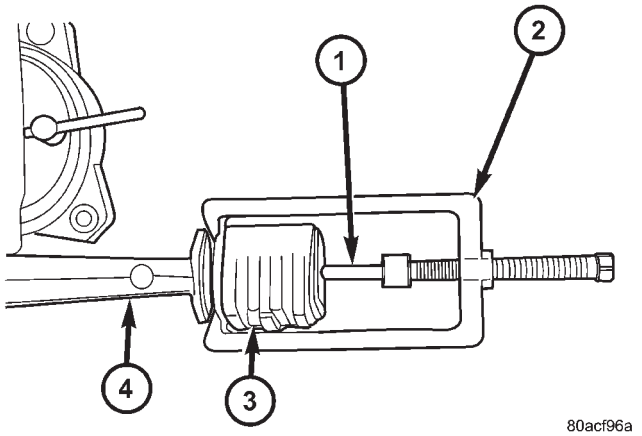

Fig. 24 HYDRO-BUSHING REMOVAL

1 - REMOVAL PIN (8460-3)
2 - BRIDGE (8460-1)
3 - HYDRO-BUSHING
4 - LOWER CONTROL ARM

INSPECTION - LOWER CONTROL ARM

Inspect lower control arm for signs of damage from contact with the ground or road debris. If lower control arm shows any sign of damage, inspect lower control arm for distortion. Do not attempt to repair or straighten a broken or bent lower control arm. If damaged, the lower control arm casting is serviced only as a complete component.

Inspect both lower control arm isolator bushings for severe deterioration, and replace as required. Inspect the rear hydro-bushing for seepage. Both type rear bushings are serviceable. If the front bushing fails, the lower control arm must be replaced.

Inspect and test the ball joint per the procedure listed in Lower Ball Joint. (Refer to 2 - SUSPENSION/FRONT/LOWER BALL JOINT - DIAGNOSIS AND TESTING)

ASSEMBLY

ASSEMBLY - LOWER CONTROL ARM (REAR BUSHING - STANDARD)

CAUTION: Do not apply grease or any other type of lubricant other than the silicone lubricant specified below to the control arm bushing.

(1) Apply Mopar Silicone Spray Lube or an equivalent, to the hole in lower control arm rear bushing. This will aid in the installation of the bushing on the lower control arm.

(2) With the lower control arm held securely in a vise, install bushing on lower control arm. Install bushing by pushing and rocking the bushing until it is fully installed on lower control arm. Be sure that when bushing is installed it is past the upset on the end of the lower control arm (Fig. 25).

(3) The rear bushing of the lower control arm, when correctly installed, is to be positioned on the lower control arm as shown (Fig. 25).

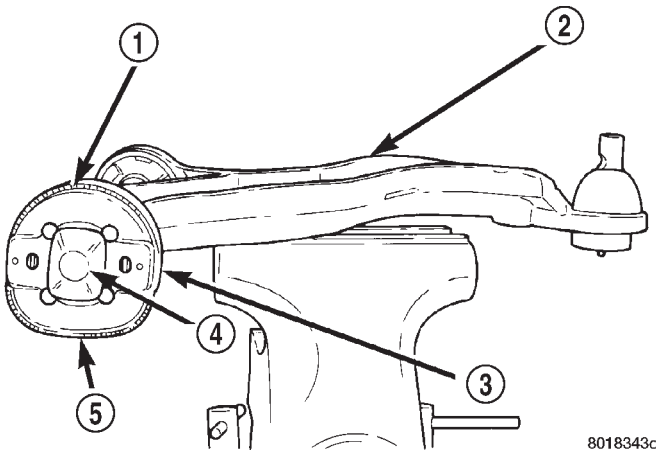

Fig. 25 Correctly Installed Lower Control Arm Bushing

1 - ROUND SURFACE OF BUSHING
2 - LOWER CONTROL ARM
3 - LOWER CONTROL ARM REAR BUSHING
4 - UPSET
5 - FLAT SURFACE OF BUSHING

(4) Install lower control arm on vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION)

LOWER CONTROL ARM (Continued)

ASSEMBLY - LOWER CONTROL ARM (REAR BUSHING - HYDRO)

CAUTION: Do not apply grease or any other type of lubricant to the arm stem where the bushing is to be mounted. Such action will reduce proper bushing adhesion to arm.

(1) Secure lower control arm in a vise.

NOTE: Hydro bushings and grooves on control arm stems are unique for right and left sides. Left side bushing master spline and control arm groove are on the top (when mounted on vehicle). Right side bushing master spline and control arm groove are on the bottom (when mounted on vehicle).

(2) Align master spline on bushing inner sleeve with groove on lower control arm rear bushing stem (Fig. 26). Start bushing on stem by hand.

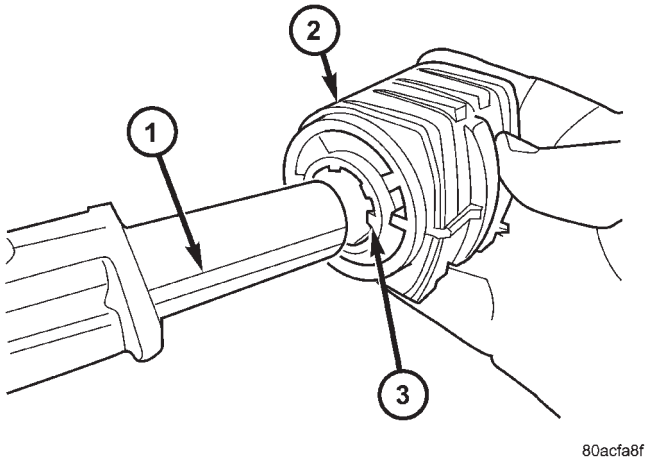

Fig. 26 BUSHING MASTER SPLINE LINED UP WITH GROOVE (RIGHT SIDE SHOWN)

1 - GROOVE
2 - HYDRO-BUSHING
3 - MASTER SPLINE

(3) Install Remover/Installer, Special Tool 8460, over bushing and lower control arm as shown (Fig. 27). Engage flange on lower control arm with tips of Bridge, Special Tool 8460–1 as shown (Fig. 27). The contoured side of Installer Cup, Special Tool 8460–2, should be fitted up against rear of the bushing.

(4) Begin to tighten forcing screw. As bushing nears lower control arm flange, place Spacer Plate, Special Tool 8460–4 between flange and bushing inner sleeve, straddling the stem as shown (Fig. 28).

(5) Install bushing up against Spacer Plate, tightening the bridge forcing screw with a torque wrench until approximately 50 N·m (37 ft. lbs.) torque is reached. This will properly space bushing on the stem in relation to the flange.

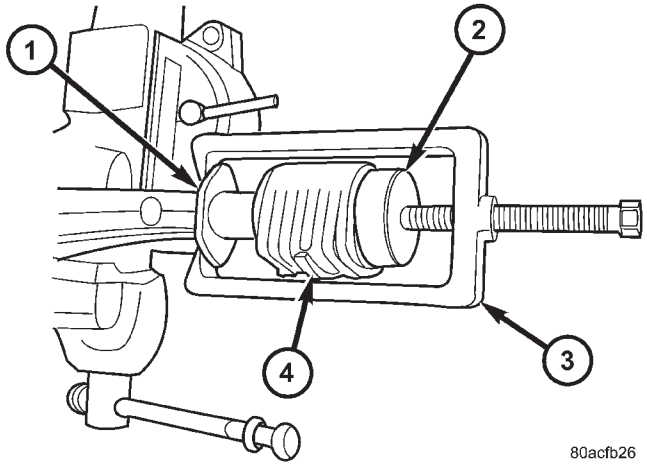

Fig. 27 HYDRO-BUSHING INSTALLATION

1 - LOWER CONTROL ARM FLANGE
2 - INSTALLER CUP (8460-2)
3 - BRIDGE (8460-1)
4 - HYDRO-BUSHING

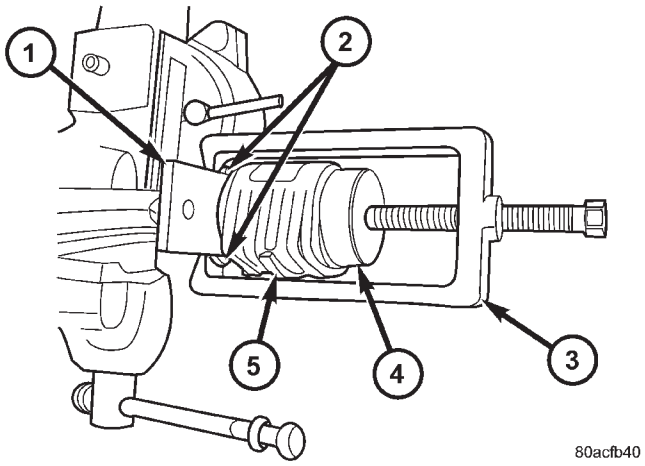

Fig. 28 SPACER PLATE POSITIONED

1 - SPACER PLATE (8460-4)
2 - LOWER CONTROL ARM FLANGE
3 - BRIDGE (8460-1)
4 - INSTALLER CUP (8460-2)
5 - HYDRO-BUSHING

(6) Back off the forcing screw and remove tool.

(7) Install lower control arm on vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION)

INSTALLATION - LOWER CONTROL ARM

(1) Position lower control arm assembly into front suspension cradle crossmember guiding bushings into mounting position (Fig. 22).

LOWER CONTROL ARM (Continued)

(2) Install NEW pivot bolt attaching front bushing of lower control arm to front suspension cradle crossmember (Fig. 29). **Do not tighten or torque pivot bolt at this time.**

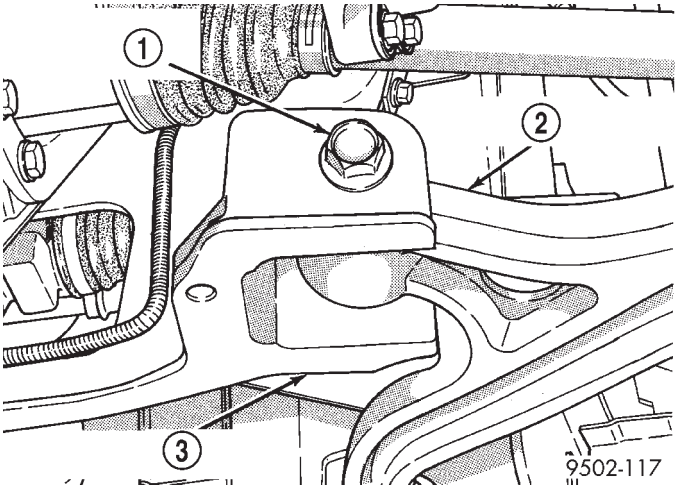

Fig. 29 Lower Control Arm Bushing Pivot Bolt Correctly Installed

1 - PIVOT BOLT
2 - LOWER CONTROL ARM
3 - FRONT SUSPENSION CRADLE CROSSMEMBER

(3) Install the reinforcement on the front suspension cradle crossmember and install the bolts attaching the reinforcement to the cradle crossmember (Fig. 22). Tighten the M-14 size bolts to a torque of 153 N·m (113 ft. lbs.). Tighten the M-12 size bolts to a torque of 106 N·m (78 ft. lbs.).

(4) Install the lower control arm rear bushing retainer bolts through reinforcement on each side of each lower control arm rear bushing. Tighten these M-10 size bolts to a torque of 61 N·m (45 ft. lbs.).

(5) Install the two bolts and bushings attaching the reinforcement and rear of cradle crossmember to body of vehicle (Fig. 22). Tighten bolts to a torque of 163 N·m (120 ft. lbs.).

(6) Install the power steering cooler (Fig. 21). Tighten bolts to a torque of 11 N·m (100 in. lbs.).

(7) Reinstall steering knuckle, brake rotor and caliper. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - INSTALLATION)

CAUTION: When locating jack stands under lower control arms, do not place the jack stands under the ball joints (Fig. 30).

(8) Position jack stands under the lower control arms as close to the ball joints as possible (Fig. 30). Lower the vehicle onto the jack stands until the jack stands are supporting the total weight of the vehicle.

(9) Tighten front lower control arm pivot bolt to a torque of 183 N·m (135 ft. lbs.).

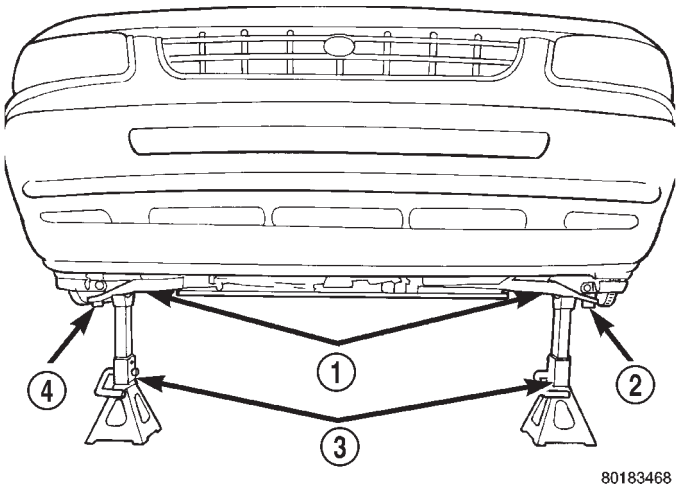

Fig. 30 Jack Stands Supporting Vehicle Weight

1 - LOWER CONTROL ARMS
2 - BALL JOINT
3 - JACK STANDS
4 - BALL JOINT

(10) Install the wheel and tire assembly. Install and tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(11) Raise vehicle, remove jack stands and lower vehicle to the ground.

(12) Perform front wheel alignment as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

STABILIZER BAR

DESCRIPTION

The stabilizer bar interconnects both front struts of the vehicle and is attached to the front crossmember (Fig. 1) .

Attachment of the stabilizer bar to the front crossmember is through 2 rubber-isolator cushion bushings and retainers. A double ball jointed stabilizer bar link is used to attach each end of the stabilizer bar to the front strut assemblies. All parts of the stabilizer bar are replaceable as individual components.

The stabilizer bar to front crossmember cushion bushings are split for easy removal and installation. The split in the bushings should be positioned toward the rear of the vehicle, with the square corner facing down, when the stabilizer bar is installed.

OPERATION

Jounce and rebound movements affecting one wheel are partially transmitted to the opposite wheel of the vehicle through the stabilizer bar. This helps

STABILIZER BAR (Continued)

to minimize the body roll of the vehicle during suspension movement.

Connecting the stabilizer bar links to the strut assemblies helps reduce the fore-and-aft rate of the stabilizer bar from the rest of the front suspension.

REMOVAL

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the bolts fastening the power steering cooler to the front suspension cradle crossmember reinforcement (Fig. 31).

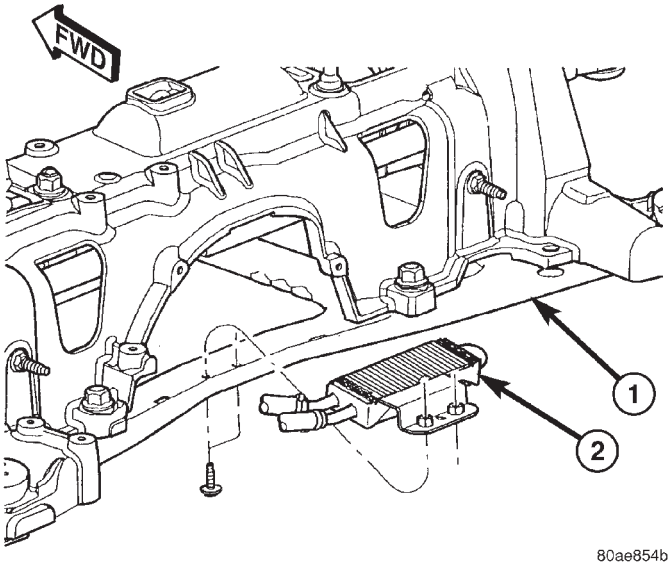

Fig. 31 Power Steering Cooler

1 - CRADLE CROSSMEMBER REINFORCEMENT
2 - POWER STEERING COOLER

(3) Remove the lower control arm rear bushing retainer bolts located on each side of each lower control arm rear bushing.

NOTE: The bolts fastening the cradle crossmember reinforcement are of two different thread sizes. Note the location of the various sizes.

(4) Remove the bolts attaching the cradle crossmember reinforcement to the front suspension cradle crossmember (Fig. 32). Remove the 2 bolts fastening the reinforcement and rear of cradle crossmember to the body of the vehicle. Remove the reinforcement.

CAUTION: When removing the nut from the stud of the stabilizer bar link, do not allow the stud to rotate in it's socket. Hold the stud from rotating by placing an open-end wrench on the flat machined into the stud (Fig. 33).

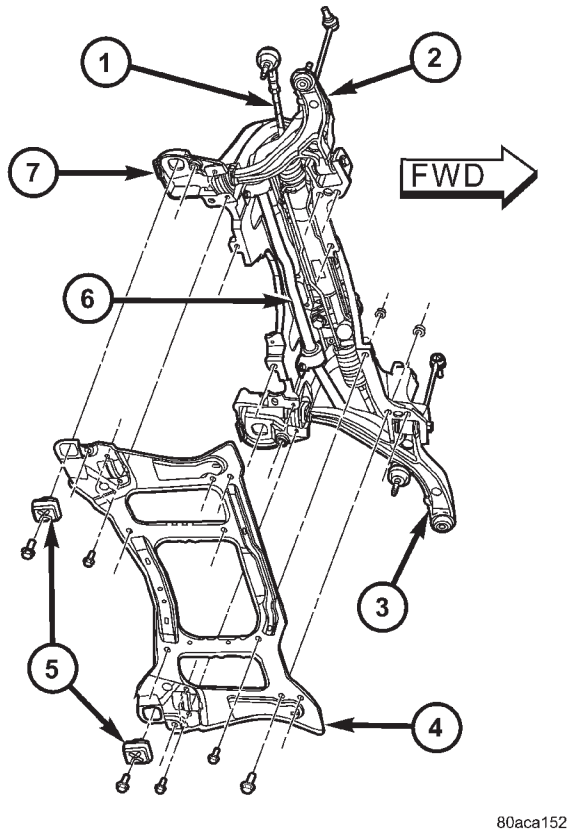

Fig. 32 Cradle Crossmember Reinforcement Attachment

1 - STEERING GEAR
2 - RIGHT LOWER CONTROL ARM
3 - LEFT LOWER CONTROL ARM
4 - CRADLE CROSSMEMBER REINFORCEMENT
5 - REAR CRADLE CROSSMEMBER ISOLATOR BUSHING
6 - STABILIZER BAR
7 - CRADLE CROSSMEMBER

(5) Remove the stabilizer bar links from each end of the stabilizer bar (Fig. 33). To do so, place an open-end wrench on the flat machined into the link's mounting stud, then remove the nut while holding the wrench in place. Push each stud out of the hole in the stabilizer bar.

(6) Remove the stabilizer bar bushing (cushion) retainers from the front suspension cradle crossmember (Fig. 34).

(7) Remove the stabilizer bar and bushings (cushions) as an assembly from the front suspension cradle crossmember.

INSPECTION

Inspect for broken or distorted stabilizer bar bushings (cushions), bushing retainers, and worn or damaged stabilizer bar links.

STABILIZER BAR (Continued)

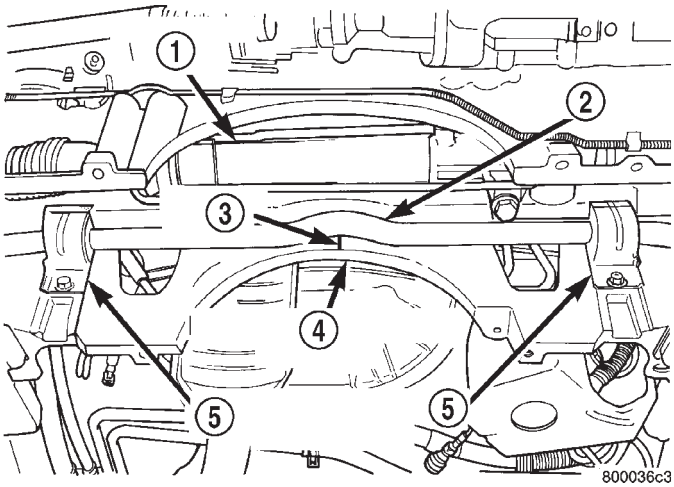

Fig. 34 Front Stabilizer Bar Retainers

1 - STEERING GEAR
2 - STABILIZER BAR
3 - RAISED BEAD
4 - FRONT CRADLE CROSSMEMBER
5 - RETAINERS

INSTALLATION

NOTE: Two different diameter stabilizer bars are available for this vehicle. Therefore, two different size bushings/cushions are also used. Use the correct bushing/cushion on the correct stabilizer bar.

(1) If the stabilizer bar to front suspension cradle bushings require replacement at time of inspection, install new bushings before installing stabilizer bar. Bushings are replaced by opening slit on bushings and peeling them off stabilizer bar. Install new bushings on stabilizer bar by spreading bushing at slit and forcing them on the stabilizer bar. **Bushings must be installed on stabilizer bar so slit in bushing will be facing toward the rear of vehicle with the square corner toward the ground, when the stabilizer bar is installed on the vehicle (Fig. 35).**

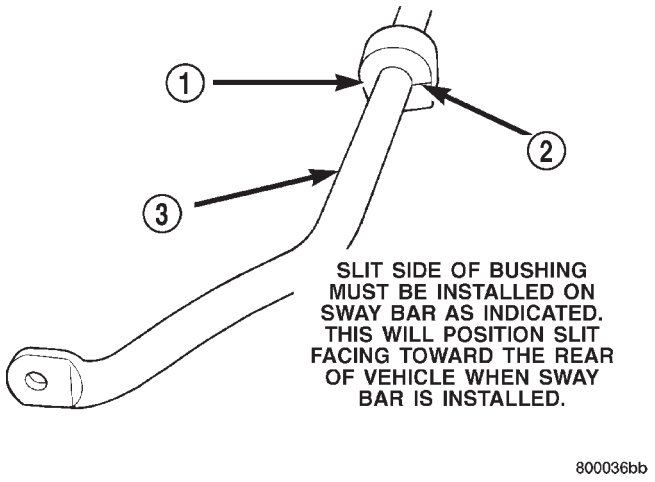

Fig. 35 Correctly Installed Stabilizer Bar To Cradle Bushing

1 - SWAY BAR ISOLATOR BUSHING
2 - SLIT IN SWAY BAR BUSHING
3 - SWAY BAR

(2) Position stabilizer bar into front suspension cradle so stabilizer bar bushings are aligned with depressions in cradle. Install stabilizer bar bushing retainers onto crossmember aligning raised bead on retainer with cutouts in bushings (Fig. 36). **Do not tighten Stabilizer bar bushing retainers bolts at this time.**

(3) Check position of the stabilizer bar in the front suspension cradle. The center of the curved section of the stabilizer bar must be aligned with the raised line in the center of the front suspension cradle (Fig. 37).

(4) Install the stabilizer bar link mounting stud through the hole in each end of the stabilizer bar (Fig. 33).

CAUTION: When installing the nut on the mounting stud of the stabilizer bar link, do not allow the stud to rotate in it's socket. Hold the stud from rotating by placing an open-end wrench on the flat machined into the stud (Fig. 33).

STABILIZER BAR (Continued)

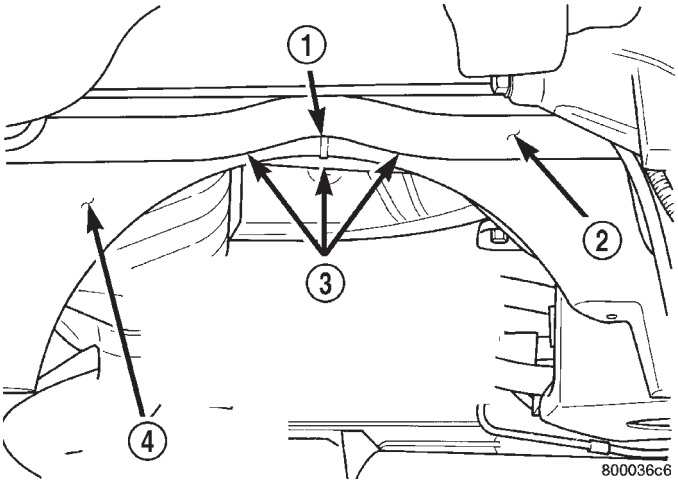

Fig. 37 Stabilizer Bar Correctly Positioned In Cradle

1 - RAISED BEAD
2 - SWAY BAR
3 - WHEN INSTALLING SWAY BAR THE RAISED BEAD ON THE SUSPENSION CRADLE MUST BE IN THE CENTER OF RADIUS IN SWAY BAR
4 - FRONT SUSPENSION CRADLE

(5) Hand-thread the nut on the end of each stabilizer bar link stud. Hold the studs from turning by placing an open-end wrench on the flat machined into the link's mounting stud, then tighten each nut while holding the wrench in place (Fig. 33). Tighten each nut to a torque of 88 N·m (65 ft. lbs.).

(6) Tighten the stabilizer bar bushing retainer to cradle attaching bolts (Fig. 34) to 68 N·m (50 ft. lbs.) torque.

(7) Install the reinforcement on the front suspension cradle crossmember and install the bolts attaching the reinforcement to the cradle crossmember (Fig. 32). Tighten the M-14 size bolts to a torque of 153 N·m (113 ft. lbs.). Tighten the M-12 size bolts to a torque of 106 N·m (78 ft. lbs.).

(8) Install the lower control arm rear bushing retainer bolts through reinforcement on each side of each lower control arm rear bushing. Tighten these M-10 size bolts to a torque of 61 N·m (45 ft. lbs.).

(9) Install the two bolts and bushings attaching the reinforcement and rear of cradle crossmember to body of vehicle (Fig. 32). Tighten bolts to a torque of 163 N·m (120 ft. lbs.).

(10) Install the power steering cooler (Fig. 31). Tighten bolts to a torque of 11 N·m (100 in. lbs.).

(11) Lower the vehicle.

STRUT

DESCRIPTION - STRUT ASSEMBLY

A Macpherson type strut assembly is used in place of a conventional front suspension's upper control arm and upper ball joint. The bottom of the strut mounts directly to the steering knuckle using two bolts and nuts going through the strut clevis bracket and steering knuckle. The top of the strut mounts directly to the strut tower of the vehicle using the threaded studs on the strut assemblies upper mount.

The strut assembly includes the components listed in the figure (Fig. 38).

Each component is serviced by removing the strut assembly from the vehicle and disassembling it.

The coil springs are side-oriented. Springs on the left side of the vehicle have a left-hand wind top-to-bottom while springs on the right side have a right-hand wind top-to-bottom. This helps provide better vehicle stability during jounce and rebound maneuvers of the front suspension. Left and right springs must not be interchanged. Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. If the coil springs require replacement, be sure that the springs are replaced with springs meeting the correct load rating and spring rate for the vehicle and its specific options.

OPERATION - STRUT ASSEMBLY

The strut assembly cushions the ride of the vehicle, controlling vibration, along with jounce and rebound of the suspension.

STRUT (Continued)

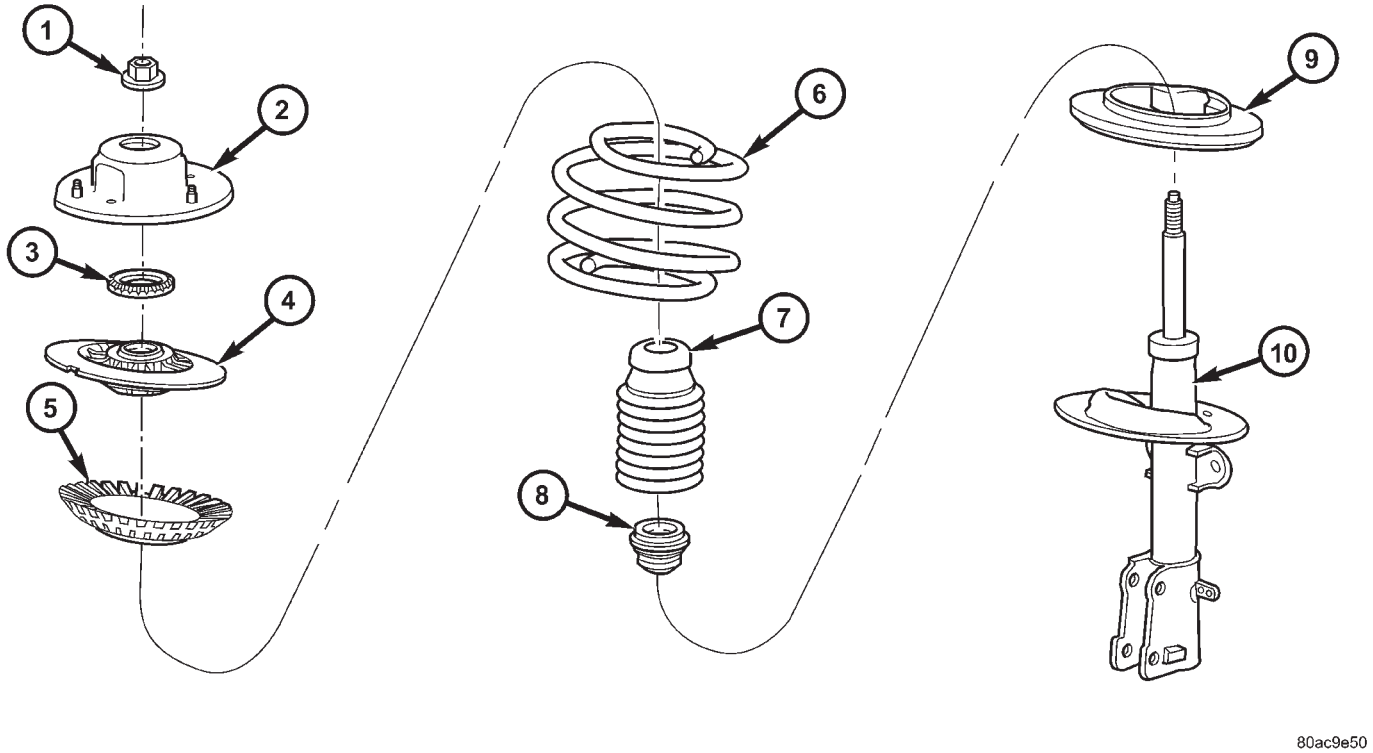

Fig. 38 STRUT ASSEMBLY

1 - NUT	6 - COIL SPRING
2 - UPPER MOUNT	7 - DUST SHIELD
3 - PIVOT BEARING	8 - JOUNCE BUMPER
4 - UPPER SPRING SEAT	9 - LOWER SPRING ISOLATOR
5 - UPPER SPRING ISOLATOR	10 - STRUT (DAMPER)

The coil spring controls ride quality and maintains proper ride height.

The spring isolators isolate the coil spring at the top and bottom from coming into metal-to-metal contact with the upper seat and strut.

The jounce bumper limits suspension travel and metal-to-metal contact under full jounce condition.

The strut dampens jounce and rebound motions of the coil spring and suspension.

During steering maneuvers, the strut assembly (through a pivot bearing in the upper strut mount) and steering knuckle (through the lower ball joint) turn as an assembly.

DIAGNOSIS AND TESTING - STRUT ASSEMBLY

(1) Inspect for damaged or broken coil springs (Fig. 38).

(2) Inspect for torn or damaged strut assembly dust boots (Fig. 38).

(3) Inspect the coil spring isolator on the lower spring seat for any signs of damage or deterioration.

(4) Lift dust boot (Fig. 39) and inspect strut assembly for evidence of fluid running from the upper end of fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off lower end of unit). A slight amount of seepage between the strut rod and strut shaft seal is not unusual and does not affect performance of the strut assembly (Fig. 39). Also inspect jounce bumpers for signs of damage or deterioration.

REMOVAL - STRUT ASSEMBLY

WARNING: DO NOT REMOVE THE NUT FROM THE STRUT ROD WHILE STRUT ASSEMBLY IS INSTALLED IN VEHICLE, OR BEFORE STRUT ASSEMBLY SPRING IS COMPRESSED.

(1) Raise the vehicle. See Hoisting in Lubrication and Maintenance.

(2) Remove the wheel and tire assembly from location on front of vehicle requiring strut removal.

(3) If both strut assemblies are to be removed, mark the strut assemblies right or left according to which side of the vehicle they were removed from.

(4) Remove the hydraulic brake hose routing bracket and the speed sensor cable routing bracket from the strut damper brackets (Fig. 40).

STRUT (Continued)

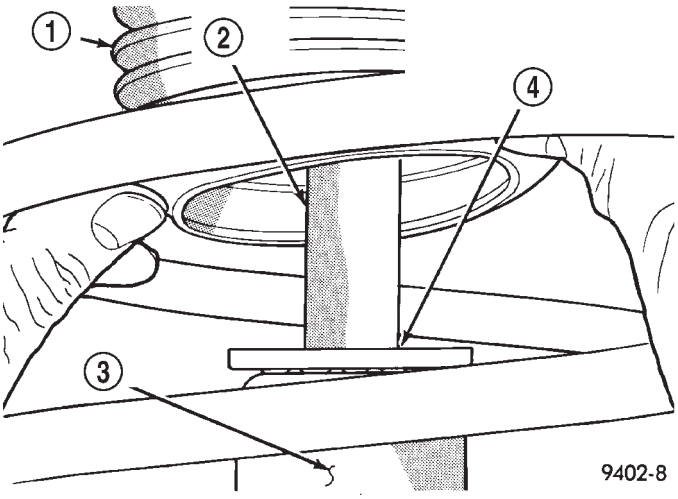

Fig. 39 Strut Assembly Leakage Inspection (Typical)

1 - DUST BOOT
2 - STRUT SHAFT
3 - STRUT FLUID RESERVOIR
4 - INSPECT THIS AREA FOR EVIDENCE OF EXCESSIVE FLUID LEAKAGE

2 - WHEEL SPEED SENSOR CABLE
3 - ROUTING BRACKET
4 - HYDRAULIC BRAKE HOSE
5 - ATTACHING BOLT
6 - ROUTING BRACKET

CAUTION: When removing the nut from the stud of the stabilizer bar link, do not allow the stud to rotate in it's socket. Hold the stud from rotating by placing an open-end wrench on the flat machined into the stud (Fig. 41).

(5) Remove the stabilizer bar link from the bracket on the strut assembly (Fig. 41). To do so, place an open-end wrench on the flat machined into the link's mounting stud, then remove the nut while holding the wrench in place. Push the stud out of the bracket.

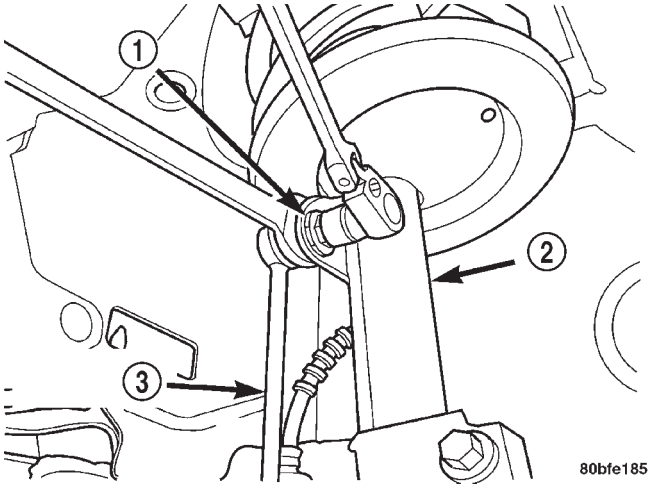

Fig. 41 Stabilizer Bar Link To Strut Attachment

1 - NUT
2 - STRUT
3 - STABILIZER BAR LINK

CAUTION: The steering knuckle to strut assembly attaching bolts are serrated and must not be turned during removal. Remove nuts while holding bolts stationary in the steering knuckles.

(6) Remove the 2 strut assembly clevis bracket to steering knuckle attaching bolts (Fig. 42).

2 - STRUT TOWER
3 - STRUT MOUNT ATTACHING BOLTS
4 - UPPER STRUT MOUNT

(8) To disassemble the strut assembly, (Refer to 2 - SUSPENSION/FRONT/STRUT - DISASSEMBLY).

DISASSEMBLY - STRUT ASSEMBLY

The strut assembly must be removed from the vehicle for it to be disassembled and assembled.

For the disassembly and assembly of the strut assembly, use of Strut Spring Compressor, Pentastar Service Equipment (PSE) tool W-7200, or the equivalent, is recommended to compress the coil spring. Follow the manufacturer's instructions closely.

WARNING: DO NOT REMOVE THE STRUT SHAFT NUT BEFORE THE COIL SPRING IS COMPRESSED. THE COIL SPRING IS HELD UNDER PRESSURE AND MUST BE COMPRESSED, REMOVING SPRING TENSION FROM THE UPPER MOUNT AND PIVOT BEARING, BEFORE THE SHAFT NUT IS REMOVED.

(1) Position the strut assembly in the strut coil spring compressor following the manufacturers instructions. Position the lower hooks on the coil spring first. The strut clevis bracket should be positioned straight outward from the compressor.

(2) Turn the upper mount of the strut assembly toward the inside of the compressor as shown to allow positioning of the compressor upper hooks (Fig. 44). Position the upper hooks on top of the coil spring upper seat approximately 1 inch from outside diameter of seat (Fig. 47). **Do not allow hooks to be placed closer to edge.** Place a clamp on the lower end of the coil spring, so the strut is held in place once the strut shaft nut is removed.

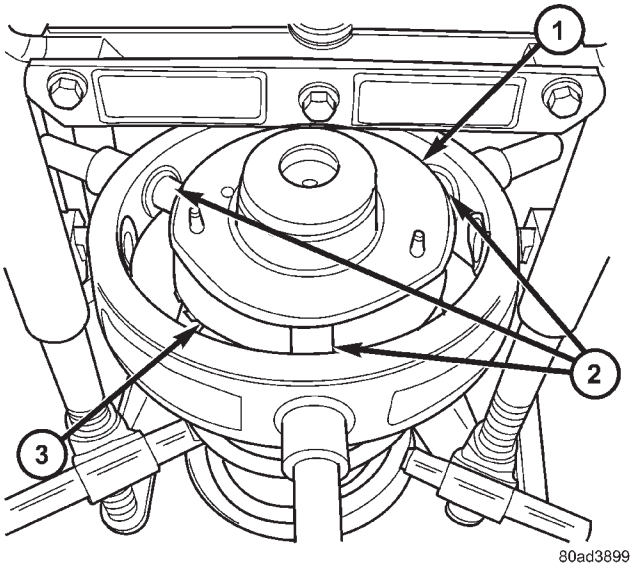

Fig. 44 Mount Rotated And Hooks Positioned

1 - UPPER MOUNT TURNED TOWARD COMPRESSOR
2 - COMPRESSOR UPPER HOOKS
3 - UPPER SPRING SEAT

(3) Compress the coil spring until all coil spring tension is removed from the upper mount.

(4) Install Strut Nut Socket, Special Tool 6864, on the strut shaft retaining nut (Fig. 45). Next, install a 10 mm socket on the hex on the end of the strut shaft. While holding the strut shaft from turning, remove the nut from the strut shaft.

(5) Remove the upper mount from the strut shaft.

(6) If the pivot bearing needs to be serviced, remove it from the top of the coil spring upper seat by pulling it straight up.

(7) Remove the clamp from the bottom of the coil spring and remove the strut out through the bottom of the coil spring.

NOTE: If the coil spring or upper spring seat needs to be serviced, proceed with the next step, otherwise, proceed with step 10.

(8) Release the tension from the coil spring by backing off the compressor drive fully. Push back the compressor upper hooks and remove the upper spring seat with upper spring isolator.

(9) Remove the coil spring from the spring compressor.

(10) Remove the dust shield and jounce bumper as an assembly from the strut shaft by pulling both straight up and off the strut shaft. The dust shield cannot be separated from the jounce bumper until after it is removed from strut shaft.

STRUT (Continued)

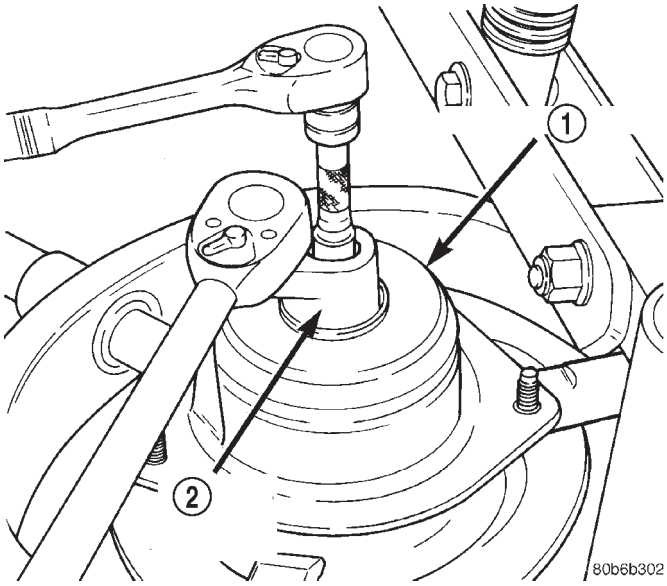

Fig. 45 Retaining Nut Removal/Installation (Typical)

1 - UPPER MOUNT
2 - SPECIAL TOOL 6864

(11) Remove the jounce bumper from the dust shield. The jounce bumper is removed from the dust shield by collapsing the dust shield until the jounce bumper can be pulled free from the dust boot.

(12) Remove the spring isolator from the lower spring seat on the strut (Fig. 38).

(13) Inspect the strut assembly components (Fig. 38) for the following and replace as necessary:

- Inspect the strut for any condition of shaft binding over the full stroke of the shaft.
- Check the upper mount for cracks and distortion and its retaining studs for any sign of damage.
- Check the upper seat for stress cracks and wear.
- Check the upper spring isolator for severe deterioration.
- Check for binding of the strut assembly pivot bearing.
- Inspect the dust shield for rips and deterioration.
- Inspect the jounce bumper for cracks and signs of deterioration.

ASSEMBLY - STRUT ASSEMBLY

For the disassembly and assembly of the strut assembly, use of Strut Spring Compressor, Pentastar Service Equipment (PSE) tool W-7200, or the equivalent, is recommended to compress the coil spring. Follow the manufacturer's instructions closely.

NOTE: Coil Springs on this vehicle are side-oriented. Springs on the left side of the vehicle have a left-hand wind top-to-bottom while springs on the right side have a right-hand wind top-to-bottom. Left and right springs must not be interchanged.

NOTE: If the coil spring has been removed from the spring compressor, proceed with the next step, otherwise, proceed with step 5.

(1) Place the coil spring in the compressor lower hooks following the manufacturers instructions. Proper orientation of the spring to the strut (once installed) is necessary. Consider the following when placing the coil spring in the compressor: From above, the compressor back is at the 12 o'clock position, and you, standing in the front of the machine, are at the 6 o'clock position. Place the lower coil spring end at the 6 o'clock position for both left and right springs. (Fig. 46).

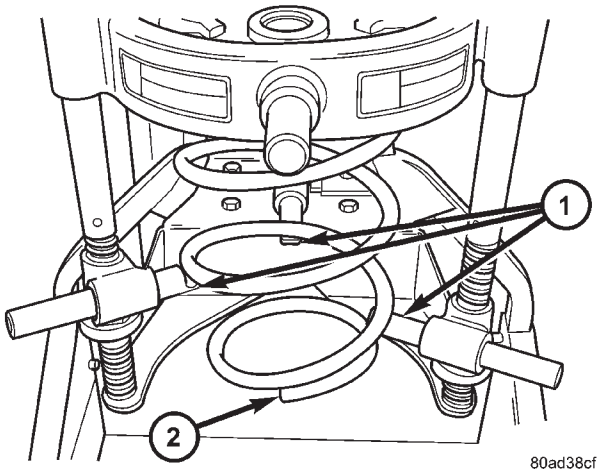

Fig. 46 Spring Positioned In Compressor (Right Spring Shown)

1 - COMPRESSOR LOWER HOOKS
2 - COIL SPRING END

(2) Install the upper seat and upper isolator on top of the coil spring. Position the notch in the perimeter of the upper seat toward the front of the compressor (same 6 o'clock position as in step 1).

(3) Position the upper hooks on top of the coil spring upper seat so the upper hooks span approximately 1 inch past outside diameter of upper seat (Fig. 47). This will allow proper clearance for upper mount installation without pinching the hooks in-between the two pieces. **Do not allow hooks to be placed closer to edge.**

(4) Compress the coil spring far enough to allow strut installation.

STRUT (Continued)

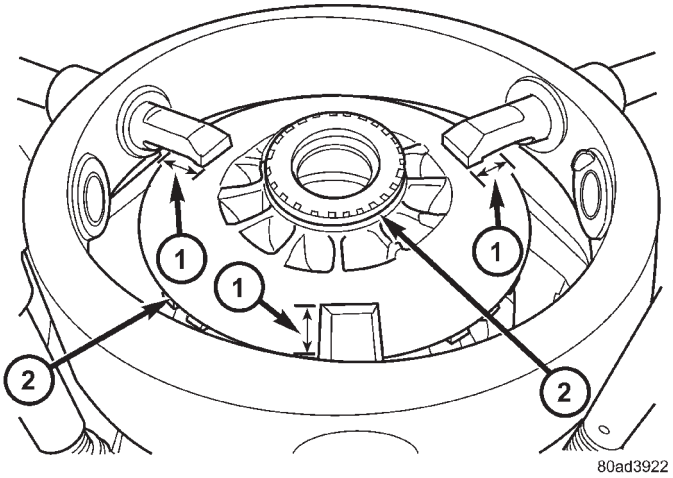

Fig. 47 Hook Placement On Upper Seat

1 - HOOKS POSITIONED 1 INCH FROM EDGE
2 - PIVOT BEARING AND UPPER SEAT

(5) If the pivot bearing has been removed from the upper seat, install the pivot bearing on the top of the upper spring seat (Fig. 48). The bearing must be installed on upper seat with the smaller diameter side of the pivot bearing toward the spring seat. Be sure the pivot bearing is sitting flat on the spring seat once mounted.

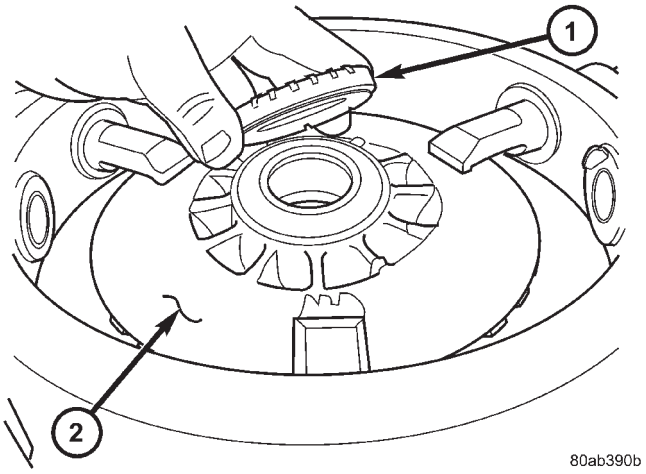

Fig. 48 Pivot Bearing Installation

1 - PIVOT BEARING
2 - UPPER SEAT

(6) Install the spring isolator on the lower spring seat of the strut (Fig. 38).

(7) Install the jounce bumper on the strut shaft (Fig. 38). The jounce bumper is to be installed with the small end pointing downward.

(8) Install the dust shield on the strut. Collapse and stretch the dust shield down over the top of the jounce bumper until the dust shield snaps into the slot on the jounce bumper. The jounce bumper will be at the top of the inner dust boot. Return the dust shield to its fully extended length.

(9) Install the strut through the bottom of the coil spring until the lower spring seat contacts the lower end of the coil spring. The clevis bracket on the strut should point straight outward away from the compressor (to the 6 o'clock position). This position should be within 5° of the lower end tip of the coil spring (Fig. 49). If necessary, reposition the strut or coil spring in the compressor so both of these line up straight outward away from the compressor (to the 6 o'clock position). Install the clamp to hold the strut and coil together.

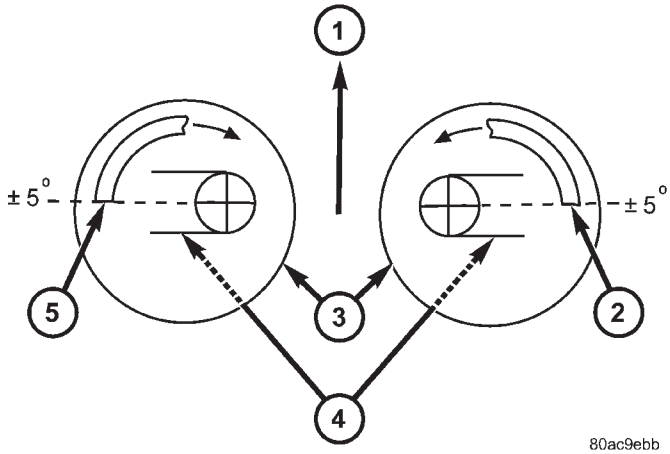

Fig. 49 Coil Spring Positioning

1 - FRONT OF VEHICLE
2 - END OF RIGHT COIL SPRING AT STRUT LOWER SEAT
3 - LOWER SEATS OF STRUTS
4 - STRUT CLEVIS BRACKETS
5 - END OF LEFT COIL SPRING AT STRUT LOWER SEAT

(10) Install the strut mount over the strut shaft and onto the top of the pivot bearing and upper seat as shown (Fig. 44). Loosely install the retaining nut on the strut shaft.

(11) Install Strut Nut Socket (on the end of a torque wrench), Special Tool 6864, on the strut shaft retaining nut (Fig. 45). Next, install a 10 mm socket on the hex on the end of the strut shaft. While holding the strut shaft from turning, tighten the strut shaft retaining nut to a torque of 100 N·m (75 ft. lbs.).

NOTE: Before releasing the tension the compressor has on the spring, using the following figure as reference (Fig. 50), make sure the upper spring seat, coil spring and strut clevis bracket are all lined up properly (within 5° of one another).

STRUT (Continued)

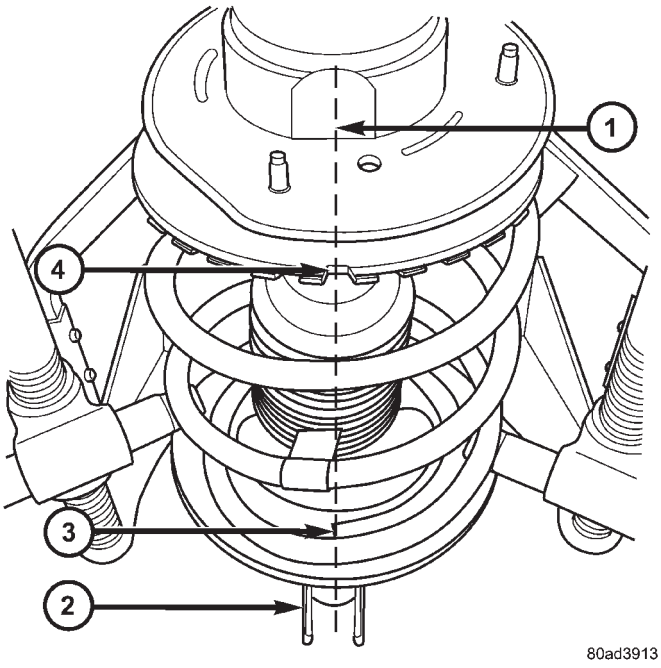

Fig. 50 Components Lined Up

1 - IMAGINARY VERTICAL LINE
2 - CLEVIS BRACKET
3 - END OF COIL SPRING
4 - NOTCH IN UPPER SPRING SEAT

(12) Slowly release the tension from the coil spring by backing off the compressor drive fully. As the tension is relieved, make sure the upper mount, pivot bearing and upper seat are align properly. Remove the clamp from the lower end of the coil spring and strut. Push back the spring compressor upper and lower hooks, then remove the strut assembly from the spring compressor.

(13) Install strut assembly on the vehicle. (Refer to 2 - SUSPENSION/FRONT/STRUT - INSTALLATION)

INSTALLATION - STRUT ASSEMBLY

CAUTION: Front strut coil springs are side-oriented. When installing a strut assembly, make sure the strut being installed has the correct coil spring for that side of the vehicle. Springs on the left side of the vehicle have a left-hand wind top-to-bottom while springs on the right side have a right-hand wind top-to-bottom (Fig. 49). Do not interchange the two sides.

(1) Install strut assembly into strut tower, aligning and installing the 3 studs on the upper strut mount into the holes in shock tower. Install the 3 upper strut mount attaching nut/washer assemblies (Fig. 43). Then using a crow foot. tighten the 3 attaching nuts to a torque of 28 N·m (250 in. lbs.).

CAUTION: The steering knuckle to strut assembly attaching bolts are serrated and must not be turned during installation. Install nuts while holding bolts stationary in the steering knuckles.

NOTE: The strut clevis-to-steering knuckle bolts are installed differently on each side of the vehicle. Left hand side bolts are to be installed from vehicle rear to front. Right side bolts are to be installed from vehicle front to rear.

(2) Align strut assembly with steering knuckle. Position arm of steering knuckle into strut assembly clevis bracket. Align the strut assembly clevis bracket mounting holes with the steering knuckle mounting holes. Install the 2 strut assembly to steering knuckle attaching bolts (Fig. 42). **If strut assembly is attached to steering knuckle using a cam bolt, the cam bolt must be installed in the lower slotted hole on strut clevis bracket.** Tighten the strut clevis-to-steering knuckle attaching bolts to a torque of 81 N·m (60 ft. lbs.) plus an additional 1/4 (90°) turn after specified torque is met.

(3) Install the stabilizer bar link mounting stud through the bracket on the strut assembly (Fig. 41).

CAUTION: When installing the nut on the mounting stud of the stabilizer bar link, do not allow the stud to rotate in it's socket. Hold the stud from rotating by placing an open-end wrench on the flat machined into the stud (Fig. 41).

(4) Hand thread the nut on the end of the stabilizer bar link stud. Hold the stud from turning by placing an open-end wrench on the flat machined into the link's mounting stud, then tighten the nut while holding the wrench in place (Fig. 41). Tighten the nut to a torque of 88 N·m (65 ft. lbs.).

(5) Install the hydraulic brake hose and speed sensor cable routing brackets on the strut assembly brackets (Fig. 40). Tighten the routing bracket attaching bolts to a torque of 13 N·m (10 ft. lbs.).

(6) Install the wheel/tire assembly on the vehicle.

(7) Install and tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

REAR SUSPENSION

DESCRIPTION - REAR SUSPENSION

The rear suspension design on this vehicle uses leaf springs, and a tube and casting axle (Fig. 1) (Fig. 2). The leaf springs used on the rear suspension of this vehicle are of either a mono-leaf or multi-leaf design.

There are 2 different rear suspension designs available:

- Front-Wheel-Drive
- All-Wheel-Drive

The rear axle used on Front-Wheel-Drive applications of this vehicle is mounted to the rear leaf springs using isolator bushings at the axle mounting brackets.

The rear axle used on All-Wheel-Drive applications of this vehicle is also mounted to the rear leaf springs, but does not use isolator bushings between the rear axle and the leaf springs.

Each side of the rear suspension consists of these major components:

- Leaf spring
- Jounce bumper
- Shock absorber
- Hub and bearing
- Track bar (one per suspension)
- Stabilizer bar (one per suspension)

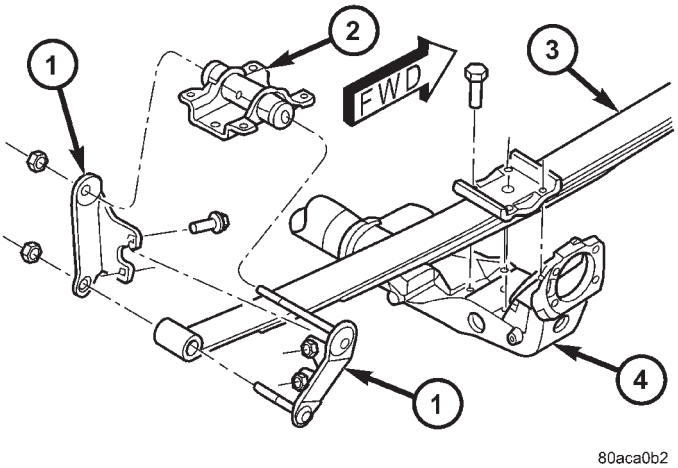

Fig. 2 All-Wheel-Drive Rear Suspension

1 - SHACKLE
2 - REAR MOUNT (HANGER)
3 - LEAF SPRING (MULTI-LEAF)
4 - AWD REAR AXLE

OPERATION - REAR SUSPENSION

This rear suspension is designed to handle the various load requirements of the vehicle yet allow for a comfortable ride.

The rear wheel bearings used are similar to the bearings used in the front suspension. A hub and bearing assembly is used.

BUSHINGS

REMOVAL - LEAF SPRING FRONT BUSHING

(1) Raise vehicle on frame-contact hoist as follows:
(a) Position the hoist arm supporting the corner of the vehicle to be serviced against a block of wood placed on the body sill as shown (Fig. 3).
(b) Position the remaining hoist arms at each corner of the vehicle in the normal fashion. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
(c) Raise the vehicle to a comfortable working level.

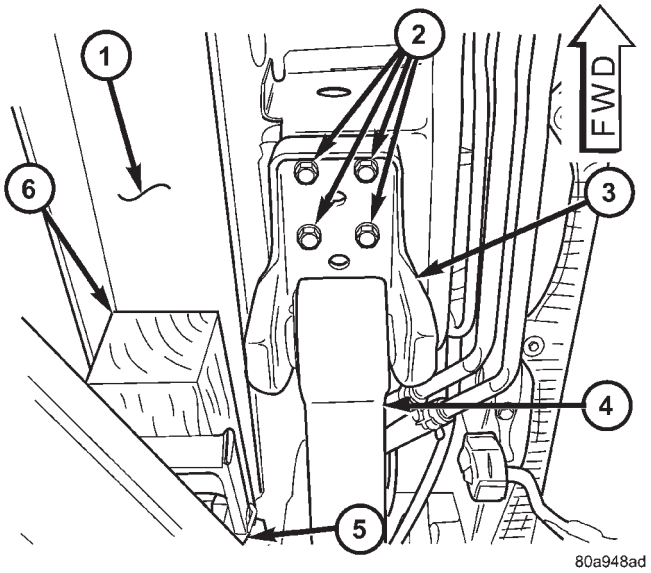

Fig. 3 LIFTING POINT AND SPRING MOUNT

1 - BODY SILL AREA
2 - MOUNTING BOLTS
3 - SPRING MOUNTING BRACKET
4 - LEAF SPRING
5 - HOIST LIFT ARM
6 - WOODEN BLOCK

(2) Position an under-hoist utility jack or transmission jack under rear axle toward the side needing bushing replacement. Jack pad should just contact axle.
(3) Remove shock absorber lower mounting bolt.

NOTE: If shock absorber bolt deflects upward during removal, raise axle by adjusting support jack. If shock absorber bolt deflects downward during removal, lower axle by adjusting support jack (or by pulling on axle).

(4) Remove four bolts securing leaf spring front mounting bracket to the body (Fig. 3).
(5) Using jack, **slowly** lower rear axle, permitting the forward end of rear spring to hang down. Lower it enough to allow access to spring pivot bolt. It may be necessary to place a wooden block between the spring and vehicle to hold forward end of the spring in place.
(6) Remove leaf spring forward pivot bolt, then remove mounting bracket.
(7) Straighten the retainer tabs on the bushing (Fig. 4).

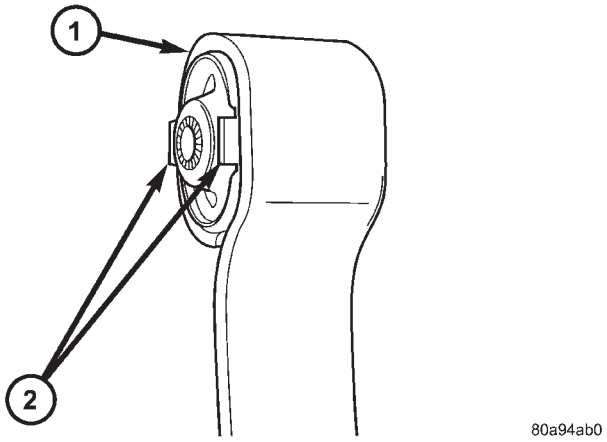

Fig. 4 STRAIGHTENED RETAINING TABS

1 - SPRING EYE
2 - RETAINING TABS

(8) Place Remover/Installer, Special Tool 8459 on leaf spring and bushing as shown (Fig. 5) and tighten Set Screw securing Remover Plate to tool threaded shaft.
(9) Tighten nut (Fig. 5), removing bushing from spring eye.
(10) Remove the tool from spring, then remove bushing from tool.

INSTALLATION - LEAF SPRING FRONT BUSHING

(1) Install by hand NEW bushing in left side of leaf spring eye.
(2) Place Remover/Installer, Special Tool 8459 on leaf spring and bushing as shown (Fig. 6) and tighten Set Screw securing Installer Plate (8459–3) to tool threaded shaft.
(3) Tighten nut (Fig. 6), installing bushing in spring eye. Tighten nut until there is approximately a 1 mm gap between the bushing flange and the spring eye. **Do not bottom the flange against the spring eye.**
(4) Remove Remover/Installer from the bushing and leaf spring.
(5) Bend the retainer tabs on bushing outward against spring eye.

BUSHINGS (Continued)

2 - WASHER
3 - BEARING
4 - LEAF SPRING EYE
5 - BUSHING
6 - INSTALLER PLATE (8459-3)
7 - PIN
8 - BODY (8459-1)

(6) Position spring mounting bracket over spring eye and install pivot bolt through center of bushing from the **outboard** side.

NOTE: The pivot bolt must be installed from the outboard side to allow proper bracket to body mounting.

(7) Install the nut on the pivot bolt and lightly tighten. Do not fully tighten bolt at this time.

(8) Raise the under-hoist utility jack or transmission jack, guiding the forward mounting bracket into place against the body. It may help to use a drift punch placed through the hole centered between the mounting bolt holes in the bracket and the pilot hole in the body of the vehicle as a guide. When the four mounting bolt holes line up with their threads in the body, Install the mounting bolts (Fig. 3). Tighten the four mounting bolts to 61 N·m (45 ft. lbs.) torque.

(9) Raise or lower the jack until shock absorber lower eye aligns with threads in axle housing. Install shock absorber lower mounting bolt. Do not fully tighten bolt at this time.

(10) Lower the vehicle and remove hoist arms and block of wood from under vehicle.

(11) Tighten the spring front pivot bolt to 156 N·m (115 ft. lbs.) torque.

(12) Tighten the lower shock absorber mounting bolt to 88 N·m (65 ft. lbs.) torque.

HUB / BEARING

DESCRIPTION

The rear wheel bearing and rear wheel hub of this vehicle are a one-piece sealed unit, or hub and bearing unit type assembly (Unit III). The hub and bearing is mounted to the center of the rear axle using 4 mounting bolts. It has five wheel mounting studs on the hub flange.

All-Wheel-Drive vehicles have a hub and bearing unit with a splined hole in the center of the hub for rear driveshaft stub axle acceptance.

Front-Wheel-Drive vehicles with antilock brakes have an internally mounted wheel speed sensor and tone wheel. This hub and bearing can be identified by the rounded cap and molded in connector on the rear of the assembly (Fig. 7). The sensor and tone wheel cannot be serviced separately from the hub and bearing.

HUB / BEARING (Continued)

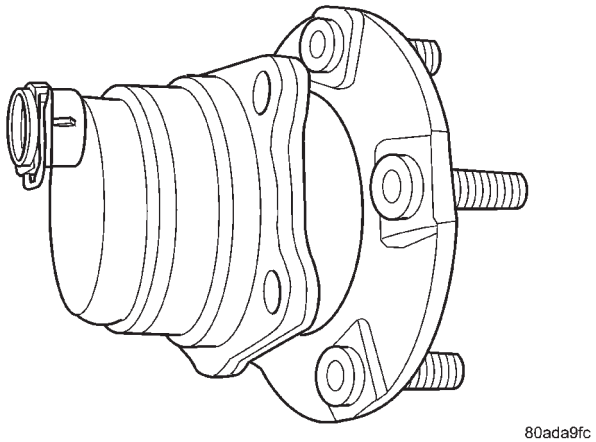

Fig. 7 Hub And Bearing - FWD With ABS

OPERATION

The hub and bearing has internal bearings that allow the hub to rotate with the tire and wheel assembly (and driveshaft on All-Wheel-Drive vehicles). The five wheel mounting studs mount the tire and wheel assembly, and disc brake rotor or brake drum to the vehicle.

On All-Wheel-Drive vehicles, the splined mating of the driveshaft stub axle and hub allows the driveshaft to rotate with the hub and wheel.

Front-Wheel-Drive vehicles equipped with antilock brakes have a wheel speed sensor and tone wheel mounted to the rear of the hub and bearing. The tone wheel rotates with the hub which is sensed by the wheel speed sensor.

DIAGNOSIS AND TESTING - HUB AND BEARING

The bearing contained in the hub and bearing assembly will produce noise and vibration when worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine the location of a worn or damaged bearing.

Find a smooth level road surface and bring the vehicle up to a constant speed. When vehicle is at a constant speed, swerve the vehicle back and forth from the left and to the right. This will load and unload the bearings and change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at speeds above 105 km/h (65 mph).

REMOVAL

FRONT-WHEEL-DRIVE VEHICLES

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove wheel and tire. (Refer to 22 - TIRES/WHEELS - REMOVAL)

(3) Remove brake drum or disc brake caliper and rotor from hub and bearing. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - REMOVAL-)(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - REMOVAL)

(4) If equipped with antilock brakes, perform the following:

(a) Remove secondary (yellow) retaining clip at rear of wheel speed sensor head (Fig. 8).

(b) Push up on metal retaining clip (Fig. 8) until it bottoms. This will release wheel speed sensor head from hub and bearing.

(c) While holding metal clip up, pull back on wheel speed sensor head removing it from hub and bearing.

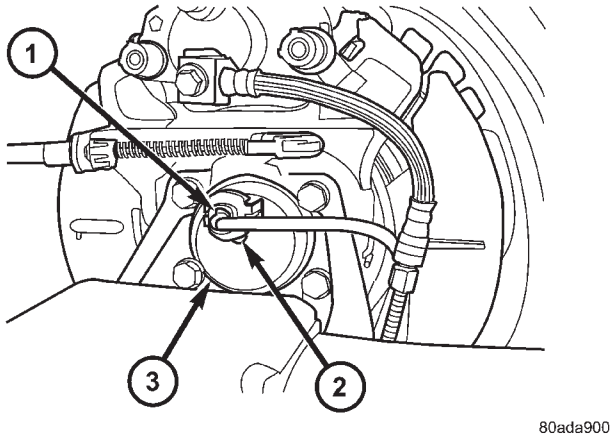

Fig. 8 Sensor Connector At Hub And Bearing

1 - SECONDARY SENSOR RETAINING CLIP
2 - METAL SENSOR RETAINING CLIP
3 - HUB AND BEARING

(5) Remove the 4 bolts attaching the hub and bearing to the rear axle.

CAUTION: Corrosion may occur between the hub and bearing, and the axle. If this occurs the hub and bearing will be difficult to remove from the axle. If the hub and bearing will not come out of the axle by pulling on it by hand, do not pound on the hub and bearing to remove it from the axle. Damage will occur. Use the following procedure.

HUB / BEARING (Continued)

(6) If hub and bearing cannot be removed from the axle by hand, use Remover, Special Tool 8458 (Fig. 9) and following procedure to press the hub and bearing out of the axle.

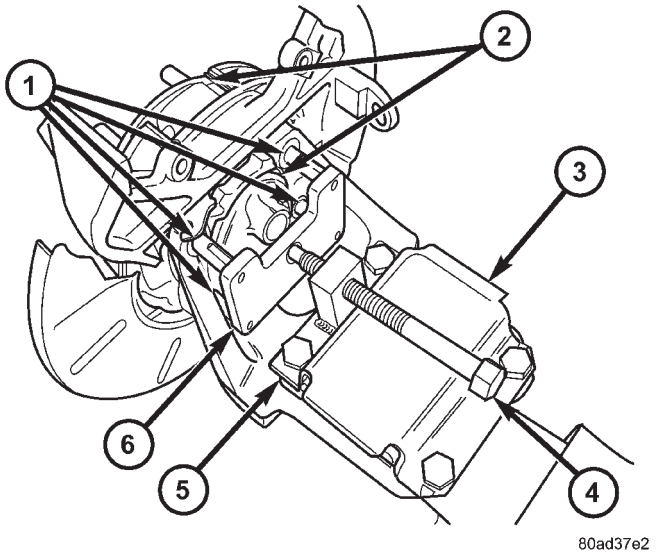

Fig. 9 Removal Using Special Tool 8458

1 - THREADED GUIDE PINS 8458-4
2 - HUB AND BEARING
3 - LEAF SPRING PLATE
4 - FORCING SCREW 8458-3
5 - SCREW MOUNT 8458-2
6 - PUSH PLATE 8458-1

(a) Thread Threaded Guide Pins into hub and bearing mounting bolt holes.

(b) Remove the two outboard spring plate bolts.

(c) Using the spring plate bolts, install the Screw Mount, Special Tool 8458–2, as shown (Fig. 9).

(d) Place Push Plate, Special Tool 8458–1, on ends of Threaded Guide Pins

(e) Place a dab of grease in dimple of Push Plate.

(f) Tighten the Forcing Screw, Special Tool 8458–3, up against dimple in Push Plate and press hub and bearing out of axle by continuing to tighten screw.

(g) Remove the tool.

(h) Reinstall the two outboard spring plate bolts. Tighten the bolts to 102 N·m (75 ft. lbs.) torque.

(7) Remove the hub/bearing from the rear axle and brake support plate.

ALL-WHEEL-DRIVE VEHICLES

(1) Set the parking brake. **The parking brake is set to keep the hub and bearing, and axle shaft from rotating when loosening the hub nut.**

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove the wheel/tire assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)

(4) Remove the cotter pin and nut retainer (Fig. 18) from the stub shaft of the outer C/V joint.

(5) Remove the spring washer (Fig. 17) from the stub shaft of the outer C/V joint.

(6) Remove the hub nut and washer (Fig. 16) from the stub shaft of the outer C/V joint.

(7) Remove the 6 bolts mounting the driveshaft inner joint to the output shaft of the rear drive line module.

(8) Remove the rear wheel speed sensor (Fig. 19) from the rear hub/bearing.

(9) Release the parking brake.

(10) Remove the disc brake caliper to adapter guide pin bolts (Fig. 15).

(11) Remove rear caliper from adapter using the following procedure. First rotate front of caliper up from the adapter. Then pull the rear of the caliper and the outboard brake shoe anti-rattle clip out from under the rear abutment on the adapter (Fig. 14).

(12) Support caliper to prevent the weight of the caliper from damaging the flexible brake hose (Fig. 10).

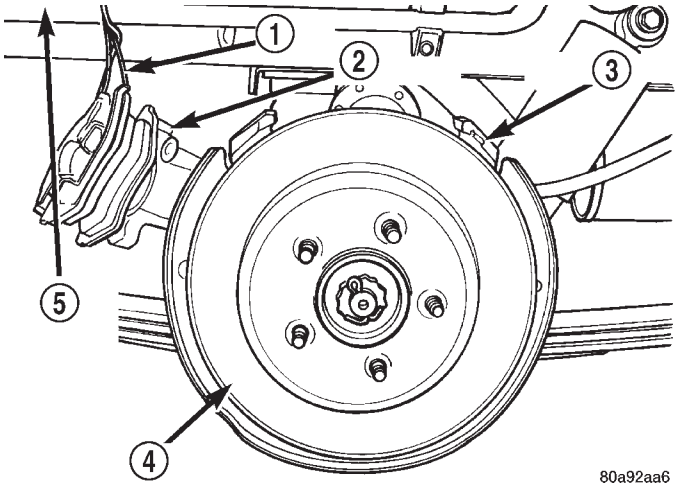

Fig. 10 Correctly Supported Caliper

1 - WIRE
2 - CALIPER
3 - ADAPTER
4 - ROTOR
5 - INNER FENDER

(13) Remove the rotor from the hub/bearing.

(14) Remove driveshaft from rear drive line module and hub/bearing. Driveshaft is removed by first compressing the inner joint on the driveshaft and removing it from the drive line module. Then, slide

HUB / BEARING (Continued)

the outer joint of the driveshaft out of the hub/bearing.

(15) Remove the hub/bearing to axle mounting bolts (Fig. 13).

CAUTION: Corrosion may occur between the hub/bearing and the axle. If this occurs the hub/bearing will be difficult to remove from the axle. If the hub/bearing will not come out of the axle by pulling on it by hand, do not pound on the hub/bearing to remove it from the axle. Pounding on the hub/bearing to remove it from the axle will damage the hub/bearing. This damage will result in noise or failure of the hub/bearing. To remove a hub/bearing which is corroded to the axle, lightly tap the disc brake caliper adapter using a soft faced hammer. This will remove both the disc brake caliper adapter and hub/bearing from the axle. The hub/bearing will then need to be removed from the caliper adapter.

(16) Remove the hub/bearing from the axle. (Fig. 12).

(17) If the disc brake caliper adapter and hub/bearing were removed as an assembly from the axle and the hub/bearing cannot be removed from the adapter by hand, use the following procedure to remove it from the adapter. With a helper supporting the caliper adapter in his hands, position Remover, Special Tool 8214-1 on the cast housing of hub/bearing (Fig. 11). **Do not position special tool on inner race of hub/bearing.** Lightly strike Remover, Special Tool 8214-1 with a hammer to remove the hub/bearing from the caliper adapter.

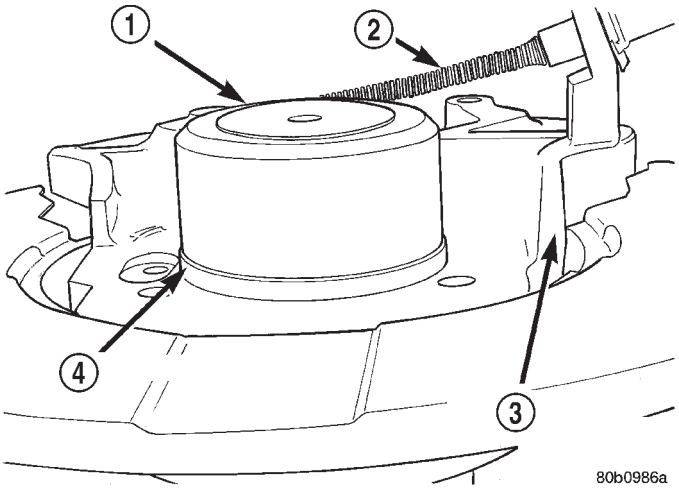

Fig. 11 Hub/Bearing Removal From Caliper Adapter

1 - SPECIAL TOOL 8214-1
2 - PARK BRAKE CABLE
3 - DISC BRAKE CALIPER ADAPTER
4 - HUB/BEARING

INSTALLATION

FRONT-WHEEL-DRIVE VEHICLES

(1) Install the 4 hub and bearing to axle mounting bolts into the holes in the flange of the rear axle.

(2) Install the rear brake support plate on the 4 mounting bolts installed in the flange of the rear axle.

(3) Align the rear hub and bearing with the 4 mounting bolts and start mounting bolts into hub and bearing. Tighten the 4 bolts in a crisscross pattern until the hub and bearing and brake support plate is fully and squarely seated onto flange of rear axle. Tighten the 4 mounting bolts to a torque of 129 N·m (95 ft. lbs.)

NOTE: If equipped with antilock brakes, make sure wheel speed sensor stays clean and dry as it is installed into the hub and bearing cap.

(4) If the vehicle is equipped with antilock brakes, perform the following:

(a) If metal sensor retaining clip is not in the neutral installed position on hub and bearing cap, install from the bottom, if necessary, and push clip upward until it snaps into position.

(b) Install wheel speed sensor head into rear of hub and bearing aligning index tab with the notch in the top of the mounting hole. Push the sensor in until it snaps into place on the metal retaining clip.

(c) Install secondary (yellow) retaining clip over wheel speed sensor head and engage the tabs on each side (Fig. 8).

(5) Install brake drum or disc brake rotor and brake caliper. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - INSTALLATION)(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - INSTALLATION)

(6) Install wheel and tire (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten the wheel nuts in the proper sequence to a torque of 135 N·m (100 ft. lbs.).

(7) Adjust the rear brakes as necessary. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - ADJUSTMENTS)

(8) Lower vehicle.

(9) Road test vehicle to ensure proper operation of brakes.

ALL-WHEEL-DRIVE VEHICLES

(1) Install hub/bearing on end of axle. (Fig. 12).

(2) Install the hub/bearing mounting bolts. In a progressive crisscross pattern, tighten the 4 hub/bearing mounting bolts (Fig. 13) until the disc brake caliper adapter and hub/bearing are squarely seated against the axle. Then tighten the hub/bearing mounting bolts to a torque of 129 N·m (95 ft. lbs.).

HUB / BEARING (Continued)

3 - PARK BRAKE BRAKE SHOE

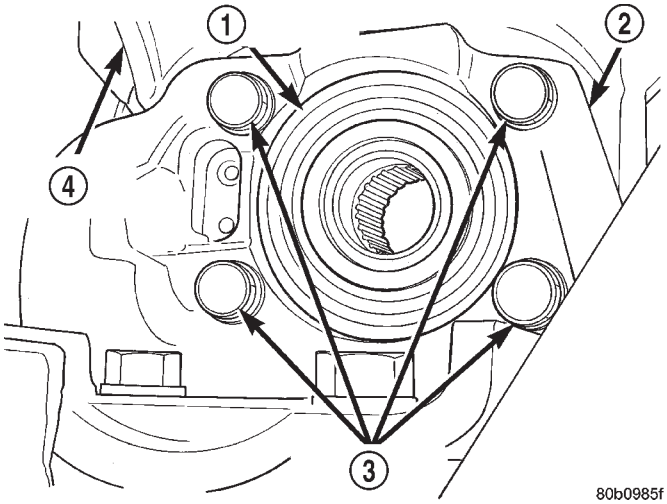

Fig. 13 Hub/Bearing Mounting Bolts

1 - HUB/BEARING
2 - AXLE
3 - MOUNTING BOLTS
4 - CALIPER ADAPTER

(3) Install driveshaft in hub/bearing and on output shaft of rear drive line module. Driveshaft is installed by first sliding the outer joint of the driveshaft into the hub/bearing and then compressing the inner joint on the driveshaft and installing it on the output shaft the drive line module.

(4) Install rotor on hub/bearing.

(5) Carefully lower disc brake caliper and brake shoes over rotor and onto caliper adapter by reversing the removal procedure (Fig. 14).

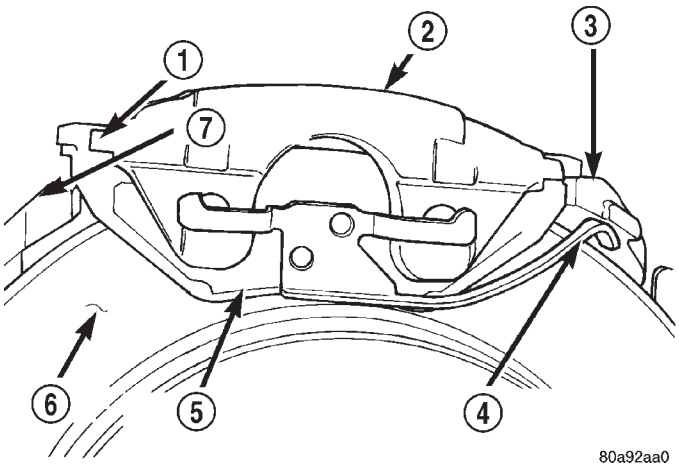

Fig. 14 Removing/Installing Caliper (Left Side Shown)

3 - ADAPTER ABUTMENT
4 - OUTBOARD BRAKE SHOE HOLD DOWN CLIP
5 - OUTBOARD BRAKE SHOE
6 - ROTOR
7 - ADAPTER

CAUTION: When installing guide pin bolts extreme caution should be taken not to cross-thread the caliper guide pin bolts.

(6) Install the disc brake caliper guide pin bolts (Fig. 15). Tighten the guide pin bolts to a torque of 35 N·m (26 ft. lbs.).

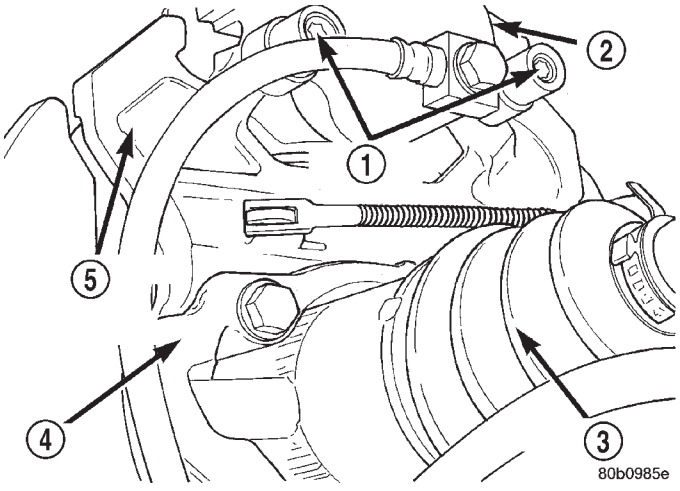

Fig. 15 Caliper Guide Pin Bolts

1 - STUD PIN BOLTS
2 - DISC BRAKE CALIPER
3 - DRIVESHAFT
4 - AXLE
5 - DISC BRAKE CALIPER ADAPTER

HUB / BEARING (Continued)

(7) Clean all foreign material off the threads of the outer C/V joint stub shaft. Install the washer and hub nut (Fig. 16) on the stub shaft of the outer C/V joint.

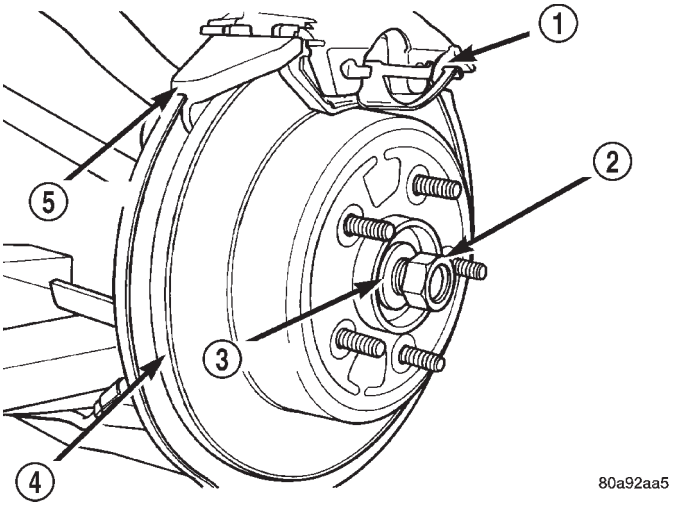

Fig. 16 Hub Nut And Washer

1 - CALIPER
2 - HUB NUT
3 - WASHER
4 - ROTOR
5 - ADAPTER

(8) Lower vehicle.

(9) Set the park brake. **This is required to keep the driveshaft from rotating when tightening and torquing the hub nut and driveshaft inner joint to driveline module mounting nuts.**

(10) Raise vehicle.

(11) Tighten the driveshaft inner joint to drive line module output shaft mounting bolts to a torque of 61 N·m (45 ft. lbs.).

(12) Tighten the outer C/V joint hub nut (Fig. 16) to a torque of 244 N·m (180 ft. lbs.).

(13) Install the spring washer (Fig. 17) on the stub shaft of the outer C/V joint.

(14) Install the nut retainer and cotter pin (Fig. 18) on the stub shaft of the outer C/V joint.

(15) Install the wheel speed sensor on the hub/bearing and adapter. Install the wheel speed sensor attaching bolt (Fig. 19). Tighten the wheel speed sensor attaching bolt to a torque of 12 N·m (105 in. lbs).

(16) Install wheel and tire. (Refer to 22 - TIRES/WHEELS - INSTALLATION)

(17) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(18) Lower vehicle.

CAUTION: Before moving vehicle, pump the brake pedal several times to insure the vehicle has a firm brake pedal to adequately stop vehicle.

HUB / BEARING (Continued)

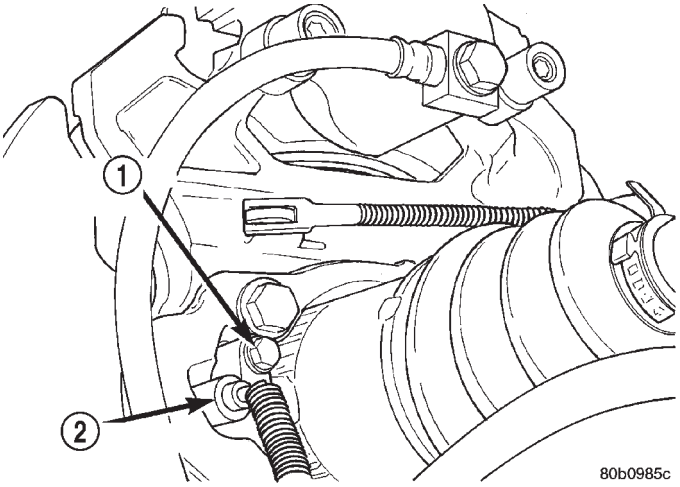

Fig. 19 Wheel Speed Sensor

1 - MOUNTING BOLT
2 - WHEEL SPEED SENSOR

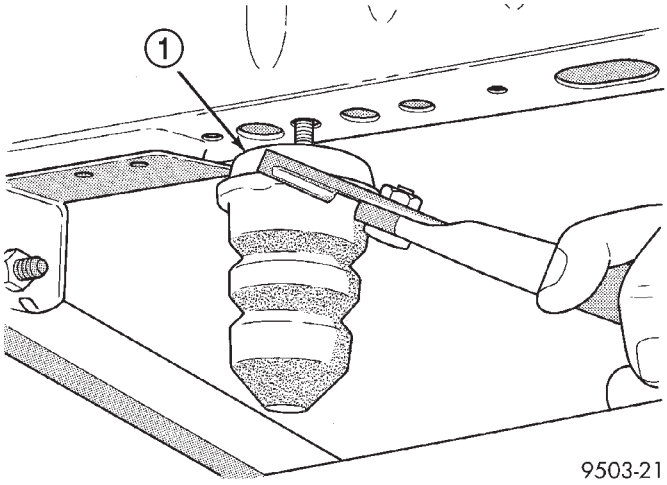

Fig. 20 Jounce Bumper

1 - JOUNCE BUMPER

(19) Road test vehicle to ensure proper operation of the brake system.

JOUNCE BUMPER

DESCRIPTION

There are two jounce bumpers used in the rear suspension. One mounts to each frame rail above the rear axle.

OPERATION

The jounce bumper limits suspension travel and metal-to-metal contact of the rear axle with the frame under full jounce conditions.

REMOVAL

REMOVAL - AWD AND HEAVY DUTY

(1) Using slip-joint pliers grasp the base of the jounce bumper. Turn the base counterclockwise (Fig. 20).

(2) Remove the jounce bumper from the frame rail.

REMOVAL - FRONT-WHEEL-DRIVE

(1) Remove the bolt attaching the jounce bumper to frame rail (Fig. 21).

(2) Remove the jounce bumper from the frame rail.

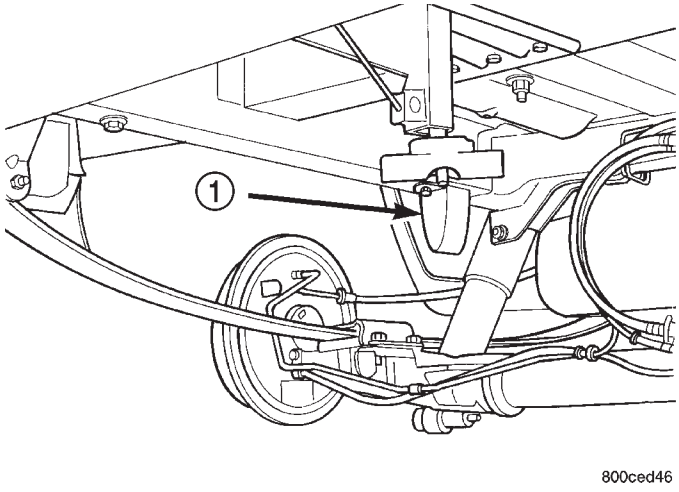

Fig. 21 Jounce Bumper - FWD

1 - **JOUNCE BUMPER**

INSTALLATION

INSTALLATION - AWD AND HEAVY DUTY

(1) Install jounce bumper through bumper support plate and thread into welded nut in frame rail.

(2) Tighten the jounce bumper to 33 N·m (290 in. lbs.) torque.

INSTALLATION - FRONT-WHEEL-DRIVE

(1) Hook the forward end of the jounce bumper bracket in the mounting hole of the frame rail, then install the mounting bolt in the opposite end, securing the bumper to the frame rail. Tighten the jounce bumper mounting bolt to 33 N·m (290 in. lbs.) torque.

SHOCK ABSORBER

DESCRIPTION

There is one shock absorber on each side of the rear suspension. The top of each shock absorber is bolted to the frame rail. The bottom of each shock absorber is bolted to the rear axle.

This vehicle is available with either standard type or load-leveling shock absorbers. On the exterior, load-leveling shock absorbers are larger in diameter than standard shock absorbers. The load-leveling shock absorbers mount the same as the standard shock absorbers.

OPERATION

The shock absorber dampens jounce and rebound motions of the spring and suspension.

Each load-leveling shock absorber is a self-leveling, self-contained vehicle leveling system and shock absorber combined. It does not require an external compressor, hoses, or height leveling sensors. All the height leveling sensors, hydraulic pump, etc., are contained inside the shock absorber. It uses road inputs (bumps, stops, starts, turns, acceleration, deceleration, etc.) to activate pumping, which results in the extension and compression of the shock absorber.

REMOVAL - SHOCK ABSORBER

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Support the rear axle of the vehicle using 2 jackstands positioned at the outer ends of the axle.

NOTE: If the shock absorber lower mounting bolt deflects upward during removal, raise axle by adjusting the support jack. If the lower shock absorber bolt deflects downward during removal, lower the axle by adjusting the support jack.

(3) Remove the shock absorber lower mounting bolt.

(4) While holding shock absorber, remove the shock absorber upper mounting bolt and shock absorber.

DISASSEMBLY - SHOCK ABSORBER (UPPER BUSHING)

NOTE: This procedure applies to load-leveling shock absorbers only.

(1) Remove the shock absorber from the vehicle.

(2) Install the Receiver, Special Tool 8526-1, into the cup of the Ball Joint Press, Special Tool C-4212F, and tighten the set screw. Install the Driver, Special Tool 8526-2, on the tip of the Ball Joint Press screw drive as shown (Fig. 22).

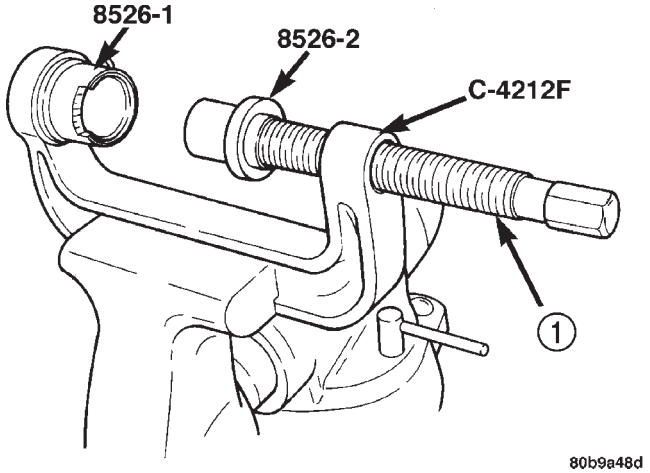

Fig. 22 Special Tools Positioned For Removal

1 - SCREW DRIVE

NOTE: It works well to place the Ball Joint Press, Special Tool C-4212F, in a bench vise as shown (Fig. 22) to perform this procedure.

(3) Place the shock absorber upper mounting eye in the Receiver so the notch in the Receiver clears the shock absorber body (Fig. 23).

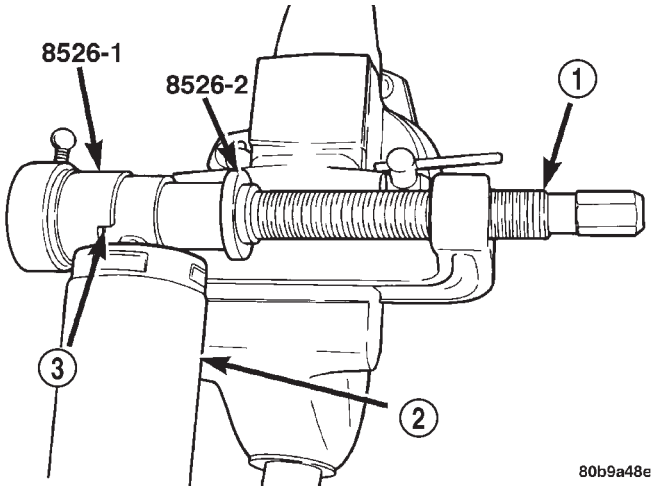

Fig. 23 Removing Bushing From Shock Absorber

1 - SCREW DRIVE
2 - SHOCK ABSORBER
3 - NOTCH

(4) Tighten the screw drive until the Driver contacts the outer circumference of the bushing evenly (Fig. 23). Continue to tighten the screw drive until the bushing is pressed completely out of the shock absorber eye and into the Receiver.

(5) Back off the screw drive and remove the bushing from the Receiver.

SHOCK ABSORBER (Continued)

ASSEMBLY - SHOCK ABSORBER (UPPER BUSHING)

NOTE: This procedure applies to load-leveling shock absorbers only.

(1) Install the Receiver, Special Tool 8526-1, into the cup of the Ball Joint Press, Special Tool C-4212F, and tighten the set screw. Install the Driver, Special Tool 8526-2, on the tip of the Ball Joint Press screw drive as shown (Fig. 24). Position the Driver this way to seat the bushing to its correct depth.

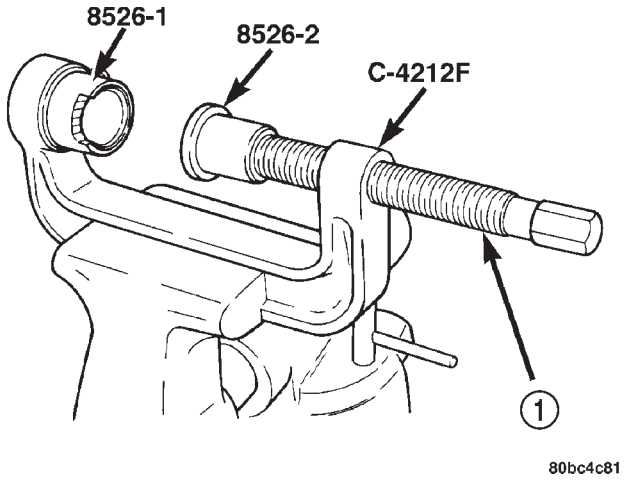

Fig. 24 Special Tools Positioned For Installation

1 - SCREW DRIVE

(2) Place the shock absorber upper mounting eye in the Receiver so the notch in the Receiver clears the shock absorber body (Fig. 25).

(3) Position the bushing between the shock absorber eye and the Driver (Fig. 25). Tighten the screw drive until the Driver, bushing, and shock absorber eye are touching and squarely aligned.

(4) Press the bushing into the shock absorber eye until the Driver bottoms against the face of the eye.

(5) Back off the Ball Joint Press screw drive and remove the shock absorber from the press.

(6) Install the shock absorber on the vehicle. Refer to REMOVAL AND INSTALLATION in this section for the procedure.

INSTALLATION - SHOCK ABSORBER

(1) While holding shock absorber in position against the frame rail, install the shock absorber upper mounting bolt.

(2) Install the shock absorber lower mounting bolt securing the lower end of the shock absorber to the axle.

(3) Remove the support jack.

(4) Lower the vehicle to the ground so the full curb weight of the vehicle is supported by the suspension.

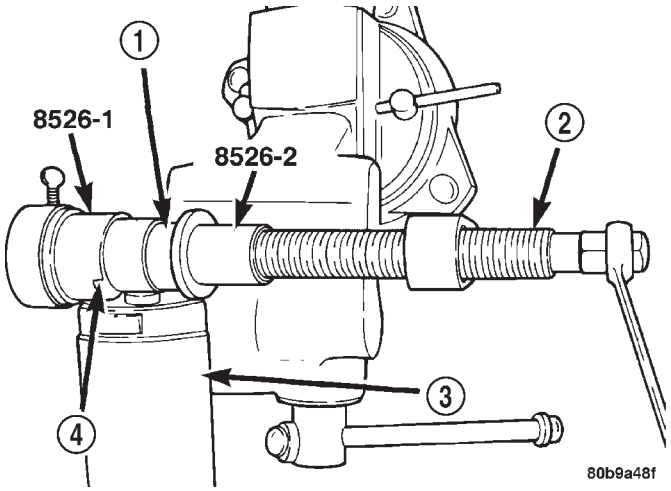

Fig. 25 Installing Bushing In Shock Absorber

1 - BUSHING
2 - SCREW DRIVE
3 - SHOCK ABSORBER
4 - NOTCH

(5) Tighten the upper and lower shock absorber mounting bolt to a torque of 88 N·m (65 ft. lbs.).

SPRING - AWD

DESCRIPTION

The leaf springs used on the rear suspension of this vehicle are of either a mono-leaf or multi-leaf design depending on model and options.

Since the rear springs come in various designs and rates, be sure the correct spring is in use.

OPERATION

The leaf spring controls ride quality and maintains ride height.

REMOVAL - AWD

(1) Raise vehicle on frame-contact hoist as follows:

(a) Position the hoist arm supporting the corner of the vehicle to be serviced against a block of wood placed on the body sill as shown (Fig. 26).

(b) Position the remaining hoist arms at each corner of the vehicle in the normal fashion. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(c) Raise the vehicle to a comfortable working level.

(2) Position an under-hoist utility jack or transmission jack under rear axle toward the side needing spring replacement. Jack pad should just contact axle.

SPRING - AWD (Continued)

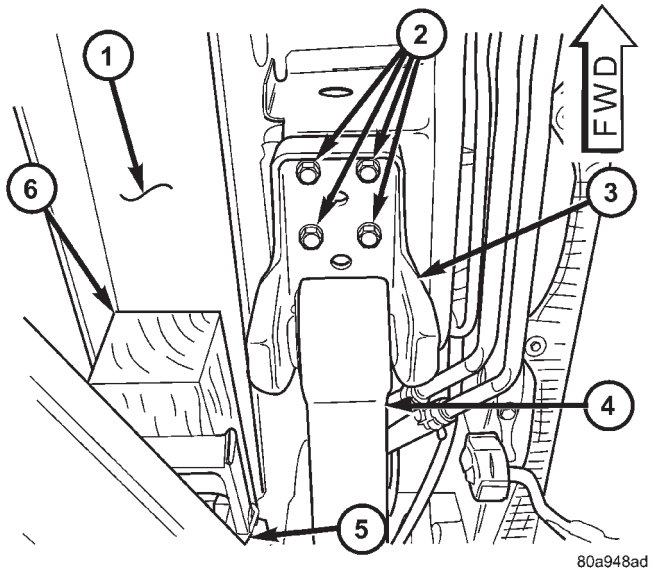

Fig. 26 LIFTING POINT AND SPRING MOUNT

1 - BODY SILL AREA
2 - MOUNTING BOLTS
3 - SPRING MOUNTING BRACKET
4 - LEAF SPRING
5 - HOIST LIFT ARM
6 - WOODEN BLOCK

NOTE: If shock absorber bolt deflects upward during removal, raise axle by adjusting support jack. If shock absorber bolt deflects downward during removal, lower axle by adjusting support jack (or by pulling on axle).

(3) Begin removal of the shock absorber lower mounting bolt (Fig. 27).

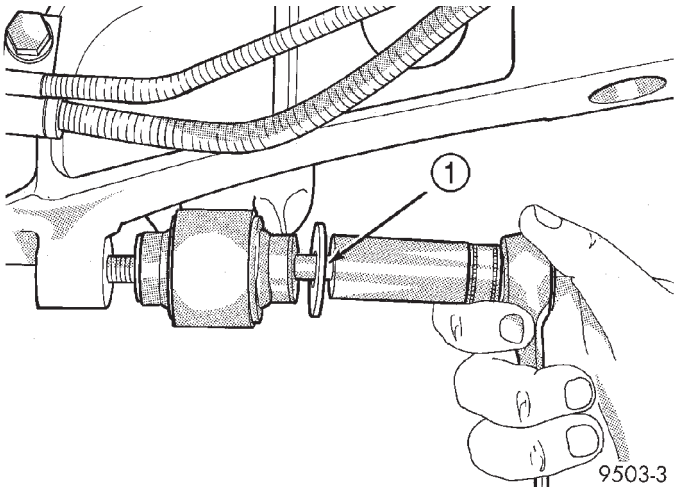

Fig. 27 Rear Shock Absorber Mounting Bolt

1 - SHOCK BOLT

(4) Using 2 jack stands positioned under the outer ends of the axle, raise the axle enough to remove the weight of the axle from the rear springs.

(5) Loosen and remove the axle plate bolts from the rear axle (Fig. 28).

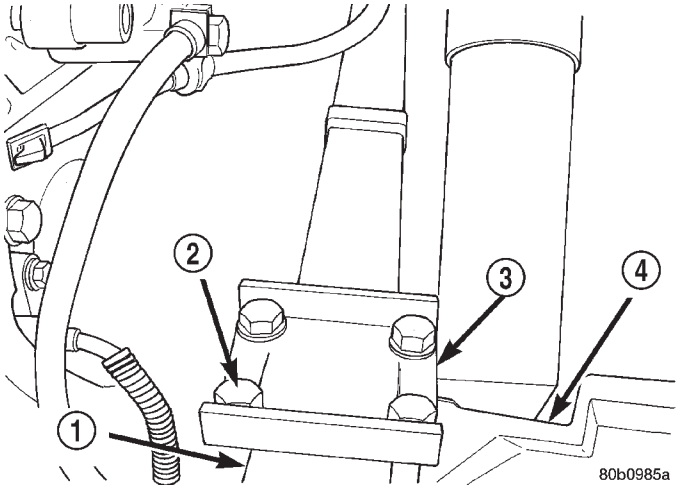

Fig. 28 Axle Plate Bolts

1 - LEAF SPRING
2 - AXLE PLATE BOLTS (4)
3 - AXLE PLATE
4 - AXLE

(6) Using the jack stands **slowly** lower the rear axle, permitting the rear springs to hang free.

(7) Loosen and remove the 4 bolts at the front mount of the rear leaf spring (Fig. 26).

(8) Loosen and remove the 2 bolts and the 2 pin nuts from the spring shackle for the rear leaf spring (Fig. 29). Then remove the inner half of the spring shackle from the outer half hanger of the spring hanger and the spring.

(9) Remove the rear leaf spring from the outer half of the spring shackle.

(10) Remove the leaf spring from the vehicle.

(11) Loosen and remove the pivot bolt from the front mount of the rear leaf spring. (Fig. 30).

INSTALLATION - AWD

CAUTION: Pivot bolt must face inboard to prevent structural damage during installation of spring.

(1) Install the front eyelet of the rear leaf spring into the spring mount. Install the pivot bolt and nut. **Do not tighten the pivot bolt at this time.**

(2) Position the front spring mount for the rear leaf spring against the floor pan of the vehicle. Install the 4 mounting bolts for the front spring mount (Fig. 26). Tighten the 4 mounting bolts to a torque of 61 N·m (45 ft. lbs.).

SPRING - AWD (Continued)

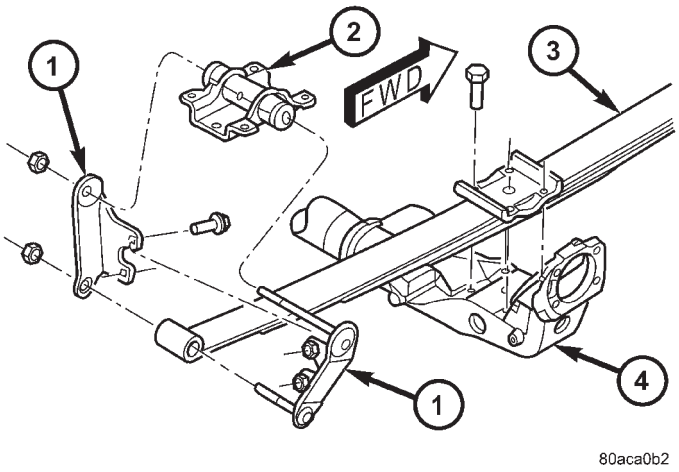

Fig. 29 All-Wheel-Drive Rear Suspension

1 - SHACKLE
2 - REAR MOUNT (HANGER)
3 - LEAF SPRING (MULTI-LEAF)
4 - AWD REAR AXLE

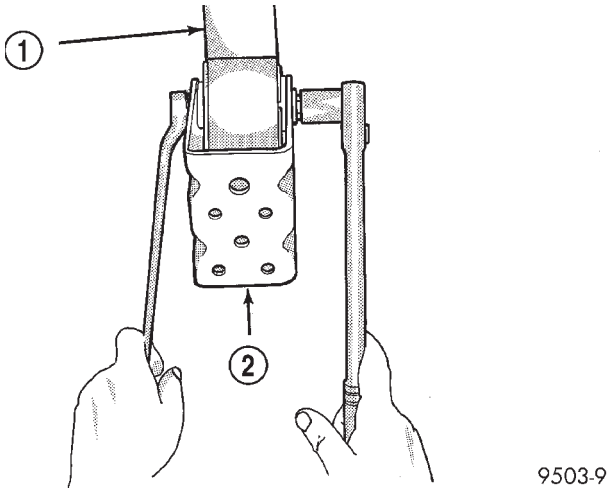

Fig. 30 Leaf Spring Front Mount (Typical)

1 - LEAF SPRING
2 - SPRING MOUNT

(3) Install the rear of the leaf spring onto the outer half of the rear shackle. Install the inner half of the rear hanger. Install the pin nuts and bolts on the rear shackle, **but do not tighten at this time.**

(4) Raise axle assembly into correct position with axle centered under spring locator post.

(5) Install axle plate bolts (Fig. 28). Tighten bolts to 95 N·m (70 ft. lbs.) torque.

(6) Install shock absorber bolts. **Do not tighten at this time.**

(7) Lower the vehicle and remove hoist arms and block of wood from under vehicle.

CAUTION: The following sequence must be followed when tightening the pin nuts on the rear hanger for the rear leaf spring. First the hanger pin nuts must be tightened to the specified torque shown below. Then tighten the retaining bolts for the inner to outer half of the spring hanger to the torque specification listed below. This sequence must be followed to properly seat the bushings into the springs and to avoid bending the spring hanger.

(8) Tighten the spring front pivot bolt to 156 N·m (115 ft. lbs.) torque.

(9) Tighten rear spring shackle pin nuts to 61 N·m (45 ft. lbs.) torque.

(10) Tighten rear spring shackle inner to outer half retaining bolts to 61 N·m (45 ft. lbs.) torque.

(11) Tighten the lower shock absorber mounting bolt to 102 N·m (75 ft. lbs.) torque.

SPRING - FWD

DESCRIPTION

The leaf springs used on the rear suspension of this vehicle are of either a mono-leaf or multi-leaf design depending on model and options.

Since the rear springs come in various designs and rates, be sure the correct spring is in use.

OPERATION

The leaf spring controls ride quality and maintains ride height.

REMOVAL - FWD

(1) Raise vehicle on frame-contact hoist as follows:

(a) Position the hoist arm supporting the corner of the vehicle to be serviced against a block of wood placed on the body sill as shown (Fig. 31).

(b) Position the remaining hoist arms at each corner of the vehicle in the normal fashion. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(c) Raise the vehicle to a comfortable working level.

(2) Position an under-hoist utility jack or transmission jack under rear axle toward the side needing spring replacement. Jack pad should just contact axle.

(3) Remove the shock absorber lower mounting bolt (Fig. 32).

NOTE: If shock absorber bolt deflects upward during removal, raise axle by adjusting support jack. If shock absorber bolt deflects downward during removal, lower axle by adjusting support jack (or by pulling on axle).

SPRING - FWD (Continued)

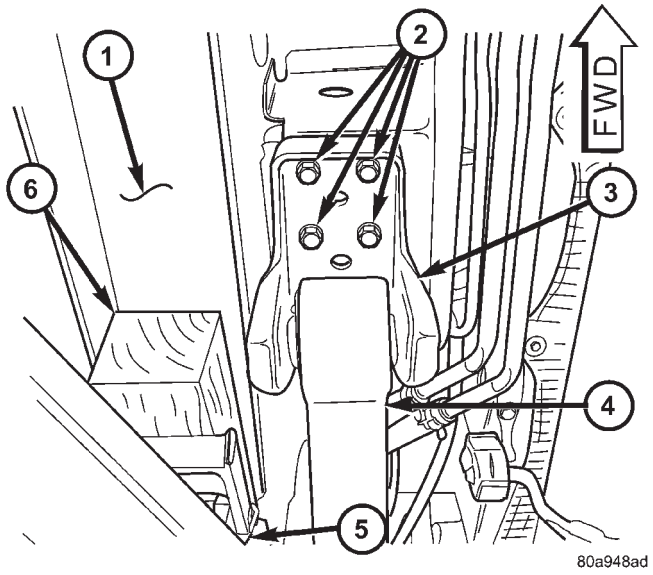

Fig. 31 LIFTING POINT AND SPRING MOUNT

1 - BODY SILL AREA
2 - MOUNTING BOLTS
3 - SPRING MOUNTING BRACKET
4 - LEAF SPRING
5 - HOIST LIFT ARM
6 - WOODEN BLOCK

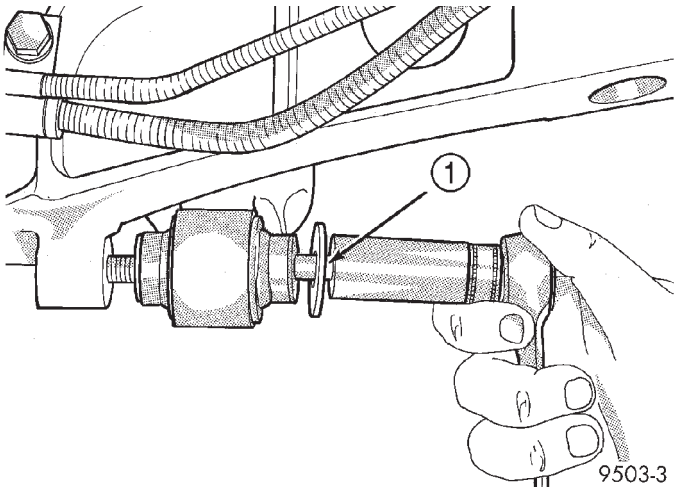

Fig. 32 Rear Shock Mounting Bolt

1 - SHOCK BOLT

(4) Using 2 jack stands positioned under the outer ends of the axle, raise the axle enough to remove the weight of the axle from the rear springs.

(5) Loosen and remove the spring plate bolts from the rear axle (Fig. 33).

(6) Remove the spring plate from the rear axle and the leaf spring (Fig. 34).

(7) Using the jack stands **slowly** lower the rear axle, permitting the rear springs to hang free.

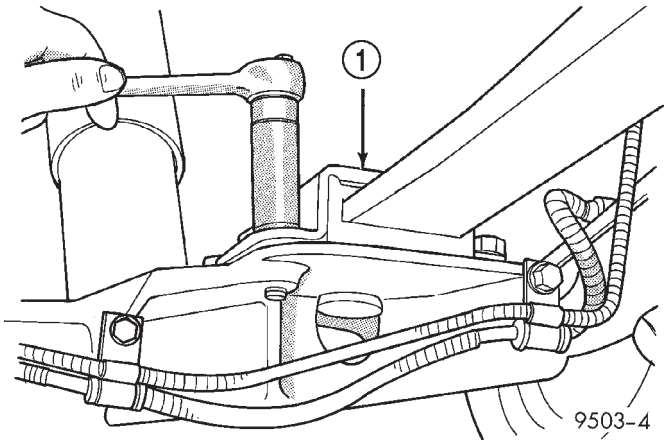

Fig. 33 Spring Plate Bolts

1 - SPRING PLATE

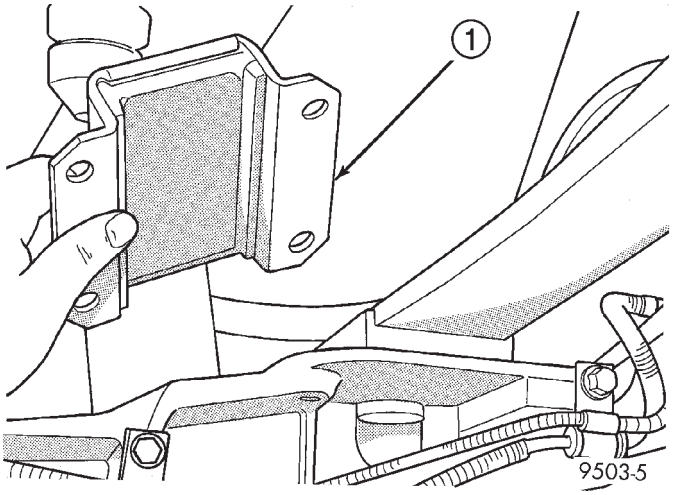

Fig. 34 Spring Plate

1 - SPRING PLATE

(8) Loosen and remove the 4 bolts securing the front mount of the leaf spring to the vehicle (Fig. 31).

(9) Loosen and remove the nuts from the spring hanger (Fig. 35) for the rear leaf spring. Then remove the hanger plate from the hanger and remove the spring from the spring hanger (Fig. 35).

(10) Remove the leaf spring from the vehicle.

(11) Loosen and remove the pivot bolt from the front mount of the rear leaf spring. Remove mount.

INSTALLATION - FWD

(1) Assemble front spring mount to front of spring eye and install pivot bolt and nut. **Do not tighten at this time.**

CAUTION: Pivot bolt must face inboard to prevent structural damage during installation of spring.

SPRING - FWD (Continued)

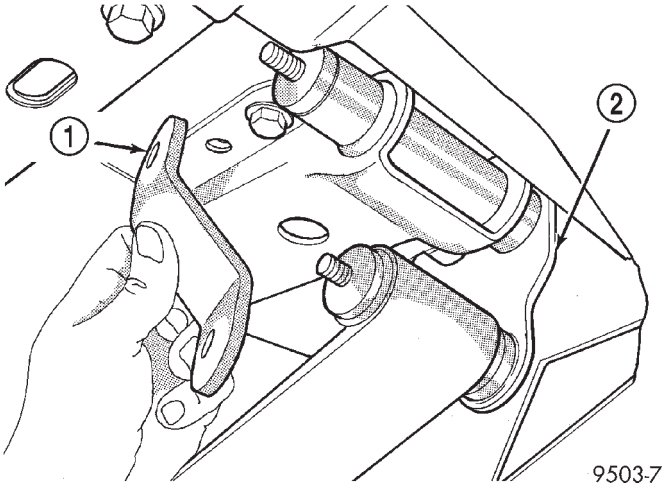

Fig. 35 Rear Spring Hanger

1 - SHACKLE PLATE
2 - SPRING HANGER

(2) Raise front of spring and install four mounting bolts (Fig. 31). Tighten bolts to 61 N·m (45 ft. lbs.) torque.

(3) Install rear of spring onto rear spring shackle. Install shackle plate. Do not tighten.

(4) Verify lower leaf spring isolator is in position.

(5) Raise axle into correct position on leaf spring with axle centered under spring locator post (Fig. 36).

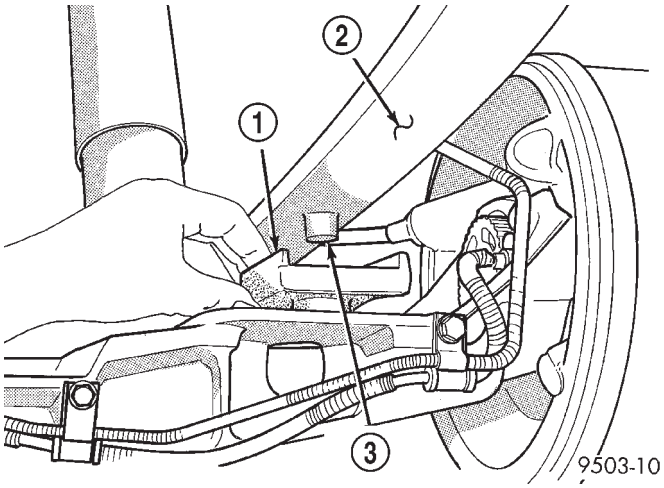

Fig. 36 Leaf Spring Locator Post

1 - LEAF SPRING ISOLATOR
2 - LEAF SPRING
3 - LOCATOR POST

(6) Verify that the leaf spring isolator is correctly positioned in the spring plate.

(7) Install spring plate in position on the spring (Fig. 33).

(8) Install spring plate bolts (Fig. 33). Tighten bolts to 95 N·m (70 ft. lbs.) torque.

(9) Install lower shock absorber bolt. **Do not tighten at this time**.

(10) Remove jack under axle.

(11) Lower the vehicle and remove hoist arms and block of wood from under vehicle.

CAUTION: The following sequence must be followed when tightening the pin nuts on the rear hanger for the rear leaf spring. First the hanger pin nuts must be tightened to the specified torque shown below. Then tighten the retaining bolts for the inner to outer half of the spring hanger to the torque specification listed below. This sequence must be followed to properly seat the bushings into the springs and to avoid bending the spring hanger.

(12) Tighten the spring front pivot bolt to 156 N·m (115 ft. lbs.) torque.

(13) Tighten rear spring shackle pin nuts to 61 N·m (45 ft. lbs.) torque.

(14) Tighten rear spring shackle inner to outer half retaining bolts to 61 N·m (45 ft. lbs.) torque.

(15) Tighten the lower shock absorber mounting bolt to 102 N·m (75 ft. lbs.) torque.

SPRING MOUNTS - FRONT

REMOVAL

(1) Raise vehicle on frame-contact hoist as follows:

(a) Position the hoist arm supporting the corner of the vehicle to be serviced against a block of wood placed on the body sill as shown (Fig. 37).

(b) Position the remaining hoist arms at each corner of the vehicle in the normal fashion. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(c) Raise the vehicle to a comfortable working level.

(2) Position an under-hoist utility jack or transmission jack under rear axle toward the side needing bushing replacement. Jack pad should just contact axle.

(3) Remove shock absorber lower mounting bolt.

NOTE: If shock absorber bolt deflects upward during removal, raise axle by adjusting support jack. If shock absorber bolt deflects downward during removal, lower axle by adjusting support jack (or by pulling on axle).

(4) Remove four bolts securing leaf spring front mounting bracket to the body (Fig. 37).

(5) Using jack, **slowly** lower rear axle, permitting the forward end of rear spring to hang down. Lower

SPRING MOUNTS - FRONT (Continued)

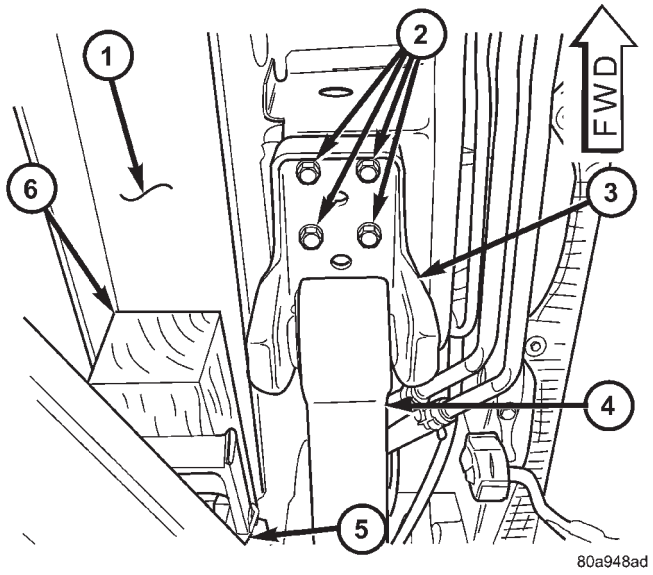

Fig. 37 LIFTING POINT AND SPRING MOUNT

1 - BODY SILL AREA
2 - MOUNTING BOLTS
3 - SPRING MOUNTING BRACKET
4 - LEAF SPRING
5 - HOIST LIFT ARM
6 - WOODEN BLOCK

it enough to allow access to spring pivot bolt. It may be necessary to place a wooden block between the spring and vehicle to hold forward end of the spring in place.

(6) Remove leaf spring forward pivot bolt, then remove mounting bracket.

INSTALLATION

(1) Position spring mounting bracket over spring eye and install pivot bolt through center of bushing from the **outboard** side.

NOTE: The pivot bolt must be installed from the outboard side to allow proper bracket to body mounting.

(2) Install the nut on the pivot bolt and lightly tighten. Do not fully tighten bolt at this time.

(3) Raise the under-hoist utility jack or transmission jack, guiding the forward mounting bracket into place against the body. It may help to use a drift punch placed through the hole centered between the mounting bolt holes in the bracket and the pilot hole in the body of the vehicle as a guide. When the four mounting bolt holes line up with their threads in the body, Install the mounting bolts (Fig. 37). Tighten the four mounting bolts to 61 N·m (45 ft. lbs.) torque.

(4) Raise or lower the jack until shock absorber lower eye aligns with threads in axle housing. Install shock absorber lower mounting bolt. Do not fully tighten bolt at this time.

(5) Lower the vehicle and remove hoist arms and block of wood from under vehicle.

(6) Tighten the spring front pivot bolt to 156 N·m (115 ft. lbs.) torque.

(7) Tighten the lower shock absorber mounting bolt to 88 N·m (65 ft. lbs.) torque.

SPRING MOUNTS - REAR

REMOVAL

(1) Remove the attaching nuts and bolts from the leaf spring rear shackle (Fig. 38) and (Fig. 39).

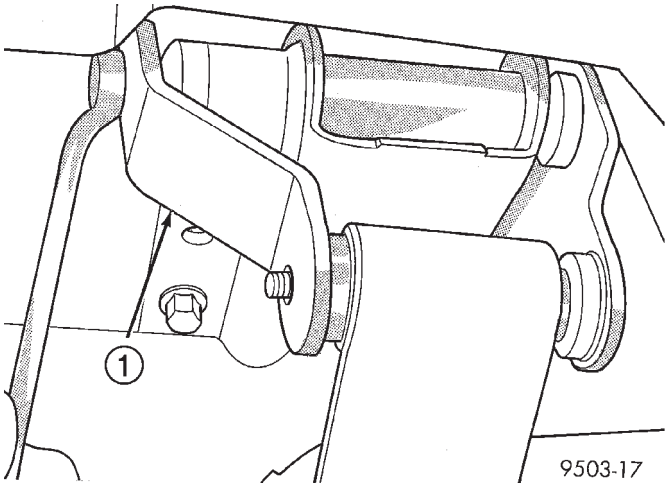

Fig. 38 Leaf Spring Shackle Nuts (FWD)

1 - SHACKLE PLATE

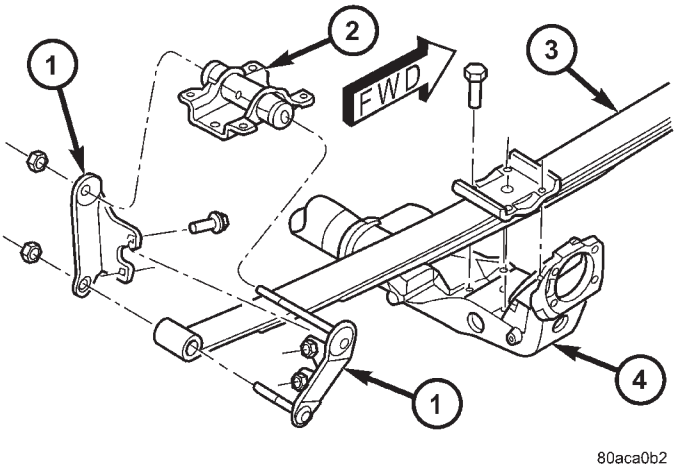

Fig. 39 All-Wheel-Drive Rear Suspension

1 - SHACKLE
2 - REAR MOUNT (HANGER)
3 - LEAF SPRING (MULTI-LEAF)
4 - AWD REAR AXLE

SPRING MOUNTS - REAR (Continued)

(2) Install a jackstand under the side of the axle having the leaf spring mount removed. Using the jackstand, support the weight of the axle and leaf spring.

(3) Remove the lower mounting bolt from the shock absorber.

(4) Remove the bolts attaching the leaf spring rear mount to the body of the vehicle (Fig. 40).

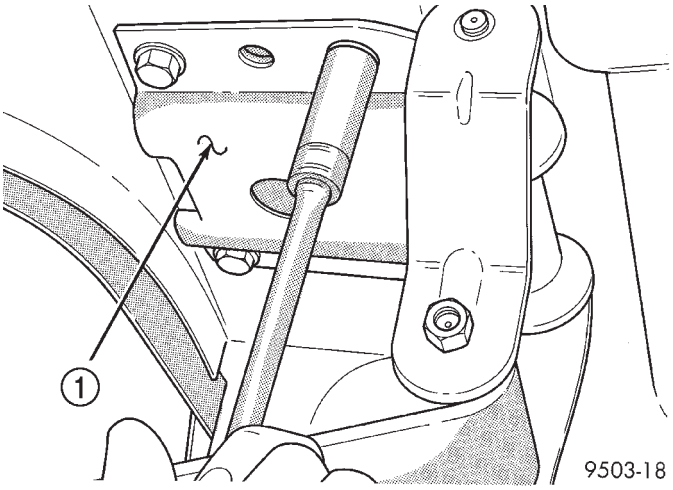

Fig. 40 Rear Spring Mount

1 - LEAF SPRING MOUNT

(5) Lower the jackstand and the rear of the leaf spring. Remove the shackle from the leaf spring bushing.

INSTALLATION

CAUTION: The following sequence must be followed when tightening the pin nuts on the rear hanger for the rear leaf spring. First the hanger pin nuts must be tightened to the specified torque. Then tighten the retaining bolts for the inner to outer half of the spring hanger to the specified torque. This sequence must be followed to avoid bending the spring hanger.

(1) For installation, reverse removal procedure. Do not tighten rear spring shackle nuts fully until vehicle is lowered and the full vehicle weight is applied to the rear wheels. Tighten rear spring mount bolts to 61 N·m (45 ft. lbs.). Tighten shackle nuts to 61 N·m (45 ft. lbs.).

STABILIZER BAR

DESCRIPTION

Front-wheel-drive models use a stabilizer bar that is mounted behind the rear axle. All-wheel-drive models use a stabilizer bar that is mounted in front of the rear axle.

The stabilizer bar interconnects both sides of the rear axle and attaches to the rear frame rails using 2 rubber isolated link arms.

Both type stabilizer bars have the same basic components. Attachment to the rear axle tube, and rear frame rails is through rubber-isolated bushings.

The 2 rubber isolated links are connected to the rear frame rails by brackets. These brackets are bolted to the bottom of the frame rails.

OPERATION

Jounce and rebound movements affecting one wheel are partially transmitted to the opposite wheel to reduce body roll.

REMOVAL

REMOVAL - AWD

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the bolts securing the stabilizer bar to links on each end of the bar.

(3) While holding the stabilizer bar in place, remove the bolts that attach the stabilizer bar bushing retainers to the rear axle.

(4) Remove the stabilizer bar from the vehicle.

(5) If the links need to be serviced, remove the upper link arm to bracket bolt. Then remove link arm from frame rail attaching bracket.

REMOVAL - FWD

(1) Raise vehicle. See Hoisting in Lubrication and Maintenance.

(2) Remove the bolts securing the stabilizer bar to links on each side of bar.

(3) While holding the stabilizer bar in place, remove the bolts that attach the stabilizer bar bushing retainers to the rear axle.

(4) Remove the stabilizer bar from the vehicle.

INSTALLATION

INSTALLATION - AWD

(1) Install the stabilizer bar on the rear axle.

(2) Install bushing retainer bolts. Do not tighten at this time.

(3) Install bolts connecting links to stabilizer bar. Do not tighten at this time.

(4) Lower the vehicle so that the full weight of the vehicle is on all four tires. With the vehicle at its curb height, tighten the following bolts to the torques listed:

- Stabilizer bar bushing retainer-to-axle bracket bolts — 61 N·m (45 ft. lbs.)

STABILIZER BAR (Continued)

- Stabilizer bar-to-link bolts — 61 N·m (45 ft. lbs.)

INSTALLATION - FWD

(1) Lift the stabilizer bar onto the rear axle and install the two retainer mounting bolts. DO NOT TIGHTEN.

(2) Install the bolts attaching the stabilizer bar links to the stabilizer bar. DO NOT TIGHTEN.

(3) Lower the vehicle so that the full weight of the vehicle is on all four tires. With the vehicle at its curb height, tighten the following bolts to the torques listed:

- Stabilizer bar bushing retainer-to-axle bracket bolts — 61 N·m (45 ft. lbs.)
- Stabilizer bar-to-link — 61 N·m (45 ft. lbs.)

TRACK BAR

DESCRIPTION

On front-wheel-drive applications of this vehicle that are equipped with single leaf rear springs, a track bar is used on the rear axle (Fig. 1).

The track bar connects the rear axle to the frame/body of the vehicle. The track bar is isolated from the body of the vehicle by an isolator bushing located in each end of the track bar.

OPERATION

The track bar prevents excessive side-to-side movement of the rear axle. The track bar is used to keep the location of the axle in the correct position for optimum handling and control of the vehicle.

REMOVAL

(1) Remove the nut and bolt mounting the track bar to the rear axle (Fig. 41).

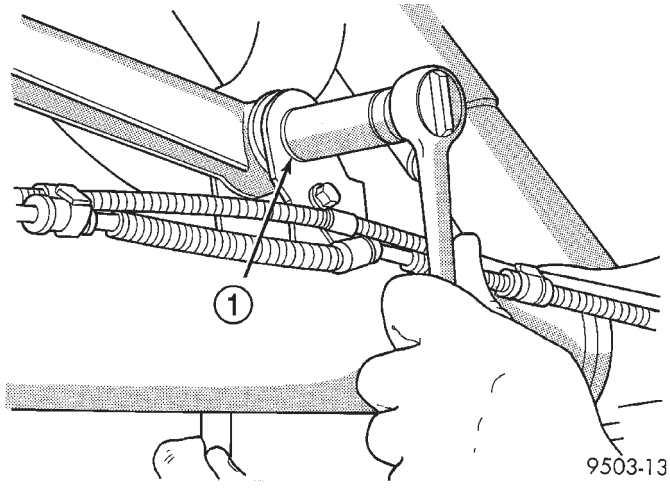

Fig. 41 Track Bar Mounting To Axle (Typical)

1 - LOWER TRACK BAR BOLT INSTALLATION

(2) Remove the nut and bolt attaching the track bar to the track bar mount on the body of the vehicle. Remove the track bar from the track bar mount.

INSTALLATION

(1) Install the track bar first into the body mount for the track bar (Fig. 42). Install the track bar bolt with the head of the bolt facing toward the rear of the vehicle (Fig. 43). Do not tighten.

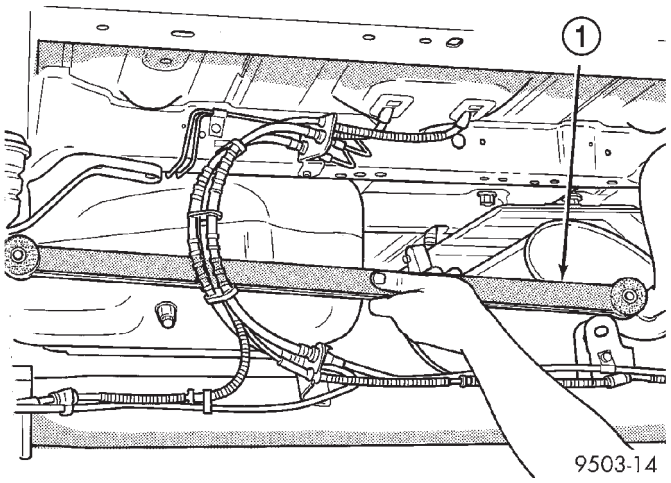

Fig. 42 Track Bar Installation (Typical)

1 - TRACK BAR REPLACEMENT

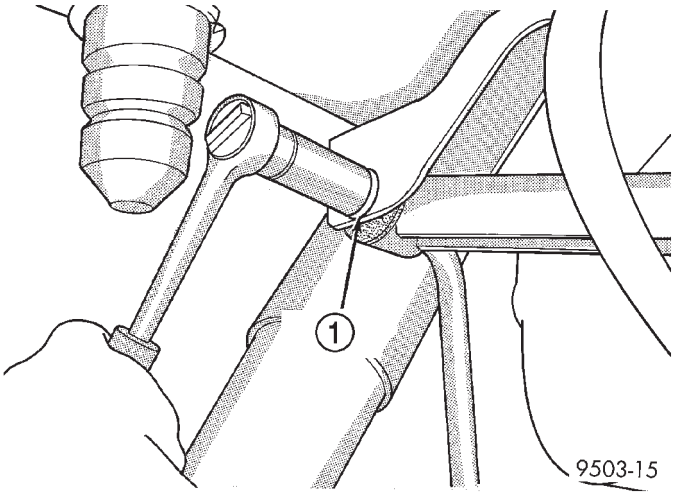

Fig. 43 Track Bar Bolt Installation

1 - TRACK BAR BOLT

(2) Install the track bar into its mounting bracket on the rear axle (Fig. 41). Install the track bar bolt with the head of the bolt facing toward the rear of the vehicle. Do not tighten.

(3) Lower the vehicle to the ground until the full weight of the vehicle is supported by the wheels. Tighten both track bar attaching bolts to a torque of 95 N·m (70 ft. lbs.).

WHEEL ALIGNMENT

DESCRIPTION - WHEEL ALIGNMENT

Vehicle wheel alignment is the positioning of all interrelated front and rear suspension angles. These angles affect the handling and steering of the vehicle when it is in motion. Proper wheel alignment is essential for efficient steering, good directional stability, and proper tire wear.

The method of checking a vehicle's front and rear wheel alignment varies depending on the manufacturer and type of equipment used. The manufacturer's instructions should always be followed to ensure accuracy of the alignment, except when DaimlerChrysler Corporation's wheel alignment specifications differ.

On this vehicle, the suspension angles that can be adjusted are as follows:

- Front Camber (with camber bolt package and standard procedure)
- Front Toe

Check the wheel alignment and make all wheel alignment adjustments with the vehicle standing at its proper curb height specification. Curb height is the normal riding height of the vehicle. It is measured from a certain point on the vehicle to the ground or a designated area while the vehicle is sitting on a flat, level surface. Refer to Curb Height Measurement in this section for additional information.

Typical wheel alignment angles and measurements are described in the following paragraphs.

CAMBER

Camber is the inward or outward tilt of the top of the tire and wheel assembly (Fig. 1). Camber is measured in degrees of angle relative to a true vertical line. Camber is a tire wearing angle.

- Excessive negative camber will cause tread wear at the inside of the tire.
- Excessive positive camber will cause tread wear on the outside of the tire.

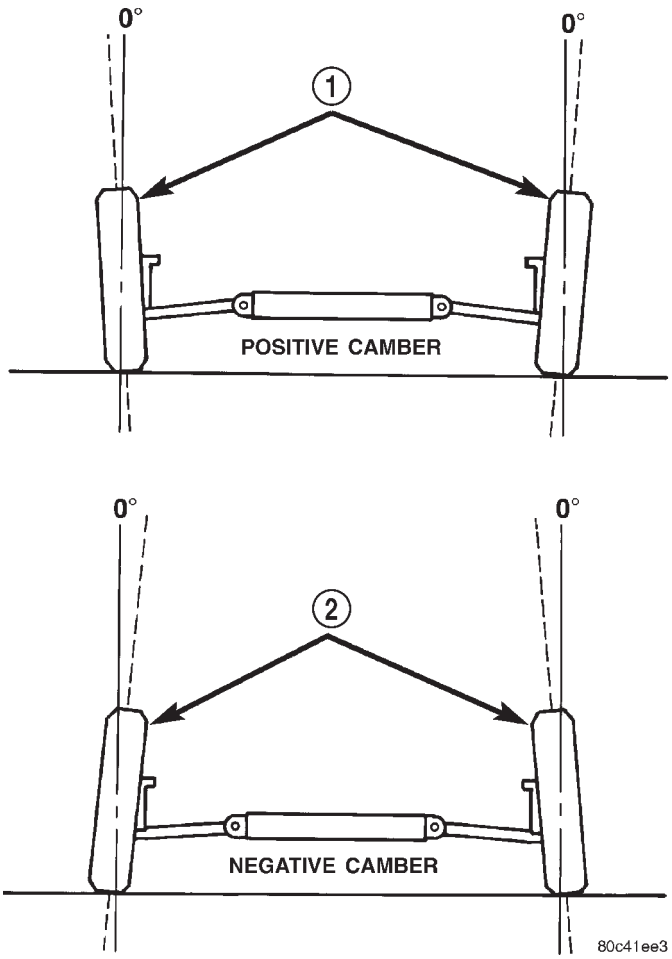

Fig. 1 Camber

1 - WHEELS TILTED OUT AT TOP
2 - WHEELS TILTED IN AT TOP

WHEEL ALIGNMENT (Continued)

CROSS CAMBER

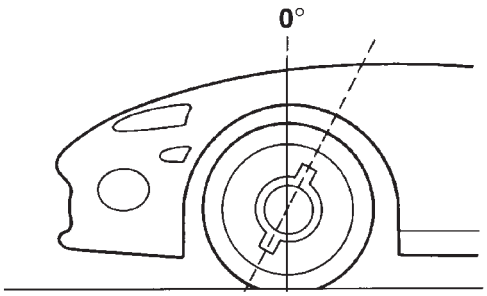
Cross camber is the difference between left and right camber. To achieve the cross camber reading, subtract the right side camber reading from the left. For example, if the left camber is +0.3° and the right camber is 0.0°, the cross camber would be +0.3°.

CASTER

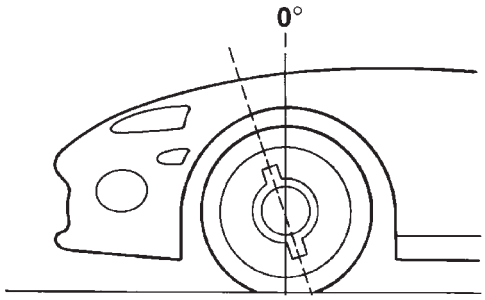
Caster is the forward or rearward tilt of the steering knuckle in reference to the position of the upper and lower ball joints. Caster is measured in degrees of angle relative to a true vertical center line. This line is viewed from the side of the tire and wheel assembly (Fig. 2).

- Forward tilt (upper ball joint ahead of lower) results in a negative caster angle.
- Rearward tilt (upper ball joint trailing lower) results in a positive caster angle.

Although caster does not affect tire wear, a caster imbalance between the two front wheels may cause the vehicle to lead to the side with the least positive caster.



POSITIVE CASTER



NEGATIVE CASTER

80c41ee4

Fig. 2 Caster

CROSS CASTER

Cross caster is the difference between left and right caster.

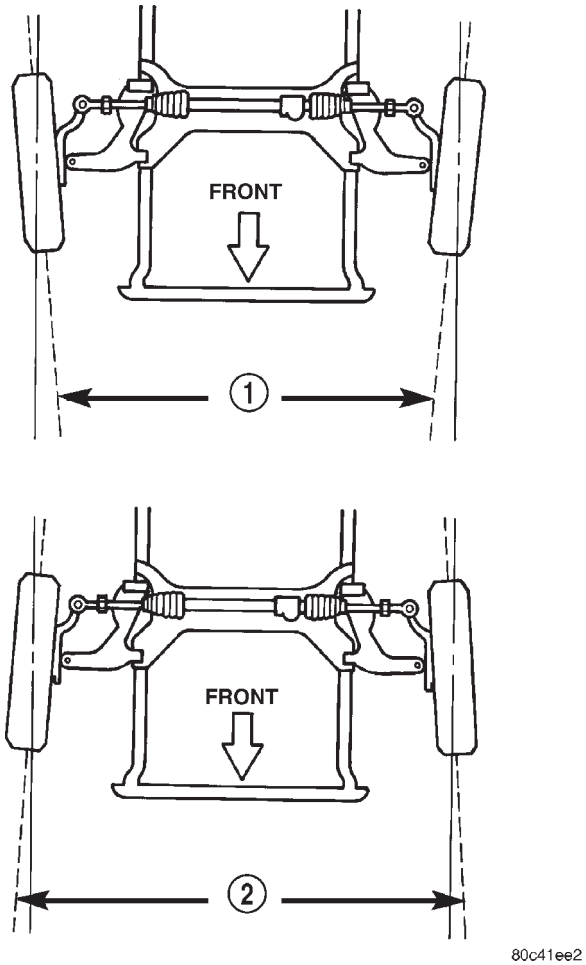
TOE

Toe is the inward or outward angle of the wheels as viewed from above the vehicle (Fig. 3).

- Toe-in is produced when the front edges of the wheels on the same axle are closer together than the rear edges.
- Toe-out is produced when the front edges of the wheels on the same axle are farther apart than the rear edges.

Toe-in and toe-out can occur at the front wheels and the rear wheels.

Toe is measured in degrees or inches. The measurement identifies the amount that the front of the wheels point inward (toe-in) or outward (toe-out). Toe is measured at the spindle height. Zero toe means the front and rear edges of the wheels on the same axle are equally distant.



80c41ee2

Fig. 3 Toe

1 - TOE-IN
2 - TOE-OUT

WHEEL ALIGNMENT (Continued)

TOE-OUT ON TURNS

Toe-out on turns is the relative positioning of the front wheels while steering through a turn (Fig. 4). This compensates for each front wheel's turning radius. As the vehicle encounters a turn, the outboard wheel must travel in a larger radius circle than the inboard wheel. The steering system is designed to make each wheel follow its particular radius circle. To accomplish this, the front wheels must progressively toe outward as the steering is turned from center. This eliminates tire scrubbing and undue tire wear when steering a vehicle through a turn.

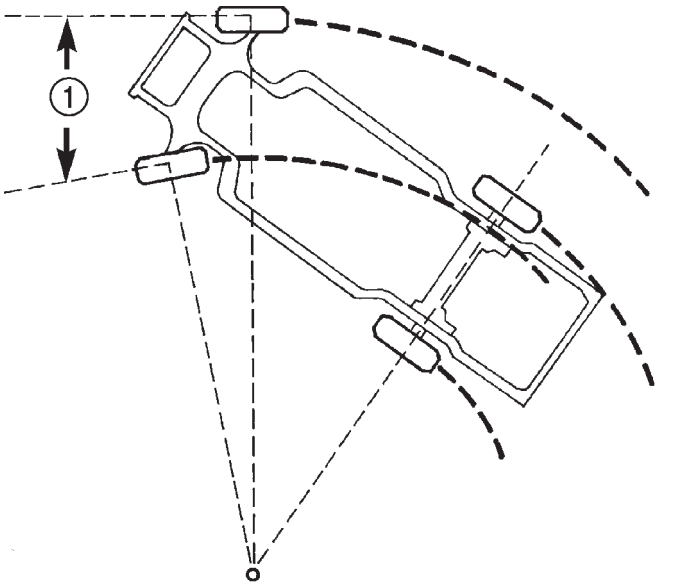


Fig. 4 Toe-Out On Turns

1 - TOE-OUT ON TURNS

DYNAMIC TOE PATTERN

Dynamic toe pattern is the inward and outward toe movement of the front and rear tires through the suspension's jounce and rebound travel. As the vehicle's suspension moves up and down, the toe pattern varies. Toe pattern is critical in controlling the directional stability of the vehicle while in motion. Front and rear dynamic toe pattern is preset by the factory at the time the vehicle is assembled.

It is not necessary to check or adjust front or rear dynamic toe pattern when doing a normal wheel alignment. The only time dynamic toe pattern needs to be checked or adjusted is if the frame of the vehicle has been damaged.

STEERING AXIS INCLINATION (S. A. I.)

Steering axis inclination is the angle between a true vertical line starting at the center of the tire at the road contact point and a line drawn through the center of the upper ball joint (or strut) and the lower ball joint (Fig. 5). S.A.I. is built into the vehicle and is not an adjustable angle. If S.A.I. is not within specifications, a bent or damaged suspension component may be the cause.

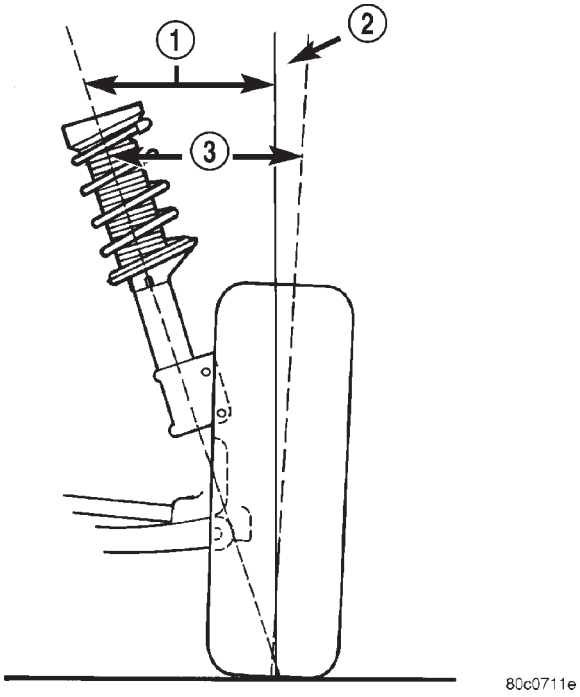

Fig. 5 S.A.I. and I.A.

1 - S.A.I.
2 - CAMBER
3 - I.A.

INCLUDED ANGLE (I. A.)

Included angle is the sum of the S.A.I. angle plus or minus the camber angle, depending on whether or not the wheel has positive or negative camber (Fig. 5). If camber is positive, add the camber angle to the S.A.I. angle. If camber is negative, subtract the camber angle from the S.A.I. angle. Included angle is not adjustable, but can be used to diagnose a frame misalignment or bent suspension component (spindle, strut).

WHEEL ALIGNMENT (Continued)

THRUST ANGLE

Thrust angle is the averaged direction the rear wheels are pointing in relation to the vehicle's center line (Fig. 6). The presence of negative or positive thrust angle causes the rear tires to track improperly to the left or right of the front tires (dog tracking).

- Negative thrust angle means the rear tires are tracking to the left of the front tires.
- Positive thrust angle means the rear tires are tracking to the right of the front tires.

Improper tracking can cause undue tire wear, a lead or pull and a crooked steering wheel. Excessive thrust angle can usually be corrected by adjusting the rear wheel toe so that each wheel has one-half of the total toe measurement.

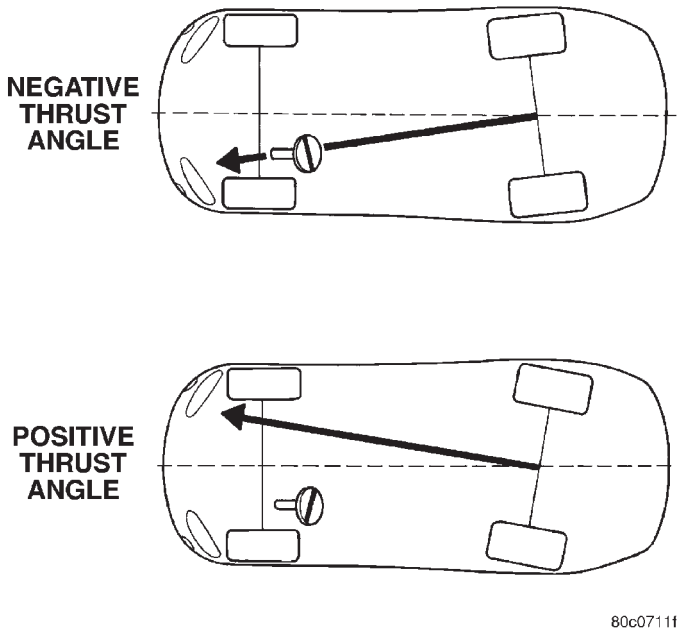

Fig. 6 Thrust Angle

DIAGNOSIS AND TESTING - SUSPENSION AND STEERING

CONDITION	POSSIBLE CAUSES	CORRECTION
Front End Whine On Turns	1. Defective wheel bearing	1. Replace wheel bearing
	2. Incorrect wheel alignment	2. Check and reset wheel alignment
	3. Worn tires	3. Replace tires
Front End Growl Or Grinding On Turns	1. Defective wheel bearing	1. Replace wheel bearing
	2. Engine mount grounding	2. Check for motor mount hitting frame rail and reposition engine as required
	3. Worn or broken C/V joint	3. Replace C/V joint
	4. Loose wheel lug nuts	4. Verify wheel lug nut torque
	5. Incorrect wheel alignment	5. Check and reset wheel alignment
	6. Worn tires	6. Replace tires
	7. Front strut pin in upper strut mount	7. Replace the front strut upper mount and bearing
Front End Clunk Or Snap On Turns	1. Loose lug nuts	1. Verify wheel lug nut torque
	2. Worn or broken C/V joint	2. Replace C/V joint
	3. Worn or loose tie rod	3. Tighten or replace tie rod end
	4. Worn or loose ball joint	4. Tighten or replace ball joint
	5. Worn/loose control arm bushing	5. Replace control arm bushing
	6. Loose stabilizer bar.	6. Tighten stabilizer bar to specified torque

WHEEL ALIGNMENT (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	7. Loose strut mount to body attachment	7. Tighten strut attachment to specified torque
	8. Loose crossmember bolts	8. Tighten crossmember bolts to specified torque
Front End Whine With Vehicle Going Straight At A Constant Speed	1. Defective wheel bearing	1. Replace wheel bearing
	2. Incorrect wheel alignment	2. Check and reset wheel alignment
	3. Worn tires	3. Replace tires
	4. Worn or defective transaxle gears or bearings	4. Replace transaxle gears or bearings
Front End Growl Or Grinding With Vehicle Going Straight At A Constant Speed	1. Engine mount grounding	1. Reposition engine as required
	2. Worn or broken C/V joint	2. Replace C/V joint
Front End Whine When Accelerating Or Decelerating	1. Worn or defective transaxle gears or bearings	1. Replace transaxle gears or bearings
Front End Clunk When Accelerating Or Decelerating	1. Worn or broken engine mount	1. Replace engine mount
	2. Worn or defective transaxle gears or bearings	2. Replace transaxle gears or bearings
	3. Loose lug nuts	3. Verify wheel lug nut torque
	4. Worn or broken C/V joint	4. Replace C/V joint
	5. Worn or loose ball joint	5. Tighten or replace ball joint
	6. Worn or loose control arm bushing	6. Replace control arm bushing
	7. Loose crossmember bolts	7. Tighten crossmember bolts to specified torque
	8. Worn tie rod end	8. Replace tie rod end
Road Wander	1. Incorrect tire pressure	1. Inflate tires to recommended pressure
	2. Incorrect front or rear wheel toe	2. Check and reset wheel toe
	3. Worn wheel bearings	3. Replace wheel bearing
	4. Worn control arm bushings	4. Replace control arm bushing
	5. Excessive friction in steering gear	5. Replace steering gear
	6. Excessive friction in steering shaft coupling	6. Replace steering coupler
	7. Excessive friction in strut upper bearing	7. Replace strut bearing
Lateral Pull	1. Unequal tire pressure	1. Inflate all tires to recommended pressure
	2. Radial tire lead	2. Perform lead correction procedure

WHEEL ALIGNMENT (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Incorrect front wheel camber	3. Check and reset front wheel camber
	4. Power steering gear imbalance	4. Replace power steering gear
	5. Wheel braking	5. Correct braking condition causing lateral pull
Excessive Steering Free Play	1. Incorrect Steering Gear Adjustment	1. Adjust Or Replace Steering Gear
	2. Worn or loose tie rod ends	2. Replace or tighten tie rod ends
	3. Loose steering gear mounting bolts	3. Tighten steering gear bolts to specified torque
	4. Loose or worn steering shaft coupler	4. Replace steering shaft coupler
Excessive Steering Effort	1. Low tire pressure	1. Inflate all tires to recommended pressure
	2. Lack of lubricant in steering gear	2. Replace steering gear
	3. Low power steering fluid level	3. Fill power steering fluid reservoir to correct level
	4. Loose power steering pump drive belt	4. Correctly adjust power steering pump drive belt
	5. Lack of lubricant in ball joints	5. Lubricate or replace ball joints
	6. Steering gear malfunction	6. Replace steering gear
	7. Lack of lubricant in steering coupler	7. Replace steering coupler

STANDARD PROCEDURE

STANDARD PROCEDURE - WHEEL ALIGNMENT

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to ensure proper alignment.

(1) Verify that the fuel tank is full of fuel. If the tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment angles.

(2) The passenger and luggage compartments of the vehicle should be free of any load that is not factory equipment.

(3) Check the tires on the vehicle. All tires must be the same size and in good condition with approximately the same amount of tread wear. Inflate all the tires to the recommended air pressure.

(4) Check the front wheel and tire assemblies for excessive radial runout.

(5) Inspect lower ball joints and all steering linkage for looseness, binding, wear or damage. Repair as necessary.

(6) Check suspension fasteners for proper torque and retighten as necessary.

(7) Inspect all suspension component rubber bushings for signs of wear or deterioration. Replace any faulty bushings or components before aligning the vehicle.

(8) Check the vehicle's curb height to verify it is within specifications. Refer to Curb Height Measurement.

WHEEL ALIGNMENT SETUP

(1) Position the vehicle on an alignment rack.

(2) Install all required alignment equipment on the vehicle per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced. Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.

(3) Read the vehicle's current front and rear alignment settings. Compare the vehicle's current align-

ment settings to the vehicle specifications for camber, caster and toe-in. (Refer to 2 - SUSPENSION/ WHEEL ALIGNMENT - SPECIFICATIONS)

(4) If front camber and caster are not within specifications, proceed to CAMBER AND CASTER below. If caster and camber are within specifications, proceed to TOE which can be found following CAMBER AND CASTER. Rear camber, caster and toe are not adjustable. If found not to be within specifications, reinspect for damaged suspension or body components and replace as necessary.

CAMBER AND CASTER

Camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as NET BUILD. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles. Camber and caster should be checked to ensure they meet vehicle specifications.

If front camber is found not to meet alignment specifications, it can be adjusted using an available camber adjustment bolt package. Before installing a camber adjustment bolt package on a vehicle found to be outside the specifications, inspect the suspension components for any signs of damage or bending.

CAUTION: Do not attempt to adjust the vehicles wheel alignment by heating, bending or by performing any other modification to the vehicle's front suspension components or body.

If camber readings are not within specifications, use the following procedure to install the front camber adjustment bolt package and then adjust front camber.

CAMBER ADJUSTMENT BOLT PACKAGE INSTALLATION

The camber adjustment bolt package contains 2 flange bolts, 2 cam bolts, 2 dog bone washers, and 4 nuts. This package services both sides of the vehicle. Use the package to attach the strut clevis bracket to the steering knuckle after the strut clevis bracket has been modified. To install and adjust the camber adjustment bolt package, follow the procedure below.

(1) Raise the vehicle until its tires are not supporting the weight of the vehicle.

(2) Remove the front tire and wheel assemblies.

CAUTION: When removing the steering knuckle from the strut clevis bracket, do not put a strain on the brake flex hose. Also, do not let the weight of the steering knuckle assembly be supported by the brake flex hose when removed from the strut assembly. If necessary use a wire hanger to support the steering knuckle assembly or if required remove the brake flex hose from the caliper assembly.

CAUTION: The knuckle to strut assembly attaching bolt shanks are serrated and must not be turned during removal. Remove the nuts while holding the bolts stationary.

(3) Remove the top and bottom, strut clevis bracket to steering knuckle attaching bolts (Fig. 7)and discard. Separate the steering knuckle from the strut clevis bracket and position steering knuckle so it is out of the way of the strut.

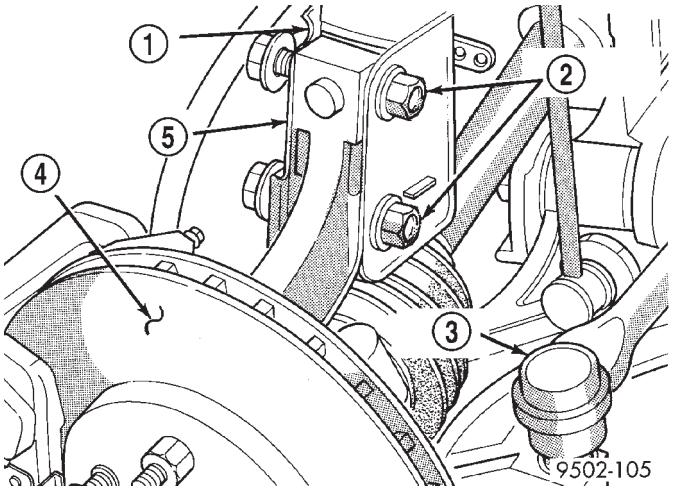

Fig. 7 Clevis Bracket To Steering Knuckle Attaching Bolts

1 - STRUT CLEVIS BRACKET
2 - ATTACHING BOLTS
3 - TIE ROD END
4 - ROTOR
5 - STEERING KNUCKLE

CAUTION: When slotting the bottom mounting hole on the strut clevis bracket, do not enlarge the hole beyond the indentations on the sides of the strut clevis bracket (Fig. 8).

(4) Using an appropriate grinder and grinding wheel, slot the bottom hole in both sides of the strut clevis bracket (Fig. 8).

CAUTION: After slotting the strut clevis bracket hole, do not install the original attaching bolts when assembling the steering knuckle to the strut assembly. Only the flange bolts, cam bolts, and dog bone washers from the service package must be used to attach the steering knuckle to the strut after the mounting hole is slotted.

WHEEL ALIGNMENT (Continued)

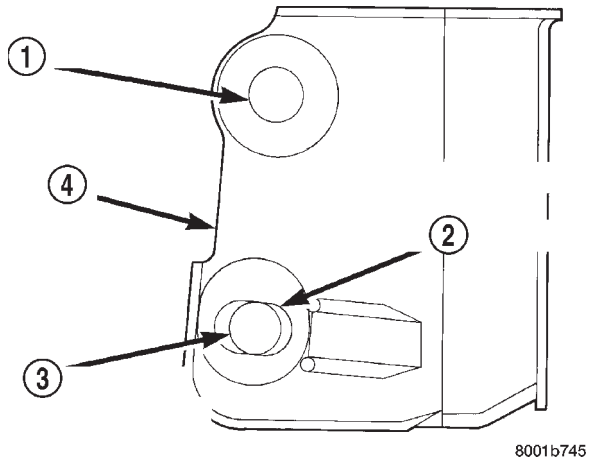

Fig. 8 Strut Clevis Bracket Bolt Hole Grinding Area

1 - UPPER STRUT TO STEERING KNUCKLE ATTACHING HOLE
2 - CAMBER ADJUSTMENT SLOT INDENTATION AREA ON CLEVIS BRACKET
3 - LOWER STRUT TO STEERING KNUCKLE ATTACHING HOLE
4 - STRUT CLEVIS BRACKET

NOTE: The strut clevis-to-knuckle bolts are installed differently on each side of the vehicle. Left-hand-side bolts are installed from vehicle rear to front (Fig. 9). Right-hand-side bolts are installed from vehicle front to rear.

(5) Position the knuckle back into the strut clevis bracket. Using the direction indicated in the above note, install a flanged bolt from the service package into the upper mounting hole. Using the direction indicated in the above note, install a cam bolt into the bottom mounting hole (Fig. 9).

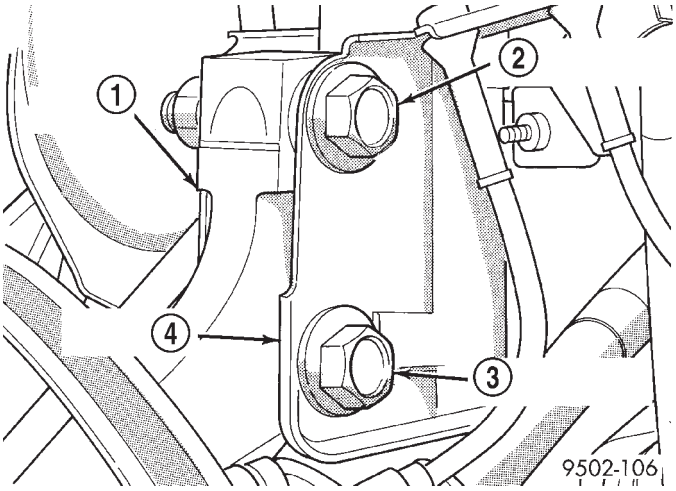

Fig. 9 Package Bolts Correctly Installed

1 - STEERING KNUCKLE
2 - FLANGED BOLT IN TOP HOLE
3 - CAM BOLT IN BOTTOM HOLE
4 - STRUT CLEVIS BRACKET

(6) Install a dog bone washer on the steering knuckle to strut clevis bracket attaching bolts, then install the nuts onto the bolts from the service package (Fig. 10). Tighten the bolts just enough to hold the steering knuckle in position when adjusting camber, while still allowing the steering knuckle to move in clevis bracket.

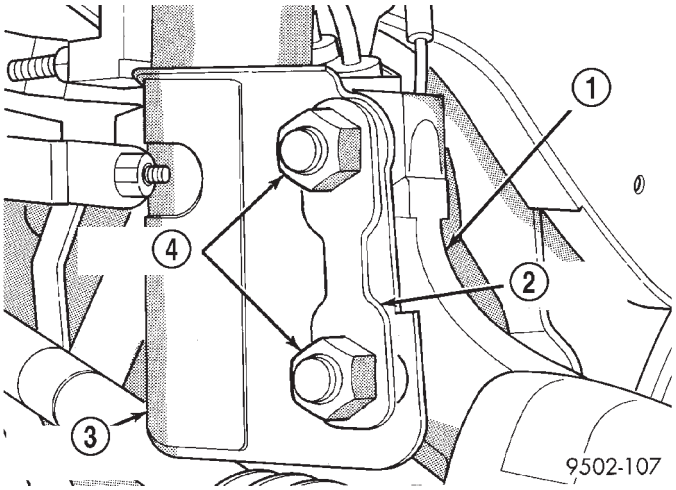

Fig. 10 Dog Bone Washer And Nuts Installed

1 - STEERING KNUCKLE
2 - DOG BONE WASHER
3 - STRUT CLEVIS BRACKET
4 - ATTACHING NUTS

(7) Repeat the procedure to the other side strut clevis bracket.

(8) Reinstall both front tire and wheel assemblies and tighten to specifications.

(9) Lower the vehicle. Jounce the front and rear of vehicle an equal amount of times.

(10) Adjust the front camber to the preferred setting by rotating the lower eccentric cam bolt against the cam stop areas on the strut clevis bracket (Fig. 11). When camber is set, tighten the upper strut clevis bracket bolt and lower cam bolt. Again jounce front and rear of vehicle an equal amount of times and verify front camber setting. Torque both front strut to steering knuckle attaching bolts to 81 N·m (60 ft. lbs.) plus an additional 1/4 (90°) turn after the required torque is met.

(11) If toe readings obtained are not within the required specification range, adjust toe to meet the preferred specification setting. Toe is adjustable using the following procedure.

TOE

(1) Center the steering wheel and lock in place using a steering wheel clamp.

WHEEL ALIGNMENT (Continued)

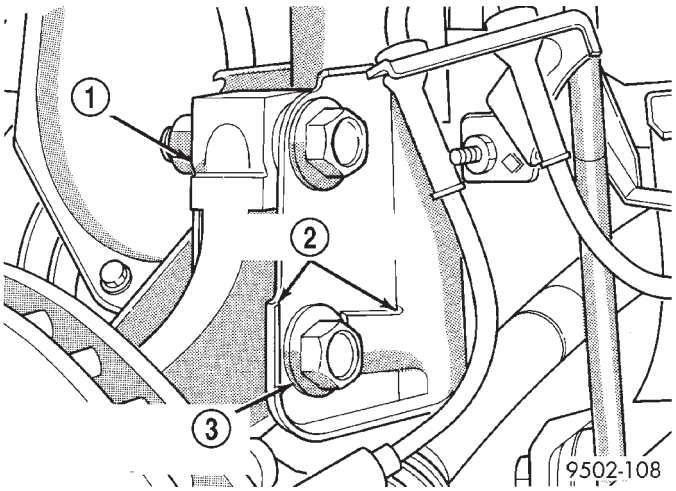

Fig. 11 Camber Adjustment Cam Bolt

1 - STEERING KNUCKLE
2 - CLEVIS BRACKET CAM STOP AREAS
3 - LOWER ECCENTRIC CAMBER ADJUSTMENT BOLT

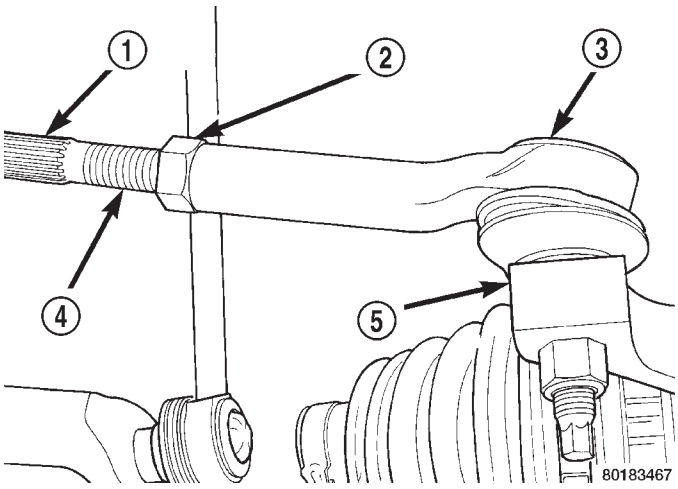

Fig. 12 Front Wheel Toe Adjustment

1 - INNER TIE ROD SERRATION
2 - OUTER TIE ROD JAM NUT
3 - OUTER TIE ROD END
4 - INNER TIE ROD
5 - STEERING KNUCKLE

CAUTION: Do not twist front inner tie rod to steering gear rubber boots during front wheel Toe adjustment.

(2) Loosen front inner to outer tie rod end jam nuts (Fig. 12). Grasp inner tie rods at serrations and rotate inner tie rods of steering gear (Fig. 12) to set front toe to the preferred toe specification. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS)

(3) Tighten tie rod jam nuts (Fig. 12) to 75 N·m (55 ft. lbs.) torque.

(4) Adjust steering gear to tie rod boots at the inner tie rod.

(5) Remove steering wheel clamp.

(6) Remove the alignment equipment.

(7) Road test the vehicle to verify the steering wheel is straight and the vehicle does not wander or pull.

STANDARD PROCEDURE - CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

(1) Measure from the inboard edge of the wheel opening fender lip directly above the wheel center (spindle), to the floor or alignment rack surface.

(2) When measuring, the maximum left-to-right differential is not to exceed 12.5 mm (0.5 in.).

(3) Compare the measurements to the specifications listed in the following Curb Height Specifications charts.

WHEEL ALIGNMENT (Continued)

CURB HEIGHT SPECIFICATIONS - LONG WHEEL BASE VEHICLES

HALF SHAFT - FRONT

DESCRIPTION

All vehicles use an unequal length half shaft system (Fig. 1).

The left half shaft uses a tuned rubber damper weight. When replacing the left half shaft, be sure the replacement half shaft has the same damper weight as the original.

All half shaft assemblies use the same type of inner and outer joints. The inner joint of both half shaft assemblies is a tripod joint, and the outer joint of both half shaft assemblies is a Rzeppa joint. Both tripod joints and Rzeppa joints are true constant velocity (CV) joint assemblies. The inner tripod joint allows for the changes in half shaft length through the jounce and rebound travel of the front suspension.

On vehicles equipped with ABS brakes, the outer CV joint is equipped with a tone wheel used to determine vehicle speed for ABS brake operation.

The inner tripod joint of both half shafts is splined into the transaxle side gears. The inner tripod joints are retained in the side gears of the transaxle using a snap ring located in the stub shaft of the tripod joint. The outer CV joint has a stub shaft that is splined into the wheel hub and retained by a steel hub nut.

DIAGNOSIS AND TESTING - HALF SHAFT

VEHICLE INSPECTION

(1) Check for grease in the vicinity of the inboard tripod joint and outboard CV joint; this is a sign of inner or outer joint seal boot or seal boot clamp damage.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

- Damaged outer CV or inner tripod joint seal boot or seal boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
- Noise may also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

- A torn seal boot on the inner or outer joint of the half shaft assembly.

14 - INTERCONNECTING SHAFT LEFT HALFSHAFT

- A loose or missing clamp on the inner or outer joint of the half shaft assembly.
- A damaged or worn half shaft CV joint.

SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

- A worn or damaged half shaft inner tripod joint.
- A sticking tripod joint spider assembly (inner tripod joint only).
- Improper wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

- Foreign material (mud, etc.) packed on the backside of the wheel(s).
- Out of balance tires or wheels. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)
- Improper tire and/or wheel runout. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

REMOVAL

(1) Raise vehicle.

(2) Remove the cotter pin and nut lock (Fig. 2) from the end of the half shaft.

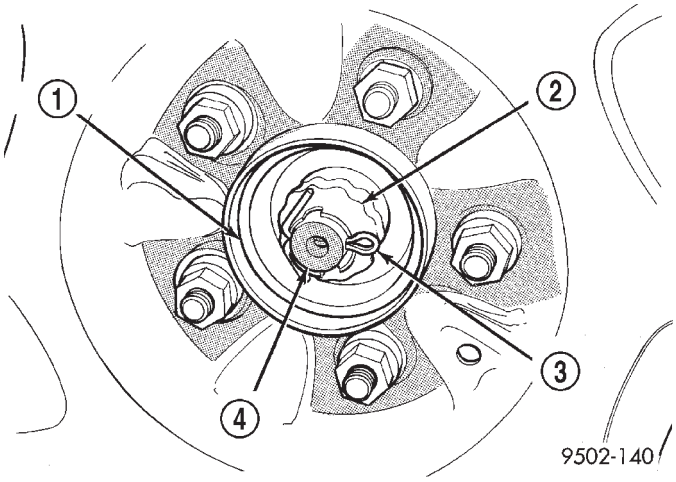

Fig. 2 Half Shaft Retaining Nut

1 - HUB/BEARING

(3) Remove the wheel and tire assembly from the vehicle. (Refer to 22 - TIRES/WHEELS - REMOVAL)

(4) Remove the wave washer (Fig. 3) from the end of the half shaft.

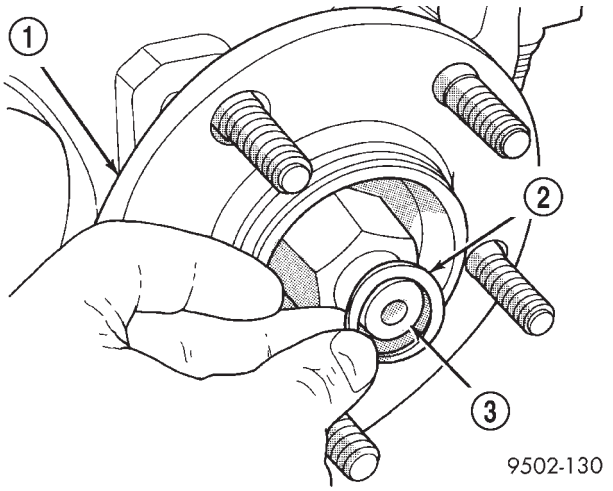

Fig. 3 Wave Washer

1 - HUB/BEARING ASSEMBLY
2 - WAVE WASHER
3 - STUB AXLE

(5) With the vehicle's brakes applied to keep hub from turning, **loosen and remove** the half shaft nut.

(6) Remove the two front disc brake caliper adapter to steering knuckle attaching bolts (Fig. 4).

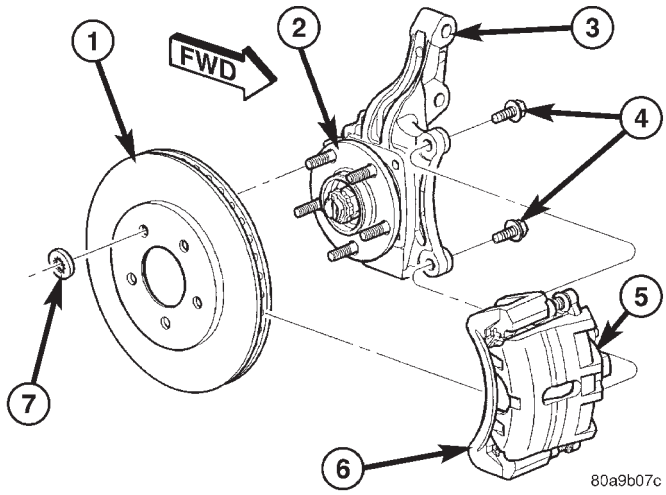

Fig. 4 Front Brake Mounting

1 - BRAKE ROTOR
2 - HUB AND BEARING
3 - STEERING KNUCKLE
4 - ADAPTER MOUNTING BOLTS
5 - BRAKE CALIPER
6 - ADAPTER
7 - CLIP

(7) Remove the disc brake caliper assembly from the steering knuckle. Caliper assembly is removed by first rotating top of caliper assembly away from steering knuckle and then removing bottom of assembly out from under machined abutment on steering knuckle.

(8) Support disc brake caliper assembly by using a wire hook and suspending it from the strut assembly (Fig. 5). **Do not allow the brake caliper assembly to hang by the brake flex hose.**

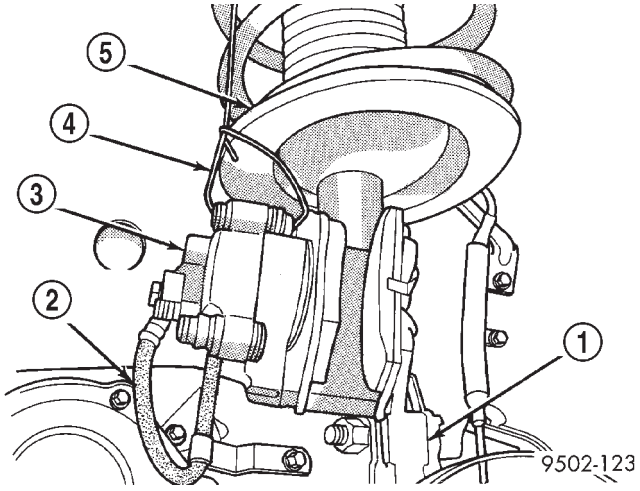

Fig. 5 Properly Supported Disc Brake Caliper - Typical

1 - STEERING KNUCKLE
2 - BRAKE FLEX HOSE
3 - CALIPER ASSEMBLY
4 - WIRE HANGER
5 - STRUT ASSEMBLY

(9) Remove the brake rotor from the hub and bearing assembly.

(10) Remove the steering knuckle-to-strut attachment bolts (Fig. 6) from the steering knuckle.

(11) Pull the steering knuckle from the strut clevis bracket.

NOTE: Care must be taken not to separate the inner C/V joint during this operation. Do not allow half shaft to hang by inner C/V joint after removing outer C/V Joint from the hub/bearing assembly in steering knuckle, end of half shaft must be supported.

(12) Pull steering knuckle assembly down and away from the outer C/V joint of the half shaft assembly while pulling the joint out of the hub bearing.

HALF SHAFT - FRONT (Continued)

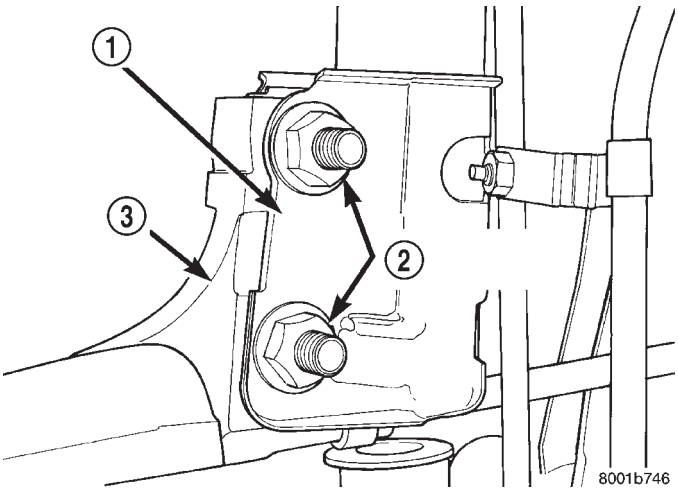

Fig. 6 Strut To Steering Knuckle Attaching Bolts

1 - STRUT CLEVIS BRACKET
2 - NUTS AND BOLTS
3 - STEERING KNUCKLE

(13) Support the outer end of the half shaft assembly. Insert a pry bar between inner tripod joint and transaxle case (Fig. 7). Pry against inner tripod joint, until tripod joint retaining snap-ring is disengaged from transaxle side gear.

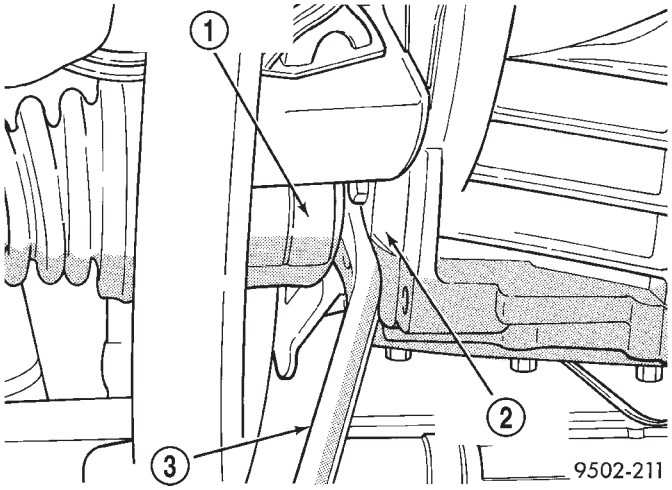

Fig. 7 Disengaging Inner Tripod Joint From Transaxle

1 - INNER TRIPOD JOINT
2 - TRANSAXLE CASE
3 - PRY BAR

(14) Hold inner tripod joint and interconnecting shaft of half shaft assembly. Remove inner tripod joint from transaxle, by pulling it straight out of transaxle side gear and transaxle oil seal (Fig. 8). **When removing tripod joint, do not let spline or snap-ring drag across sealing lip of the transaxle to tripod joint oil seal.**

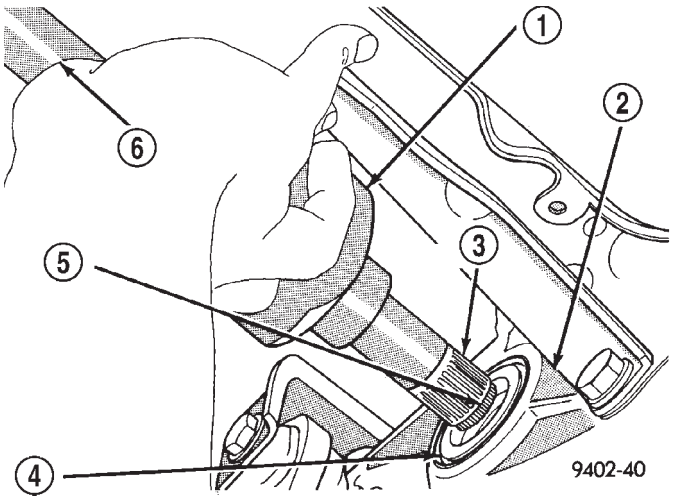

Fig. 8 Tripod Joint Removal from Transaxle

1 - INNER TRIPOD JOINT
2 - TRANSAXLE
3 - SPLINE
4 - OIL SEAL
5 - SNAP-RING
6 - INTERCONNECTING SHAFT

INSTALLATION

(1) Thoroughly clean spline and oil seal sealing surface, on tripod joint. Lightly lubricate oil seal sealing surface on tripod joint with fresh clean transmission lubricant.

(2) Holding half shaft assembly by tripod joint and interconnecting shaft, install tripod joint into transaxle side gear as far as possible by hand (Fig. 8).

(3) Grasp inner tripod joint an interconnecting shaft. Forcefully push the tripod joint into side gear of transaxle, until snap-ring is engaged with transaxle side gear. **Test that snap-ring is fully engaged with side gear by attempting to remove tripod joint from transaxle by hand. If snap-ring is fully engaged with side gear, tripod joint will not be removable by hand.**

(4) Clean all debris and moisture out of steering knuckle, in the area were outer CV joint will be installed into steering knuckle.

(5) Ensure that front of outer CV joint which fits against the face of the hub and bearing is free of debris and moisture before installing outer CV joint into hub and bearing assembly (Fig. 9).

(6) Slide half shaft back into front hub and bearing assembly.

CAUTION: The steering knuckle to strut assembly attaching bolts are serrated and must not be turned during installation. Install nuts while holding bolts stationary in the steering knuckle.

HALF SHAFT - FRONT (Continued)

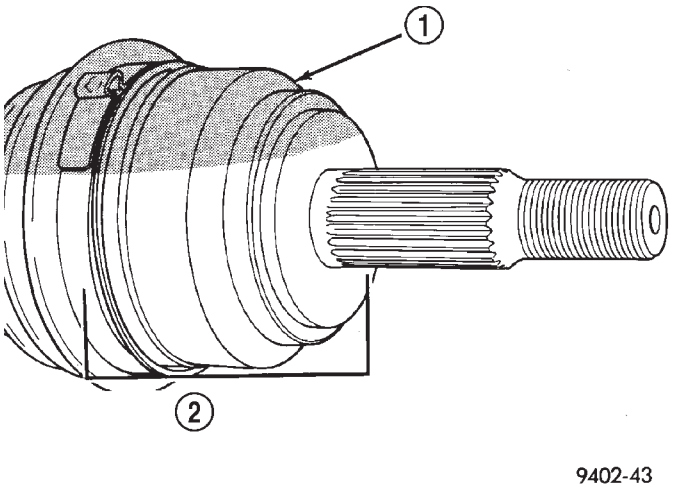

Fig. 9 Outer CV Joint Inspection

1 - OUTER C/V JOINT
2 - THIS AREA OF OUTER C/V JOINT MUST BE FREE OF ALL DEBRIS AND MOISTURE, BEFORE INSTALLATION INTO STEERING KNUCKLE.

CAUTION: If the vehicle being serviced is equipped with eccentric strut assembly attaching bolts, the eccentric bolt must be installed in the bottom (slotted) hole on the strut clevis bracket (Fig. 10).

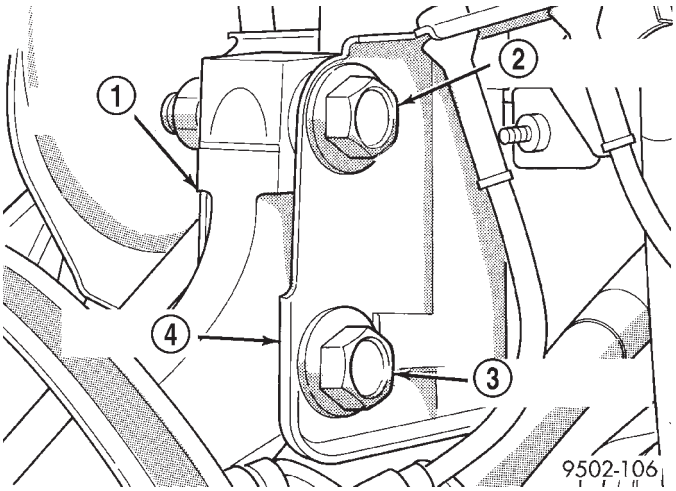

Fig. 10 Correctly Installed Eccentric Attaching Bolt

1 - STEERING KNUCKLE
2 - FLANGED BOLT IN TOP HOLE
3 - CAM BOLT IN BOTTOM HOLE
4 - STRUT CLEVIS BRACKET

(7) Install steering knuckle in clevis bracket of strut damper assembly. Install the strut damper to steering knuckle attaching bolts. Tighten both bolts to a torque of 81 N·m (60 ft. lbs.) plus an additional 1/4 turn.

(8) Install braking disc on hub and bearing assembly.

(9) Install disc brake caliper assembly on steering knuckle. Caliper is installed by first sliding bottom of caliper assembly under abutment on steering knuckle, and then rotating top of caliper against top abutment.

(10) Install disc brake caliper adapter to steering knuckle attaching bolts (Fig. 4). Tighten the disc brake caliper adapter attaching bolts to a torque of 169 N·m (125 ft. lbs.).

(11) Clean all foreign matter from the threads of the outer CV joint. Install the washer and half shaft to hub/bearing assembly nut on half shaft and securely tighten nut.

(12) Install front wheel and tire assembly. Install and tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half the required specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(13) Lower vehicle.

(14) With the vehicle's brakes applied to keep hub from turning, tighten the hub nut to a torque of 244 N·m (180 ft. lbs.) (Fig. 11).

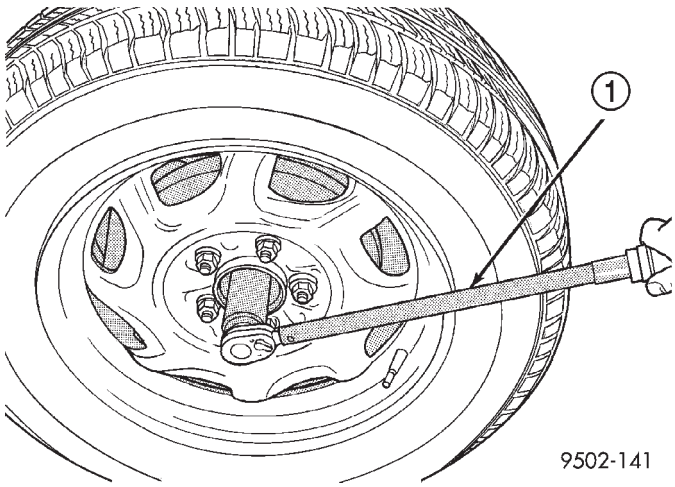

Fig. 11 Torquing Front Half Shaft To Hub Nut

1 - TORQUE WRENCH

(15) Install the spring wave washer on the end of the half shaft.

(16) Install the hub nut lock, and a **new** cotter pin (Fig. 2). Wrap cotter pin prongs tightly around the hub nut lock as shown in (Fig. 2).

(17) Check for correct fluid level in transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

HALF SHAFT - FRONT (Continued)

SPECIFICATIONS - HALF SHAFT - FRONT

CV BOOT - INNER

REMOVAL

(1) Remove the half shaft requiring boot replacement from the vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

(2) Remove large boot clamp which retains inner tripod joint sealing boot to tripod joint housing and discard.

(3) Remove small clamp which retains inner tripod joint sealing boot to interconnecting shaft and discard.

(4) Remove the sealing boot from the tripod housing and slide it down the interconnecting shaft.

CAUTION: When removing the tripod joint housing from the spider assembly, hold the bearings in place on the spider trunions to prevent the bearings from falling away.

(5) Slide the tripod joint housing off the spider assembly and the interconnecting shaft (Fig. 12).

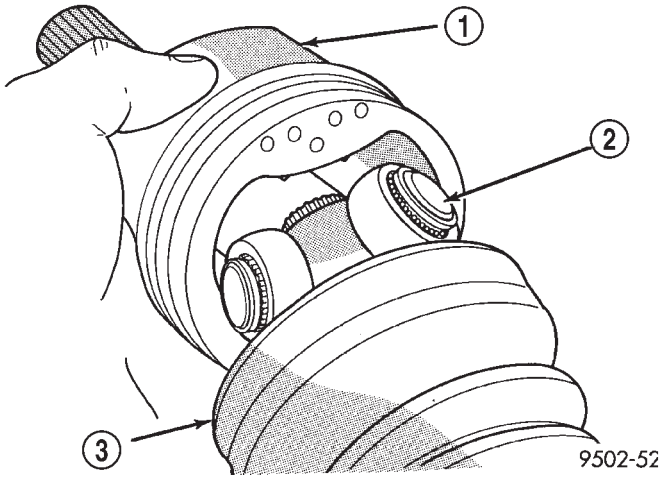

Fig. 12 Spider Assembly Removal from Tripod Joint Housing

1 - TRIPOD JOINT HOUSING
2 - SPIDER ASSEMBLY
3 - SEALING BOOT

(6) Remove snap-ring which retains spider assembly to interconnecting shaft (Fig. 13). **Do not hit the outer tripod bearings in an attempt to remove spider assembly from interconnecting shaft.**

(7) Remove the spider assembly from interconnecting shaft. If spider assembly will not come off interconnecting shaft by hand, it can be removed by tapping spider assembly with a brass drift (Fig. 14).

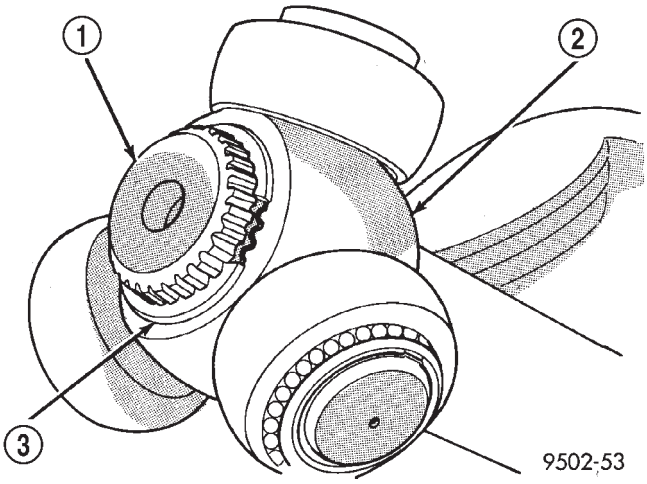

Fig. 13 Spider Assembly Retaining Snap-Ring

1 - INTERCONNECTING SHAFT
2 - SPIDER ASSEMBLY
3 - RETAINING SNAP-RING

(8) Slide sealing boot off interconnecting shaft.

(9) Thoroughly clean and inspect spider assembly, tripod joint housing, and interconnecting shaft for any signs of excessive wear. **If any parts show signs of excessive wear, the half shaft assembly will require replacement. Component parts of these half shaft assemblies are not serviceable.**

INSTALLATION

(1) Slide inner CV joint seal boot retaining clamp, onto the interconnecting shaft. Then, slide the replacement inner CV joint sealing boot onto the interconnecting shaft. **Inner CV joint seal boot**

CV BOOT - INNER (Continued)

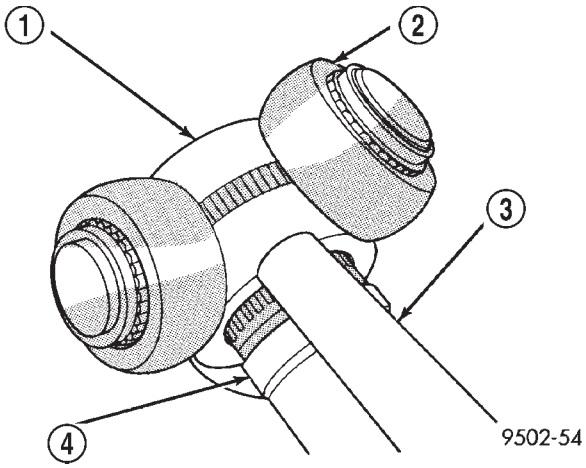

Fig. 14 Spider Assembly Removal from Interconnecting Shaft

1 - SPIDER ASSEMBLY
2 - DO NOT HIT SPIDER ASSEMBLY BEARINGS WHEN REMOVING SPIDER ASSEMBLY
3 - BRASS DRIFT
4 - INTERCONNECTING SHAFT

MUST be positioned on interconnecting shaft so the raised bead on the inside of the small diameter end of the seal boot is in mating groove on interconnecting shaft (Fig. 15).

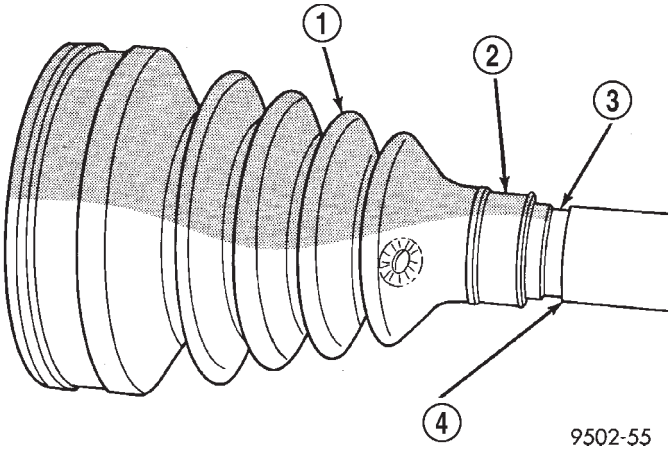

Fig. 15 Sealing Boot Installation on Interconnecting Shaft

1 - SEALING BOOT
2 - RAISED BEAD IN THIS AREA OF SEALING BOOT
3 - GROOVE
4 - INTERCONNECTING SHAFT

(2) Install spider assembly onto interconnecting shaft (Fig. 16). Spider assembly must be installed on interconnecting shaft far enough to fully install spider retaining snap-ring. If the spider assembly will not fully install on interconnecting shaft by hand, it can be installed by tapping the spider body with a brass drift (Fig. 17). **Do not hit the outer tripod bearings in an attempt to install spider assembly on interconnecting shaft.**

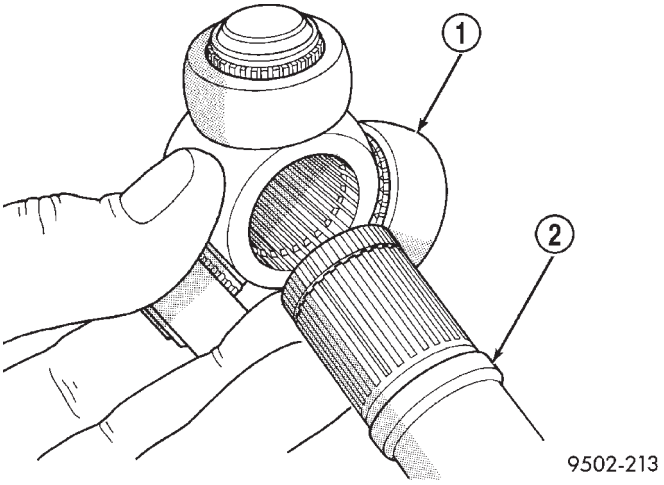

Fig. 16 Spider Assembly Installation on Interconnecting Shaft

1 - SPIDER ASSEMBLY
2 - INTERCONNECTING SHAFT

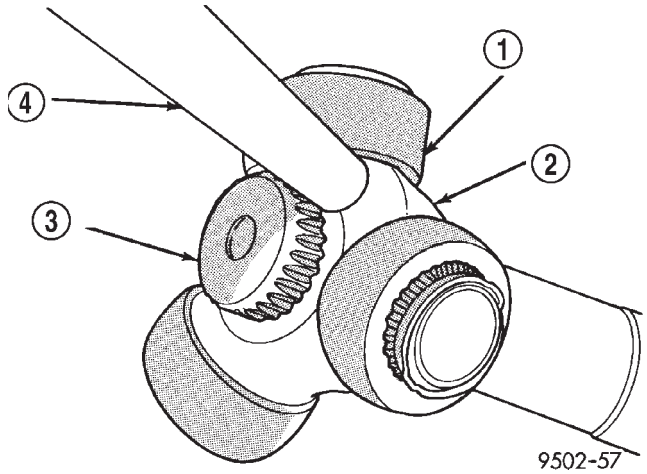

Fig. 17 Installing Spider Assembly on Interconnecting Shaft

1 - DO NOT HIT BEARINGS WHEN INSTALLING THE SPIDER ASSEMBLY
2 - SPIDER ASSEMBLY
3 - INTERCONNECTING SHAFT
4 - BRASS DRIFT

CV BOOT - INNER (Continued)

(3) Install the spider assembly to interconnecting shaft retaining snap-ring into groove on end of interconnecting shaft (Fig. 18). Be sure the snap-ring is fully seated into groove on interconnecting shaft.

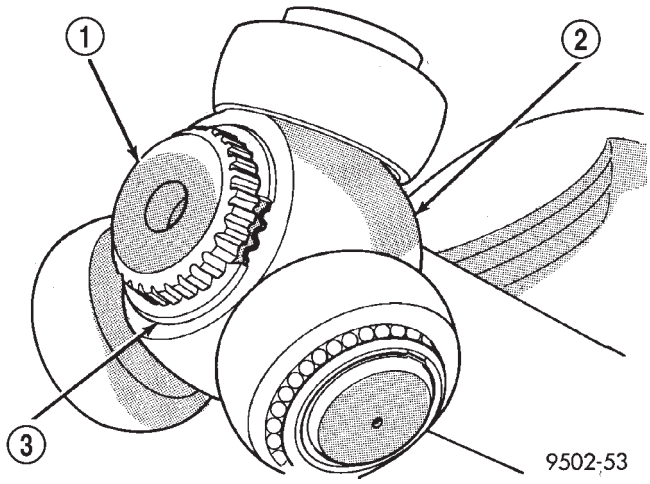

Fig. 18 Spider Assembly Retaining Snap-Ring Installed

1 - INTERCONNECTING SHAFT
2 - SPIDER ASSEMBLY
3 - RETAINING SNAP-RING

(4) Distribute 1/2 the amount of grease provided in the seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into tripod housing. Put the remaining amount into the sealing boot.

(5) Align tripod housing with spider assembly and then slide tripod housing over spider assembly and interconnecting shaft (Fig. 19).

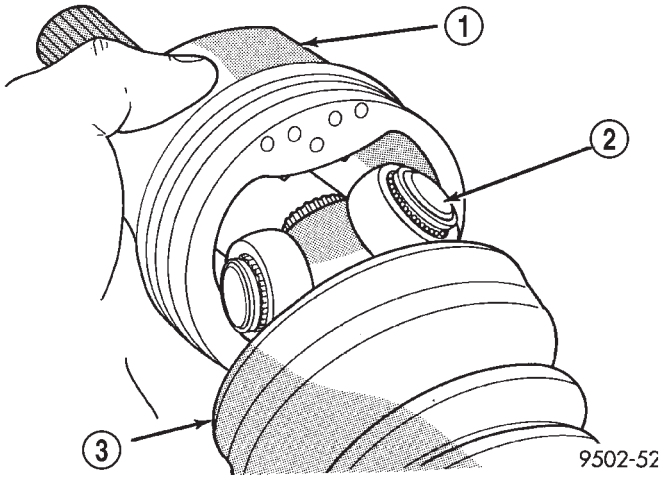

Fig. 19 Installing Tripod Housing on Spider Assembly

1 - TRIPOD JOINT HOUSING
2 - SPIDER ASSEMBLY
3 - SEALING BOOT

(6) Install inner CV joint seal boot to interconnecting shaft clamp evenly on sealing boot.

(7) Place crimping tool C-4975-A over bridge of clamp (Fig. 20).

(8) Tighten nut on crimping tool C-4975-A until jaws on tool are closed completely together, face to face (Fig. 21).

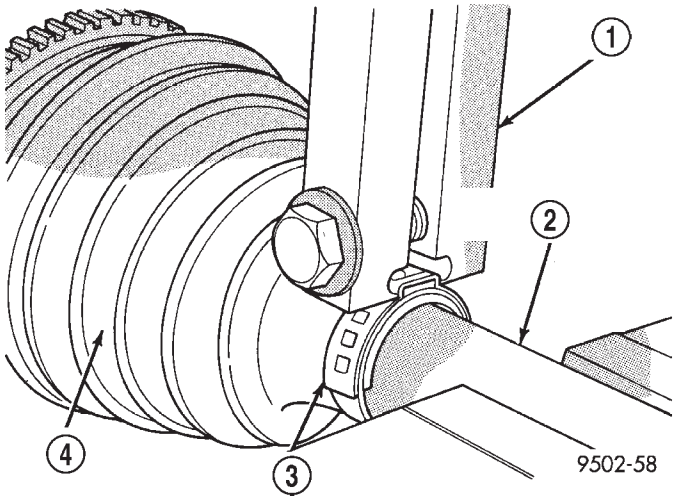

Fig. 20 Crimping Tool Installed on Sealing Boot Clamp - Typical

1 - SPECIAL TOOL C-4975-A
2 - INTERCONNECTING SHAFT
3 - CLAMP
4 - SEALING BOOT

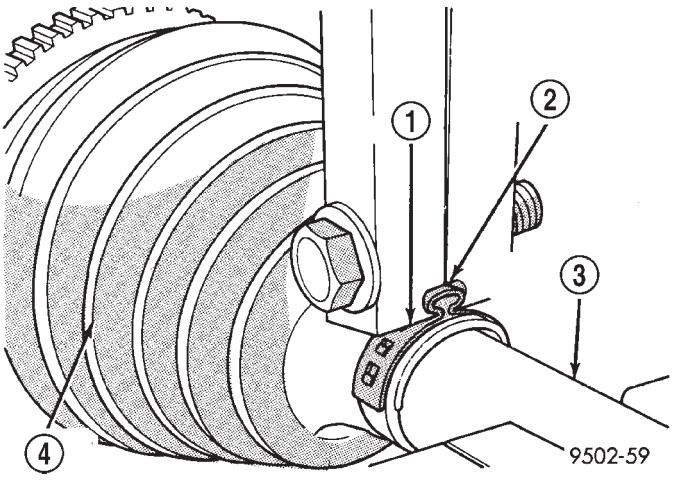

Fig. 21 Sealing Boot Retaining Clamp Installed - Typical

1 - CLAMP
2 - JAWS OF SPECIAL TOOL C-4975-A MUST BE CLOSED COMPLETELY TOGETHER HERE
3 - INTERCONNECTING SHAFT
4 - SEALING BOOT

CV BOOT - INNER (Continued)

CAUTION: Seal boot must not be dimpled, stretched or out of shape in any way. If seal boot is NOT shaped correctly, equalize pressure in seal and shape it by hand.

(9) Position sealing boot into the tripod housing retaining groove. Install seal boot retaining clamp evenly on sealing boot.

(10) Position trilobal boot to interface with the tripod housing. The lobes of the boot must be properly aligned with the recess's of the tripod housing.

CAUTION: The following positioning procedure determines the correct air pressure inside the inner CV joint assembly prior to clamping the sealing boot to inner CV joint housing. If this procedure is not done prior to clamping sealing boot to CV joint housing sealing boot durability can be adversely affected.

CAUTION: When venting the inner CV joint assembly, use care so that the inner CV sealing boot does not get punctured, or in any other way damaged. If sealing boot is punctured, or damaged in any way while being vented, the sealing boot can not be used.

(11) Insert a trim stick between the CV joint housing and the sealing boot insert to vent inner CV joint assembly (Fig. 22). **When inserting trim stick between tripod housing and sealing boot ensure trim stick is held flat and firmly against the tripod housing. If this is not done damage to the sealing boot can occur.**

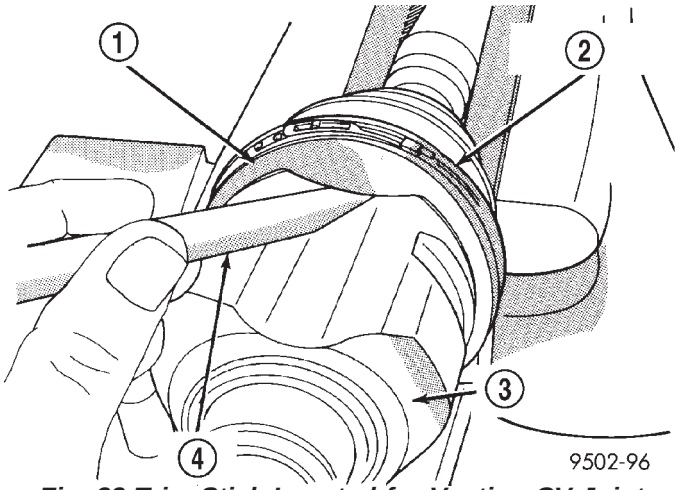

Fig. 22 Trim Stick Inserted for Venting CV Joint

1 - INNER CV JOINT SEALING BOOT
2 - SEALING BOOT CLAMP
3 - INNER CV JOINT HOUSING
4 - TRIM STICK

(12) With trim stick inserted between sealing boot insert and the CV joint housing, position the interconnecting shaft so it is at the center of its travel in the tripod joint housing. Remove the trim stick from between the sealing boot insert and the CV joint housing. **This procedure will equalize the air pressure in the CV joint, preventing premature sealing boot failure.**

(13) Clamp CV joint sealing boot to CV joint, using required procedure for type of boot clamp application.

CRIMP TYPE BOOT CLAMP

If seal boot uses crimp type boot clamp, use the following procedure to install the retaining clamp.

(1) Place crimping tool C-4975-A over bridge of clamp (Fig. 23).

(2) Tighten nut on crimping tool C-4975-A until jaws on tool are closed completely together, face to face (Fig. 24).

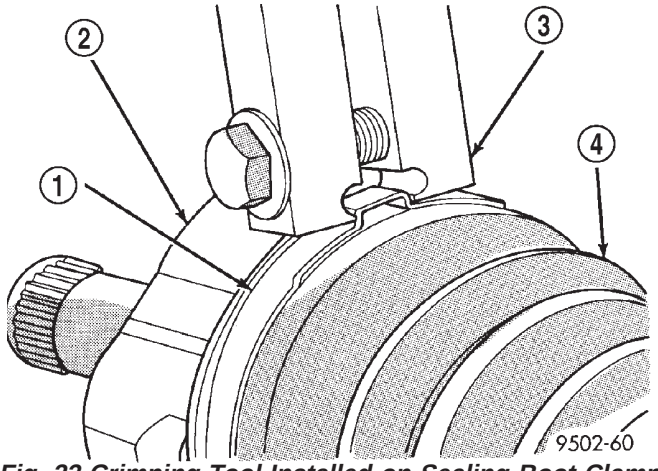

Fig. 23 Crimping Tool Installed on Sealing Boot Clamp

1 - CLAMP
2 - TRIPOD JOINT HOUSING
3 - SPECIAL TOOL C-4975-A
4 - SEALING BOOT

5 - SEALING BOOT

CV BOOT - INNER (Continued)

LATCHING TYPE BOOT CLAMP

If seal boot uses low profile latching type boot clamp, use the following procedure to install the retaining clamp.

(1) Place prongs of clamp locking tool in the holes of the clamp (Fig. 25).

(2) Squeeze tool together until top band of clamp is latched behind the two tabs on lower band of clamp (Fig. 26).

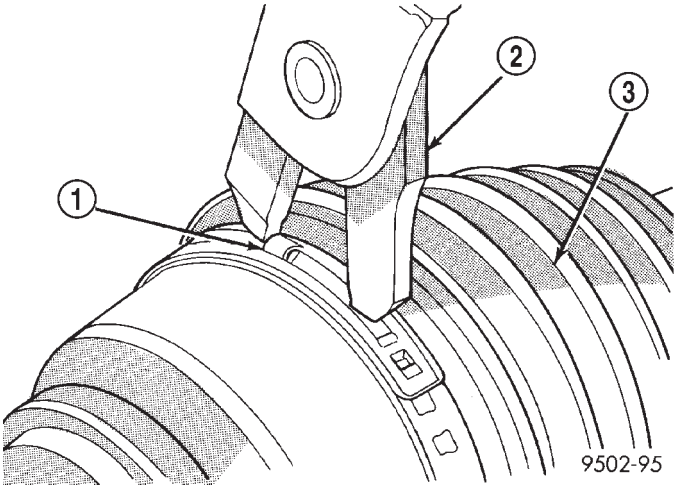

Fig. 25 Clamping Tool Installed on Sealing Boot Clamp

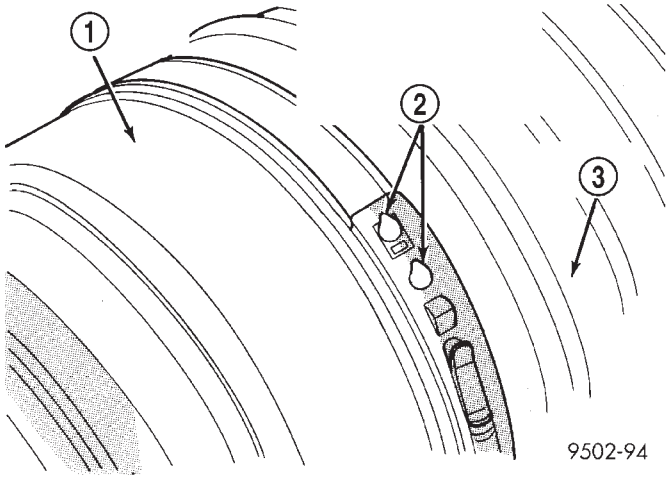

Fig. 26 Sealing Boot Clamp Correctly Installed

1 - INNER TRIPOD JOINT HOUSING
2 - TOP BAND OF CLAMP MUST BE RETAINED BY TABS AS SHOWN HERE TO CORRECTLY LATCH BOOT CLAMP
3 - SEALING BOOT

(14) Install the half shaft back into the vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

CV BOOT - OUTER

REMOVAL

(1) Remove half shaft assembly requiring boot replacement from vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

(2) Remove large boot clamp retaining CV joint sealing boot to CV joint housing (Fig. 27) and discard.

(3) Remove small clamp that retains outer CV joint sealing boot to interconnecting shaft and discard.

(4) Remove sealing boot from outer CV joint housing and slide it down interconnecting shaft.

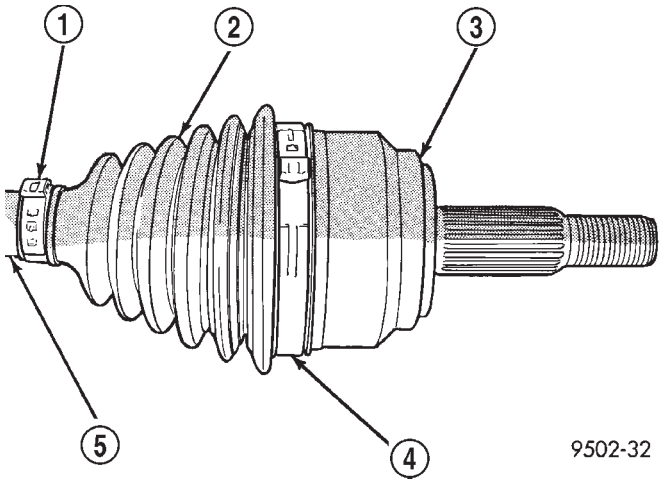

Fig. 27 Outer CV Joint Seal Boot Clamps

1 - SMALL CLAMP
2 - SEALING BOOT
3 - OUTER C/V JOINT HOUSING
4 - LARGE CLAMP
5 - INTERCONNECTING SHAFT

(5) Wipe away grease to expose outer CV joint to interconnecting shaft retaining ring.

(6) Spread ears apart on CV joint assembly to interconnecting shaft retaining ring (Fig. 28).

(7) Slide outer CV joint assembly off end of interconnecting shaft.

(8) Slide sealing boot off interconnecting shaft.

(9) Thoroughly clean and inspect outer CV joint assembly and interconnecting joint for any signs of excessive wear. **If any parts show signs of excessive wear, the half shaft assembly will require replacement. Component parts of these half shaft assemblies are not serviceable.**

INSTALLATION

(1) Slide the new small diameter seal boot retaining clamp onto the interconnecting shaft. Then slide

CV BOOT - OUTER (Continued)

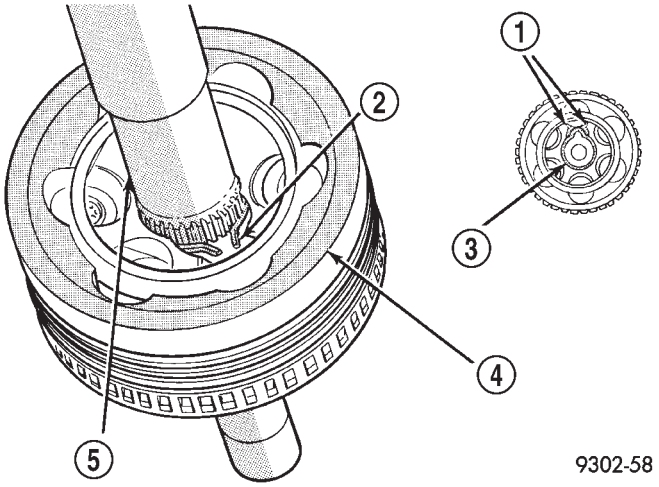

Fig. 28 Outer CV Joint Removal From Interconnecting Shaft

3 - RETAINING RING
4 - OUTER C/V JOINT ASSEMBLY
5 - INTERCONNECTING SHAFT

the replacement outer CV joint assembly sealing boot onto the interconnecting shaft.

(2) Install the outer CV joint assembly onto the interconnecting shaft. Joint is installed on interconnecting shaft, by pushing interconnecting shaft into outer CV joint, until retaining ring is seated in groove on interconnecting shaft (Fig. 29). Verify that the retaining ring is fully seated into groove on interconnecting shaft.

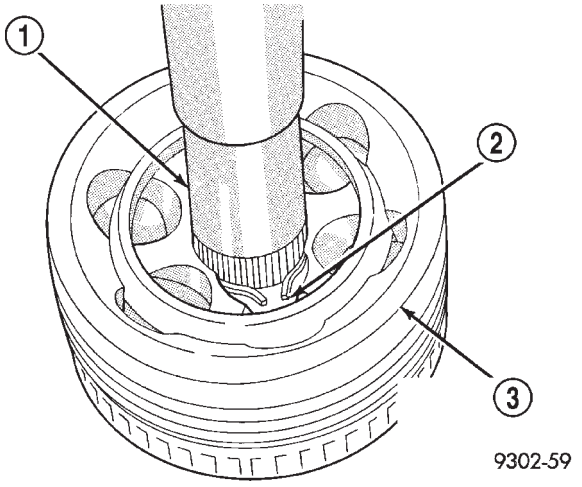

Fig. 29 Outer CV Joint Installed On Interconnecting Shaft

1 - INTERCONNECTING SHAFT
2 - RETAINING SNAP RING
3 - OUTER C/V JOINT ASSEMBLY

(3) Distribute 1/2 the amount of grease provided in seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into outer CV joint assembly housing. Put the remaining amount into the sealing boot.

(4) Install outer CV joint seal boot retaining clamp, onto interconnecting shaft. Install replacement outer CV joint sealing boot onto interconnecting shaft. **Outer CV joint seal boot MUST be positioned on interconnecting shaft, so that only the thinnest (sight) groove on interconnecting shaft is visible (Fig. 30).**

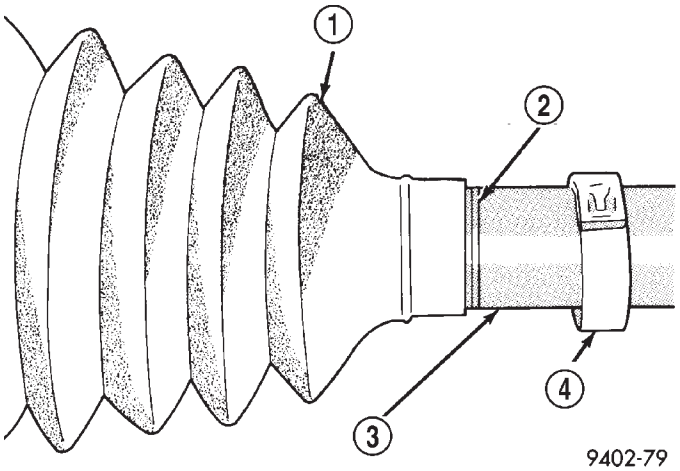

Fig. 30 Seal Boot Correctly Positioned On Interconnecting Shaft

OUTER CV JOINT BEARING SHIELD

REMOVAL

(1) Clamp half shaft in a vise by the interconnecting shaft.

(2) Using a drift (Fig. 35) tap around the entire edge of the bearing shield until it is removed from the outer CV joint.

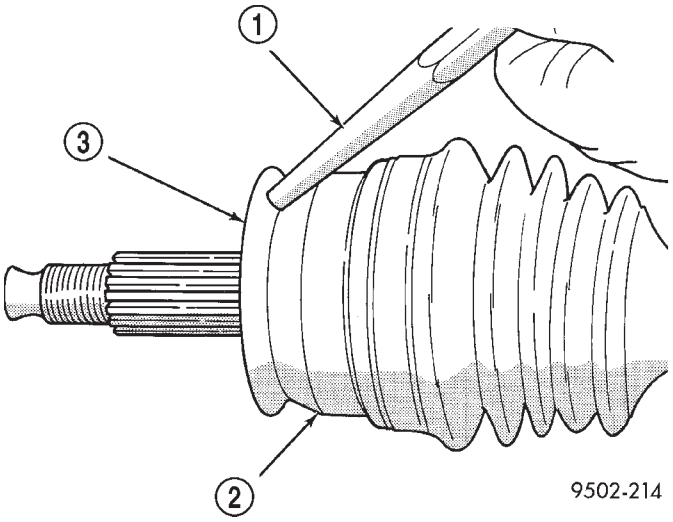

Fig. 35 Removing Bearing Shield from Outer CV Joint

1 - DRIFT
2 - OUTER C/V JOINT
3 - BEARING SHIELD

INSTALLATION

(1) Install bearing shield by hand on outer CV Joint so that it is installed squarely on the CV joint.

(2) Position installer, Special Tool C-4698-2, and handle, Special Tool C-4698-1, on face of bearing shield (Fig. 36).

CAUTION: If bearing shield is not installed flush against the face of the outer CV joint, interference with steering knuckle will occur when driveshaft is installed.

(3) Using a hammer, drive the bearing shield on the outer CV joint until it is flush against the front of the outer CV joint (Fig. 37).

INSTALLATION 18

HALF SHAFT - REAR

DESCRIPTION

The inner and outer joints of both half shaft assemblies are tripod joints. The tripod joints are true constant velocity (CV) joint assemblies, which allow for the changes in half shaft length through the jounce and rebound travel of the rear suspension.

On vehicles equipped with ABS brakes, the outer CV joint is equipped with a tone wheel used to determine vehicle speed for ABS brake operation.

The inner tripod joint of both half shafts is bolted rear differential assembly's output flanges. The outer CV joint has a stub shaft that is splined into the wheel hub and retained by a steel hub nut.

DIAGNOSIS AND TESTING - HALF SHAFT

VEHICLE INSPECTION

(1) Check for grease in the vicinity of the inboard tripod joint and outboard CV joint; this is a sign of inner or outer joint seal boot or seal boot clamp damage.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

- Damaged outer CV or inner tripod joint seal boot or seal boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
- Noise may also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

- A torn seal boot on the inner or outer joint of the half shaft assembly.
- A loose or missing clamp on the inner or outer joint of the half shaft assembly.
- A damaged or worn half shaft CV joint.

SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

- A worn or damaged half shaft inner tripod joint.
- A sticking tripod joint spider assembly (inner tripod joint only).
- Improper wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

- Foreign material (mud, etc.) packed on the backside of the wheel(s).
- Out of balance tires or wheels. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)
- Improper tire and/or wheel runout. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

HALF SHAFT - REAR (Continued)

REMOVAL

(1) Lift vehicle on hoist so that the wheels hang freely.
(2) Remove rear wheel.
(3) Remove cotter pin, nut lock, and wave washer (Fig. 1).

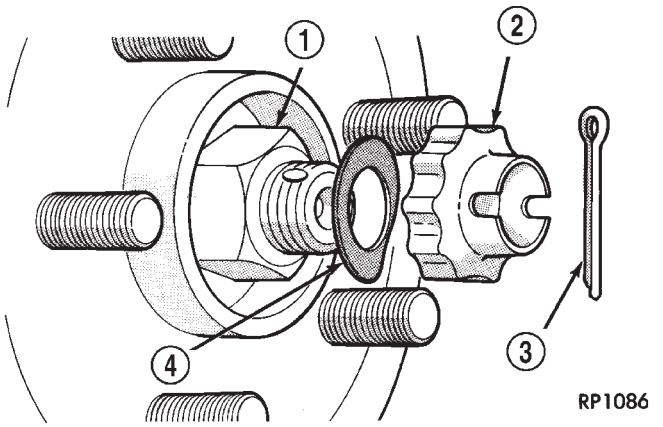

Fig. 1 Cotter Pin, Nut Lock, And Wave Washer

1 - HUB NUT
2 - NUT LOCK
3 - COTTER PIN
4 - SPRING WASHER

(4) Remove hub nut and washer.

CAUTION: The half shaft outer CV joint, when installed, acts as a bolt and secures the hub/bearing assembly. If the vehicle is to be supported or moved on its wheels, install and torque a bolt through the hub. This will ensure that the hub/bearing assembly cannot loosen.

(5) Remove inner half shaft retaining bolts (Fig. 2).

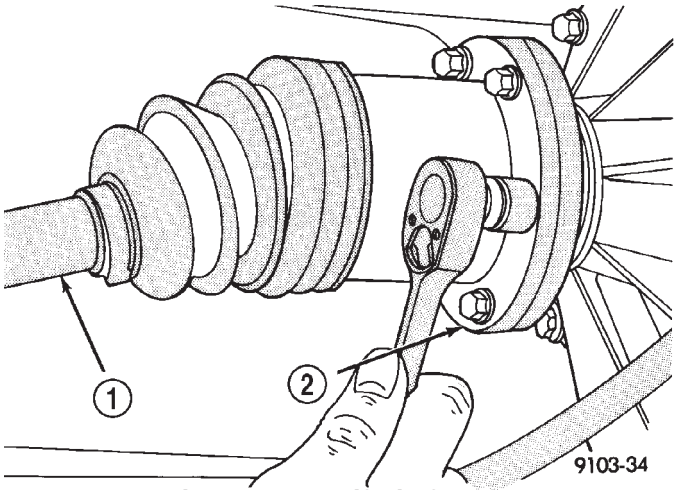

Fig. 2 Inner Half Shaft Bolts

1 - SHAFT
2 - FLANGE

(6) The half shaft is spring loaded. Compress inner half shaft joint slightly and pull downward to clear rear differential output flange. Then pull half shaft assembly outward to remove (Fig. 3).

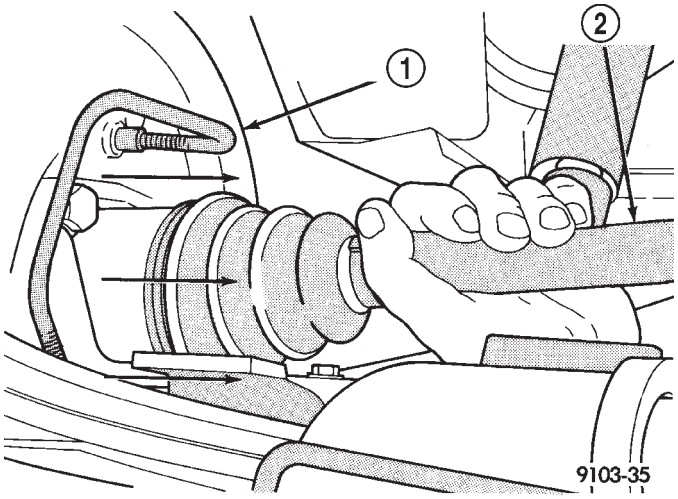

Fig. 3 Half Shaft Removal

1 - BRAKE BACKING PLATE
2 - HALF SHAFT

INSTALLATION

(1) Install the outer CV joint stub shaft through the hub bearing (Fig. 4).
(2) The half shaft is spring loaded. Compress inner half shaft joint slightly and push upward until the inner CV joint flange engages the rear differential output flange.

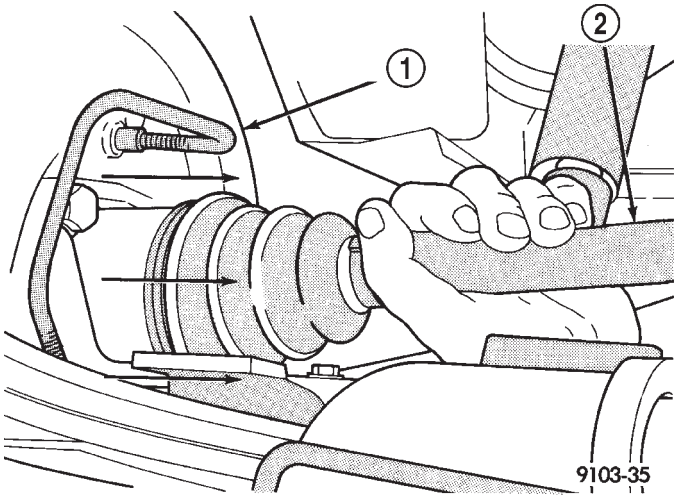

Fig. 4 Half Shaft Installation

1 - BRAKE BACKING PLATE
2 - HALF SHAFT

(3) Install the inner half shaft retaining bolts (Fig. 5). Torque the bolts to 61 N·m (45 ft.lbs.).

3 - TRIPOD ASSEMBLY
4 - SNAP RING PLIERS

(6) Install the new large diameter retaining clamp onto the CV joint housing.

(7) Distribute 1/2 the amount of grease provided in the seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into tripod housing. Put the remaining amount into the sealing boot.

(8) Install the CV housing onto the interconnecting shaft and tripod assembly (Fig. 17).

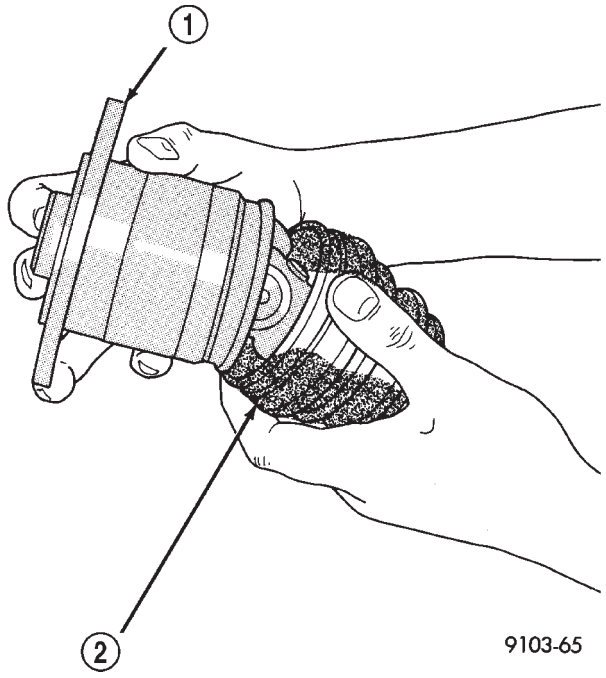

Fig. 17 Install CV Housing

1 - HALF SHAFT JOINT HOUSING
2 - BOOT

(9) Clamp the half shaft into a suitable vise with protective jaws clamped onto the interconnecting shaft.

CV BOOT - INNER/OUTER (Continued)

(10) Position the inner CV joint boot on interconnecting shaft so the raised bead on the inside of the small diameter end of the seal boot is in mating groove on interconnecting shaft (Fig. 18).

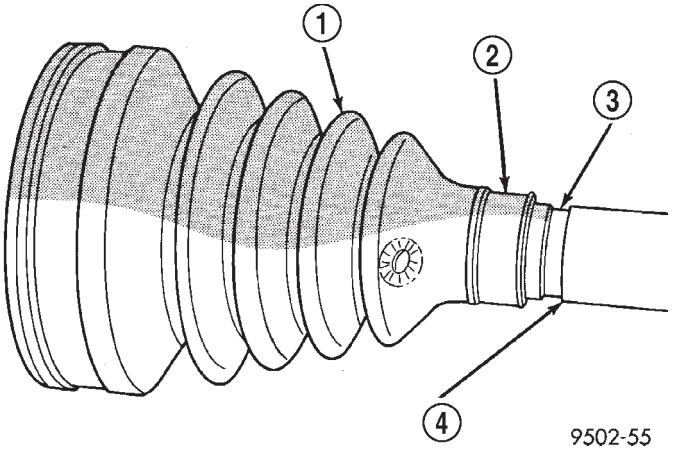

Fig. 18 Sealing Boot Installation on Interconnecting Shaft

1 - SEALING BOOT
2 - RAISED BEAD IN THIS AREA OF SEALING BOOT
3 - GROOVE
4 - INTERCONNECTING SHAFT

(11) Install inner CV joint seal boot to interconnecting shaft clamp evenly on sealing boot.

(12) Place crimping tool C-4975-A over bridge of clamp (Fig. 19).

(13) Tighten nut on crimping tool C-4975-A until jaws on tool are closed completely together, face to face (Fig. 20).

CAUTION: The boot must not be dimpled, stretched or out of shape in any way. If boot is NOT shaped correctly, equalize pressure in boot and shape it by hand.

(14) Position CV boot into the CV housing retaining groove. Install the boot large diameter retaining clamp evenly onto the boot.

(15) Clamp the CV joint boot to the CV joint, using required procedure for type of boot clamp application.

CV BOOT - INNER/OUTER (Continued)

CRIMP TYPE BOOT CLAMP

If seal boot uses crimp type boot clamp, use the following procedure to install the retaining clamp.

(1) Place crimping tool C-4975-A over bridge of clamp (Fig. 21).

(2) Tighten nut on crimping tool C-4975-A until jaws on tool are closed completely together, face to face (Fig. 22).

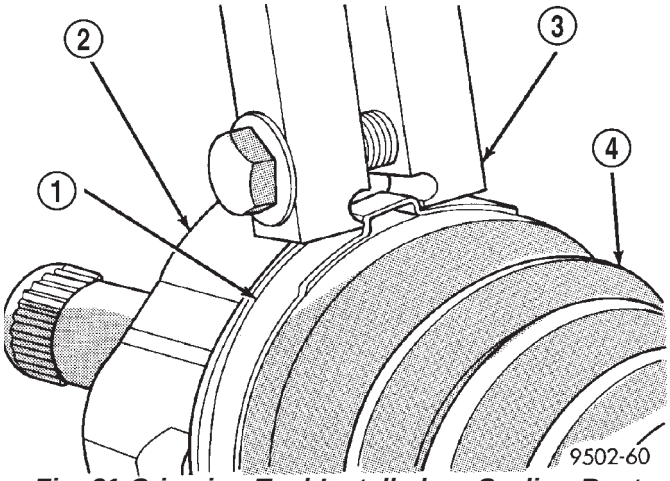

Fig. 21 Crimping Tool Installed on Sealing Boot Clamp - Typical

5 - SEALING BOOT

LATCHING TYPE BOOT CLAMP

If seal boot uses low profile latching type boot clamp, use the following procedure to install the retaining clamp.

(1) Place prongs of clamp locking tool in the holes of the clamp (Fig. 23).

(2) Squeeze tool together until top band of clamp is latched behind the two tabs on lower band of clamp (Fig. 24).

PROPELLER SHAFT

DESCRIPTION

WARNING: Due to propeller shaft imbalance concerns, the propeller shaft can only be serviced as an assembly.

AWD models utilize a “two-piece” propeller shaft (Fig. 1) to transmit power to the rear driveline module assembly. This two-piece design consists of:

- Front and rear shaft segments.
- Plunging center CV joint
- Center support bearing
- Rubber coupler at driveline module flange

The front shaft segment utilizes a CV joint at the power transfer unit connection, and a plunging CV joint at the center bearing location.

The rear shaft segment utilizes a center support bearing at the forward position, and a rubber coupler at the driveline module flange.

OPERATION

The propeller shaft (Fig. 1) is used to transmit torque from the transaxle power transfer unit (PTU)

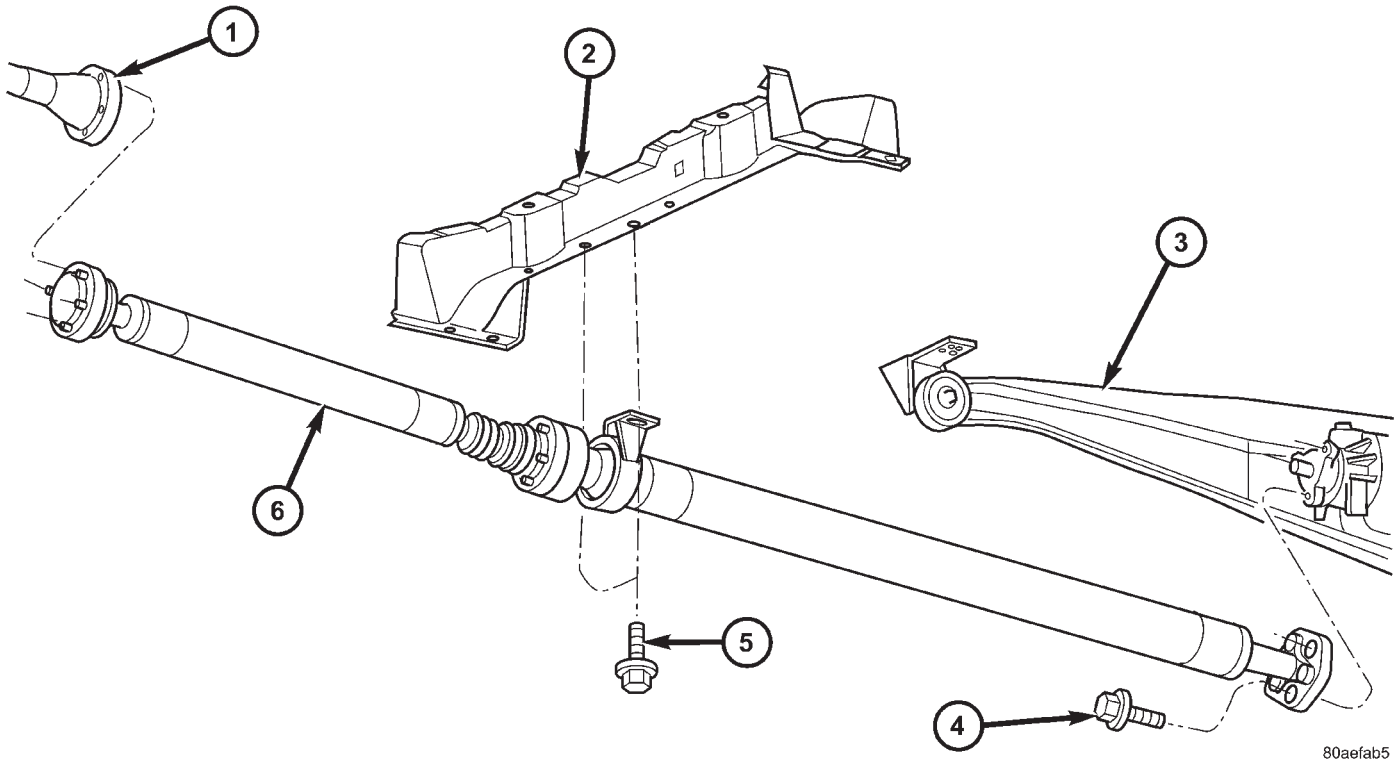

Fig. 1 Propeller Shaft Removal/Installation

1 - PTU FLANGE	3 - REAR DRIVELINE MODULE	5 - BOLT-CENTER SUPPORT BEARING-TO-CROSSMEMBER

PROPELLER SHAFT (Continued)

to the rear driveline module of AWD equipped models.

The propeller shaft front half utilizes a CV joint at the PTU flange, and a plunging CV joint at the center bearing location. These joints are flexible, allowing for torsional movement of the powertrain.

The propeller shaft rear half utilizes a center support bearing, which supports this two-piece assembly. The bearing also stabilizes the rear shaft segment to minimize axle wind-up. The rubber coupler at the driveline module flange dampens out propeller shaft torsional vibrations, as the driveline module it connects to is fastened to the vehicle body.

REMOVAL

CAUTION: Propeller shaft removal is a two-man operation. Never allow propeller shaft to hang while connected to power transfer unit (PTU) or rear driveline module flanges. A helper is required.

(1) Make sure transaxle is in neutral (N). Using chalk, mark propeller shaft flanges at PTU and rear driveline module for installation reference.

(2) Remove six propeller shaft-to-power transfer unit bolts.

(3) Have helper remove three propeller shaft rubber coupler-to-driveline module bolts while he/she supports rear shaft by hand.

(4) Remove center bearing support-to-crossmember bolts, while supporting front shaft with two hands.

(5) Lower propeller shaft assembly to ground, using care not to damage fore and aft flanges (Fig. 1).

INSTALLATION

CAUTION: Propeller shaft installation is a two-man operation. Never allow propeller shaft to hang while connected to power transfer unit (PTU) or rear driveline module flanges. A helper is required.

(1) Make sure transaxle is in Neutral (N) position.

(2) Obtain a helper and lift propeller shaft assembly into position (Fig. 1).

(3) While helper supports front half of shaft level to underbody, align paint marks at driveline module flange and install three propeller shaft rubber coupler-to-rear driveline module bolts by hand. Do not torque at this time.

(4) While helper supports front half of shaft level to underbody, align chalk marks at PTU flange. Install six propeller shaft-to-PTU flange bolts and torque to 30 N·m (22 ft. lbs.). Torque bolts alternately to ensure proper flange mating.

(5) Place center bearing into position. Install and torque center bearing-to-crossmember bolts to 54 N·m (40 ft. lbs.).

(6) Torque propeller shaft rubber coupler-to-rear driveline module assembly to 54 N·m (40 ft. lbs.).

REAR DRIVELINE MODULE

DESCRIPTION

The rear driveline module assembly (Fig. 1) consists of four main components:

- Bi-Directional Overrunning Clutch (BOC)
- Viscous Coupling
- Differential Assembly
- Torque Arm

The viscous coupling and bi-directional overrunning clutch are contained within an overrunning clutch housing, which fastens to the differential assembly. The overrunning clutch housing and differential assembly have unique fluid sumps, each requiring their own type and capacity of fluid. The overrunning clutch housing requires Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602) or equivalent. The differential assembly requires

Driveline module service is limited to the following components:

- Differential Assembly (serviced only as assembly)
- Viscous Coupling
- Bi-Directional Overrunning Clutch (BOC)
- Overrunning Clutch Housing
- Seals (Input Flange, Output Flange, Overrunning Clutch Housing O-rings)
- Input Flange/Shield
- Torque Arm
- Vents
- Fasteners

OPERATION

The primary benefits of All Wheel Drive are:

- Superior straight line acceleration, and cornering on all surfaces
- Better traction and handling under adverse conditions, resulting in improved hill climbing ability and safer driving.

The heart of the system is an inter-axle viscous coupling. The vehicle retains predominantly front-wheel drive characteristics, but the All Wheel Drive capability takes effect when the front wheels start to slip. Under normal level road, straight line driving, 100% of the torque is allocated to the front wheels. The viscous coupling controls and distributes torque/power to the rear wheels. The viscous coupling transmits torque to the rear wheels in proportion of the amount of the slippage at the front wheels. Thais variable torque distribution is automatic with no driver inputs required. The coupling is similar to a multi-plate clutch. It consists of a series of closely spaced discs, which are alternately connected to the front and rear drive units. The unit is totally sealed and partially filled with silicone fluid. There is no

adjustment, maintenance or fluid checks required during the life of the unit.

The overrunning clutch allows the rear wheels to overrun the front wheels during a rapid front wheel lock braking maneuver. The overrunning action prevents any feed-back of front wheel braking torque to the rear wheels. It also allows the braking system to control the braking behavior as a two wheel drive (2WD) vehicle.

The overrunning clutch housing has a separate oil sump and is filled independently from the differential. The fill plug is located on the side of the overrunning clutch case. When filling the overrunning clutch with lubricant use Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602) or equivalent.

The differential assembly contains a conventional open differential with hypoid ring gear and pinion gear set. The hypoid gears are lubricated by SAE 80W-90 gear lubricant.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR DRIVELINE MODULE NOISE

Different sources can be the cause of noise that the rear driveline module assembly is suspected of making. Refer to the following causes for noise diagnosis.

DRIVELINE MODULE ASSEMBLY NOISE

The most important part of driveline module service is properly identifying the cause of failures and noise complaints. The cause of most driveline module failures is relatively easy to identify. The cause of driveline module noise is more difficult to identify.

If vehicle noise becomes intolerable, an effort should be made to isolate the noise. Many noises that are reported as coming from the driveline module may actually originate at other sources. For example:

- Tires
- Road surfaces

REAR DRIVELINE MODULE (Continued)

- Wheel bearings
- Engine
- Transmission
- Exhaust
- Propeller shaft (vibration)
- Vehicle body (drumming)

Driveline module noises are normally divided into two categories: gear noise or bearing noise. A thorough and careful inspection should be completed to determine the actual source of the noise before replacing the driveline module.

The rubber mounting bushings help to dampen-out driveline module noise when properly installed. Inspect to confirm that no metal contact exists between the driveline module case and the body. The complete isolation of noise to one area requires expertise and experience. Identifying certain types of vehicle noise baffles even the most capable technicians. Often such practices as:

- Increase tire inflation pressure to eliminate tire noise.
- Listen for noise at varying speeds with different driveline load conditions
- Swerving the vehicle from left to right to detect wheel bearing noise.

All driveline module assemblies produce noise to a certain extent. Slight carrier noise that is noticeable only at certain speeds or isolated situations should be considered normal. Carrier noise tends to peak at a variety of vehicle speeds. Noise is **NOT ALWAYS** an indication of a problem within the carrier.

TIRE NOISE

Tire noise is often mistaken for driveline module noise. Tires that are unbalanced, worn unevenly or are worn in a saw-tooth manner are usually noisy. They often produce a noise that appears to originate in the driveline module.

Tire noise changes with different road surfaces, but driveline module noise does not. Inflate all four tires with approximately 20 psi (138 kPa) more than the recommended inflation pressure (for test purposes only). This will alter noise caused by tires, but will not affect noise caused by the differential. Rear axle noise usually ceases when coasting at speeds less than 30 mph (48 km/h); however, tire noise continues, but at a lower frequency, as the speed is reduced.

After test has been completed lower tire pressure back to recommended pressure.

GEAR NOISE (DRIVE PINION AND RING GEAR)

Abnormal gear noise is rare and is usually caused by scoring on the ring gear and drive pinion. Scoring is the result of insufficient or incorrect lubricant in the carrier housing.

Abnormal gear noise can be easily recognized. It produces a cycling tone that will be very pronounced within a given speed range. The noise can occur during one or more of the following drive conditions:

- Drive
- Road load
- Float
- Coast

Abnormal gear noise usually tends to peak within a narrow vehicle speed range or ranges. It is usually more pronounced between 30 to 40 mph (48 to 64 km/h) and 50 to 60 mph (80 to 96 km/h). When objectionable gear noise occurs, note the driving conditions and the speed range.

BEARING NOISE (DRIVE PINION AND DIFFERENTIAL)

Defective bearings produce a rough growl that is constant in pitch and varies with the speed of vehicle. Being aware of this will enable a technician to separate bearing noise from gear noise.

Drive pinion bearing noise that results from defective or damaged bearings can usually be identified by its constant, rough sound. Drive pinion front bearing is usually more pronounced during a coast condition. Drive pinion rear bearing noise is more pronounced during a drive condition. The drive pinion bearings are rotating at a higher rate of speed than either the differential side bearings or the axle shaft bearing.

Differential side bearing noise will usually produce a constant, rough sound. The sound is much lower in frequency than the noise caused by drive pinion bearings.

Bearing noise can best be detected by road testing the vehicle on a smooth road (black top). However, it is easy to mistake tire noise for bearing noise. If a doubt exists, the tire treads should be examined for irregularities that often causes a noise that resembles bearing noise.

ENGINE AND TRANSMISSION NOISE

Sometimes noise that appears to be in the driveline module assembly is actually caused by the engine or the transmission. To identify the true source of the noise, note the approximate vehicle speed and/or RPM when the noise is most noticeable. Stop the vehicle next to a flat brick or cement wall (this will help reflect the sound). Place the transaxle in **NEUTRAL**. Accelerate the engine slowly up through the engine speed that matches the vehicle speed noted when the noise occurred. If the same noise is produced, it usually indicates that the noise is being caused by the engine or transaxle.

DIAGNOSIS AND TESTING - REAR DRIVELINE MODULE OPERATION

Driveline module operation requires relatively straight-forward diagnosis. Refer to the following chart:

DRIVELINE MODULE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
Rear wheels not overrunning	1) Bi-directional overrunning clutch failure	1) Replace overrunning clutch components as required
No AWD in forward or reverse directions, propeller shaft turning	1) Bi-directional overrunning clutch failure	1) Replace overrunning clutch components as required
	2) Viscous coupling failure	2) Replace viscous coupling
	3) Rear differential failure	3) Replace the rear differential assembly
No AWD in forward or reverse directions, propeller shaft not turning	1) Power transfer unit failure.	1) Replace power transfer unit components as necessary
Vibration at all speeds, continuous torque transfer	1) Mis-matched tires, worn tires on front axle.	1) Replace worn or incorrect (mis-matched) tires with same make and size

REMOVAL

(1) Raise vehicle on hoist.

(2) Drain fluid from overrunning clutch housing and/or differential assembly if necessary.

(3) Remove propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL)

(4) Disconnect left and right rear halfshafts from output flanges (Fig. 2).

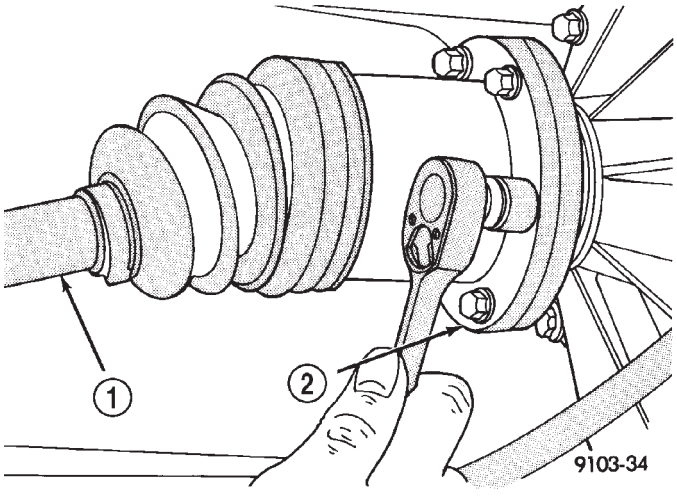

Fig. 2 Half Shaft Mounting Bolts

1 - SHAFT
2 - FLANGE

(5) Remove torque arm mount to body bolts.

(6) Position transmission jack to driveline module assembly and secure assembly to jack.

(7) Remove two driveline module-to-body bolts (Fig. 3).

BI-DIRECTIONAL OVERRUNNING CLUTCH

DESCRIPTION

The bi-directional overrunning clutch (BOC) (Fig. 28) works as a mechanical disconnect between the front and rear axles, preventing torque from being transferred from the rear axle to the front. The BOC is a simply an overrunning clutch which works in both clockwise and counter-clockwise rotations. This means that when the output (the rear axle) is rotating faster in one direction than the input (front axle), there is no torque transmission. But when the input speed is equal to the output speed, the unit becomes locked. The BOC provides significant benefits regarding braking stability, handling, and driveline durability. Disconnecting the front and the rear driveline during braking helps to maintain the braking stability of an AWD vehicle. In an ABS/braking event, the locking of the rear wheels must be avoided for stability reasons. Therefore brake systems are designed to lock the front wheels first. Any torque transfer from the rear axle to the front axle disturbs the ABS/braking system and causes potential instabilities on a slippery surface. The BOC de-couples the rear driveline as soon the rear wheels begin to spin faster than the front wheels (front wheels locked) in order to provide increased braking stability. Furthermore the BOC also reduces the likelihood of throttle off over-steer during cornering. In a throttle off maneuver, the BOC once again de-couples the rear driveline forcing all the engine brake torque to the front wheels. This eliminates the chance of lateral slip on the rear axle and increases it on the front. The vehicle will therefore tend to understeer, a situation which is considered easier to manage in most circumstances. During this maneuver, and during the ABS braking event, the BOC does not transmit torque through to the rear wheels. The rear driveline module, with the BOC, will perform the same as a front wheel drive vehicle during these events. The gear ratio offset between the front and rear differentials force the BOC into the overrunning mode most of the time. This allows BOC to significantly reduce the rolling resistance of the vehicle, which improves fuel consumption, allows the downsizing of the driveline components, and prevents the PTU and propshaft joints from overheating.

BI-DIRECTIONAL OVERRUNNING CLUTCH (Continued)

OPERATION

In order to achieve all-wheel drive operation in reverse, the overrunning clutch locking functional direction must be reversible. The bi-directional overrunning clutch (BOC) changes the operational mode direction depending on the propeller shaft direction. The propeller shaft rotates in the clockwise (when viewed from the front) direction when the vehicle is moving forward, which indexes the BOC to the forward overrunning position. When the vehicle is in reverse, the propeller shaft will rotate counter-clockwise and index the BOC to the reverse overrunning position.

The BOC acts as a mechanical stator. It is active (transmitting torque), or it is not active and in overrunning mode (not transmitting torque). This “all or nothing” approach to torque transfer would cause a sudden application of all available power to the rear wheels, which is not desirable. Therefore it is run in series with a viscous coupler to smooth, dampen, and limit the transmission of torque to the rear axle and to prevent a step style torque input to the rear axle.

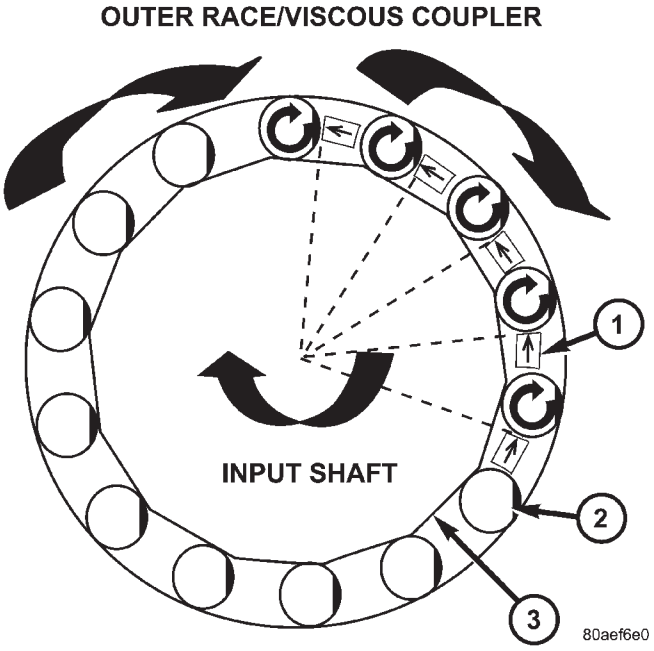

Fig. 29 BOC Operation at Low Speeds With No Front Wheel Slip

1 - CAGE
2 - ROLLER
3 - INPUT SHAFT

STEADY STATE, LOW TO MODERATE SPEED, NO FRONT WHEEL SLIP, FORWARD DIRECTION

During normal driving conditions, (no wheel slip), the inner shaft (front axle) and outer race (viscous coupler) are running at different speeds due to the different gear ratios between the front and rear differentials. In this condition, the outer race is always spinning faster (overdriving between 5-32 rpm) than the inner shaft. When the BOC (Fig. 29) is running under these conditions, at low vehicle speeds the drag shoes and the cage keep the rollers up on the left side (forward side) of the inner shaft flats. This is what is known as “overrunning mode.” Notice that when the clutch is in overrunning mode, the rollers are spinning clockwise and with the outer race, thus no torque is being transferred.

NOTE: Low speed, forward and reverse operation is identical, just in opposite directions. (Fig. 29) shows forward direction in reverse the rollers are on the other side of the flats due to a reversal of the cage force.

TRANSIENT CONDITION (BOC LOCKED), FRONT WHEEL SLIP, FORWARD DIRECTION

When the front wheels lose traction and begin to slip, the propeller shaft and rear axle pinion speed difference decreases to zero. At this point the input shaft (cam) becomes the driving member of the BOC (Fig. 30), compressing the rollers against the outer race. This locks the input shaft with the outer race and transmits torque to the housing of the viscous coupler, that in turn transmits torque to the rear axle pinion. It should also be noted that when the device is locked, the inner shaft and the outer race are rotating at the same speed. The rollers are pinched at this point and will stay locked until a torque reversal (no front wheel slip) occurs. When locked, the viscous coupler slips during the torque transfer and the amount of torque transferred is dependent on the coupling characteristic and the amount of front wheel slip.

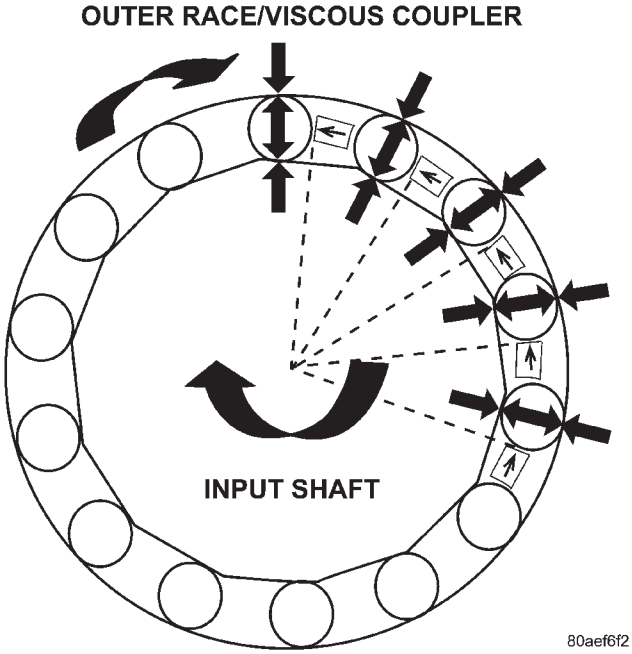

Fig. 30 BOC Operation with Front Wheel Slip

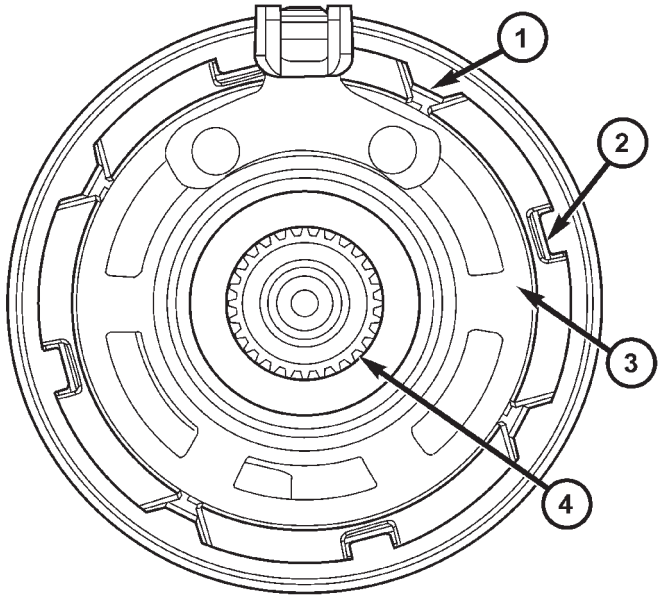
BI-DIRECTIONAL OVERRUNNING CLUTCH (Continued)

STEADY STATE, HIGH SPEED, NO WHEEL SLIP

The roller cage positions the rollers on the input shaft flats during low and high speed overrunning and during initial BOC lockup. The roller cage is rotating at input shaft (propeller shaft) speed at all times. At low speeds, the friction shoes (Fig. 31) are pressed against the friction ground via the garter spring (Fig. 32), creating a drag force on the roller cage. The drag force positions the cage, which in turn positions the rollers to one side of the flat. The direction of this drag force (position of the roller) is dependent on the input (propeller shaft) rotational direction. Since the rollers are always in contact with the outer race, due to centrifugal forces, the rollers want to follow the outer race due to drag. During overrunning operation, the outer race is rotating faster than the input; causing the rollers to want to traverse the flat from one side to the other. During low speeds, the brake shoes counteract this effect. To avoid excessive wear, the ground shoes are designed to lift off from the friction ground due to centrifugal forces at higher rotational speeds.



80aef6f6

Fig. 31 Front View of BOC

1 - GARTER SPRING
2 - FRICTION BRAKE SHOES
3 - FRICTION GROUND CONNECTED TO GROUND TAB
4 - INPUT SHAFT

To keep the rollers in the overrunning position and avoid undesired ″high speed lockup″, a high speed latch (Fig. 33) positions the cage before the ground shoes lift off. A further explanation of the high speed effects follows as well. Utilizing only the friction shoes approach means that at high speed the required ground shoe drag torque would cause excessive brake shoe wear or the roller will begin to migrate to the opposite side of the flat due to the drag force of the outer race. This would result in system lock-up. (Fig. 34) shows the BOC as it crosses the speed where the brake shoe force is overcome by the roller drag on the outer race. Notice that the roller is locking up on the opposite side of the flat and the cage supplies no force on the rollers.

4 - TWO PART DESIGN

BI-DIRECTIONAL OVERRUNNING CLUTCH (Continued)

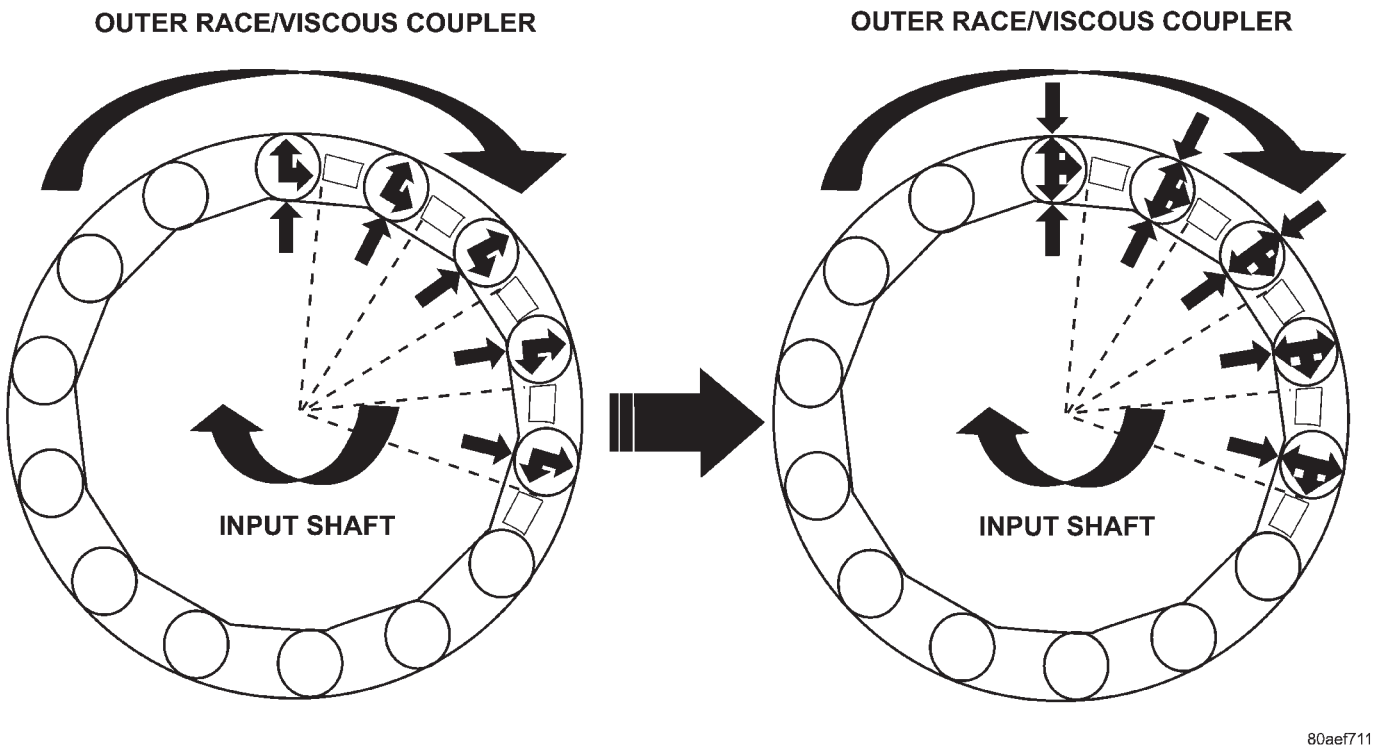

Fig. 34 BOC Operation During High Speed Lock-up Without High Speed Latch

This lock-up is not desired, and requires the use of another mechanism to prevent the lock-up. The device that prevents undesired high-speed lock-up is called a ″high speed latch″.

Similar to the friction shoes, the two-piece high-speed latch will separate from each other at high rotational speeds due to centrifugal effects. (Fig. 35) shows the high speed latch engaged. The gap ″x″ increases with speed, eventually locking into one of the slots in the BOC shaft. When the high-speed latch is activated (propeller shaft speed reaches X amount), the cage is partially fixed, and cannot lock on the wrong side of the flat as shown (Fig. 34). The high speed latch is a one way device and does not prevent high-speed lockup in the reverse direction. At high speeds, the BOC provides the same function as low speeds, transferring torque to the viscous coupler only when front wheel slip overcomes the axle ratio offset.

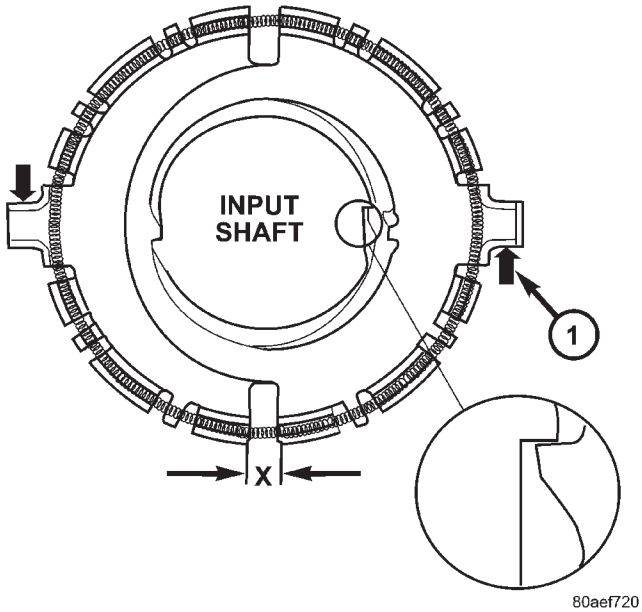

Fig. 35 High Speed Latch Engaged

1 - CAGE FORCE EXERTED BY ROLLERS AT HIGH SPEED

BI-DIRECTIONAL OVERRUNNING CLUTCH (Continued)

At high speed, the rollers are forced outward to the outer race because of centrifugal force. At high speeds, the friction shoes can no longer prevent lock-up. When the teeth on the high-speed latch engage into the input shaft, it keeps the rollers centered above the flats because the tabs on the latch are locked into the cage. (Fig. 36) shows the roller configuration with the High-Speed Latch engaged.

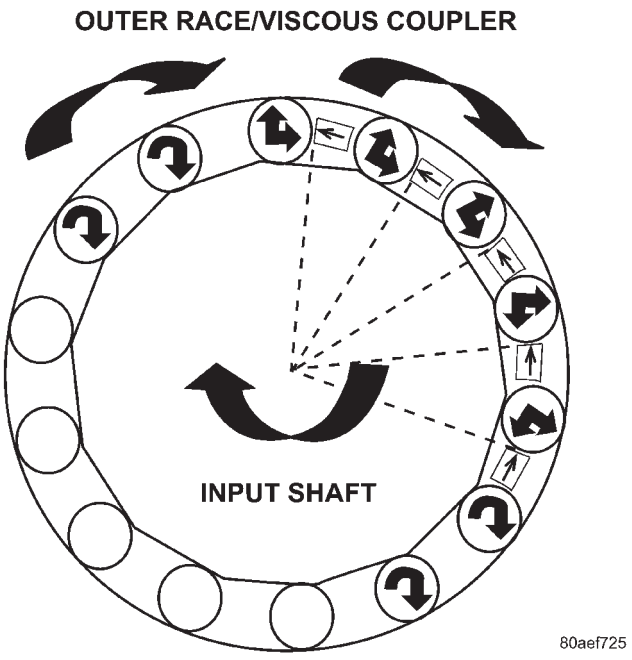

Fig. 36 BOC Operation at High Speed with High Speed Latch

On the BOC shaft, the high speed latch teeth lock up in the grooved areas, shown in (Fig. 37), when the turning speed reaches the critical value. (Fig. 37) also shows the outer race/viscous coupler. Notice the surface (outer race) the rollers mate against when transferring torque.

DIFFERENTIAL ASSEMBLY

DESCRIPTION

The differential gear system divides the torque between the axle shafts. It allows the axle shafts to rotate at different speeds when turning corners.

Each differential side gear is splined to an axle shaft. The pinion gears are mounted on a pinion mate shaft and are free to rotate on the shaft. The pinion gear is fitted in a bore in the differential case and is positioned at a right angle to the axle shafts.

OPERATION

In operation, power flow occurs as follows:

- The pinion gear rotates the ring gear
- The ring gear (bolted to the differential case) rotates the case
- The differential pinion gears (mounted on the pinion mate shaft in the case) rotate the side gears
- The side gears (splined to the axle shafts) rotate the shafts

During straight-ahead driving, the differential pinion gears do not rotate on the pinion mate shaft. This occurs because input torque applied to the gears is divided and distributed equally between the two side gears. As a result, the pinion gears revolve with the pinion mate shaft but do not rotate around it (Fig. 38).

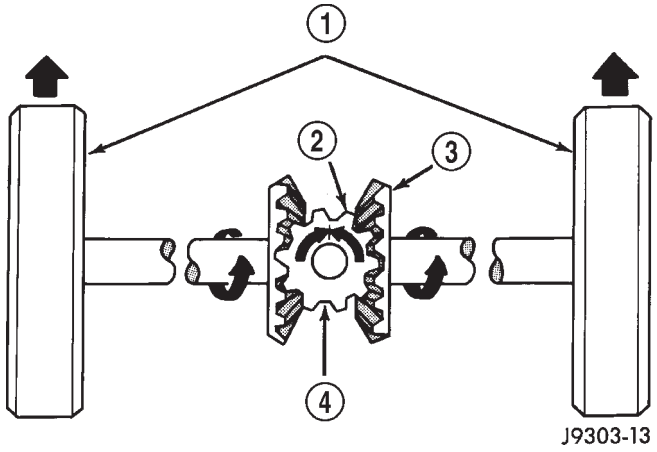

Fig. 38 Differential Operation—Straight Ahead Driving

1 - IN STRAIGHT AHEAD DRIVING EACH WHEEL ROTATES AT 100% OF CASE SPEED
2 - PINION GEAR
3 - SIDE GEAR
4 - PINION GEARS ROTATE WITH CASE

DIFFERENTIAL ASSEMBLY (Continued)

When turning corners, the outside wheel must travel a greater distance than the inside wheel to complete a turn. The difference must be compensated for to prevent the tires from scuffing and skidding through turns. To accomplish this, the differential allows the axle shafts to turn at unequal speeds (Fig. 39). In this instance, the input torque applied to the pinion gears is not divided equally. The pinion gears now rotate around the pinion mate shaft in opposite directions. This allows the side gear and axle shaft attached to the outside wheel to rotate at a faster speed.

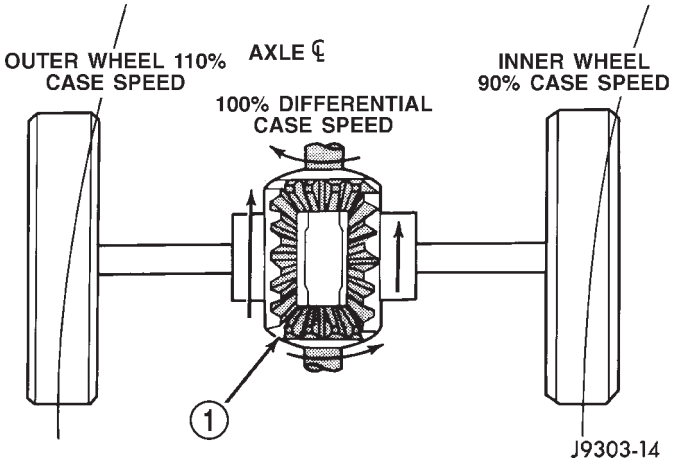

Fig. 39 Differential Operation—On Turns

FLUID - DIFFERENTIAL ASSEMBLY

STANDARD PROCEDURE - DIFFERENTIAL ASSEMBLY FLUID DRAIN AND FILL

The drain plug (Fig. 40) for the differential assembly is located in the bottom of the differential assembly case, toward the rear of the unit.

The fill plug (Fig. 41) for the differential assembly is located on the rear of the assembly case.

The correct fill level is to the bottom of the fill plug hole. Be sure the vehicle is on a level surface, or is hoisted in a level manner, in order to obtain the correct fill level.

(1) Raise the vehicle on a hoist.

(2) Position a drain pan under the differential drain plug (Fig. 40).

(3) Remove the drain plug and allow the fluid to drain into the pan.

(4) Install the drain plug and torque to 35 N·m (26 ft. lbs.).

(5) Re-position the drain pan under the differential fill plug.

(6) Remove the differential fill plug (Fig. 41).

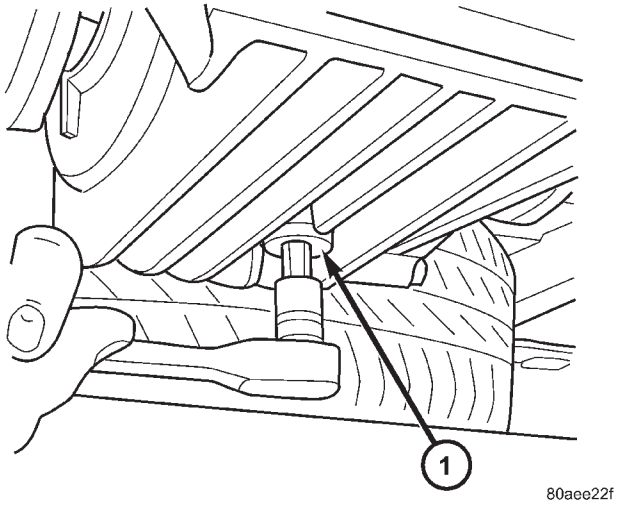

Fig. 40 Differential Drain Plug

VISCOUS COUPLER

DESCRIPTION

The heart of the all-wheel drive system is the inter-axle viscous coupling and bi-directional overrunning clutch. Under normal driving the vehicle retains predominantly front wheel drive characteristics. The all-wheel drive takes effect when the front wheels start to slip. Under normal level road, straight line driving, 100% of the torque is allocated to the front wheels. The viscous coupler allows more torque to the rear wheels in accordance with the amount of slippage at the front wheels. The variable torque distribution is automatic with no driver inputs required.

OPERATION

The viscous coupler (Fig. 46) is a housing nearly filled with a high viscosity silicone liquid and thin metal plates alternately splined to an inner and outer drum. The viscous coupler provides torque in the following modes:

- Shear mode (normal operation)
- Hump mode (locked mode)

The inner plates are slotted around the radius and the outer plates have holes in them. In the shear mode (normal operation), the plates are evenly spaced and the torque is created by the shearing of the plates through the fluid and 90-100% of the torque is applied to the rear axle. During the shear mode, a fluid flow pattern is created from this design (holes and slots). This fluid flow causes high pressure on each side of each pair of plates and low pressure between each pair of plates.

When a high speed difference (shear) occurs because of loss of traction (one axle spinning faster than the other), the silicone fluid expands as it heats from this shearing. When the silicone expands to fill the viscous coupler completely, this pressure difference is high enough to squeeze each pair of plates together. The resulting hump torque is up to 8 times higher than the shear torque. When the viscous coupler is in the hump mode, it does not lock the axles (undifferentiated 4-Wheel Drive). It controls the amount of slippage while delivering maximum power to the axle having greatest traction. Once the speed difference equalizes the fluid and plates cool down and the viscous coupler goes back to the shear mode.

TORQUE ARM

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove rear driveline module assembly. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR DRIVELINE MODULE - REMOVAL)
(3) Remove six torque arm-to-differential assembly bolts (Fig. 47). Remove torque arm.

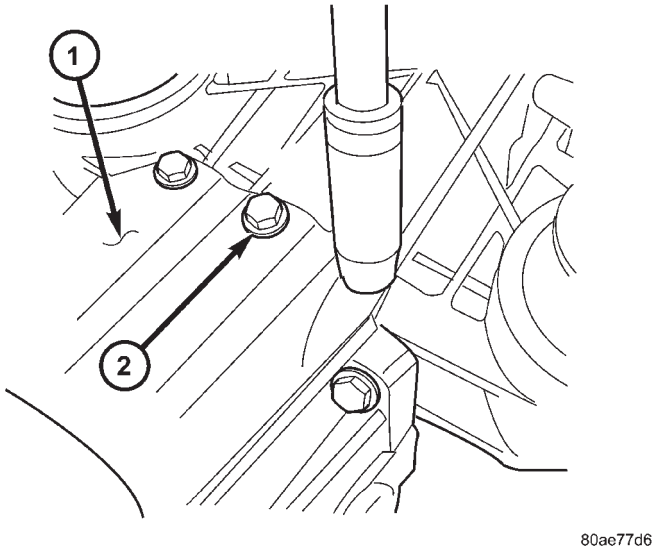

Fig. 47 Torque Arm Fasteners

1 - TORQUE ARM ASSEMBLY
2 - BOLT (SIX)

INSTALLATION

(1) Install six torque arm-to-differential assembly bolts (Fig. 47) and torque to 60 N·m (44 ft. lbs.).
(2) Install rear driveline module assembly. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR DRIVELINE MODULE - INSTALLATION)
(3) Lower vehicle.

INPUT FLANGE SEAL

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL)
(3) Using tool 6958, remove input flange nut and washer (Fig. 48).
(4) Remove input flange (Fig. 49).

BRAKES - BASE

DESCRIPTION

DESCRIPTION - BASE BRAKES

The base brake system consists of the following components:

- Brake pedal
- Power brake booster
- Master cylinder
- Brake tubes and hoses
- Proportioning valve (non-ABS vehicles only)
- Disc brakes
- Drum brakes
- Brake lamp switch
- Brake fluid level switch
- Parking brakes

Front disc brakes control the braking of the front wheels; rear braking is controlled by rear drum brakes or rear disc brakes depending on options.

The hydraulic brake system is diagonally split on both the non-antilock braking systems and antilock braking systems. That means the left front and right rear brakes are on one hydraulic circuit and the right front and left rear are on the other.

For information on the brake lamp switch, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - DESCRIPTION)

Vehicles equipped with the optional antilock brake system (ABS) use a system designated Mark 20e. It is available with or without traction control. This system shares most base brake hardware used on vehicles without ABS. ABS components are described in detail in ANTILOCK BRAKE SYSTEM.

DESCRIPTION - BASE BRAKES (EXPORT)

Four-Wheel Disc Antilock Brakes are standard on all models.

OPERATION - BASE BRAKES

When a vehicle needs to be stopped, the driver applies the brake pedal. The brake pedal pushes the input rod of the power brake booster into the booster. The booster uses vacuum to ease pedal effort as force is transferred through the booster to the master cylinder. The booster's output rod pushes in the master cylinder's primary and secondary pistons applying hydraulic pressure through the chassis brake tubes to the brakes at each tire and wheel assembly.

The parking brakes are foot-operated. When applied, the parking brake lever pulls on cables that actuate brake shoes at each rear wheel. These shoes

come in contact with a hub mounted drum (drum for disc/drum brakes or drum-in-hat for disc/disc brakes) and hold it in place.

WARNING

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

CAUTION

CAUTION: During service procedures, grease or any other foreign material must be kept off brake shoe assemblies, and braking surfaces of brake rotor or drum, and external surfaces of hub and bearing assembly.

CAUTION: Handling of brake rotors and calipers must be done in such a way as to avoid damage to the rotor and scratching or nicking of brake lining on the brake shoes.

CAUTION: At no time when servicing a vehicle, can a sheet metal screw, bolt or other metal fastener be installed in the shock tower to take the place of an original plastic clip. Also, NO holes can be drilled into the front shock tower in the area shown in (Fig. 1), for the installation of any metal fasteners into the shock tower. Because of the minimum clearance in this area (Fig. 1), installation of metal fasteners could damage the coil spring coating and lead to a corrosion failure of the spring. If a plastic clip is missing, or is lost or broken during servicing a vehicle, replace only with the equivalent part listed in the Mopar parts catalog.

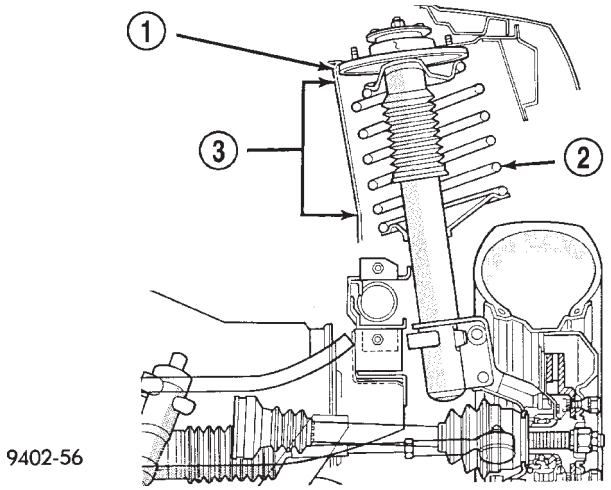

Fig. 1 Shock Tower To Spring Minimum Clearance Area

1 - SHOCK TOWER
2 - COIL SPRING
3 - NO SHEET METAL SCREWS, BOLTS, OR ANY OTHER METAL FASTENERS ARE TO BE INSTALLED INTO SHOCK TOWER IN THIS AREA. ALSO, NO HOLES ARE TO BE DRILLED INTO SHOCK TOWER IN THIS SAME AREA.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle. Failure to raise a vehicle from the recommended locations could result in lifting a vehicle by the hydraulic control unit mounting bracket. Lifting a vehicle by the hydraulic control unit mounting bracket will result in damage to the mounting bracket and the hydraulic control unit.

DIAGNOSIS AND TESTING - BASE BRAKE SYSTEM

NOTE: There are three diagnosis charts following that cover the RED BRAKE WARNING INDICATOR LAMP, BRAKE NOISE and OTHER BRAKE CONDITIONS.

BRAKES - BASE (Continued)

RED BRAKE WARNING INDICATOR LAMP

CONDITION	POSSIBLE CAUSES	CORRECTION
RED BRAKE WARNING LAMP ON	1. Parking brake lever not fully released.	1. Release parking brake lever.
	2. Parking brake warning lamp switch on parking brake lever.	2. Inspect and replace switch as necessary.
	3. Brake fluid level low in reservoir.	3. Fill reservoir. Check entire system for leaks. Repair or replace as required.
	4. Brake fluid level switch.	4. Disconnect switch wiring connector. If lamp goes out, replace switch.
	5. Mechanical instrument cluster (MIC) problem.	5. Refer to appropriate Diagnostic information.
	6. Amber ABS Warning Indicator Lamp also illuminated.	6. Refer to appropriate Diagnostic information.

BRAKE NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLICK OR SQUAWK ON PEDAL APPLICATION	1. Brake lamp switch.	1. Replace switch.
	2. Brake Transmission Shift Interlock Linkage.	2. Lubricate BTSI linkage.
	3. Pedal pivot bushings	3. Lubricate pivot bushings. Replace if necessary.
DISC BRAKE CHIRP	1. Excessive brake rotor runout.	1. Follow brake rotor diagnosis and testing. Correct as necessary.
	2. Lack of lubricant on brake caliper slides.	2. Lubricate brake caliper slides.
	3. Caliper/shoes not fully seated.	3. Reseat caliper/shoes.
DISC BRAKE RATTLE OR CLUNK	1. Broken or missing anti-rattle spring clips on shoes.	1. Replace brake shoes.
	2. Caliper guide pins/bolts loose.	2. Tighten guide pins/bolts.
DISC BRAKE SQUEAK AT LOW SPEED (WHILE APPLYING LIGHT BRAKE PEDAL EFFORT)	1. Brake shoe linings.	1. Replace brake shoes.
DRUM BRAKE CHIRP	1. Lack of lubricant on brake shoe support plate where shoes ride.	1. Lubricate shoe contact areas on brake shoe support plates.
DRUM BRAKE CLUNK	1. Drum(s) have threaded machined braking surface.	1. Replace brake drums as necessary.
DRUM BRAKE HOWL OR MOAN	1. Lack of lubricant on brake shoe support plate where shoes ride and at the anchor.	1. Lubricate shoe contact areas on brake shoe support plates and at the anchor.
	2. Rear brake shoes.	2. Replace rear brake shoes.
DRUM BRAKE SCRAPING OR WHIRRING	1. ABS wheel speed sensor or tone wheel.	1. Inspect, correct or replace faulty component(s).

BRAKES - BASE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SCRAPING (METAL-TO-METAL).	1. Foreign object interference with brakes.	1. Inspect brakes and remove foreign object.
	2. Brake shoes worn out.	2. Replace brake shoes. Inspect rotors and drums. Reface or replace as necessary.

OTHER BRAKE CONDITIONS

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKES CHATTER	1. Rear brake drum out of round or disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake drums or rotors as necessary.
BRAKES DRAG (FRONT OR ALL)	1. Contaminated brake fluid.	1. Check for swollen seals. Replace all system components containing rubber.
	2. Binding caliper pins or bushings.	2. Replace pins and bushings.
	3. Binding master cylinder.	3. Replace master cylinder.
	4. Binding brake pedal.	4. Replace brake pedal.
	5. Brake lamp switch not adjusted properly and mounting bracket is bent.	5. Straighten mounting bracket and replace brake lamp switch.
BRAKES DRAG (REAR ONLY)	1. Parking brake cables binding or froze up.	1. Check cable routing. Replace cables as necessary.
	2. Parking brake cable return spring not returning shoes.	2. Replace cables as necessary.
	3. Service brakes not adjusted properly (rear drum brakes only).	3. Follow the procedure listed in the adjustment section.
	4. Rear disc brake parking brake not properly adjusted.	Adjust parking brake shoes.
BRAKES GRAB	1. Contaminated brake shoe linings.	1. Inspect and clean, or replace shoes. Repair source of contamination.
	2. Improper power brake booster assist.	2. Refer to power brake booster diagnosis and testing.
EXCESSIVE PEDAL EFFORT	1. Obstruction of brake pedal.	1. Inspect, remove or move obstruction.
	2. Low power brake booster assist (vacuum leak).	2. Refer to power brake booster diagnosis and testing.
	3. Glazed brake linings.	3. Reface or replace brake rotors as necessary. Replace brake shoes.
	4. Brake shoe lining transfer to brake rotor.	4. Reface or replace brake rotors as necessary. Replace brake shoes.
EXCESSIVE PEDAL TRAVEL (VEHICLE STOPS OK)	1. Air in brake lines.	1. Bleed brakes.
	2. Rear drum brake auto-adjuster malfunctioning.	2. Inspect and replace drum brake components as necessary. Adjust rear brakes.

BRAKES - BASE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE PEDAL TRAVEL (ONE FRONT WHEEL LOCKS UP DURING HARD BRAKING)	1. One of the two hydraulic circuits to the front brakes is malfunctioning.	1. Inspect system for leaks. Check master cylinder for internal malfunction.
PEDAL PULSATES/ SURGES DURING BRAKING	1. Rear brake drum out of round or disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake drums or rotors as necessary.
PEDAL IS SPONGY	1. Air in brake lines. 2. Power brake booster runout (vacuum assist).	1. Bleed brakes. 2. Check booster vacuum hose and engine tune for adequate vacuum supply. Refer to power brake booster diagnosis and testing.
PREMATURE REAR WHEEL LOCKUP	1. Contaminated brake shoe linings. 2. Inoperative proportioning valve (non-ABS vehicles). 3. Improper power brake booster assist.	1. Inspect and clean, or replace shoes. Repair source of contamination. 2. Refer to proportioning valve diagnosis and testing. Replace valve as necessary. 3. Refer to power brake booster in the diagnosis and testing section.
STOP/BRAKE LAMPS STAY ON	1. Brake lamp switch out of adjustment. 2. Brake pedal binding. 3. Obstruction in pedal linkage. 4. Power Brake Booster not allowing pedal to return completely.	1. Replace brake lamp switch. 2. Inspect and replace as necessary. 3. Remove obstruction. 4. Replace power brake booster.
VEHICLE PULLS TO RIGHT OR LEFT ON BRAKING	1. Frozen brake caliper piston. 2. Contaminated brake shoe lining. 3. Pinched brake lines. 4. Leaking piston seal. 5. Suspension problem.	1. Replace frozen piston or caliper. Bleed brakes. 2. Inspect and clean, or replace shoes. Repair source of contamination. 3. Replace pinched line. 4. Replace piston seal or brake caliper. 5. Refer to the Suspension group.
PARKING BRAKE - EXCESSIVE HANDLE TRAVEL	1. Rear drum brakes or rear disc brake parking brake shoes out of adjustment.	1. Adjust rear drum brake shoes, or rear parking brake shoes on vehicles with rear disc brakes.

STANDARD PROCEDURE - BASE BRAKE BLEEDING

NOTE: This bleeding procedure is only for the vehicle's base brakes hydraulic system. For bleeding the antilock brakes hydraulic system, (Refer to 5 - BRAKES - ABS - STANDARD PROCEDURE)

CAUTION: Before removing the master cylinder cover, thoroughly clean the cover and master cylinder fluid reservoir to prevent dirt and other foreign matter from dropping into the master cylinder fluid reservoir.

BRAKES - BASE (Continued)

NOTE: The following wheel sequence should be used when bleeding the brake hydraulic system. The use of this wheel sequence will ensure adequate removal of all trapped air from the brake hydraulic system.

- Left Rear Wheel
- Right Front Wheel
- Right Rear Wheel
- Left Front Wheel

NOTE: When bleeding the brake system, some air may be trapped in the brake lines or valves far upstream, as much as ten feet from the bleeder screw (Fig. 2). Therefore, it is essential to have a fast flow of a large volume of brake fluid when bleeding the brakes to ensure all the air gets out.

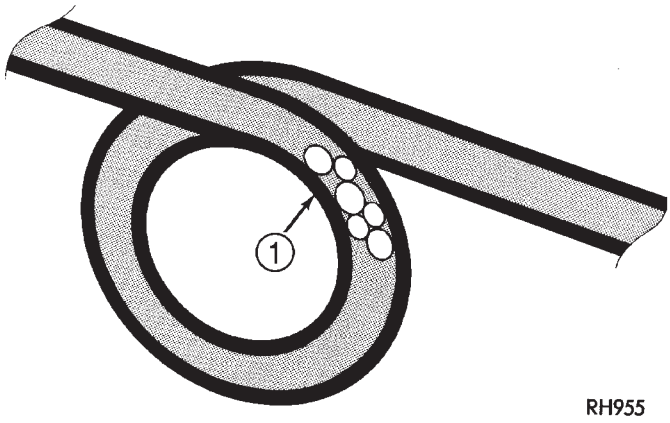

Fig. 2 Trapped Air In Brake Fluid Line

1 - TRAPPED AIR

The brakes may be manually bled or pressure bled. Refer to the appropriate following procedure.

MANUAL BLEEDING PROCEDURE

NOTE: Correct manual bleeding of the brakes hydraulic system will require the aid of a helper.

NOTE: To adequately bleed the brakes using the manual bleeding procedure the rear brakes must be correctly adjusted. Prior to the manual bleeding of the brake hydraulic system, correctly adjust the rear brakes.

(1) Pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

(2) Push the brake pedal toward the floor and hold it down. Then open the left rear bleeder screw at least 1 full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor.

CAUTION: "Just cracking" the bleeder screw often restricts fluid flow, allowing only a slow, weak fluid discharge of fluid. This practice will NOT get all the air out. Make sure the bleeder is opened at least 1 full turn when bleeding.

(3) Release the brake pedal only **after** the bleeder screw is closed.

(4) Repeat steps 1 through 3, four or five times, at each bleeder screw in the proper sequence. This should pass a sufficient amount of fluid to expel all the trapped air from the brake system. Be sure to monitor the fluid level in the master cylinder, so it stays at a proper level so air will not enter the brake system through the master cylinder.

(5) Check pedal travel. If pedal travel is excessive or has not been improved, enough fluid has not passed through the system to expel all the trapped air. Continue to bleed system as necessary.

(6) Perform a final adjustment of the rear brake shoes (when applicable), then test drive vehicle to be sure brakes are operating correctly and that pedal is solid.

PRESSURE BLEEDING PROCEDURE

CAUTION: Use bleeder tank Special Tool C-3496-B or equivalent with Adapter, Special Tool 6921, to pressurize the hydraulic system for bleeding.

Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

(1) Install the Adapter Master Cylinder Pressure Bleed Cap, Special Tool 6921 on the fluid reservoir of the master cylinder (Fig. 3). Attach the fluid hose from the pressure bleeder to the fitting on Special Tool 6921.

(2) Attach a clear plastic hose to the bleeder screw at one wheel and feed the hose into a clear jar containing fresh brake fluid.

(3) Open the left rear wheel bleeder screw at least **one full turn** or more to obtain an adequate flow of brake fluid.

CAUTION: "Just cracking" the bleeder screw often restricts fluid flow, allowing only a slow, weak fluid discharge of fluid. This practice will NOT get all the air out. Make sure the bleeder is opened at least 1 full turn when bleeding.

(4) After 4 to 8 ounces of brake fluid has been bled through the hydraulic system, and an air-free flow is maintained in the hose and jar, this will indicate a good bleed of the hydraulic system has been obtained.

(5) Repeat the procedure at all the other remaining bleeder screws.

BRAKES - BASE (Continued)

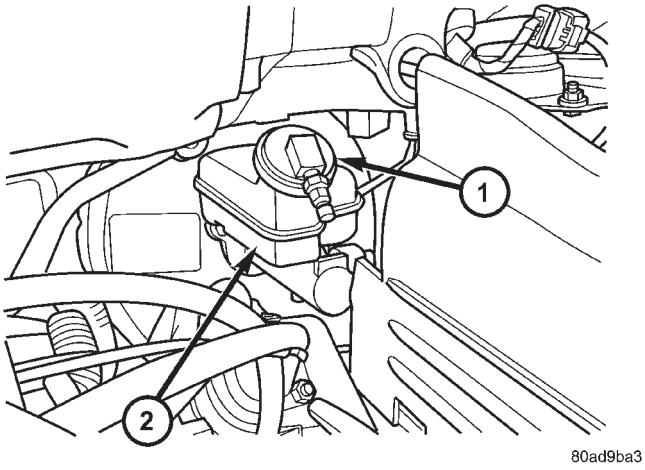

Fig. 3 TOOL 6921 INSTALLED ON MASTER CYLINDER

1 - SPECIAL TOOL 6921
2 - FLUID RESERVOIR

(6) Check pedal travel. If pedal travel is excessive or has not been improved, enough fluid has not passed through the system to expel all the trapped air. Be sure to monitor the fluid level in the pressure bleeder, so it stays at a proper level so air will not enter the brake system through the master cylinder.

(7) Perform a final adjustment of the rear brake shoes (when applicable), then test drive vehicle to be sure brakes are operating correctly and that pedal is solid.

BRAKE FLUID LEVEL SWITCH

DESCRIPTION

The brake fluid level switch is located in the brake fluid reservoir of the master cylinder (Fig. 4).

OPERATION

The purpose of the brake fluid level switch is to provide the driver with an early warning that the brake fluid level in the master cylinder fluid reservoir has dropped below a normal level. This may indicate:

- Abnormal loss of brake fluid in the master cylinder fluid reservoir resulting from a leak in the hydraulic system.
- Brake shoe linings which have worn to a point requiring replacement.

As the brake fluid drops below the minimum level, the brake fluid level switch closes to complete the red BRAKE warning indicator (lamp) circuit. This will turn on the red BRAKE warning indicator. The master cylinder fluid reservoir should be checked and refilled to the Full mark with DOT 3 brake fluid. **If the brake fluid level has dropped below the add line in the master cylinder fluid reservoir, the entire brake hydraulic system should be checked for evidence of a leak.**

REMOVAL

(1) Remove wiring harness connector from brake fluid reservoir level switch (Fig. 4).

(2) Using fingers, compress the retaining tabs on the opposite end of brake fluid level switch.

(3) With retaining tabs compressed, grasp the connector end of brake fluid level switch and pull it out of master cylinder brake fluid reservoir.

INSTALLATION

(1) Insert brake fluid level switch into left side of brake fluid reservoir. Be sure switch is pushed in until retaining tabs lock it to brake fluid reservoir.

(2) Connect vehicle wiring harness connector to brake fluid level switch (Fig. 4).

ADJUSTABLE PEDAL SWITCH

DESCRIPTION

The adjustable pedal switch is mounted on the left side of the lower steering column shroud (Fig. 5). The adjustable pedal switch adjusts the adjustable pedal assembly fore-and-aft. The pedal assembly moves in the direction the switch is actuated.

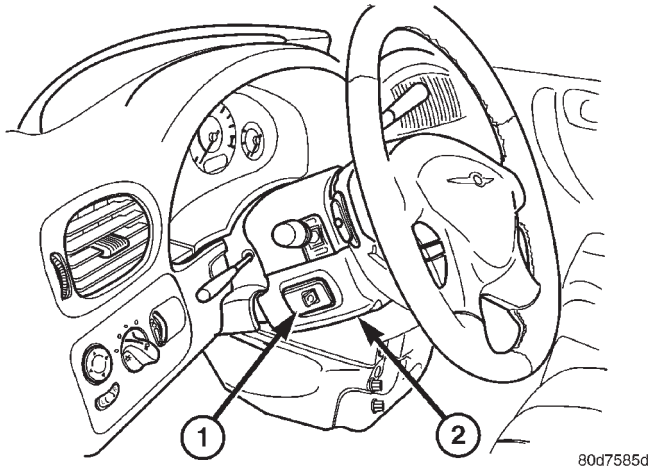

Fig. 5 Adjustable Pedal Switch Location

1 - ADJUSTABLE PEDAL SWITCH
2 - LOWER STEERING COLUMN SHROUD

DIAGNOSIS AND TESTING - ADJUSTABLE PEDAL SWITCH

Refer to Appropriate Diagnostic Information.

REMOVAL

NOTE: Before proceeding, review all Steering Column and Airbag Warnings and Cautions. (Refer to 19 - STEERING/COLUMN - WARNING)(Refer to 8 - ELECTRICAL/RESTRAINTS - WARNING)

(1) Remove battery ground cable terminal from battery negative post and isolate.

(2) Under instrument panel, remove silencer panel below lower steering column cover.

(3) Remove screws securing lower steering column cover/knee blocker, then remove it (Fig. 6).

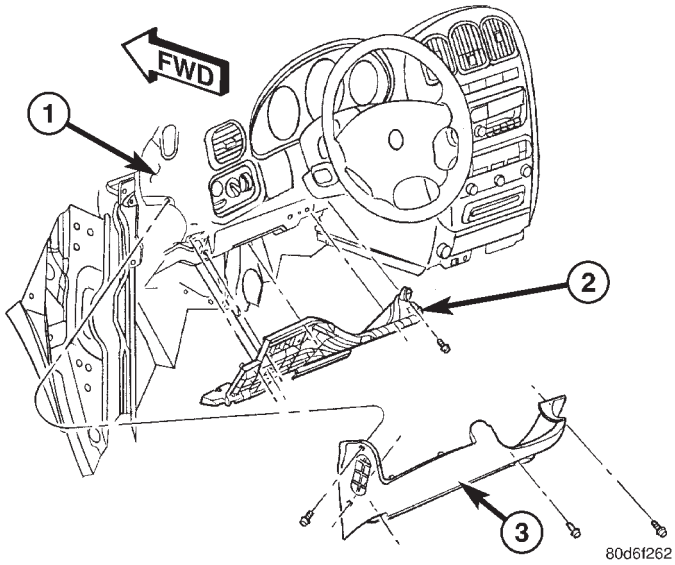

Fig. 6 Lower Steering Column Cover And Reinforcement

1 - INSTRUMENT PANEL
2 - REINFORCEMENT PLATE
3 - LOWER STEERING COLUMN COVER/KNEE BLOCKER

(4) Disconnect parking brake release link at release handle.

(5) Compress tabs on sides of data link diagnostic connector and remove it from knee blocker reinforcement plate.

(6) Remove screws securing knee blocker reinforcement plate in place, then remove reinforcement plate (Fig. 6).

(7) Remove screws fastening upper and lower steering column shrouds to steering column (Fig. 7).

(8) Remove the lower shroud with adjustable pedal switch; disconnect switch wiring connector along left side of column as shroud is removed (Fig. 8).

ADJUSTABLE PEDAL SWITCH (Continued)

3 - B.T.S.I. WIRING CONNECTOR
4 - PEDAL SWITCH WIRING CONNECTOR

(9) Depress retainers on rear of adjustable pedal switch, then remove switch from lower shroud (Fig. 9).

INSTALLATION

(1) Guide adjustable pedal switch wiring through mounting hole in lower shroud.

(2) Align switch retainers with notches in mounting hole and snap the switch into place (Fig. 9).

(3) Connect adjustable pedal switch wiring connector along left side of column (Fig. 8).

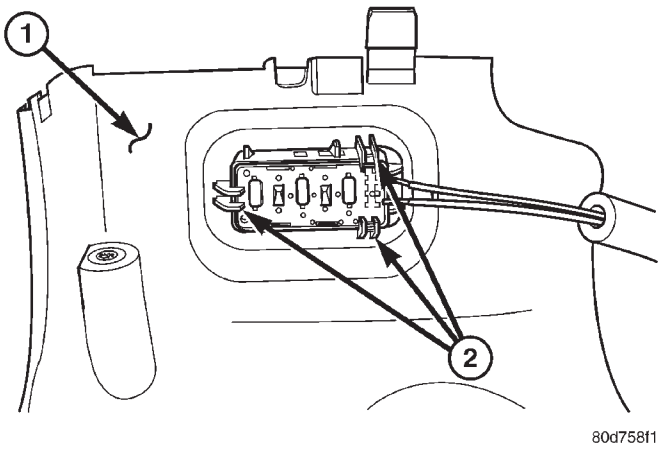

Fig. 9 Pedal Switch Retainers

1 - LOWER SHROUD INTERIOR
2 - RETAINERS

(4) Install the lower shroud with adjustable pedal switch. Install screws fastening steering column shrouds to steering column (Fig. 7).

(5) Install knee blocker reinforcement plate (Fig. 6).

(6) Connect parking brake release link to release handle.

(7) Install data link diagnostic connector to mounting hole in reinforcement plate.

(8) Install lower steering column cover/knee blocker (Fig. 6).

(9) Install silencer panel below lower steering column cover/knee blocker.

(10) Connect ground cable to negative post of battery.

(11) Connect scan tool (DRBIII®) to data link diagnostic connector located below steering column.

(12) Turn ignition key to ON position.

(13) Using scan tool, check for and clear any existing adjustable pedal fault codes.

(14) Test operation of adjustable pedals, memory sets and RKE (if equipped). If applicable, reset radio and clock.

(15) Recheck for any fault codes.

(16) Turn key to OFF and remove scan tool from vehicle.

PEDAL POSITION SENSOR

DESCRIPTION

The pedal position sensor is part of the adjustable pedal assembly. It is mounted to the left of the brake pedal (Fig. 10). It senses the fore and aft position of the brake pedal.

PEDAL POSITION SENSOR (Continued)

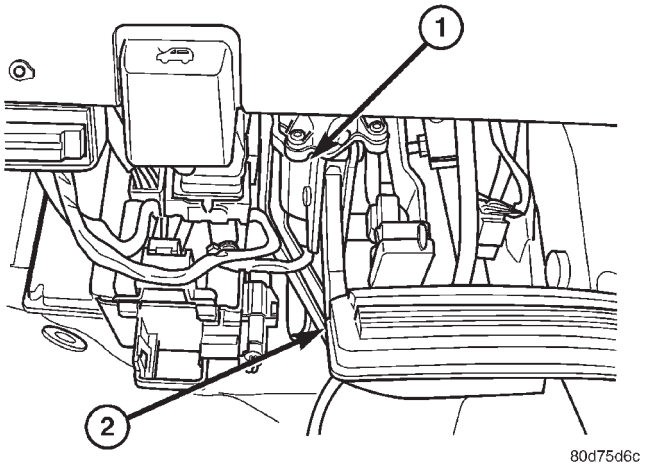

Fig. 10 Pedal Position Sensor Location

1 - PEDAL POSITION SENSOR
2 - BRAKE PEDAL

DIAGNOSIS AND TESTING - PEDAL POSITION SENSOR

Refer to Appropriate Diagnostic Information.

REMOVAL

(1) Remove battery ground cable terminal from battery negative post and isolate.

(2) Under instrument panel, remove silencer panel below lower steering column cover.

(3) Press release tab to the left (Fig. 11), then remove bulkhead connector from bracket by pulling it toward lower steering column cover.

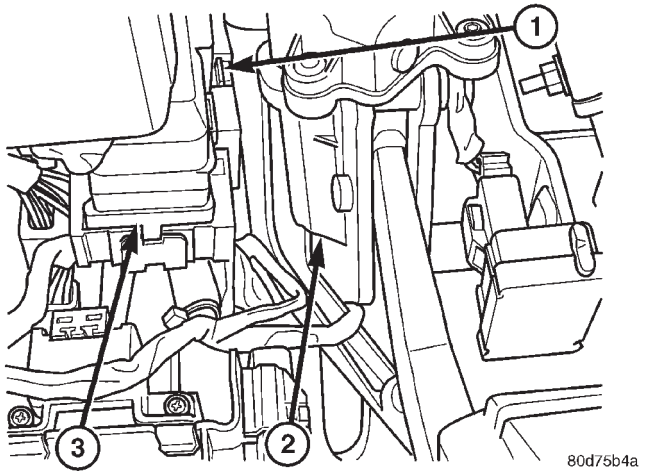

Fig. 11 Bulkhead Connector Release Tab

1 - RELEASE TAB
2 - PEDAL POSITION SENSOR
3 - BULKHEAD CONNECTOR

(4) Move bulkhead connector toward left side of vehicle as far as its wires will allow. Do not overstress wiring.

(5) Remove two mounting screws securing pedal position sensor in place (Fig. 12).

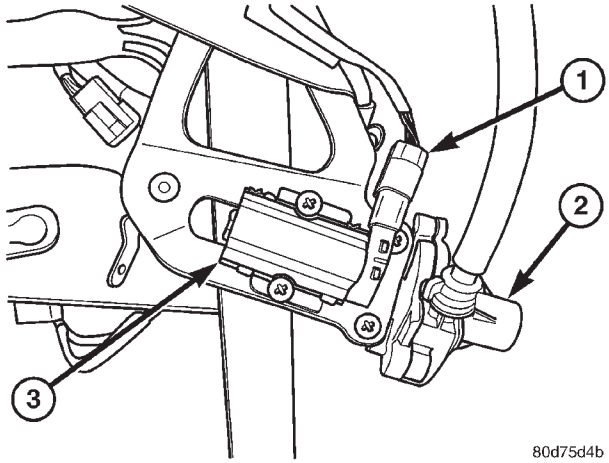

Fig. 12 Pedal Position Sensor

1 - WIRING CONNECTOR
2 - GEAR BOX
3 - PEDAL POSITION SENSOR

(6) Remove pedal position sensor from bracket.

(7) Disconnect wiring connector and remove pedal position sensor.

INSTALLATION

(1) Connect wiring connector to pedal position sensor.

NOTE: Make sure pin in pedal assembly fits into slot in sensor carriage when installing sensor.

(2) Place sensor against mounting bracket and into brake pedal (Fig. 12). Move carriage as necessary to align slot with pin. Install two mounting screws. Tighten screws to 7.5 N·m (66 in. lbs.) torque.

(3) Align the bulkhead connector mounting slot with its bracket and install it, locking it in place.

(4) Install silencer panel below lower steering column cover.

(5) Connect ground cable to negative post of battery.

(6) Connect scan tool (DRBIII®) to data link diagnostic connector located below steering column.

(7) Turn ignition key to ON position.

(8) Using scan tool, check for and clear any existing adjustable pedal fault codes.

(9) Test operation of adjustable pedals, memory sets (if equipped), and RKE (if equipped). If applicable, reset radio and clock.

(10) Recheck for any fault codes.

PEDAL POSITION SENSOR (Continued)

(11) Turn key to OFF and remove scan tool from vehicle.

(12) Road test the vehicle to ensure proper operation of the adjustable brake system.

HYDRAULIC/MECHANICAL

DESCRIPTION

DESCRIPTION - DISC BRAKES (FRONT)

Each front disc brake consists of the following components:

- Brake Rotor
- Brake Caliper
- Brake Caliper Adapter
- Shoes (Pads)

There are two non-interchangeable front disc brake systems depending on whether the vehicle is equipped with rear drum or rear disc brakes. Vehicles with the front disc/rear drum brake combination utilize a system manufactured by TRW. Vehicles with front disc/rear disc brakes utilize a system manufactured by Continental Teves.

CAUTION: Components used on the disc/drum combination brakes are not interchangeable with the disc/disc combination brakes. The two different systems must not be mixed. Improper performance, noise and increased stopping distance can occur.

The TRW front brake caliper is a one piece casting containing a single 64 mm diameter piston bore (Fig. 13) with a phenolic piston. The caliper mounts to a caliper adapter using two guide pin bolts that thread into guide pins slid into the caliper adapter (Fig. 14). The pins are lubricated and have boots that seal them in place in the adapter.

The Continental Teves front brake caliper is a one piece casting containing a single piston 66 mm diameter bore (Fig. 13) with a phenolic piston. The caliper mounts to a caliper adapter using two guide pin bolts that thread into the caliper adapter and slide on bushings mounted in the caliper.

CAUTION: TRW and Continental Teves calipers are not interchangeable. Each caliper is specifically designed for the unique brake system. If calipers are interchanged, improper performance, noise and increased stopping distance can occur.

The two different brake calipers use different devices to control rattling. While the TRW brakes use spring clips that mount at the ends of the shoes in the adapters, Continental Teves brakes use a clip on the rear of the inboard pad to hold it to the piston and a larger clip on the outside of the caliper, holding it to the adapter (Fig. 15).

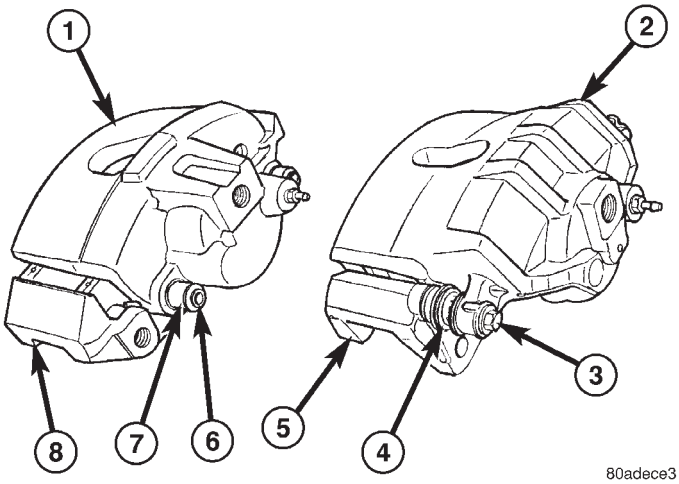

Fig. 13 FRONT DISC BRAKE CALIPERS

1 - CONTINENTAL TEVES CALIPER (66 mm bore)
2 - TRW CALIPER (64 mm bore)
3 - GUIDE PIN BOLT
4 - GUIDE PIN AND BOOT
5 - CALIPER ADAPTER
6 - GUIDE PIN BOLT
7 - GUIDE PIN BUSHING
8 - CALIPER ADAPTER

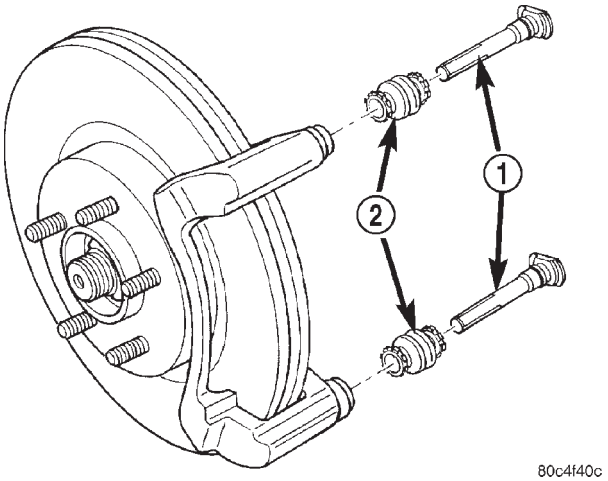

Fig. 14 Guide Pins And Boots

1 - PINS
2 - BOOTS

All brake caliper adapters mount to the steering knuckle in the same way using two mounting bolts.

The brake rotors are also different depending on brake system. The TRW (disc/drum) front brakes utilize an inverted-hat style rotor. This rotor is externally vented meaning the inner most diameter of the braking disc vents to the outboard side (or face) of the rotor (Fig. 16). The Continental Teves (disc/disc)

HYDRAULIC/MECHANICAL (Continued)

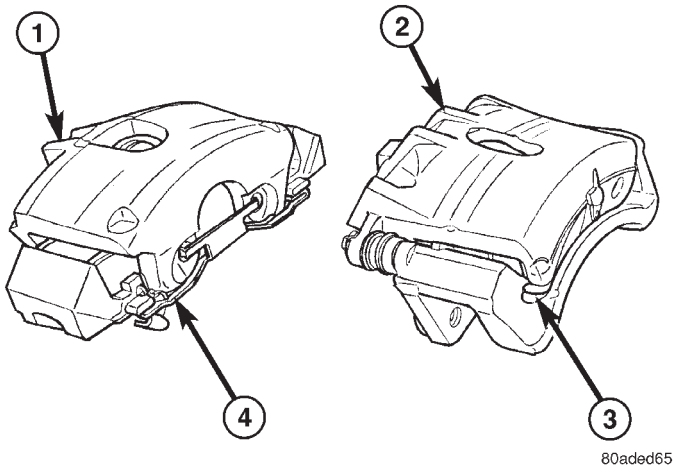

Fig. 15 ANTI-RATTLE DEVICES ON CALIPERS

1 - CONTINENTAL TEVES CALIPER
2 - TRW CALIPER
3 - ANTI-RATTLE CLIP
4 - ANTI-RATTLE CLIP

front brakes utilize the familiar internally-vented hat style rotor. Internally-vented refers to the fact that the inner most diameter of the braking disc vents to the inboard side of the rotor (Fig. 16).

CAUTION: TRW and Continental Teves brake rotors are not interchangeable. If brake rotors are interchanged, noise and wear problems can result.

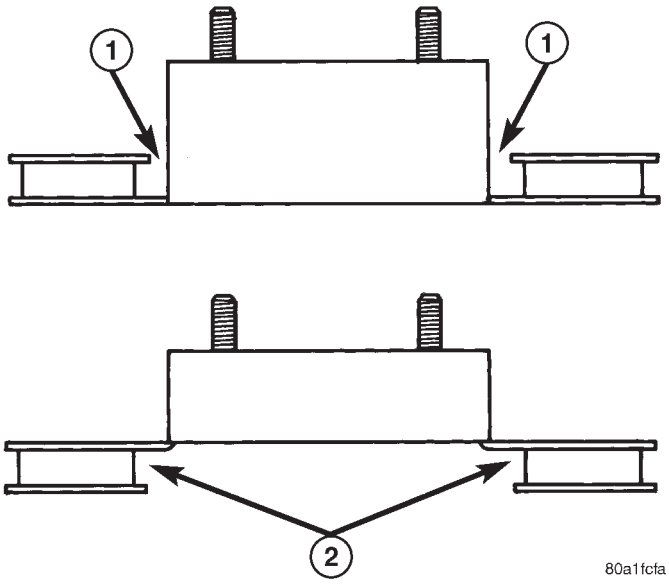

Fig. 16 Externally and Internally Vented Rotors (Cross-Sectional View)

1 - EXTERNAL VENTS (TRW)
2 - INTERNAL VENTS (Continetal Teves)

DESCRIPTION - DISC BRAKES (REAR)

There are several distinctive features to the rear disc brakes on this vehicle (Fig. 17). The single piston, floating caliper rear disc brake system includes a hub and bearing assembly, adapter, rotor, caliper, and brake shoes.

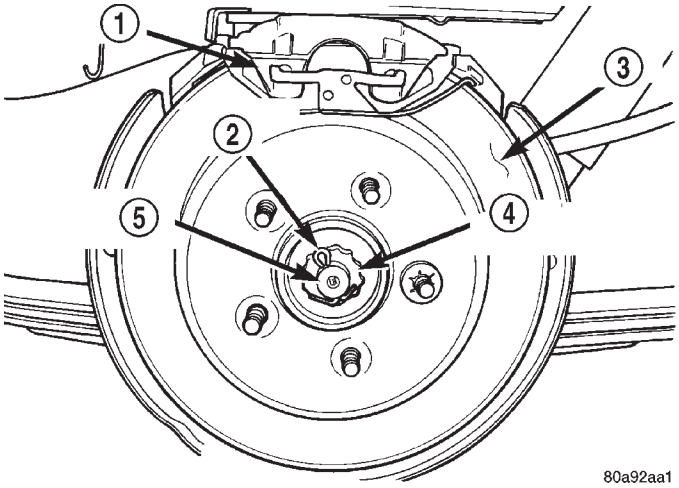

Fig. 17 Rear Disc Brakes

1 - CALIPER
2 - COTTER PIN
3 - ROTOR
4 - NUT RETAINER
5 - OUTER C/V JOINT

This vehicle is equipped with a caliper having a 42 mm (1.65 in.) piston and uses a 15 inch solid non-vented brake rotor. The brake rotor is described as a drum-in-hat style because of its dual role as a braking disc and parking brake drum.

The parking brake system on vehicles equipped with rear disc brakes consists of a small duo-servo drum brake mounted to the caliper adapter and uses the interior of the rear disc brake rotor as a drum (hat section of drum-in-hat style brake rotor).

The outboard rear disc brake shoes (pads) are side-oriented. The shoes are marked indicating which side they belong on.

DESCRIPTION - DISC BRAKES (EXPORT)

All vehicles are equipped with Four-Wheel-Disc brakes. Both 15” (BRE) and 16” (BR3) disc/disc brake systems are available. The disc brakes are manufactured by Continental Teves. The BR3 system is standard equipment on all-wheel drive and all right-hand drive models. It is optional on other models.

The BR3 system features larger, externally vented front brake rotors.

Although there are different disc/disc systems, they are serviced using the same service procedures. Some specifications differ.

HYDRAULIC/MECHANICAL (Continued)

DESCRIPTION - DRUM BRAKES (REAR)

This vehicle's rear wheel drum brakes are a two-shoe, internal-expanding type with an automatic adjuster screw. The automatic adjuster screw is located directly below the wheel cylinder that is mounted near the top of the brake assembly (Fig. 18). These and two brake shoes (and attaching parts) are mounted to a support plate at each rear wheel. A brake drum covers each brake assembly.

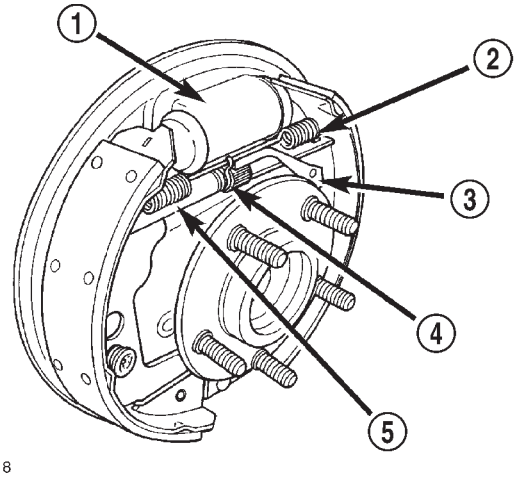

Fig. 18 Drum Brake Assembly (Right Shown)

1 - WHEEL CYLINDER
2 - BRAKE SHOE UPPER RETURN SPRING
3 - AUTOMATIC ADJUSTER LEVER
4 - TENSION CLIP
5 - AUTOMATIC ADJUSTER ASSEMBLY

OPERATION

OPERATION - DISC BRAKES (FRONT)

When the brakes are applied, fluid pressure is sent to each brake caliper. The pressure at the caliper is exerted equally against the caliper piston. The pressure applied to the piston is transmitted directly to the inboard brake shoe. This forces the shoe lining against the inner surface of the brake rotor. At the same time, fluid pressure within the caliper piston bore forces the caliper to slide inward on its guide pins. This action brings the outboard shoe lining into contact with the outer surface of the brake rotor. This pressure on both sides of the brake rotor causes friction, bringing the vehicle to a stop.

When the brake pedal is released, so is the fluid pressure. The piston seal inside the caliper is designed to pull the piston back into the bore of the caliper when the brake pedal is released (Fig. 19). This action helps maintain the proper brake shoe-to-rotor clearance.

As disc brake shoe linings wear, master cylinder reservoir brake fluid level will drop. Adjust as necessary. Fluid level should always be checked after replacing shoes.

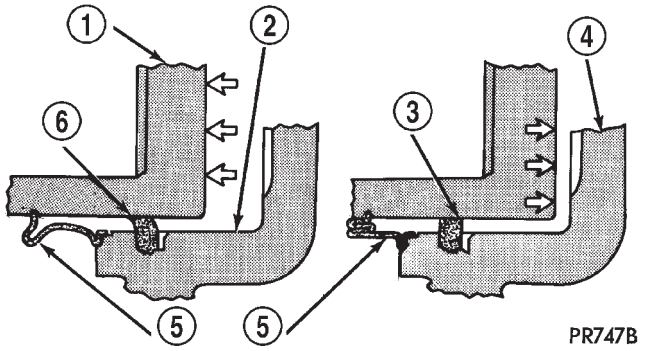

Fig. 19 Caliper Piston Seal Function For Automatic Adjustment

1 - PISTON
2 - CYLINDER BORE
3 - PISTON SEAL BRAKE PRESSURE OFF
4 - CALIPER HOUSING
5 - DUST BOOT
6 - PISTON SEAL BRAKE PRESSURE ON

OPERATION - DISC BRAKES (REAR)

The rear disc brakes operate similarly to front disc brakes, however, there are some features that require different service procedures.

DIAGNOSIS AND TESTING - DRUM BRAKE AUTOMATIC ADJUSTER

The rear drum brakes on this vehicle automatically adjust when required during the normal operation of the vehicle every time the brakes are applied. Use the following procedure to test the operation of the automatic adjuster.

Place the vehicle on a hoist with a helper in the driver's seat to apply the brakes. Remove the access plug from the adjustment hole in each brake support plate to provide visual access of the brake adjuster star wheel.

To eliminate the condition where maximum adjustment of the rear brake shoes does not allow the automatic adjuster to operate when tested, back the star wheel off approximately 30 notches. It will be necessary to hold the adjuster lever away from the star wheel to permit this adjustment.

Have the helper apply the brakes. Upon application of the brake pedal, the adjuster lever should move down, turning the adjuster star wheel. Thus, a definite rotation of the adjuster star wheel can be observed if the automatic adjuster is working properly. If one or more adjusters do not function properly, the respective drum must be removed for adjuster servicing.

BRAKE LINES

DESCRIPTION - BRAKE TUBES AND HOSES

The brake tubes are steel with a corrosion-resistant nylon coating applied to the external surfaces. The flex hoses are made of reinforced rubber with fittings at each end.

The primary and secondary brake tubes leading from the master cylinder to the ABS ICU Hydraulic Control Unit (HCU) or the non-ABS junction block have a special flexible section. This flexible section is required due to cradle movement while the vehicle is in motion (The ICU and non-ABS junction block are mounted to the cradle). **If replacement of these lines is necessary, only the original factory brake line containing the flexible section must be used**.

OPERATION - BRAKE TUBES AND HOSES

The purpose of the chassis brake tubes and flex hoses is to transfer the pressurized brake fluid developed by the master cylinder to the wheel brakes of the vehicle. The flex hoses are made of rubber to allow for the movement of the vehicle's suspension.

INSPECTION - BRAKE TUBES AND HOSES

Flexible rubber hose is used at both front brakes and at the rear axle. Inspection of brake hoses should be performed whenever the brake system is serviced and every 7,500 miles or 12 months, whichever comes first (every engine oil change). Inspect hydraulic brake hoses for surface cracking, scuffing, or worn spots. If the fabric casing of the rubber hose becomes exposed due to cracks or abrasions in the rubber hose cover, the hose should be replaced immediately. Eventual deterioration of the hose can take place with possible burst failure. Faulty installation can cause twisting, resulting in wheel, tire, or chassis interference.

The brake tubing should be inspected periodically for evidence of physical damage or contact with moving or hot components.

The flexible brake tube sections used on this vehicle in the primary and secondary tubes from the master cylinder to the ABS hydraulic control unit connections must also be inspected. This flexible tubing must be inspected for kinks, fraying and contact with other components or with the body of the vehicle.

BRAKE PADS/SHOES - FRONT

REMOVAL

REMOVAL - FRONT DISC BRAKE SHOES (DISC/DISC BRAKES)

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove both front wheel and tire assemblies.

(3) Begin on one side of the vehicle.

(4) Remove the anti-rattle clip from the outboard side of the caliper and adapter.

(5) Remove the two caliper guide pin bolts.

(6) Remove caliper from caliper adapter and brake rotor.

CAUTION: Supporting weight of caliper by the flexible brake fluid hose can damage the hose.

(7) Using wire or cord, hang the caliper from the front strut assembly (Fig. 20). Support the caliper firmly to prevent weight of caliper from being supported by the brake fluid hose.

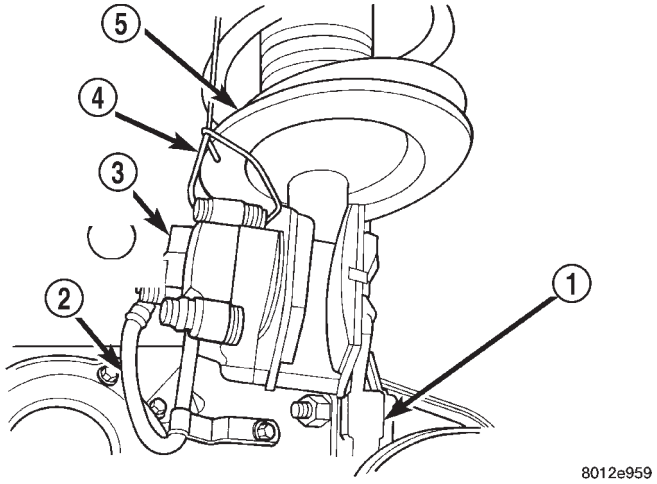

Fig. 20 Stored Front Disc Brake Caliper

1 - STEERING KNUCKLE
2 - BRAKE FLEX HOSE
3 - CALIPER ASSEMBLY
4 - WIRE HANGER
5 - STRUT ASSEMBLY

(8) Remove the outboard brake shoe from the caliper adapter.

(9) Pull the inboard brake shoe away from the caliper piston until the retaining clip on shoe is free from the cavity in the caliper piston (Fig. 21).

(10) Repeat the above procedure on other side of the vehicle.

BRAKE PADS/SHOES - FRONT (Continued)

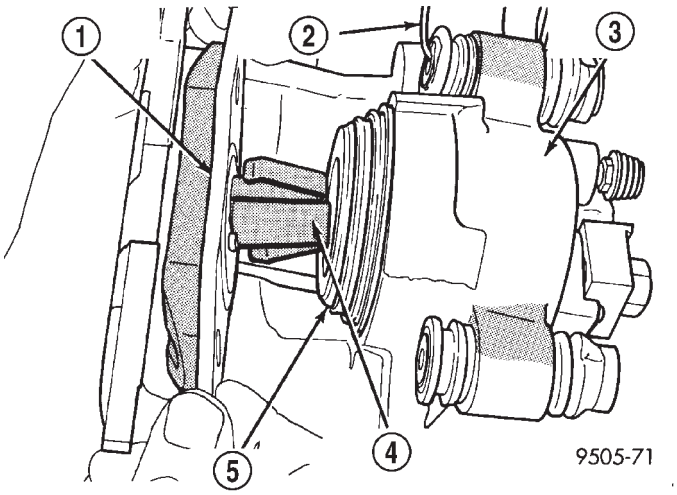

Fig. 21 Removing Inboard Shoe

1 - INBOARD BRAKE SHOE
2 - HANGER WIRE
3 - CALIPER ASSEMBLY
4 - RETAINING CLIP
5 - PISTON

REMOVAL - FRONT DISC BRAKE SHOES (DISC/DRUM BRAKES)

(1) Raise the vehicle. Refer to HOISTING in LUBRICATION AND MAINTENANCE.

NOTE: Perform Step 2 through Step 5 on each side of the vehicle.

(2) Remove the front tire and wheel assembly.
(3) Remove the two brake caliper guide pin bolts (Fig. 22).

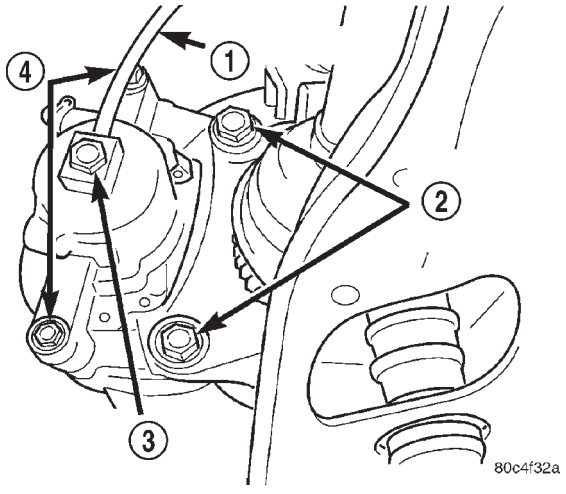

Fig. 22 Brake Caliper Mounting (Typical)

1 - BRAKE HOSE
2 - ADAPTER MOUNTING BOLTS
3 - BANJO BOLT
4 - CALIPER GUIDE PIN BOLTS

(4) Remove the disc brake caliper from the disc brake adapter and hang out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.
(5) Remove the brake shoes from the disc brake caliper adapter.

CLEANING - DISC BRAKE SHOES

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

INSPECTION - DISC BRAKE SHOES

Visually inspect brake shoes (pads) for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators on the shoes (if equipped) and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake shoes from the calipers.

Measure each brake shoe. The combined brake shoe and its lining material thickness should be measured at its thinnest point.

- For front disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.95 mm (5/16 inch), they should be replaced.
- For rear disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.0 mm (9/32 inch), they should be replaced.
- Typically, if front shoes are worn out, both fronts and rears need to be replaced. Make sure to check rears.

BRAKE PADS/SHOES - FRONT (Continued)

Replace **both** disc brake shoes (inboard and outboard) on each caliper. It is necessary to replace the shoes on the opposite side of the vehicle as well as the shoes failing inspection.

If the brake shoe assemblies do not require replacement, be sure to reinstall the brake shoes in the original position they were removed from.

INSTALLATION

INSTALLATION - FRONT DISC BRAKE SHOES

NOTE: There may be more than 1 lining material released. Make sure proper linings are being installed.

(1) Begin on one side of the vehicle or the other.

(2) Completely retract the caliper piston back into its bore in the brake caliper (This is required for caliper installation on the brake rotor with new brake shoes installed).

(3) If applied, remove the protective paper from the noise suppression gasket on the rear of both the inner and outer brake shoe assemblies.

(4) Install the new inboard brake shoe into the caliper piston by firmly pressing its retaining clip into the piston bore. Be sure the inboard brake shoe is positioned squarely against the face of the caliper piston.

(5) Lubricate both adapter abutments where the shoes slide with a small amount of Mopar® Dielectric grease, or equivalent.

(6) Slide the new outboard brake shoe into the caliper adapter with the lining up against the outside of the brake rotor.

CAUTION: Use care when installing the caliper assembly onto the caliper adapter, so the caliper guide pin bushings do not get damaged by the adapter bosses.

(7) Carefully position the brake caliper over the brake rotor and adapter.

(8) Install the caliper guide pin bolts and tighten to a torque of 35 N·m (26 ft. lbs.). **Extreme caution should be taken not to cross thread the caliper guide pin bolts.**

(9) Install the caps over the caliper guide pin bolts.

(10) Install the new caliper hold down spring (anti-rattle clip) on the outboard side of the caliper. Start the spring into the holes on the caliper, then stretch the clip legs past the abutments on the caliper adapter.

(11) Repeat the above procedure on other side of the vehicle.

(12) Install the wheel and tire assemblies. Tighten the wheel mounting nuts in proper sequence until all nuts are torqued to half specification, then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(13) Lower vehicle.

(14) Pump the brake pedal several times. This will set the shoes to the brake rotor.

(15) Check and adjust brake fluid level as necessary.

(16) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoes.

INSTALLATION - FRONT DISC BRAKE SHOES (DISC/DRUM BRAKES)

NOTE: Perform steps Step 1 through Step 5on each side of the vehicle.

(1) Place the brake shoes in the adapter anti-rattle clips.

(2) Completely retract the caliper piston back into the bore of the caliper.

CAUTION: Use care when installing the caliper onto the disc brake adapter to avoid damaging the boots on the caliper guide pins.

(3) Install the disc brake caliper over the brake shoes on the brake caliper adapter.

(4) Align the caliper guide pin bolt holes with the guide pins. Install the caliper guide pin bolts and tighten them to a torque of 35 N·m (26 ft. lbs.) (Fig. 22).

(5) Install the tire and wheel assembly. Tighten the wheel mounting nuts to a torque of 135 N·m (100 ft. lbs.).

(6) Lower the vehicle.

(7) Pump the brake pedal several times. This will set the shoes to the brake rotor.

(8) Check and adjust the brake fluid level as necessary.

(9) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoes.

BRAKE PADS/SHOES - REAR DISC

REMOVAL - REAR DISC BRAKE SHOES

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

BRAKE PADS/SHOES - REAR DISC (Continued)

(2) Remove rear wheel and tire assemblies from vehicle.

(3) Remove the caliper to adapter guide pin bolts (Fig. 23).

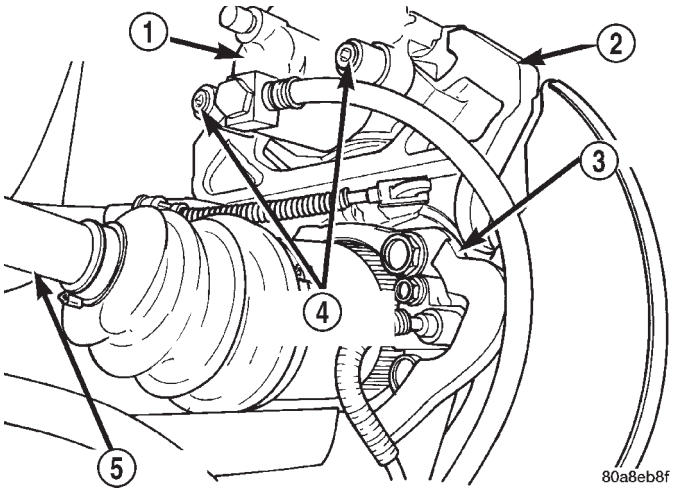

Fig. 23 Caliper Guide Pin Bolts

1 - DISC BRAKE CALIPER
2 - ADAPTER
3 - AXLE
4 - GUIDE PIN BOLTS
5 - DRIVESHAFT (AWD MODELS ONLY)

(4) Remove rear caliper from adapter using the following procedure. First rotate front of caliper up from the adapter. Then pull the rear of the caliper and the outboard brake shoe anti-rattle clip out from under the rear abutment on the adapter (Fig. 24).

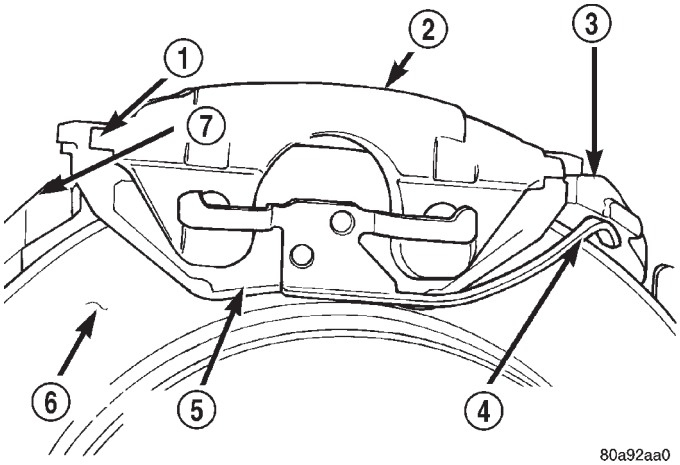

Fig. 24 Removing/Installing Caliper

1 - LIFT THIS END OF CALIPER AWAY FROM ADAPTER FIRST
2 - DISC BRAKE CALIPER
3 - ADAPTER ABUTMENT
4 - OUTBOARD BRAKE SHOE HOLD DOWN CLIP
5 - OUTBOARD BRAKE SHOE
6 - ROTOR
7 - ADAPTER

(5) Support caliper to prevent the weight of the caliper from damaging the flexible brake hose (Fig. 25).

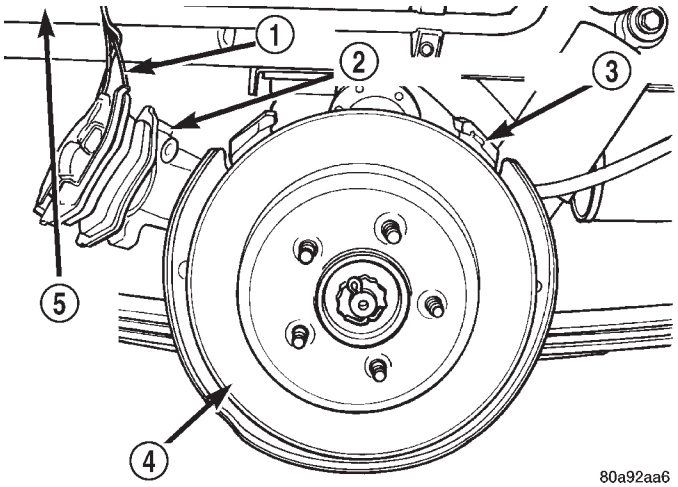

Fig. 25 Correctly Supported Caliper

1 - WIRE
2 - CALIPER
3 - ADAPTER
4 - ROTOR
5 - INNER FENDER

(6) If the brake rotor needs to be removed it can be removed by removing the retainer clips and then pulling the rotor straight off the wheel mounting studs.

(7) Remove the outboard brake shoe from the caliper. Brake shoe is removed by pushing the shoe toward the piston, disengaging the two metal protrusions on the shoe back, then sliding the brake shoe off the caliper.

(8) Remove inboard brake shoe from caliper. Inboard brake shoe is removed by pulling it out of the caliper piston, until the retaining clip is free of the piston (Fig. 26).

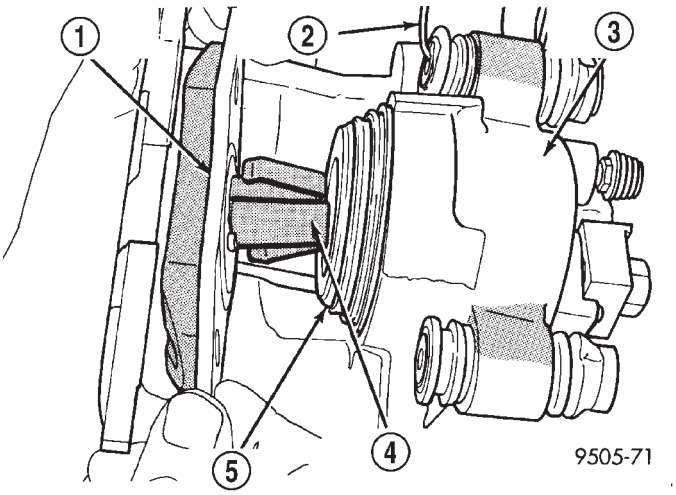

Fig. 26 Removing Inboard Brake Shoe

1 - INBOARD BRAKE SHOE
2 - HANGER WIRE
3 - CALIPER ASSEMBLY
4 - RETAINING CLIP
5 - PISTON

CLEANING - DISC BRAKE SHOES

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

INSPECTION - DISC BRAKE SHOES

Visually inspect brake shoes (pads) for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators on the shoes (if equipped) and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake shoes from the calipers.

Measure each brake shoe. The combined brake shoe and its lining material thickness should be measured at its thinnest point.

- For front disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.95 mm (5/16 inch), they should be replaced.
- For rear disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.0 mm (9/32 inch), they should be replaced.
- Typically, if front shoes are worn out, both fronts and rears need to be replaced. Make sure to check rears.

Replace **both** disc brake shoes (inboard and outboard) on each caliper. It is necessary to replace the shoes on the opposite side of the vehicle as well as the shoes failing inspection.

If the brake shoe assemblies do not require replacement, be sure to reinstall the brake shoes in the original position they were removed from.

INSTALLATION - REAR DISC BRAKE SHOES

(1) Completely retract caliper piston back into piston bore of caliper assembly.

(2) Lubricate both adapter abutments where the shoes contact with a liberal amount of Mopar® Multipurpose Lubricant, or equivalent.

(3) If removed, install the brake rotor on the hub, making sure it is squarely seated on the face of the hub.

(4) Install the inboard brake shoe into the caliper piston by firmly pressing it into the piston bore using your thumbs. Be sure inboard brake shoe is positioned squarely against the face of the caliper piston.

NOTE: The outboard shoes are different left to right. They can be identified by a L or R stamped on the clip.

(5) Install the outboard brake shoe on the disc brake caliper. Be sure the outboard shoe is positioned squarely against the outboard fingers of the caliper.

CAUTION: Use care when installing the caliper assembly onto the adapter, so the caliper guide pin bushings do not get damaged by the mounting bosses.

(6) Carefully lower caliper and brake shoes over rotor and onto adapter, reversing the removal procedure (Fig. 24).

BRAKE PADS/SHOES - REAR DISC (Continued)

CAUTION: When installing the caliper guide pin bolts extreme caution should be taken not to crossthread the guide pin bolts.

(7) Install the caliper guide pin bolts. Tighten the guide pin bolts to a torque of 35 N·m (26 ft. lbs.).

(8) Install the wheel and tire assembly. Tighten the wheel mounting nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(9) Lower vehicle.

CAUTION: Before moving vehicle, pump the brake pedal several times to insure the vehicle has a firm brake pedal to adequately stop the vehicle.

(10) Pump brake pedal several times to set brake shoes to rotors.

(11) Check fluid level in reservoir.

(12) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

BRAKE PADS/SHOES - REAR DRUM

REMOVAL - REAR DRUM BRAKE SHOES

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove the rear wheel and tire assemblies from the vehicle.

(3) Remove rear brake drum to hub retaining clips (if equipped), then remove rear brake drums. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - REMOVAL)

NOTE: When creating slack in the park brake cables by locking out the automatic adjuster, (Fig. 27) be sure that the park brake pedal is in the released (most upward) position.

(4) Create slack in the rear park brake cables. Slack is created by grabbing exposed section of front park brake cable and pulling it down and rearward. Slack is maintained in the park brake cable by installing a pair of locking pliers on the park brake cable just rearward of **only the rear** body outrigger bracket. (Fig. 27)

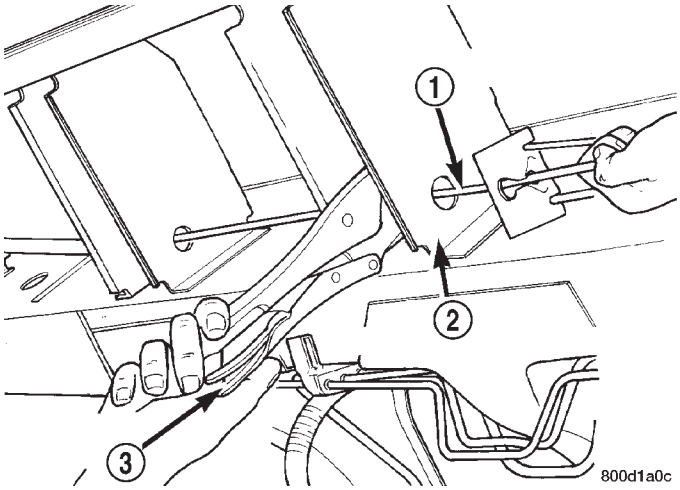

Fig. 27 Locked Out Park Brake Automatic Adjuster

1 - PARK BRAKE CABLE
2 - REAR BODY OUTRIGGER BRACKET
3 - LOCKING PLIERS

(5) Remove adjustment lever spring (Fig. 28) from adjustment lever and front brake shoe.

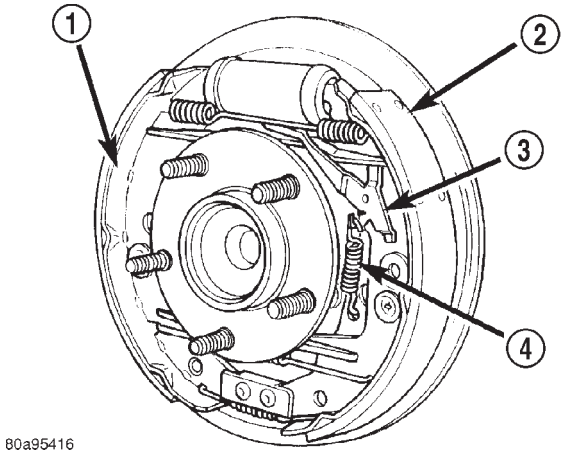

Fig. 28 Adjustment Lever Actuating Spring

1 - TRAILING BRAKE SHOE
2 - LEADING BRAKE SHOE
3 - AUTOMATIC ADJUSTER LEVER
4 - ADJUSTER LEVER ACTUATING SPRING

BRAKE PADS/SHOES - REAR DRUM (Continued)

(6) Remove adjustment lever (Fig. 29) from leading brake shoe.

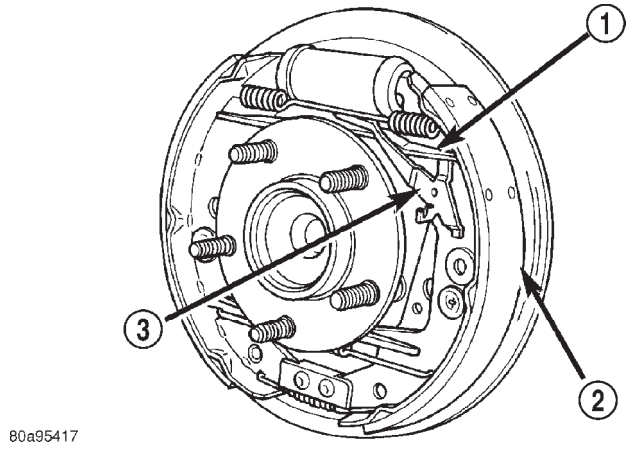

Fig. 29 Adjustment Lever

1 - AUTOMATIC ADJUSTER
2 - LEADING BRAKE SHOE
3 - AUTOMATIC ADJUSTER LEVER

(7) Remove the brake shoe to brake shoe lower return springs (Fig. 30) and (Fig. 31).

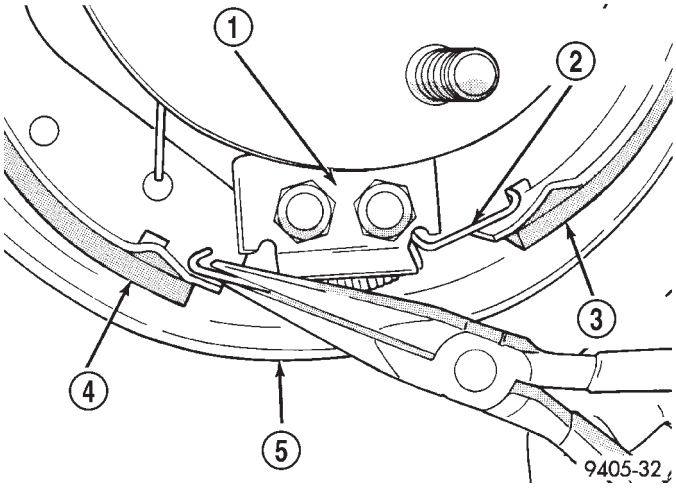

Fig. 30 Remove/Install Brake Shoe Lower Return Spring

1 - ANCHOR PLATE
2 - LOWER BRAKE SHOE RETURN SPRING
3 - REAR BRAKE SHOE
4 - FRONT BRAKE SHOE
5 - BRAKE SUPPORT PLATE

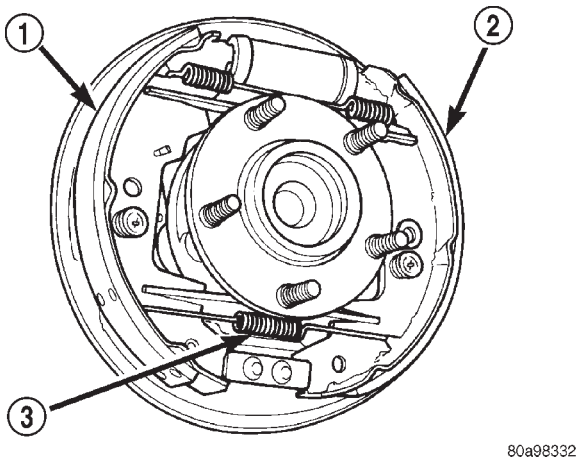

Fig. 31 Brake Shoe Lower Return Spring

1 - TRAILING BRAKE SHOE
2 - LEADING BRAKE SHOE
3 - RETURN SPRING

(8) Remove the tension clip (Fig. 32) attaching the upper return spring to the automatic adjuster assembly.

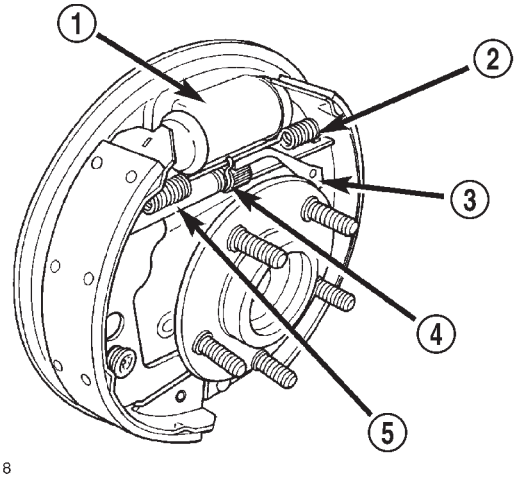

Fig. 32 Tension Clip Attachment To Adjuster

1 - WHEEL CYLINDER
2 - BRAKE SHOE UPPER RETURN SPRING
3 - AUTOMATIC ADJUSTER LEVER
4 - TENSION CLIP
5 - AUTOMATIC ADJUSTER ASSEMBLY

BRAKE PADS/SHOES - REAR DRUM (Continued)

(9) Remove the brake shoe to brake shoe upper return spring (Fig. 33).

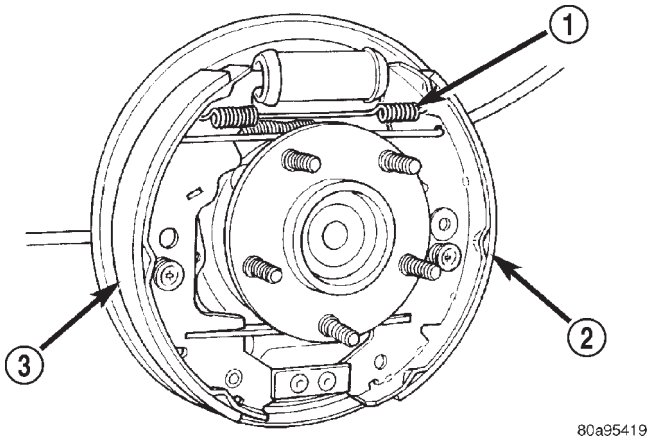

Fig. 33 Brake Shoe Upper Return Spring

1 - BRAKE SHOE RETURN SPRING
2 - LEADING BRAKE SHOE
3 - TRAILING BRAKE SHOE

(10) Remove the trailing brake shoe assembly to brake support plate hold down spring and pin (Fig. 34) from the brake shoe assembly.

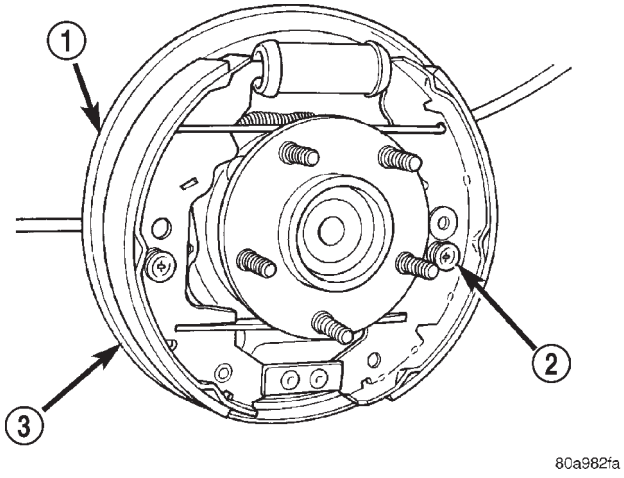

Fig. 34 Trailing Brake Shoe Hold Down Spring And Pin

1 - BRAKE SUPPORT PLATE
2 - HOLD DOWN SPRING AND PIN
3 - TRAILING BRAKE SHOE

(11) Remove the trailing brake shoe assembly from the brake support plate, park brake actuating lever and park brake actuating strut (Fig. 35). Remove the automatic adjuster assembly from the leading brake shoe.

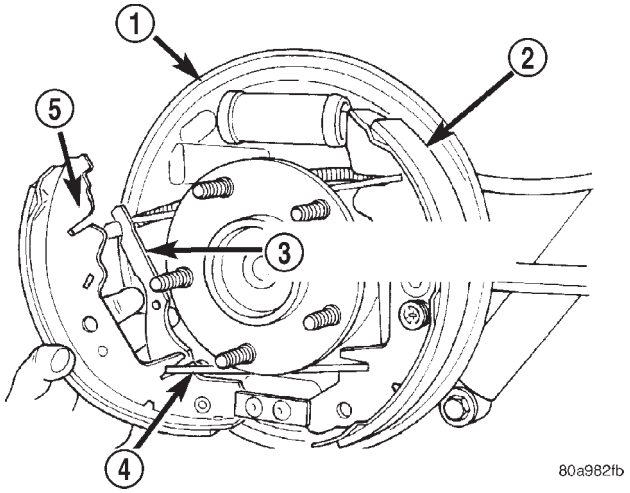

Fig. 35 Trailing Brake Shoe Removal/Installation

1 - BRAKE SUPPORT PLATE
2 - LEADING BRAKE SHOE
3 - PARK BRAKE ACTUATING LEVER
4 - PARK BRAKE ACTUATING STRUT
5 - TRAILING BRAKE SHOE

(12) Remove the leading brake shoe assembly to brake support plate hold down spring and pin (Fig. 36) from the brake shoe. Remove the leading brake shoe from the brake support plate.

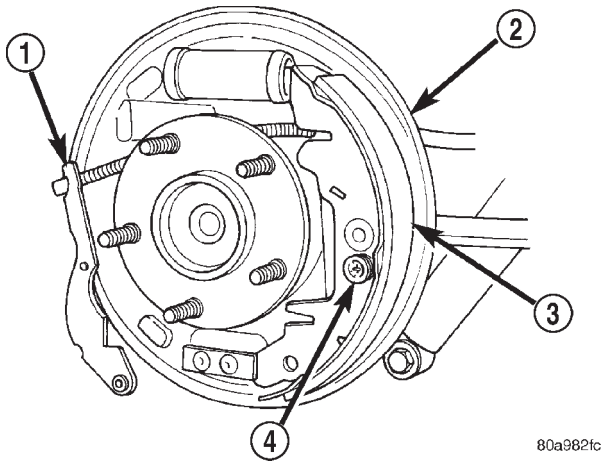

Fig. 36 Leading Brake Shoe Hold Down Spring And Pin

1 - PARK BRAKE ACTUATING LEVER
2 - BRAKE SUPPORT PLATE
3 - LEADING BRAKE SHOE
4 - HOLD DOWN SPRING AND PIN

BRAKE PADS/SHOES - REAR DRUM (Continued)

(13) Remove the park brake actuator (Fig. 37) from the leading brake shoe and transfer to the replacement brake shoe.

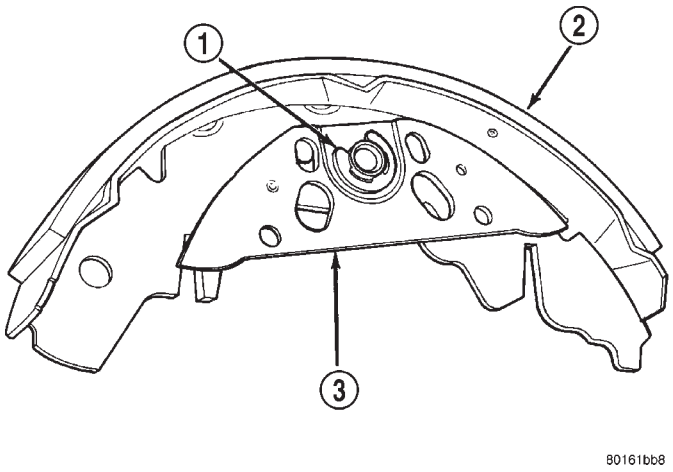

Fig. 37 Park Brake Actuator Plate

1 - RETAINING CLIP
2 - BRAKE SHOE ASSEMBLY
3 - ACTUATOR PLATE

INSPECTION - REAR DRUM BRAKE SHOE LINING

(1) Remove the tire and wheel assembly from the vehicle

(2) Remove the rear brake adjusting hole plug found in the brake support.

(3) Insert a thin screwdriver into brake adjusting hole to hold the adjusting lever away from the notches on the adjusting screw star wheel.

(4) Insert Tool C-3784 into brake adjusting hole and engage notches of brake adjusting screw star wheel. Release brake by prying down with adjusting tool.

(5) Remove the rear brake drum from the rear hub and bearing assembly. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - REMOVAL)

(6) Inspect brake lining for wear, shoe alignment, and or contamination from grease or brake fluid.

INSTALLATION - REAR DRUM BRAKE SHOES

(1) Lubricate the eight shoe contact areas on the support plate and anchor, (Fig. 38) using the required special Mopar® Brake Lubricant or equivalent.

(2) Install leading brake shoe on brake support plate. Install the leading brake shoe hold down spring and pin (Fig. 36) on the brake shoe.

(3) Install the park brake actuator strut (Fig. 39) on the leading brake shoe. Then install the park brake actuator lever on the strut (Fig. 39).

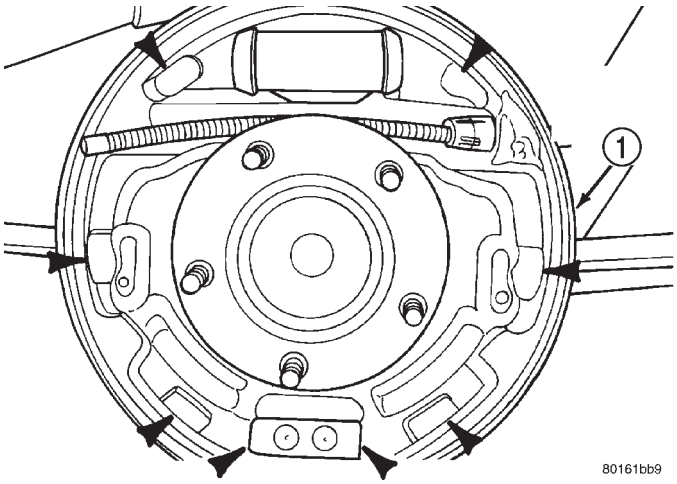

Fig. 38 Brake Support Plate Contact Areas

1 - REAR BRAKE SUPPORT PLATE

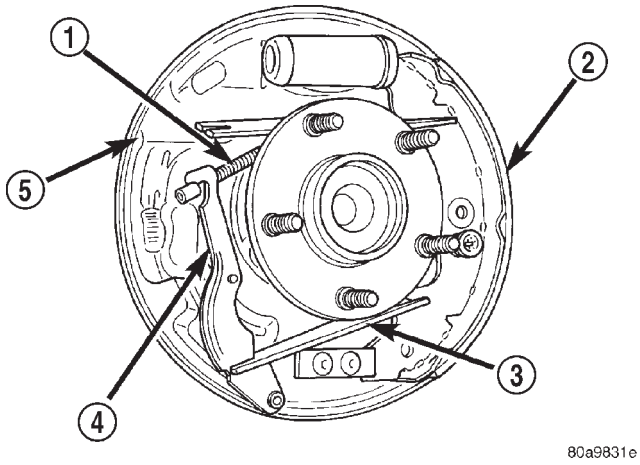

Fig. 39 Park Brake Components Assembled On Leading Brake Shoe

1 - PARK BRAKE CABLE
2 - LEADING BRAKE SHOE
3 - PARK BRAKE ACTUATING STRUT
4 - PARK BRAKE ACTUATING LEVER
5 - BRAKE SUPPORT PLATE

(4) Install the automatic adjuster screw on the leading brake shoe. Then install the trailing brake shoe on the park brake actuating lever and park brake actuating strut (Fig. 35). Position trailing brake shoe on brake support plate.

(5) Install the brake shoe hold down pin and spring on the trailing brake shoe (Fig. 34).

(6) Install the brake shoe to brake shoe upper return spring (Fig. 33).

CAUTION: When installing the tension clip on the automatic adjuster, it must be located on only the threaded area of the adjuster assembly (Fig. 32). If it is located on a non-threaded area of the adjuster, the function of the automatic adjuster will be affected.

(7) Install the tension clip (Fig. 32) attaching the upper return spring to the automatic adjuster assembly.

(8) Install the brake shoe to brake shoe lower return springs on the brake shoes (Fig. 30) and (Fig. 31).

(9) Install automatic adjustment lever on the leading brake shoe of the rear brake assembly (Fig. 29).

(10) Install the actuating spring on the automatic adjustment lever and leading brake shoe assembly (Fig. 28).

(11) Verify that the automatic adjuster lever has positive contact with the star wheel on the automatic adjuster assembly.

(12) When all components of both rear brake assemblies are correctly and fully installed, remove the locking pliers from the front park brake cable.

(13) Adjust brake shoes assemblies so as not to interfere with brake drum installation.

(14) Install the rear brake drums on the hubs.

(15) Adjust rear brake shoes.

(16) Install the wheel and tire assembly.

(17) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(18) Lower the vehicle.

(19) Push the parking brake lever (pedal) to the floor once and release pedal. This will automatically remove the slack from and correctly adjust the parking brake cables.

(20) Road test vehicle. The automatic adjuster will continue the brake adjustment during the road test of the vehicle.

ADJUSTMENTS

ADJUSTMENT - REAR DRUM BRAKE SHOES

NOTE: Normally, self-adjusting drum brakes do not require manual brake shoe adjustment. Although, in the event of a brake shoe replacement, it is advisable to make the initial adjustment manually to speed up the adjusting time.

NOTE: Before raising the vehicle, verify the parking brake lever is fully released.

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove rubber plug from rear brake adjusting hole in the rear brake support plate.

(3) Insert a thin screwdriver through the adjusting hole in the support plate and against the star wheel of the adjusting screw. Move handle of the tool upward rotating the star wheel until a slight drag is felt when tire and wheel assembly is rotated.

(4) Insert a second thin screwdriver or piece of welding rod into brake adjusting hole and push the adjusting lever out of engagement with the star wheel. **Care should be taken so as not to bend adjusting lever or distort lever spring.**

(5) While holding the adjusting lever out of engagement, back off the star wheel just enough to ensure a free wheel with no brake shoe drag.

(6) Repeat the above adjustment at the other rear wheel.

(7) Install the adjusting hole rubber plugs back in the rear brake support plates.

(8) Lower the vehicle.

DISC BRAKE CALIPER - FRONT

REMOVAL

REMOVAL - FRONT DISC BRAKE CALIPER (DISC/DISC BRAKES)

(1) Depress the brake pedal past its first inch of travel and hold it in this position using a brake pedal depressor (holding) tool. This is done to isolate the master cylinder from the brake hydraulic system disallowing the brake fluid to completely drain out of the brake fluid reservoir.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(3) Remove front wheel and tire assembly.

(4) Remove the banjo bolt connecting the brake hose to the brake caliper. There are two washers (one on each side of the brake hose fitting) that will come off with the banjo bolt. Discard these washers.

(5) Remove the 2 caliper guide pin bolts.

(6) Remove the brake caliper from the adapter.

REMOVAL - FRONT DISC BRAKE CALIPER (DISC/DRUM BRAKES)

(1) Using a brake pedal holding tool, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not

DISC BRAKE CALIPER - FRONT (Continued)

allow the brake fluid to drain out of the master cylinder reservoir when the lines are opened.

(2) Raise the vehicle. Refer to HOISTING in LUBRICATION AND MAINTENANCE.

(3) Remove the front tire and wheel assembly.

(4) Remove the banjo bolt connecting the brake hose to the brake caliper (Fig. 40). There are two washers (one on each side of the flex hose fitting) that will come off with the banjo bolt. Discard the washers.

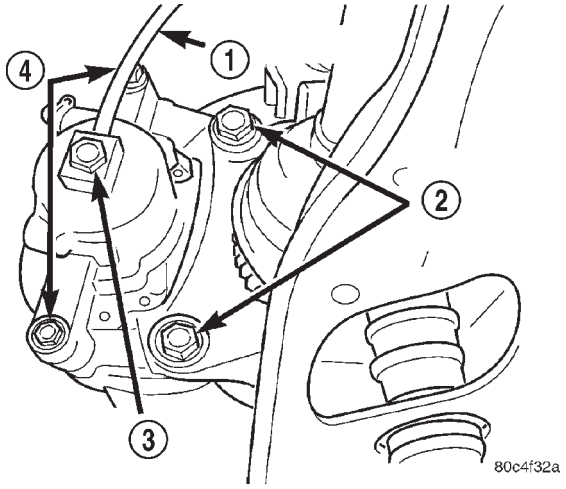

Fig. 40 Brake Caliper Mounting (Typical)

1 - BRAKE HOSE
2 - ADAPTER MOUNTING BOLTS
3 - BANJO BOLT
4 - CALIPER GUIDE PIN BOLTS

(5) Remove the two brake caliper guide pin bolts (Fig. 40).

(6) Remove the disc brake caliper from the disc brake adapter.

DISASSEMBLY

DISASSEMBLY - CALIPER GUIDE PIN BUSHINGS (DISC/DISC BRAKES)

Before disassembling the brake caliper, clean and inspect it. Refer to CLEANING or INSPECTION in this section.

(1) Using your fingers, collapse one side of the rubber guide pin bushing. Pull the guide pin bushing out the other side of the brake caliper mounting boss.

(2) Repeat this procedure on the remaining bushing.

DISASSEMBLY - CALIPER PISTON AND SEAL

WARNING: UNDER NO CONDITION SHOULD HIGH PRESSURE AIR EVER BE USED TO REMOVE A PISTON FROM A CALIPER BORE. PERSONAL INJURY COULD RESULT FROM SUCH A PRACTICE.

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to CLEANING AND INSPECTION in this section.

NOTE: The safest way to remove the piston from the caliper bore is to use the hydraulic pressure of the vehicle's brake system.

(1) Following the removal procedure in DISC BRAKE SHOES found in this section, remove the caliper from the brake rotor and hang the assembly on a wire hook away from rotor and body of the vehicle so brake fluid cannot get on these components. Remove the brake shoes, and place a small piece of wood between the piston and caliper fingers.

(2) Carefully depress the brake pedal to hydraulically push piston out of its bore. Once completed, apply and hold down the brake pedal to any position beyond the first inch of pedal travel using a brake pedal holding tool. This will prevent the fluid in the master cylinder reservoir from completely draining out.

(3) Disconnect the brake fluid flex hose from the caliper assembly and remove it from the vehicle.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

(4) Mount the caliper in a vise equipped with protective jaws.

(5) Remove the piston dust boot from the caliper and discard.

NOTE: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

(6) Using a soft tool such as a plastic trim stick, work the piston seal out of its groove in caliper piston bore (Fig. 41). Discard the old seal.

(7) Clean the piston bore and drilled passage ways using alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.

(8) Inspect the piston bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth.

DISC BRAKE CALIPER - FRONT (Continued)

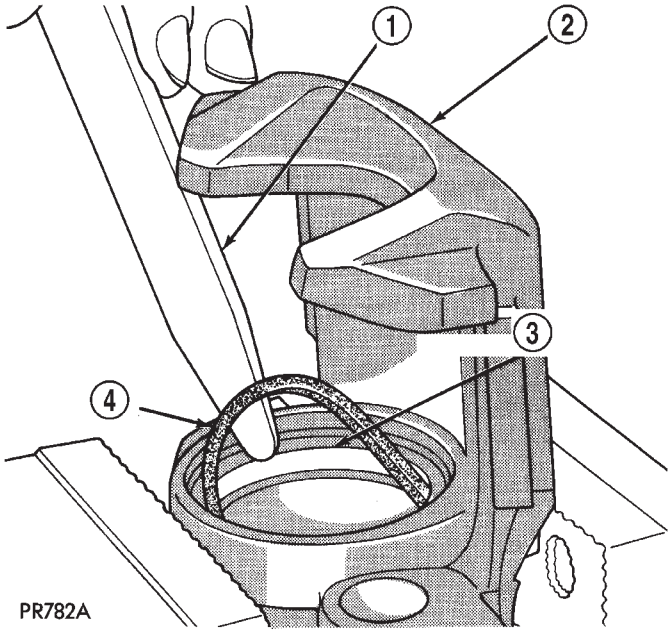

Fig. 41 Removing Piston Seal

1 - PLASTIC TRIM STICK
2 - CALIPER
3 - PISTON SEAL GROOVE
4 - PISTON SEAL

CLEANING - CALIPER

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION - CALIPER

Inspect the disc brake caliper for the following:

- Brake fluid leaks in and around boot area and inboard lining
- Ruptures, brittleness or damage to the piston dust boot
- Damaged, dry or brittle guide pin dust boots

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.

ASSEMBLY

ASSEMBLY - CALIPER GUIDE PIN BUSHINGS (DISC/DISC BRAKES)

(1) Fold the guide pin bushing in half lengthwise.

NOTE: To avoid damage to the bushing, do not use a sharp object to install the guide pin bushing.

(2) Insert the folded bushing into the caliper mounting boss using your fingers from the rear of the caliper.

(3) Unfold the bushing using your fingers or a wooden dowel until the bushing is fully seated into the caliper housing. The bushing flanges should be seated evenly on both sides of the bushing hole.

(4) Lubricate inside surfaces of bushing using Mopar® Dielectric Grease or equivalent.

(5) Repeat the procedure for remaining bushing.

ASSEMBLY - CALIPER PISTON AND SEAL

NOTE: Never use an old piston seal.

(1) Dip the new piston seal in clean brake fluid and install it in the groove of the caliper bore. The seal should be started at one area of the groove and gently worked around and into the groove (Fig. 42)using only your clean fingers to seat it.

(2) Coat the new piston boot with clean brake fluid.

(3) Position the dust boot over the piston after coating it with brake fluid.

CAUTION: Force applied to the piston to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

(4) Install piston into caliper bore pushing it past the piston seal until it bottoms in the caliper bore (Fig. 43).

DISC BRAKE CALIPER - FRONT (Continued)

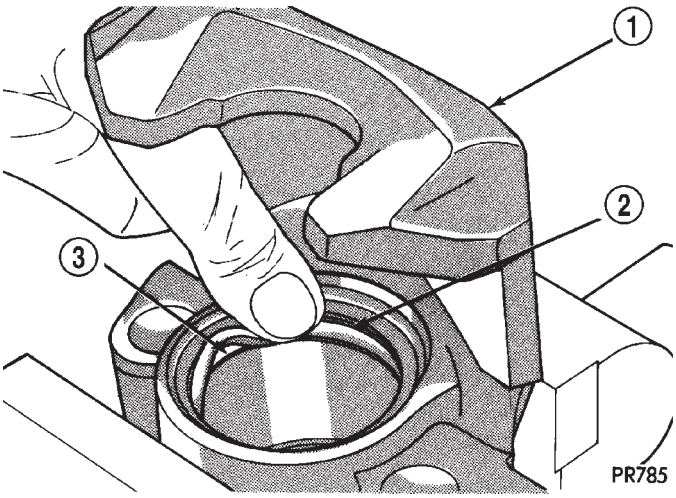

Fig. 42 Installing New Piston Seal

1 - CALIPER
2 - PISTON SEAL
3 - SEAL GROOVE

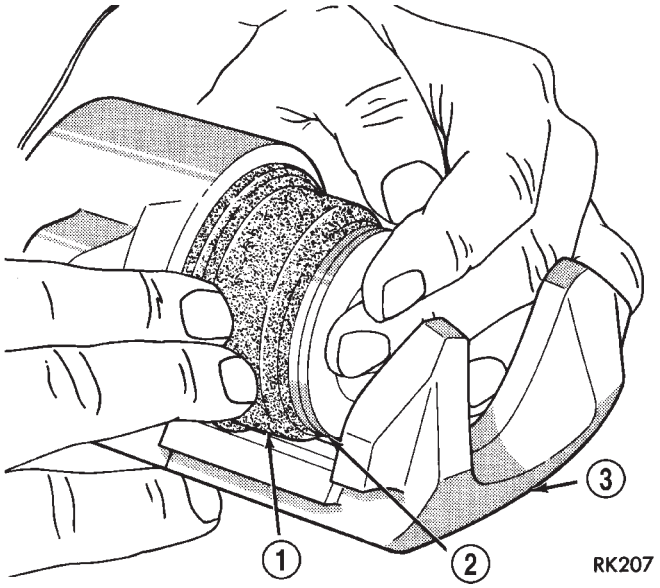

Fig. 43 Installing Piston Into Caliper Bore

1 - BOOT
2 - PISTON
3 - CALIPER

(5) Position the dust boot into the counterbore of the caliper assembly piston bore.

(6) Using a hammer and Installer, Special Tool C-4689 or C-4842 (depending on piston size), and Handle, Special Tool C-4171, drive the boot into the counterbore of the caliper as necessary (Fig. 44).

(7) Reinstall the caliper on the vehicle and bleed the brakes as necessary. Refer to Installation in this section.

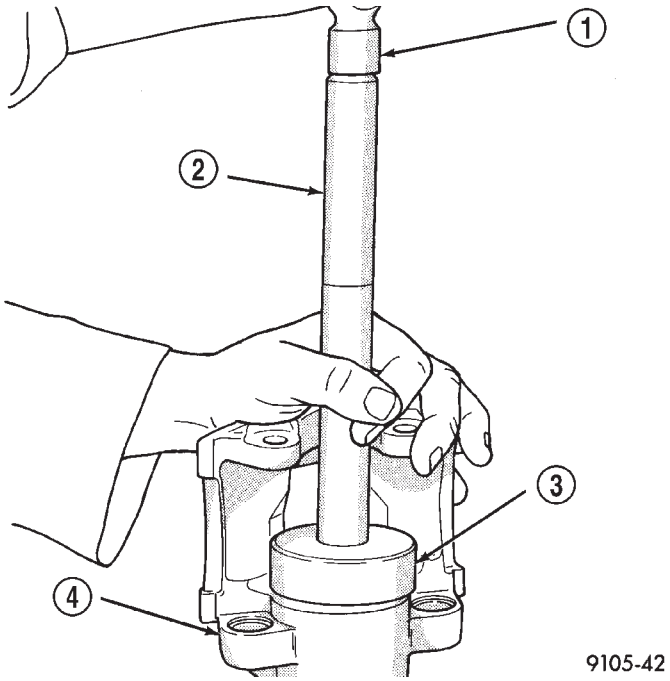

Fig. 44 Installing Dust Boot

1 - HAMMER
2 - SPECIAL TOOL C-4171
3 - SPECIAL TOOL C-4689 or C-4842
4 - CALIPER

INSTALLATION

INSTALLATION - FRONT DISC BRAKE CALIPER (DISC/DISC BRAKES)

CAUTION: TRW and Continental Teves brake calipers are not interchangeable. Each caliper is specifically designed for the unique brake system (TRW - disc/drum brake combination and Continental Teves - disc/disc brake combination). If calipers are interchanged, improper performance, noise and increased stopping distance can occur.

(1) Completely retract the caliper piston back into piston bore of the caliper. Use a C-clamp to retract the piston if necessary. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.

CAUTION: Use care when installing the brake caliper assembly onto the steering knuckle, so that the seals on the caliper guide pin bushings do not get damaged by the steering knuckle bosses.

(2) Carefully position the brake caliper and shoes over the brake rotor and adapter.

(3) Install the caliper guide pin bolts and tighten to a torque of 35 N·m (26 ft. lbs.). **Extreme caution**

DISC BRAKE CALIPER - FRONT (Continued)

should be taken not to cross thread the caliper guide pin bolts.

(4) Install the anti-rattle clip on the outboard side of the caliper. Start the clip into the holes on the caliper, then stretch the clip legs past the abutments on the caliper adapter.

CAUTION: When connecting the brake hose to the caliper, install new brake hose to caliper special copper washers.

(5) Install the brake hose on the caliper. To do this, first place one NEW special fitting washer on each side of the hose fitting, then slide the banjo bolt through the fitting. Next, thread the banjo bolt into the threaded port on the rear of the brake caliper. Tighten the banjo bolt to a torque of 47 N·m (35 ft. lbs.).

(6) Install the wheel and tire assembly. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification, then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(7) Lower the vehicle.

(8) Remove the brake pedal depressor (holding) tool.

(9) Bleed the hydraulic brake circuit to the brake caliper. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(10) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

INSTALLATION - FRONT DISC BRAKE CALIPER (DISC/DRUM BRAKES)

CAUTION: TRW and Continental Teves brake calipers are not interchangeable. Each caliper is specifically designed for the unique brake system (TRW - disc/drum brake combination and Continental Teves - disc/disc brake combination). If calipers are interchanged, improper performance, noise and increased stopping distance can occur.

(1) Completely retract the caliper piston back into the bore of the caliper. Use a C-clamp to retract the piston if necessary. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.

CAUTION: Use care when installing the caliper onto the disc brake adapter to avoid damaging the boots on the caliper guide pins.

(2) Install the disc brake caliper over the brake shoes on the brake caliper adapter.

(3) Align the caliper guide pin bolt holes with the guide pins. Install the caliper guide pin bolts and tighten them to a torque of 35 N·m (26 ft. lbs.) (Fig. 40).

(4) Install the banjo bolt connecting the brake hose to the brake caliper (Fig. 40). Install NEW copper washers on each side of the hose fitting as the banjo bolt is guided through the fitting. Thread the banjo bolt into the caliper and tighten it to a torque of 47 N·m (35 ft. lbs.).

(5) Install the tire and wheel assembly. Tighten the wheel mounting nuts to a torque of 135 N·m (100 ft. lbs.).

(6) Lower the vehicle.

(7) Remove the brake pedal holding tool.

(8) Bleed the caliper as necessary. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE).

(9) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoes.

DISC BRAKE CALIPER - REAR

REMOVAL - REAR DISC BRAKE CALIPER

NOTE: Handling of the rotor and caliper, must be done in such a way as to avoid damage to the rotor and scratching or nicking of lining on the brake shoes.

(1) Depress the brake pedal past its first inch of travel and hold it in this position using a brake pedal depressor (holding) tool. This is done to isolate the master cylinder from the brake hydraulic system disallowing the brake fluid to completely drain out of the brake fluid reservoir.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove rear wheel and tire assembly from vehicle.

(4) Remove the banjo bolt connecting the brake hose to the brake caliper. There are two washers (one on each side of the brake hose fitting) that will come off with the banjo bolt. Discard these washers.

(5) Remove the disc brake caliper to adapter guide pin bolts (Fig. 45).

(6) Remove rear caliper from adapter using the following procedure. First rotate front of caliper up from the adapter. Then pull the rear of the caliper and the outboard brake shoe anti-rattle clip out from under the rear abutment on the adapter (Fig. 46).

(7) If the brake rotor requires removal, it can now be removed by first removing the retainer clips from the wheel mounting studs, then pulling the rotor straight off the studs.

DISASSEMBLY - CALIPER PISTON AND SEAL

WARNING: UNDER NO CONDITION SHOULD HIGH PRESSURE AIR EVER BE USED TO REMOVE A PISTON FROM A CALIPER BORE. PERSONAL INJURY COULD RESULT FROM SUCH A PRACTICE.

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to CLEANING AND INSPECTION in this section.

NOTE: The safest way to remove the piston from the caliper bore is to use the hydraulic pressure of the vehicle's brake system.

(1) Following the removal procedure in DISC BRAKE SHOES found in this section, remove the caliper from the brake rotor and hang the assembly on a wire hook away from rotor and body of the vehicle so brake fluid cannot get on these components. Remove the brake shoes, and place a small piece of wood between the piston and caliper fingers.

(2) Carefully depress the brake pedal to hydraulically push piston out of its bore. Once completed, apply and hold down the brake pedal to any position beyond the first inch of pedal travel using a brake pedal holding tool. This will prevent the fluid in the master cylinder reservoir from completely draining out.

(3) Disconnect the brake fluid flex hose from the caliper assembly and remove it from the vehicle.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

(4) Mount the caliper in a vise equipped with protective jaws.

(5) Remove the piston dust boot from the caliper and discard.

NOTE: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

(6) Using a soft tool such as a plastic trim stick, work the piston seal out of its groove in caliper piston bore (Fig. 47). Discard the old seal.

(7) Clean the piston bore and drilled passage ways using alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.

(8) Inspect the piston bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth.

CLEANING - CALIPER

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION - CALIPER

Inspect the disc brake caliper for the following:

- Brake fluid leaks in and around boot area and inboard lining
- Ruptures, brittleness or damage to the piston dust boot
- Damaged, dry or brittle guide pin dust boots

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.

ASSEMBLY - CALIPER PISTON AND SEAL

NOTE: Never use an old piston seal.

(1) Dip the new piston seal in clean brake fluid and install it in the groove of the caliper bore. The seal should be started at one area of the groove and gently worked around and into the groove (Fig. 48)using only your clean fingers to seat it.

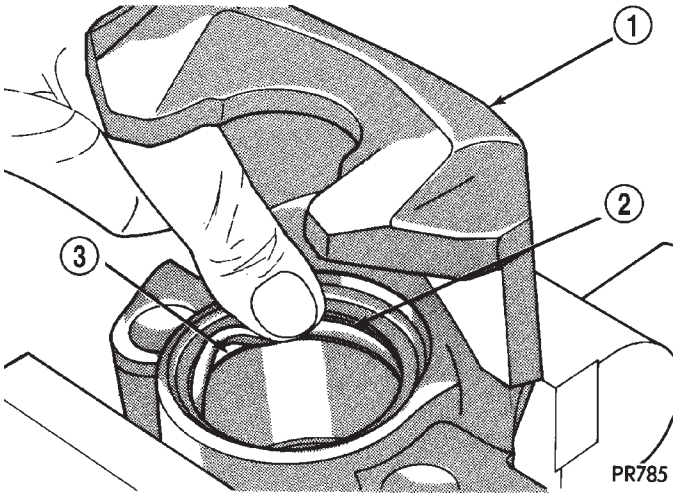

Fig. 48 Installing New Piston Seal

1 - CALIPER
2 - PISTON SEAL
3 - SEAL GROOVE

(2) Coat the new piston boot with clean brake fluid.

(3) Position the dust boot over the piston after coating it with brake fluid.

CAUTION: Force applied to the piston to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

(4) Install piston into caliper bore pushing it past the piston seal until it bottoms in the caliper bore (Fig. 49).

DISC BRAKE CALIPER - REAR (Continued)

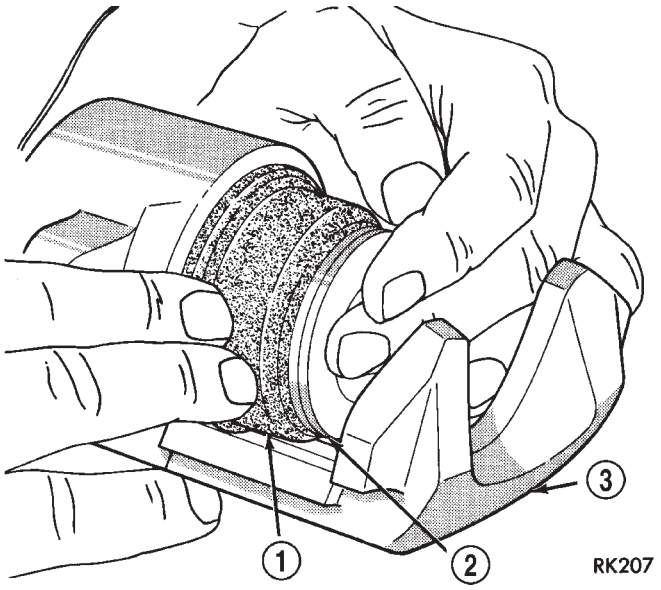

Fig. 49 Installing Piston Into Caliper Bore

1 - BOOT
2 - PISTON
3 - CALIPER

(5) Position the dust boot into the counterbore of the caliper assembly piston bore.

(6) Using a hammer and Installer, Special Tool C-4689 or C-4842 (depending on piston size), and Handle, Special Tool C-4171, drive the boot into the counterbore of the caliper as necessary (Fig. 50).

(7) Reinstall the caliper on the vehicle and bleed the brakes as necessary. Refer to Installation in this section.

INSTALLATION - REAR DISC BRAKE CALIPER

(1) Completely retract caliper piston back into piston bore of the caliper.

(2) If removed, install the brake rotor on the hub, making sure it is squarely seated on the face of the hub.

CAUTION: Use care when installing the caliper assembly onto the adapter, so the caliper guide pin bushings do not get damaged by the mounting bosses.

(3) Carefully lower caliper and brake shoes over rotor and onto the adapter using the reverse procedure for removal (Fig. 46).

CAUTION: When installing guide pin bolts extreme caution should be taken not to cross-thread the caliper guide pin bolts.

(4) Install the caliper guide pin bolts. Tighten the guide pin bolts to a torque of 35 N·m (26 ft. lbs.).

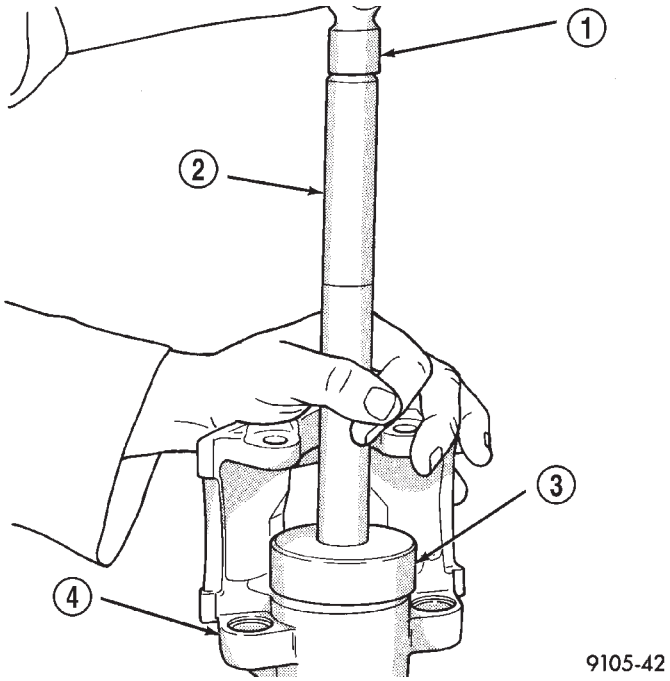

Fig. 50 Installing Dust Boot

1 - HAMMER
2 - SPECIAL TOOL C-4171
3 - SPECIAL TOOL C-4689 or C-4842
4 - CALIPER

CAUTION: When connecting the brake hose to the caliper, install new brake hose to caliper special washers.

(5) Install the brake hose on the caliper. To do this, first place one NEW special copper washer on each side of the hose fitting, then slide the banjo bolt through the fitting. Next, thread the banjo bolt into the threaded port on the rear of the brake caliper. Tighten the banjo bolt to a torque of 47 N·m (35 ft. lbs.).

(6) Install the wheel and tire assembly.

(7) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(8) Lower the vehicle.

(9) Remove the brake pedal depressor (holding) tool.

(10) Bleed the hydraulic brake circuit to the brake caliper. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(11) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

DISC BRAKE CALIPER ADAPTER

REMOVAL - FRONT DISC BRAKE CALIPER ADAPTER

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove front wheel and tire assembly, disc brake caliper and brake shoes. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL)

(3) Remove two bolts fastening adapter to steering knuckle, then remove disc brake caliper adapter.

INSTALLATION - FRONT DISC BRAKE CALIPER ADAPTER

(1) Place adapter over brake rotor and align adapter mounting holes to knuckle.

CAUTION: Adapter mounting bolts have a special Dacromet® coating applied to resist corrosion. If mounting bolts need to be replaced, use only Mopar® replacement parts.

(2) Install adapter mounting bolts and tighten to 169 N·m (125 ft. lbs.) torque.

(3) Install brake shoes, disc brake caliper and wheel and tire assembly. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION)

(4) Lower vehicle.

(5) Pump the brake pedal several times to set the pads to the brake rotor.

(6) Check and adjust brake fluid level as necessary.

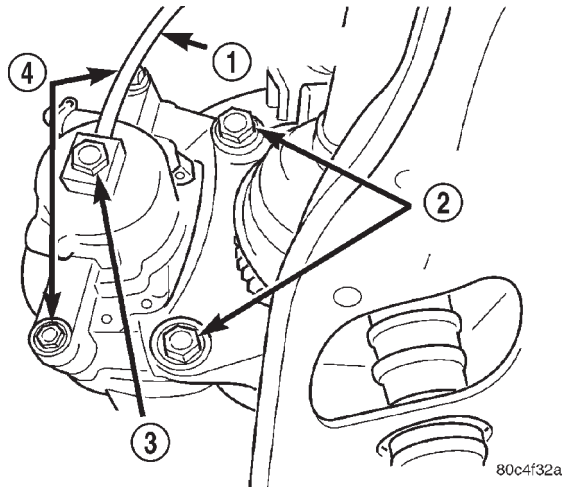

Fig. 51 Brake Caliper Mounting

1 - BRAKE HOSE
2 - ADAPTER MOUNTING BOLTS
3 - BANJO BOLT
4 - CALIPER GUIDE PIN BOLTS

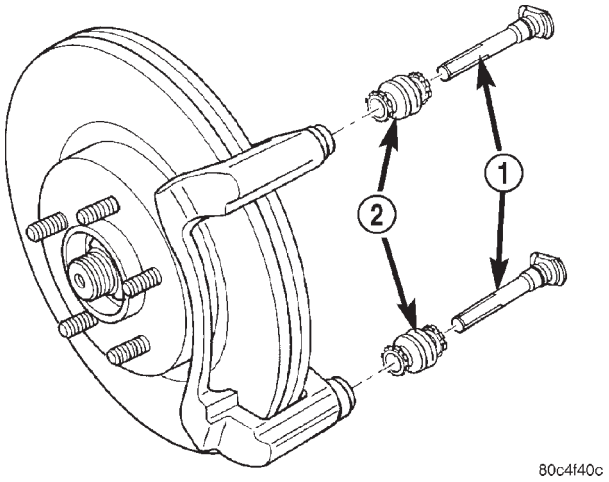

Fig. 52 Guide Pins And Boots

1 - PINS
2 - BOOTS

DISC BRAKE CALIPER GUIDE PINS

REMOVAL - DISC BRAKE CALIPER GUIDE PINS (DISC/DRUM BRAKES)

(1) Raise the vehicle. Refer to HOISTING in LUBRICATION AND MAINTENANCE.

(2) Remove the front tire and wheel assembly.

(3) Remove the two brake caliper guide pin bolts (Fig. 51).

(4) Remove the disc brake caliper from the disc brake caliper adapter and hang it out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.

(5) Remove the guide pins and boots from the adapter as shown (Fig. 52).

INSTALLATION - DISC BRAKE CALIPER GUIDE PINS (DISC/DRUM BRAKES)

(1) Lubricate the guide pins and inside the boots with the packet supplied with the service kit, Syntheso GLK-1 lubricant or equivalent.

(2) Install the guide pins and boots in the adapter as shown (Fig. 52). The boots have grooves built into their inner lips to fit onto the pins and adapter.

CAUTION: Use care when installing the caliper onto the disc brake adapter to avoid damaging the boots on the caliper guide pins.

DISC BRAKE CALIPER GUIDE PINS (Continued)

(3) Install the disc brake caliper over the brake shoes on the brake caliper adapter.

(4) Align the caliper guide pin bolt holes with the guide pins. Install the caliper guide pin bolts and tighten them to a torque of 35 N·m (26 ft. lbs.) (Fig. 51).

(5) Install the tire and wheel assembly. Tighten the wheel mounting nuts to a torque of 135 N·m (100 ft. lbs.).

(6) Lower the vehicle.

(7) Pump the brake pedal several times before moving the vehicle to set the shoes to the brake rotor.

DRUM

REMOVAL

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove the tire and wheel assembly from the vehicle

(3) Remove the rear brake shoe adjusting hole cover plug.

(4) Insert a thin screwdriver into brake adjusting hole and hold adjusting lever away from notches of adjusting screw star wheel.

(5) Insert another thin screwdriver into brake adjusting hole and engage notches of brake adjusting screw star wheel. Release brake adjustment by prying down with adjusting tool.

(6) Remove rear brake drum from rear hub/bearing assembly.

NOTE: It may be necessary to insert M8 X 1.25 MM bolts into the two removal holes on the drum to force the drum off the hub.

INSTALLATION

(1) Adjust brake shoe assemblies so as not to interfere with brake drum installation.

(2) Install the rear brake drums on the hubs.

(3) Adjust drum brake shoes as necessary per procedure found in the Adjustment section of this service manual group (Refer to 5 - BRAKES/ HYDRAULIC/MECHANICAL/DRUM - ADJUSTMENTS).

(4) Install wheel and tire assembly.

(5) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(6) Lower the vehicle.

FLUID

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brake hydraulic unit and all hydraulic fluid hoses.

STANDARD PROCEDURE - BRAKE FLUID LEVEL CHECKING

Check master cylinder reservoir fluid level a minimum of twice annually.

Fluid reservoirs are marked with the words FULL and ADD to indicate proper brake fluid fill level of the master cylinder.

If necessary, add brake fluid to bring the level to the bottom of the FULL mark on the side of the master cylinder fluid reservoir.

Use only Mopar® brake fluid or equivalent from a sealed container. Brake fluid must conform to DOT 3 specifications (DOT 4 or DOT 4+ are acceptable).

DO NOT use brake fluid with a lower boiling point, as brake failure could result during prolonged hard braking.

Use only brake fluid that was stored in a tightly-sealed container.

DO NOT use petroleum-based fluid because seal damage will result. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid etc.

SPECIFICATIONS

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications (DOT 4 and DOT 4+ are acceptable) and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

FLUID (Continued)

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

JUNCTION BLOCK

DESCRIPTION - NON-ABS JUNCTION BLOCK

A junction block is used on vehicles that are not equipped with antilock brakes (ABS). The junction block mounts in the same location as the integrated control unit (ICU) does on vehicles equipped with ABS. This allows for use of the same brake tube configuration on all vehicles. The junction block is located on the driver's side of the front suspension cradle/crossmember below the master cylinder (Fig. 53).

It has six threaded ports to which the brake tubes connect. Two are for the primary and secondary brake tubes coming from the master cylinder. The remaining four are for the chassis brake tubes going to each brake assembly.

OPERATION - NON-ABS JUNCTION BLOCK

The junction block distributes the brake fluid coming from the master cylinder primary and secondary ports to the four chassis brake tubes leading to the brakes at each wheel. Since the junction block mounts in the same location as the ABS integrated control unit (ICU), it allows for the common use of brake tubes going to the brakes whether the vehicle is equipped with or without ABS.

NOTE: Although the brake tubes coming from the master cylinder to the junction block or ABS ICU may appear to be the same, they are not. They are unique to each brake system application.

REMOVAL - NON-ABS JUNCTION BLOCK

(1) Using a brake pedal depressor, move and lock the brake pedal to a position past its first 1 inch of travel. This will prevent brake fluid from draining out of the master cylinder when the brake tubes are removed from the junction block.

(2) Disconnect the battery negative cable.

(3) If the vehicle is equipped with speed control, perform the following:

(a) Disconnect the battery positive cable.

(b) Remove the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(c) Disconnect the vacuum hose connector at the tank built into the battery tray.

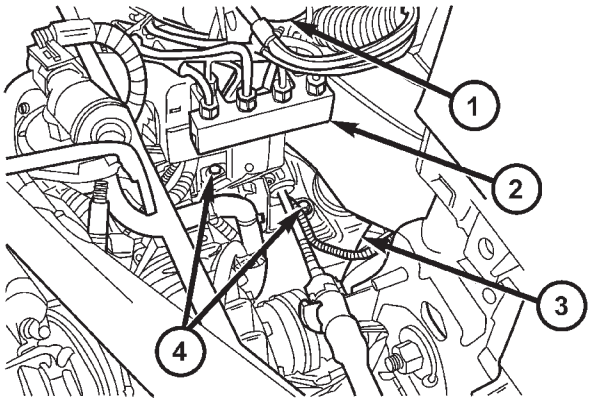
(d) Remove the screw securing the coolant filler neck to the battery tray.

(e) Remove the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

(f) Remove the fasteners and move the speed control servo off to the side, out of the way.

CAUTION: Before removing the brake tubes from the junction block, the junction block and the brake tubes must be thoroughly cleaned. This is required to prevent contamination from entering the brake hydraulic system.

(4) Remove the four chassis brake tubes from the top of the junction block (Fig. 53).



80ad9ddb

Fig. 53 NON-ABS JUNCTION BLOCK

1 - MASTER CYLINDER
2 - JUNCTION BLOCK
3 - SUSPENSION CROSSMEMBER
4 - MOUNTING BOLTS

(5) Remove the primary and secondary brake tubes from the top of the junction block.

(6) Remove the bolts attaching the junction block mounting bracket to the front suspension crossmember (Fig. 53), then remove the junction block.

INSTALLATION - NON-ABS JUNCTION BLOCK

(1) Install the junction block and mounting bracket on the front suspension crossmember (Fig. 53). Install the mounting bolts and tighten to a torque of 28 N·m (250 in. lbs.).

(2) Install the primary and secondary brake tubes from the master cylinder in their ports. Tighten tube nuts to a torque of 17 N·m (145 in. lbs.). **Take care not to twist tubes when tightening tube nuts. They must be properly positioned to allow free movement with rubber isolated suspension crossmember.**

JUNCTION BLOCK (Continued)

(3) Install the four chassis brake tubes into the outlet ports of the junction block. Tighten all 6 tube nuts to a torque of 17 N·m (145 in. lbs.).

(4) If the vehicle is equipped with speed control, perform the following:

(a) Install the speed control servo with its mounting nuts.

(b) Connect the wiring harness to the speed control servo.

(c) Install the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).

(d) Install the screw securing the coolant filler neck to the battery tray.

(e) Reconnect the vacuum hose connector at the tank built into the battery tray.

(f) Install the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

(g) Install the battery shield.

(5) Remove the brake pedal holder.

(6) Connect negative cable back on negative post of the battery.

(7) Bleed the brake system thoroughly to ensure that all air has been expelled from the hydraulic system. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

(8) Road test the vehicle to verify proper operation of the brake system.

MASTER CYLINDER

DESCRIPTION

DESCRIPTION

The master cylinder is located on the power brake booster in the engine compartment on the driver's side (Fig. 54). This vehicle uses 3 different master cylinders. Master cylinder usage depends on what type of brake system the vehicle is equipped with.

CAUTION: Master cylinders are not interchangeable between systems. Performance and stopping distance issues will result if the incorrect master cylinder is installed on the vehicle.

For information on master cylinder application, bore and type, view the following table:

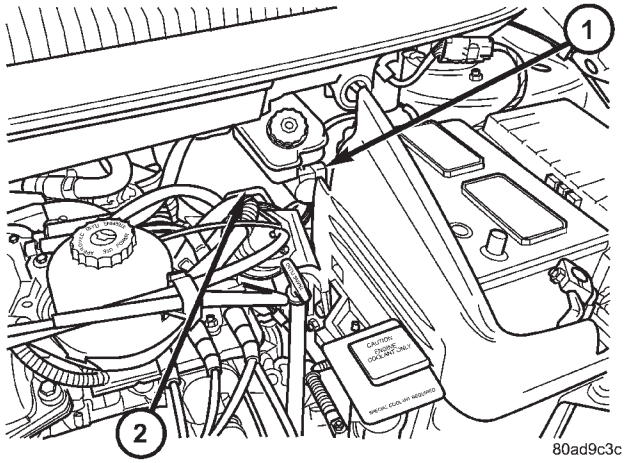


Fig. 54 Master Cylinder And Booster Location

1 - MASTER CYLINDER
2 - POWER BRAKE BOOSTER

BRAKE SYSTEM	MASTER CYLINDER BORE/TYPE
Disc/Drum - ABS	23.8 mm (15/16 in.) Conventional Compensating Port
Disc/Drum - Non-ABS	23.8 mm (15/16 in.) Conventional Compensating Port
Disc/Disc - ABS	27.0 mm (1-1/16 in.) Conventional Compensating Port
Disc/Disc ABS With Traction Control	27.0 mm (1-1/16 in.) Dual Center Port

CAUTION: When replacing a master cylinder, be sure to use the correct master cylinder for the type of brake system the vehicle is equipped with.

The body of the master cylinder is an anodized aluminum casting. It has a machined bore to accept the master cylinder pistons and threaded ports with seats for the hydraulic brake line connections.

The brake fluid reservoir is mounted on the top of the master cylinder. It is made of a see-through polypropylene type plastic for easy fluid level viewing. A brake fluid level switch is attached to the brake fluid reservoir.

The master cylinder is not a repairable component and must be replaced if diagnosed to be functioning improperly. The brake fluid reservoir and brake fluid level switch can be replaced separately.

MASTER CYLINDER (Continued)

CAUTION: Do not hone the bore of the cylinder as this will remove the anodized surface from the bore.

DESCRIPTION - RHD

The master cylinder used on right hand drive (RHD) vehicles functions similarly to that used on left hand drive (LHD) vehicles. The RHD master cylinder, as well as the RHD power brake booster, is located in the same area, but lower in the engine compartment than LHD models (Fig. 55). For that reason an extension manifold is placed between the fluid reservoir and master cylinder housing allowing the fluid reservoir to be positioned in the same location as on LHD models.

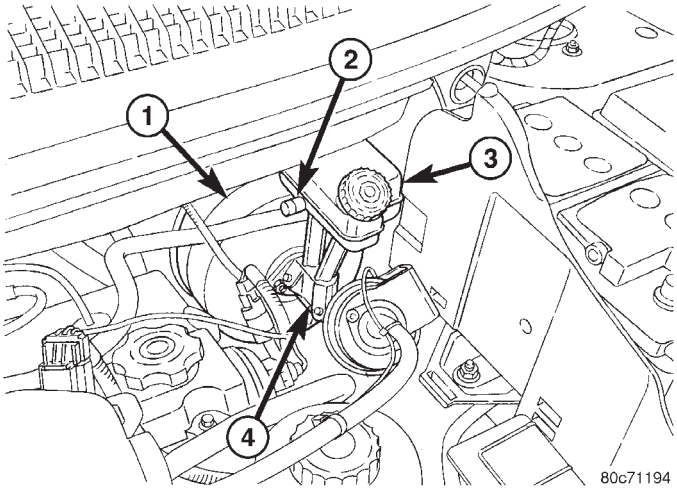

Fig. 55 RHD MASTER CYLINDER AND POWER BRAKE BOOSTER

1 - POWER BRAKE BOOSTER
2 - BRAKE FLUID LEVEL SWITCH
3 - FLUID RESERVOIR
4 - MASTER CYLINDER

OPERATION

When the brake pedal is depressed, the master cylinder primary and secondary pistons apply brake pressure through the chassis tubes to the brakes at each tire and wheel assembly.

The master cylinder primary outlet port supplies hydraulic pressure to the right front and left rear brakes. The secondary outlet port supplies hydraulic pressure to the left front and right rear brakes.

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

CAUTION: When clamping master cylinder in vise, only clamp master cylinder by its mounting flange. Do not clamp master cylinder piston rod, reservoir, seal or body.

(1) Clamp master cylinder in a vise.

NOTE: Use correct bleeder tubes when bleeding master cylinder. Master cylinder outlet ports vary in size and type depending on whether master cylinder is for a vehicle equipped with traction control or not. Traction control equipped master cylinders require the additional use of ISO style flare adapters supplied in Special Tool Package 8822 to be used in conjunction with Bleeder Tubes, Special Tool Package 8358.

(2) Attach special tools for bleeding master cylinder in the following fashion:

(a) **For non-traction control equipped master cylinders**, thread a Bleeder Tube, Special Tool 8358–1, into each outlet port. Tighten each tube to 17 N·m (145 in. lbs.) torque. Flex bleeder tubes and place open ends into mouth of fluid reservoir as far down as possible (Fig. 56).

(b) **For traction control equipped master cylinders**, thread one Adapter, Special Tool 8822–2, in each outlet port. Tighten Adapters to 17 N·m (145 in. lbs.) torque. Next, thread a Bleeder Tube, Special Tool 8358–1, into each Adapter. Tighten each tube to 17 N·m (145 in. lbs.) torque. Flex bleeder tubes and place open ends into mouth of fluid reservoir as far down as possible (Fig. 56).

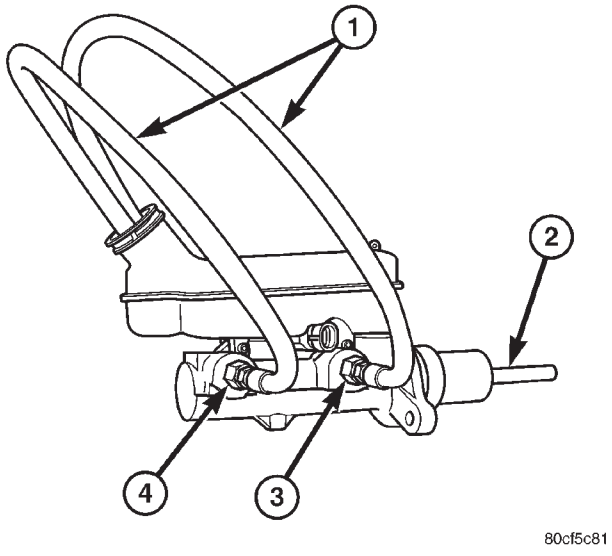

Fig. 56 Master Cylinder Set Up For Bleeding

1 - BLEEDER TUBES 8358
2 - WOODEN DOWEL
3 - ADAPTER 8822-2 (USE ONLY ON TRACTION CONTROL EQUIPPED MASTER CYLINDERS)
4 - ADAPTER 8822-2 (USE ONLY ON TRACTION CONTROL EQUIPPED MASTER CYLINDERS)

MASTER CYLINDER (Continued)

NOTE: Make sure open ends of bleeder tubes stay below surface of brake fluid once reservoir is filled to proper level.

(3) Fill brake fluid reservoir with Mopar® brake fluid or equivalent conforming to DOT 3 (DOT 4 and DOT 4+ are acceptable) specifications. Make sure fluid level is above tips of bleeder tubes in reservoir to ensure no air is ingested during bleeding.

(4) Using a wooden dowel as a pushrod (Fig. 56), slowly depress master cylinder pistons, then release pressure, allowing pistons to return to released position. Repeat several times until all air bubbles are expelled. Make sure fluid level stays above tips of bleeder tubes in reservoir while bleeding.

(5) Remove bleeder tubes from master cylinder outlet ports, then plug outlet ports and install fill cap on reservoir.

(6) Remove master cylinder from vise.

(7) Install master cylinder on vehicle. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)

REMOVAL

REMOVAL - LHD

CAUTION: Vacuum in the power brake booster must be pumped down (removed) before removing master cylinder from power brake booster. This is necessary to prevent the power brake booster from sucking in any contamination as the master cylinder is removed. This can be done simply by pumping the brake pedal, with the vehicle's engine not running, until a firm feeling brake pedal is achieved.

(1) With engine not running, pump brake pedal until a firm pedal is achieved (4-5 strokes).

(2) Disconnect negative battery terminal.

(3) Disconnect positive battery terminal.

(4) Remove battery shield.

(5) Remove nut and clamp securing battery to tray, remove battery.

(6) Thoroughly clean all surfaces of the brake fluid reservoir and master cylinder. Use only solvent such as Mopar® Brake Parts Cleaner or equivalent.

(7) Remove wiring harness connector from brake fluid level switch in master cylinder brake fluid reservoir (Fig. 57).

(8) Disconnect primary and secondary brake tubes from master cylinder housing (Fig. 57). Install sealing plugs in the now open brake tube outlet ports.

CAUTION: Before removing the master cylinder from the power brake vacuum booster, the master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into the power brake vacuum booster.

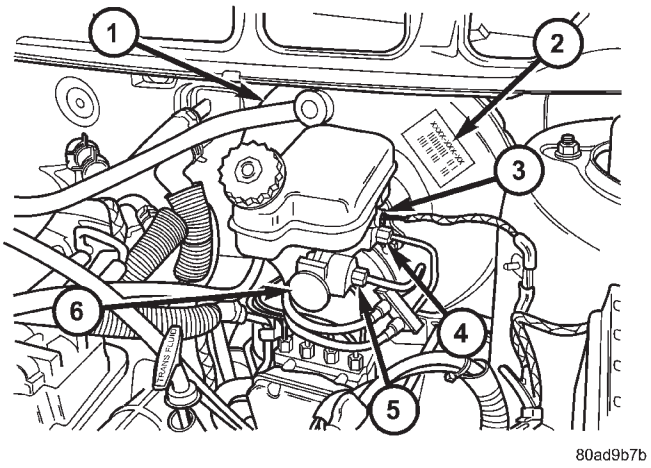

Fig. 57 MASTER CYLINDER AND BOOSTER

1 - POWER BRAKE BOOSTER
2 - BOOSTER IDENTIFICATION LABEL
3 - FLUID LEVEL SWITCH CONNECTOR
4 - PRIMARY BRAKE TUBE NUT
5 - SECONDARY BRAKE TUBE NUT
6 - MASTER CYLINDER

(9) Clean area where master cylinder assembly attaches to power brake booster. Use only a solvent such as Mopar® Brake Parts Cleaner or equivalent.

(10) Remove two nuts attaching master cylinder to power brake booster (Fig. 58).

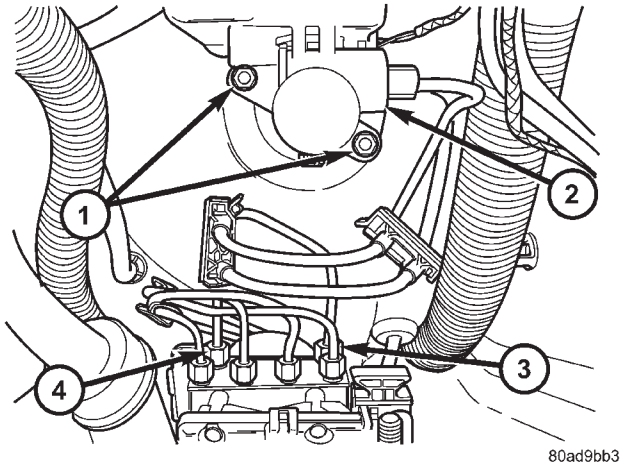

Fig. 58 MASTER CYLINDER MOUNTING

1 - MASTER CYLINDER MOUNTING NUTS
2 - MASTER CYLINDER
3 - SECONDARY TUBE NUT AT ICU
4 - PRIMARY TUBE NUT AT ICU

(11) Slide master cylinder straight out of power brake booster.

MASTER CYLINDER (Continued)

CAUTION: A seal on the rear of the master cylinder is used to create the seal for holding vacuum in the power brake vacuum booster. The vacuum seal on the master cylinder MUST be replaced whenever the master cylinder is removed from the power brake vacuum booster.

(12) Remove vacuum seal located on the mounting flange of the master cylinder. The vacuum seal is removed from master cylinder by **carefully** pulling it off the rear of master cylinder. **Do not attempt to pry the seal off the master cylinder by inserting a sharp tool between seal and master cylinder casting.**

REMOVAL - RHD

CAUTION: Vacuum in the power brake booster must be pumped down (removed) before removing master cylinder from power brake booster. This is necessary to prevent the power brake booster from sucking in any contamination as the master cylinder is removed. This can be done simply by pumping the brake pedal, with the vehicle's engine not running, until a firm feeling brake pedal is achieved.

(1) With engine not running, pump brake pedal until a firm pedal is achieved (4 or 5 strokes).
(2) Disconnect negative battery terminal.
(3) Disconnect positive battery terminal.
(4) Remove battery shield.
(5) Remove nut and clamp securing battery to tray, remove battery.
(6) Thoroughly clean all surfaces of the brake fluid reservoir and master cylinder. Use only solvent such as Mopar® Brake Parts Cleaner or equivalent.
(7) Remove wiring harness connector from brake fluid level switch in master cylinder brake fluid reservoir (Fig. 55).
(8) Disconnect primary and secondary brake tubes from master cylinder housing (Fig. 59). Install sealing plugs in the now open brake tube outlet ports.

CAUTION: Before removing the master cylinder from the power brake vacuum booster, the master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into the power brake vacuum booster.

(9) Clean area where master cylinder assembly attaches to power brake booster. Use only a solvent such as Mopar® Brake Parts Cleaner or equivalent.
(10) Remove two nuts attaching master cylinder to power brake booster (Fig. 59).
(11) Slide master cylinder straight out of power brake booster.

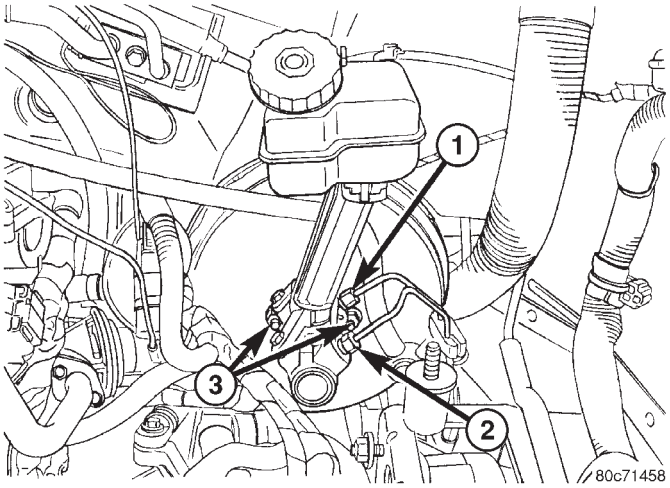

Fig. 59 RHD MASTER CYLINDER MOUNTING

1 - PRIMARY BRAKE TUBE NUT
2 - SECONDARY BRAKE TUBE NUT
3 - MASTER CYLINDER MOUNTING NUTS

CAUTION: A seal on the rear of the master cylinder is used to create the seal for holding vacuum in the power brake vacuum booster. The vacuum seal on the master cylinder MUST be replaced whenever the master cylinder is removed from the power brake vacuum booster.

(12) Remove vacuum seal located on the mounting flange of the master cylinder. The vacuum seal is removed from master cylinder by **carefully** pulling it off the rear of master cylinder. **Do not attempt to pry the seal off the master cylinder by inserting a sharp tool between seal and master cylinder casting.**

DISASSEMBLY - MASTER CYLINDER (FLUID RESERVOIR)

(1) Clean master cylinder housing and brake fluid reservoir. Use only a solvent such as Mopar Brake Parts Cleaner or an equivalent.
(2) Remove brake fluid reservoir cap. Using a syringe or equivalent type tool empty as much brake fluid as possible from the reservoir.

CAUTION: When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

(3) Remove the master cylinder assembly from the power brake vacuum booster. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL).
(4) Mount the master cylinder in a vise using the master cylinder mounting flange.

MASTER CYLINDER (Continued)

(5) Using correct size pin punch, remove the two retaining pins between the fluid reservoir and master cylinder housing (Fig. 60).

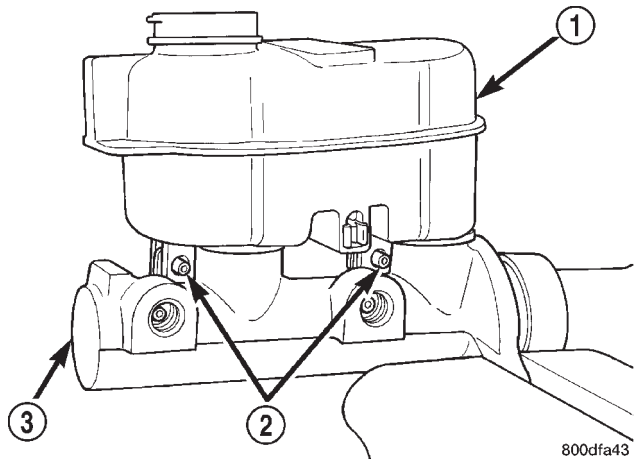

Fig. 60 Fluid Reservoir Retaining Pins (Typical)

1 - FLUID RESERVOIR
2 - RETAINING PINS
3 - MASTER CYLINDER

(6) Rock the brake fluid reservoir from side to side while pulling up to remove it from the seal grommets in master cylinder housing.

(7) Remove the two master cylinder housing to brake fluid reservoir seal grommets (Fig. 61).

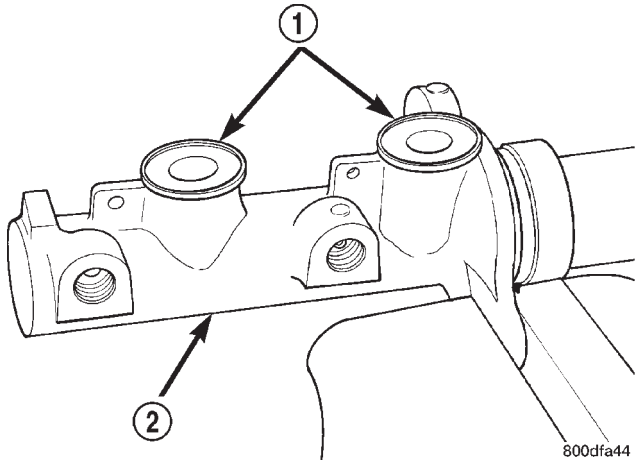

Fig. 61 Master Cylinder To Fluid Reservoir Seal Grommets

1 - SEAL GROMMETS
2 - MASTER CYLINDER

ASSEMBLY - MASTER CYLINDER (FLUID RESERVOIR)

(1) Install new master cylinder housing to brake fluid reservoir sealing grommets in master cylinder housing (Fig. 61).

(2) Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly pressing down on fluid reservoir.

(3) Be sure fluid reservoir is positioned properly on master cylinder. **Bottom of fluid reservoir is to be touching the top of both sealing grommets when properly installed on master cylinder housing.**

(4) Install the two fluid reservoir to master cylinder retaining pins (Fig. 60).

(5) Install the master cylinder assembly on the power brake booster. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)

(6) Fill fluid reservoir to its proper level as indicated on the side of the fluid reservoir.

INSTALLATION

INSTALLATION - LHD

CAUTION: Different types of master cylinders are used on this vehicle depending on brake options. If a new master cylinder is being installed, be sure it is the correct master cylinder for the type of brake system the vehicle is equipped with.

CAUTION: When replacing the master cylinder on a vehicle, a NEW vacuum seal MUST be installed on the master cylinder.

(1) Install a NEW vacuum seal on master cylinder making sure seal fits squarely in groove of master cylinder casting.

(2) Position master cylinder on studs of power brake booster, aligning booster push rod with master cylinder piston.

(3) Install the two master cylinder mounting nuts (Fig. 58). Tighten both mounting nuts to a torque of 25 N·m (225 in. lbs.).

CAUTION: When tightening the primary and secondary brake tube nuts at master cylinder, be sure brake tubes do not contact any other components within the vehicle and that there is slack in the flexible sections of the tubes. This is required due to the movement between the ABS ICU and the master cylinder while the vehicle is in motion.

(4) Connect primary and secondary brake tubes to master cylinder primary and secondary ports (Fig. 57). Brake tubes must be held securely when tightened to control orientation of flex section. Tighten tube nuts to a torque of 17 N·m (145 in. lbs.).

(5) Install wiring harness connector to brake fluid level switch mounted in brake fluid reservoir (Fig. 57).
(6) Install battery, clamp and nut.
(7) Install battery shield.
(8) Connect positive battery terminal.
(9) Connect negative battery terminal.
(10) Fill master cylinder with clean, fresh Mopar® Brake Fluid or equivalent.
(11) Road test vehicle to ensure proper operation of brakes.

INSTALLATION - RHD

CAUTION: Different types of master cylinders are used on this vehicle depending on brake options. If a new master cylinder is being installed, be sure it is the correct master cylinder for the type of brake system the vehicle is equipped with.

CAUTION: When replacing the master cylinder on a vehicle, a NEW vacuum seal MUST be installed on the master cylinder.

(1) Install a NEW vacuum seal on master cylinder making sure seal fits squarely in groove of master cylinder casting.
(2) Position master cylinder on studs of power brake booster, aligning booster push rod with master cylinder piston.
(3) Install the two master cylinder mounting nuts (Fig. 59). Tighten both mounting nuts to a torque of 25 N·m (225 in. lbs.).

CAUTION: When tightening the primary and secondary brake tube nuts at master cylinder, be sure brake tubes do not contact any other components within the vehicle and that there is slack in the flexible sections of the tubes. This is required due to the movement between the ABS ICU and the master cylinder while the vehicle is in motion.

(4) Connect primary and secondary brake tubes to master cylinder primary and secondary ports (Fig. 59). Brake tubes must be held securely when tightened to control orientation of flex section. Tighten tube nuts to a torque of 17 N·m (145 in. lbs.).
(5) Install wiring harness connector to brake fluid level switch mounted in brake fluid reservoir (Fig. 55).
(6) Install battery, clamp and nut.
(7) Install battery shield.
(8) Connect positive battery terminal.
(9) Connect negative battery terminal.
(10) Fill master cylinder with clean, fresh Mopar® Brake Fluid or equivalent.
(11) Road test vehicle to ensure proper operation of brakes.

PEDAL - ADJUSTABLE

DESCRIPTION

The Adjustable Pedals System (APS) is designed to enable the fore and aft repositioning of the brake and accelerator pedals. This results in improved ergonomics in relation to the steering wheel for taller and shorter drivers. Being able to adjust the pedal positions also allows the driver to set steering wheel tilt and seat position to the most comfortable position. The effort required for pedal application will not change regardless of pedal position.

The adjustable pedal system allows the pedals to adjust up to 3 inches (75 mm) at a rate of approximately 0.4 in./sec. (9 mm/sec.). An adjustment switch is located on the left side of the steering column lower shroud.

If the vehicle is equipped with Remote Keyless Entry (RKE), an optional memory feature is available.

The serviceable components of the APS are:

- Adjustable pedal assembly (includes motor, cables, pedals, gear box, sensor and module)
- Adjustable pedal module (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ ADJUSTABLE PEDAL MODULE)
- Adjustable pedal switch
- Pedal position sensor

OPERATION

Change of pedal position is accomplished by means of a motor driven screw. Operating the adjustable pedal switch activates the pedal drive motor. The pedal drive motor turns a screw that changes the position of the accelerator pedal. The motor also drives a cable connected to a gear box that changes the brake pedal position the same distance as the accelerator pedal. The pedals can be moved rearward (closer to the driver) or forward (away from driver). Each pedal is moved on its activating lever to a position where the driver feels most comfortable. The position and operation of the activating levers are not changed.

Pedal adjustment is inhibited when the vehicle is in reverse or when cruise control is engaged. The Electronic Vehicle Information Center (EVIC) will display a message when the Adjustable Pedal Module (APM) is disabled. i.e.: ″Adjustable Pedal Disabled - Cruise Control Engaged″ or ″Adjustable Pedal Disabled - Vehicle in Reverse″.

Foot pressure or debris can stall pedal adjustment. In order to avoid damage to system components dur-

PEDAL - ADJUSTABLE (Continued)

ing pedal adjustment, the APM will monitor pedal position sensor voltage. If the APM does not detect expected voltage change within 3 seconds, it will cut power to the adjustable pedal motor.

An optional memory feature is available. This allows storing of one or two preferred pedal positions in the APS. A preferred position can be stored and recalled using the door-mounted switches. A stored pedal position can be recalled (but not stored) using the Remote Keyless Entry (RKE) if equipped with the memory feature.

DIAGNOSIS AND TESTING - ADJUSTABLE PEDAL SYSTEM

Refer to Appropriate Diagnostic Information.

REMOVAL

NOTE: Before proceeding, review all Steering Column and Airbag Warnings and Cautions. (Refer to 19 - STEERING/COLUMN - WARNING)(Refer to 8 - ELECTRICAL/RESTRAINTS - WARNING)

(1) Remove battery ground cable terminal from battery negative post and isolate.

(2) Under instrument panel, remove silencer panel below lower steering column cover.

(3) Remove screws securing lower steering column cover/knee blocker, then remove it (Fig. 62).

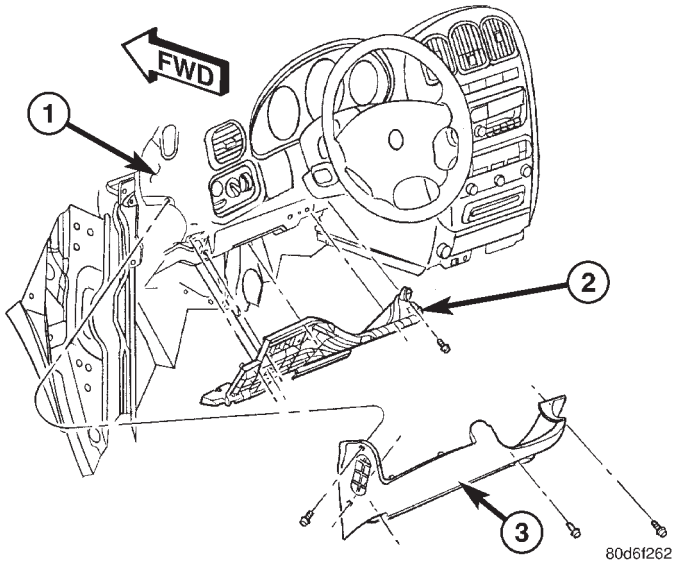

Fig. 62 Lower Steering Column Cover And Reinforcement

1 - INSTRUMENT PANEL
2 - REINFORCEMENT PLATE
3 - LOWER STEERING COLUMN COVER/KNEE BLOCKER

(4) Disconnect parking brake release link at release handle.

(5) Compress tabs on sides of data link diagnostic connector and remove it from knee blocker reinforcement plate.

(6) Remove screws securing knee blocker reinforcement plate in place, then remove reinforcement plate (Fig. 62).

(7) Remove screws securing instrument panel lower left reinforcement in place, then remove reinforcement (Fig. 63).

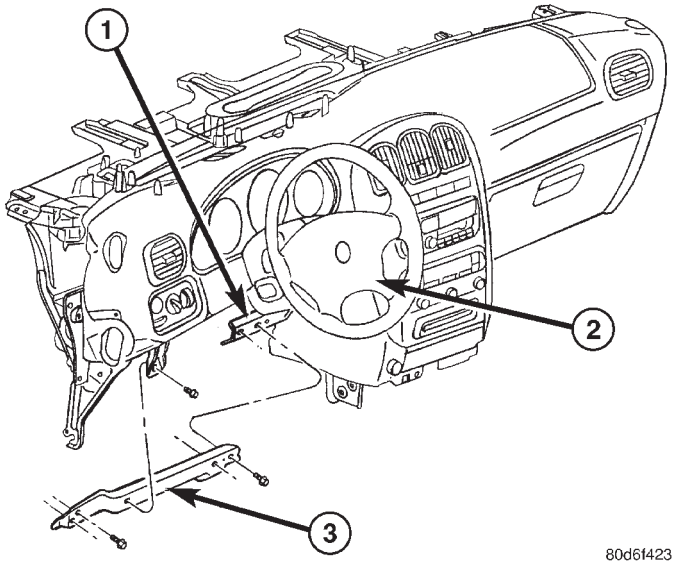

Fig. 63 Instrument Panel Lower Left Reinforcement

1 - INSTRUMENT PANEL LOWER REINFORCEMENT
2 - STEERING WHEEL
3 - LOWER LEFT REINFORCEMENT

(8) Remove brake lamp switch. Discard the original switch; it must not be reused (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL)

(9) Remove screws fastening upper and lower steering column shrouds to steering column (Fig. 64).

(10) Remove the lower shroud with adjustable pedal switch; disconnect switch wiring connector along left side of column as shroud is removed (Fig. 65).

(11) Disconnect traction control off switch wiring connector; Remove upper shroud with traction control off switch.

(12) Disconnect wiring harness connectors (as equipped) from clockspring, multi-function switch, halo lamp, SKIM module, ignition switch and BTSI solenoid (Fig. 65).

(13) Disconnect column wiring harness routing clip from column.

4 - PEDAL SWITCH WIRING CONNECTOR

(14) Disconnect PRNDL cable from shift lever and column bracket (Fig. 66).

(15) Disconnect shift cable at shift lever mechanism pin (Fig. 66).

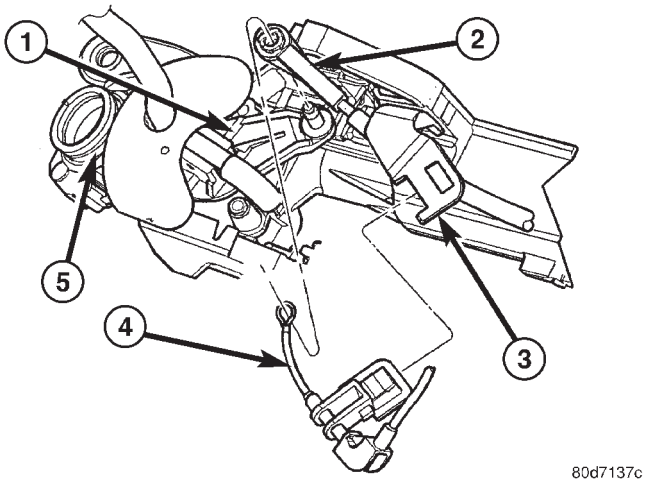

Fig. 66 Shift Cable At Steering Column

1 - SHIFT LEVER MECHANISM
2 - SHIFT CABLE
3 - BRACKET
4 - PRNDL CABLE
5 - STEERING COLUMN

(16) Remove pinch side clip, then remove shift cable from bracket on column.

(17) Turn the steering wheel from the STRAIGHT-AHEAD position 180° to the right (upside-down position), then remove the key and lock the column in place.

(18) Remove the pinch bolt securing column coupling to intermediate shaft (Fig. 67).

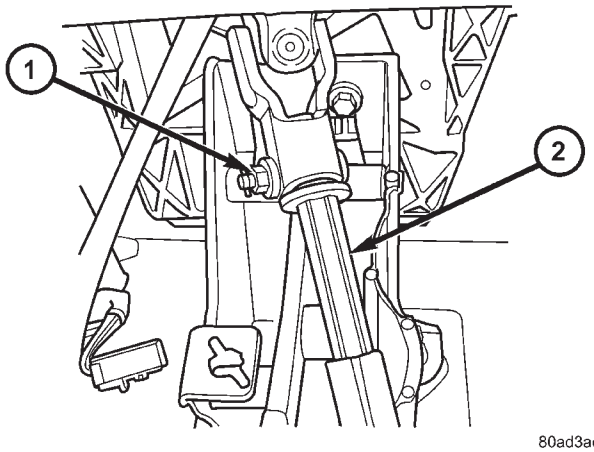

Fig. 67 Pinch Bolt

1 - PINCH BOLT
2 - STEERING COLUMN

PEDAL - ADJUSTABLE (Continued)

(19) Loosen two lower column mounting nuts.
(20) Remove two upper column mounting nuts.
(21) Remove the steering column.
(22) Remove dash seal silencer shell over steering column intermediate shaft (Fig. 68).

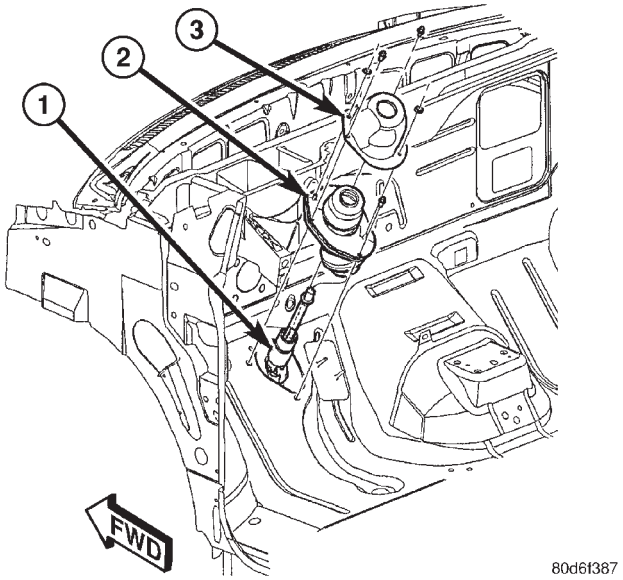

Fig. 68 Intermediate Shaft Dash Seal And Silencer Shell

1 - INTERMEDIATE SHAFT
2 - DASH SEAL
3 - SILENCER SHELL

(23) Remove two nuts securing brake lamp switch bracket to pedal assembly (Fig. 69). Remove bracket.

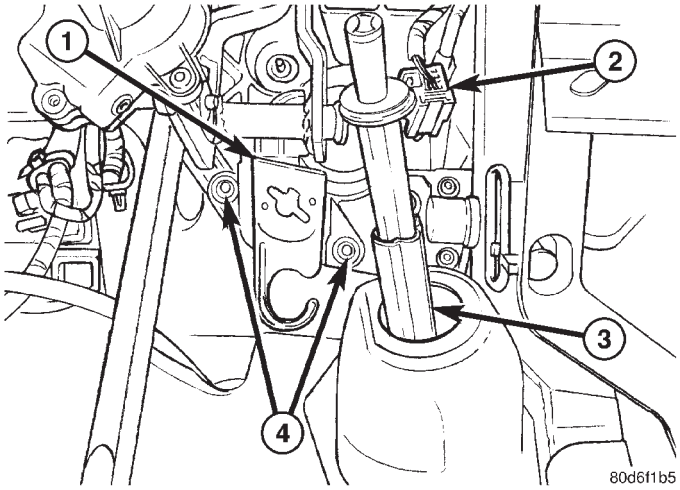

Fig. 69 Brake Lamp Switch Bracket

1 - BRAKE LAMP SWITCH BRACKET
2 - PEDAL WIRING HARNESS CONNECTOR
3 - STEERING COLUMN INTERMEDIATE SHAFT
4 - BRACKET MOUNTING NUTS

(24) Disconnect pedal wiring harness connector (Fig. 69).
(25) Remove pedal wiring harness from clips along pedal bracket.
(26) Position a small screwdriver between the center tang on the power brake booster input rod-to-brake pedal pin retaining clip (Fig. 70).

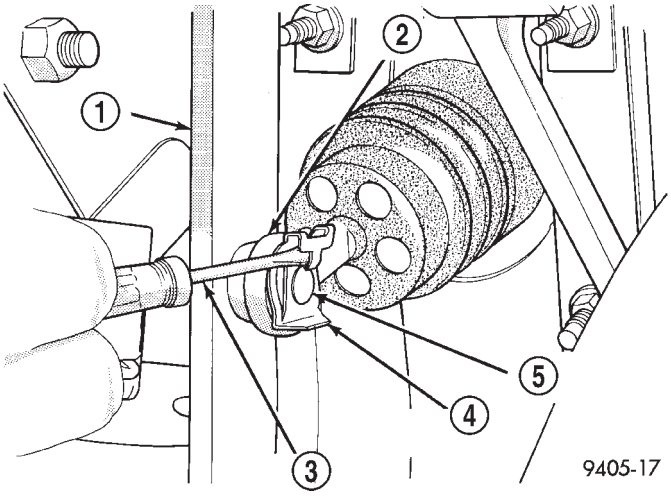

Fig. 70 Input Rod Brake Pedal Retaining Clip Removal

1 - BRAKE PEDAL
2 - INPUT ROD
3 - SCREWDRIVER
4 - RETAINING CLIP
5 - BRAKE PEDAL PIN

(27) Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin. Then pull retaining clip off brake pedal pin. **Discard retaining clip. It is not to be reused. Replace only with a new retaining clip when assembling.**
(28) Slide booster input rod off pedal pin.
(29) Remove the four nuts attaching power brake booster to dash panel (Fig. 71).
(30) Remove two brake pedal upper mounting bolts at instrument panel dash bracket (Fig. 71).
(31) Disconnect accelerator cable retainer at accelerator pedal; remove cable from pedal.
(32) Remove adjustable brake pedal assembly.

INSTALLATION

(1) Install adjustable brake pedal assembly under instrument panel.
(2) Install two brake pedal upper mounting bolts at instrument panel dash bracket (Fig. 71). Do not fully tighten at this time.
(3) Install four nuts attaching power brake booster to dash panel (Fig. 71).

PEDAL - ADJUSTABLE (Continued)

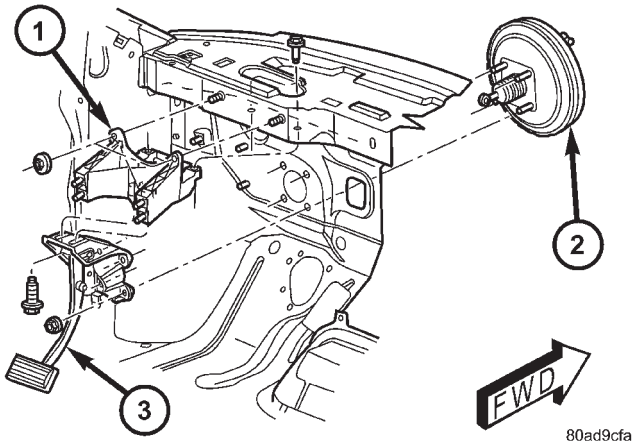

Fig. 71 Booster Mounting (Typical)

1 - DASH BRACKET
2 - POWER BRAKE BOOSTER
3 - BRAKE PEDAL ASSEMBLY

(4) Tighten four booster mounting nuts and two pedal bracket upper mounting bolts to 28 N·m (21 ft. lbs.) torque.

(5) Install accelerator cable to pedal; install cable retainer at accelerator pedal.

(6) Install booster input rod on brake pedal pin and install a NEW retaining clip (Fig. 72).

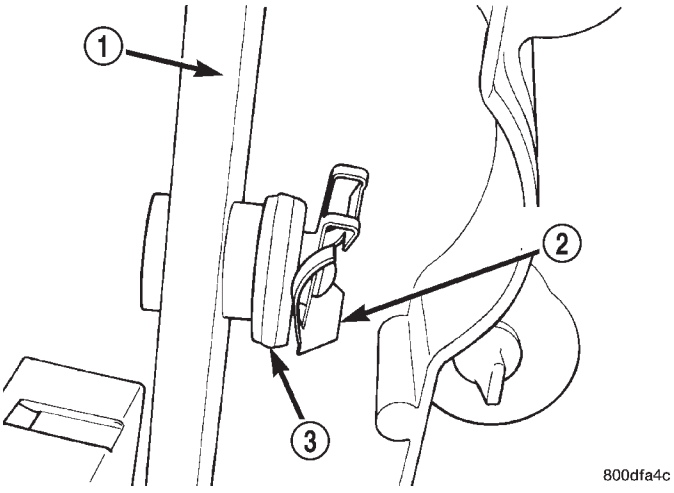

Fig. 72 Retaining Pin Installed On Brake Pedal Pin

1 - BRAKE PEDAL
2 - RETAINING CLIP
3 - BOOSTER INPUT ROD

(7) Install wiring harness in clips along pedal bracket, then connect harness to pedal wiring harness connector (Fig. 69).

(8) Install brake lamp switch bracket on pedal assembly (Fig. 69). Tighten mounting nuts to 6 N·m (50 in. lbs.) torque.

(9) Install dash seal silencer shell over steering column intermediate shaft and fasten in place (Fig. 68).

(10) Install the steering column on the mounting studs. Install the two upper and two lower mounting nuts. Tighten the upper, then lower mounting nuts to 12 N·m (105 in. lbs.) torque.

(11) Install the column shaft coupling onto the intermediate shaft and install the pinch bolt (steering column should still be locked position it was placed in during removal). Make sure the rounded side of the intermediate shaft is matched to the curvature of the coupling. Tighten the pinch bolt to 28 N·m (250 in. lbs.).

(12) Attach shift cable housing to bracket on column.

(13) Connect shift cable end to shift lever mechanism pin (Fig. 66).

(14) Connect PRNDL cable to end of shift lever mechanism pin and column bracket (Fig. 66).

(15) Connect column wiring harness connectors to SKIM (if equipped), BTSI solenoid, ignition switch, halo lamp, multi-function switch, and clockspring.

(16) Install the upper shroud (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - INSTALLATION).

(17) If equipped, connect traction control off switch wiring connector.

(18) Install upper shroud (with traction control off switch if equipped) (Fig. 64).

(19) Connect adjustable pedal switch wiring connector along left side of column (Fig. 65).

(20) Install the lower shroud with adjustable pedal switch. Install screws fastening steering column shrouds to steering column (Fig. 64).

CAUTION: Do not reuse the original brake lamp switch. The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

(21) Install and adjust NEW brake lamp switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION)

(22) Install instrument panel lower left reinforcement (Fig. 63).

(23) Attach hood release to lower left reinforcement.

(24) Install knee blocker reinforcement plate (Fig. 62).

(25) Connect parking brake release link to release handle.

(26) Install data link diagnostic connector to mounting hole in reinforcement plate.

PEDAL - ADJUSTABLE (Continued)

(27) Install lower steering column cover/knee blocker (Fig. 62).

(28) Install silencer panel below lower steering column cover/knee blocker.

NOTE: When reconnecting the battery on a vehicle that has had the airbag module removed, the following procedure should be used.

(29) Reconnect ground cable to negative post of battery in following manor:

(a) Connect scan tool (DRBIII®) to data link diagnostic connector located below steering column.

(b) Turn ignition key to ON position. Exit vehicle with scan tool leaving scan tool harness plugged in.

(c) Ensuring that there are no occupants in vehicle, connect ground (-) cable to the negative post of the battery.

(d) Using scan tool, read and record any airbag fault codes. Refer to Appropriate Diagnostic Information if any faults are found.

(e) Through drivers open window, Reach around back of steering wheel (between steering wheel and instrument cluster) and turn ignition key to OFF, then back ON while observing instrument cluster airbag indicator lamp. It should go on for six to eight seconds, then go out. This action indicates that airbag system is functioning normally. If airbag indicator lamp fails to light, blinks on and off, or goes on and stays on, there is an airbag system malfunction. Refer to Appropriate Diagnostic Information to diagnose the system malfunction.

(30) Using scan tool (DRBIII®), check for and clear any existing adjustable pedal fault codes. The adjustable pedal system is now activated.

(31) Turn key to OFF and remove scan tool from vehicle.

(32) Test operation of adjustable pedals, memory seats (if equipped), RKE (if equipped), and all functions that are steering column operated. If applicable, reset the radio and the clock.

(33) Road test the vehicle to ensure proper operation of the steering and brake systems.

PEDAL TORQUE SHAFT - RHD

REMOVAL

(1) Remove the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL)

(2) Remove the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(3) Remove the retaining clip at the torque shaft end of the brake pedal-to-torque shaft link. Remove the link from the torque shaft. Discard the retaining clip. It is not to be reused. Replace with a new clip when reassembled.

(4) Locate the booster input rod-to-brake pedal torque shaft connection and remove the retaining clip (Fig. 73). Discard the retaining clip. It is not to be reused. Replace with a new clip when reassembled.

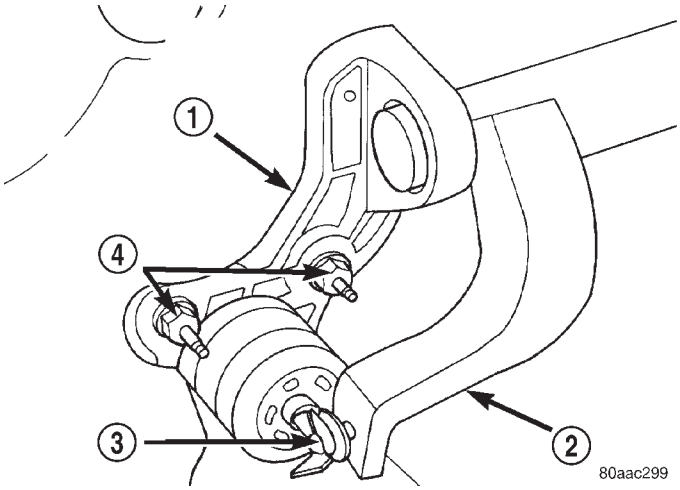

Fig. 73 POWER BRAKE BOOSTER BRACKET

1 - BOOSTER BRACKET
2 - PEDAL TORQUE SHAFT
3 - RETAINING CLIP
4 - BOOSTER MOUNTING NUTS

(5) Remove the four (4) brake booster retaining nuts from inside the passenger compartment (Fig. 74).

(6) Remove the retaining nut from the brake booster bracket located above the booster in the engine compartment (Fig. 74).

(7) Remove the power brake booster bracket.

(8) Rotate the pedal torque shaft and remove it out the left side of the vehicle.

INSTALLATION

(1) Lubricate both ends of the torque shaft with MS-4517 Lubricant or equivalent and install the torque shaft from the left side reversing the removal procedure.

(2) Install the brake booster bracket on the left end of the shaft.

(3) Install the four brake booster retaining nuts inside the passenger compartment. Tighten the mounting nuts to a torque of 29 N·m (250 in. lbs.).

(4) Install the retaining nut for the brake booster bracket in the engine compartment. Tighten the mounting nuts to a torque of 29 N·m (250 in. lbs.).

(5) Using lubriplate, or equivalent, coat the surface of the brake pedal torque shaft pin where it contacts the booster input rod. Also coat the surface of

PEDAL TORQUE SHAFT - RHD (Continued)

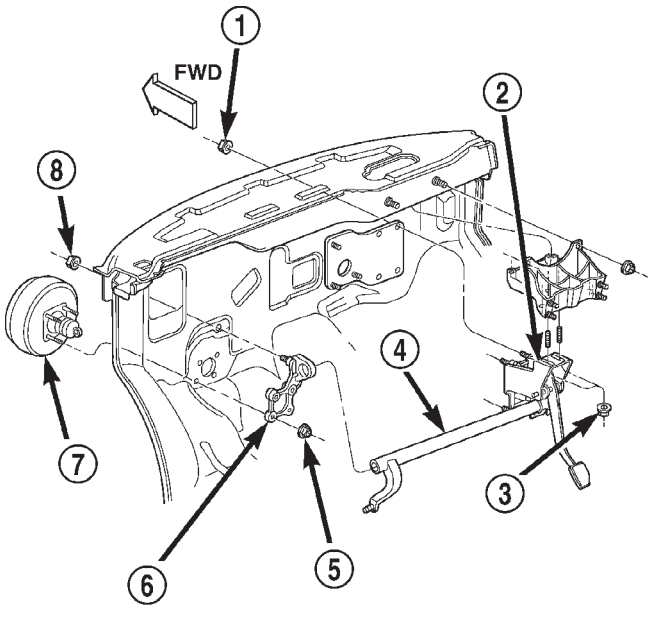

Fig. 74 BOOSTER, TORQUE SHAFT AND PEDAL MOUNTING

8 - BOOSTER BRACKET MOUNTING NUT

the brake pedal torque shaft pin where it contacts the brake pedal link.

CAUTION: When installing the power brake booster input rod on the brake pedal torque shaft pin, do not reuse the old retaining clip.

(6) Install booster input rod on brake pedal torque shaft pin and install a NEW retaining clip (Fig. 73).

CAUTION: When installing the brake pedal link on the brake pedal torque shaft pin, do not reuse the old retaining clip.

(7) Connect the brake pedal link to the torque shaft. Install a NEW retaining clip at the torque shaft end of the brake pedal-to-torque shaft link.

(8) Install the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

(9) Install the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION)

CAUTION: Do not reuse the original brake lamp switch. The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

(10) Remove and replace the brake lamp switch with a NEW switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL), (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION)

(11) Road test vehicle to ensure proper operation of the brakes.

POWER BRAKE BOOSTER

DESCRIPTION

The power brake booster mounts on the engine compartment side of the dash panel. It is connected to the brake pedal by the input (push) rod (Fig. 75). The master cylinder is bolted to the front of the booster. A vacuum line connects the power brake booster to the intake manifold.

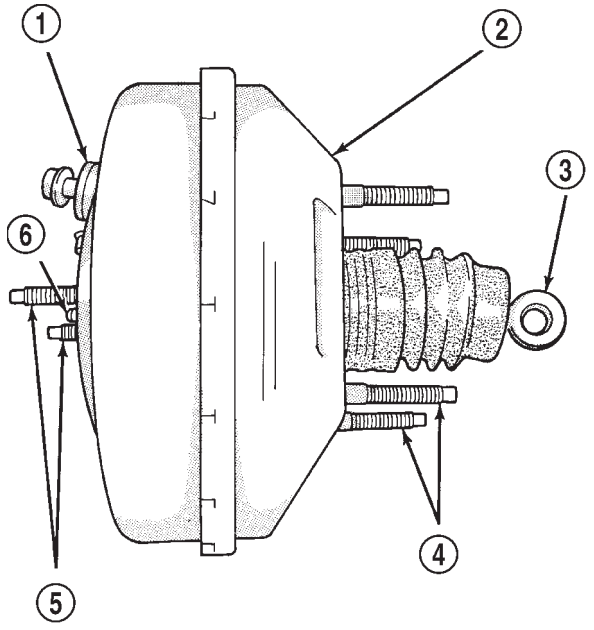

Fig. 75 Power Brake Booster (Typical)

1 - VACUUM CHECK VALVE
2 - POWER BRAKE BOOSTER ASSEMBLY
3 - INPUT ROD
4 - POWER BOOSTER ASSEMBLY TO DASH PANEL MOUNTING STUDS (4)
5 - MASTER CYLINDER MOUNTING STUDS (2)
6 - OUTPUT ROD

POWER BRAKE BOOSTER (Continued)

All vehicles use a 270 mm single diaphragm vacuum power brake booster.

Vehicles equipped with Disc/Disc brakes use a different power brake booster than vehicles equipped with Disc/Drum brakes. Differences between the two are internal. Service is the same for all boosters.

The power brake booster can be identified by the tag attached to the body of the booster (Fig. 76). This tag contains the production part number, the date it was built, and who the manufacturer of the power brake booster is.

NOTE: The power brake booster assembly is not a repairable component and must be replaced as a complete assembly if found to be faulty in any way. The check valve located on the power brake booster face is not repairable, but it can be replaced separately from the power brake booster.

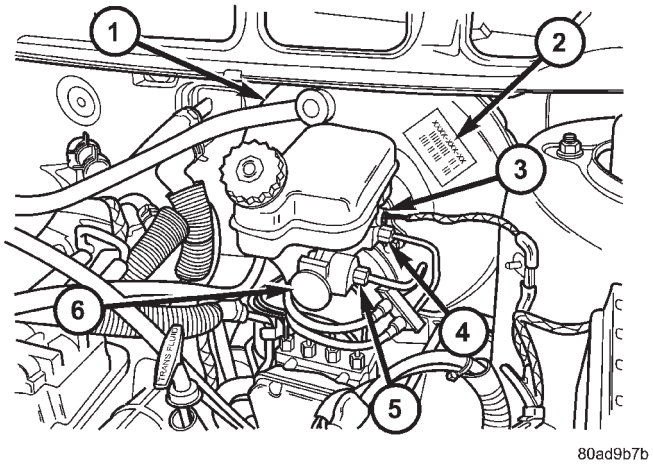

Fig. 76 MASTER CYLINDER AND BOOSTER

1 - POWER BRAKE BOOSTER
2 - BOOSTER IDENTIFICATION LABEL
3 - FLUID LEVEL SWITCH CONNECTOR
4 - PRIMARY BRAKE TUBE NUT
5 - SECONDARY BRAKE TUBE NUT
6 - MASTER CYLINDER

The different engine combinations used in this vehicle require different vacuum hose routings to the power brake booster. All vacuum hoses must be routed from the engine to the power brake booster without kinks or excessively tight bends.

OPERATION

The power brake booster reduces the amount of force required by the driver to obtain the necessary hydraulic pressure to stop a vehicle.

The power brake booster is vacuum operated. The vacuum is supplied from the intake manifold on the engine through a vacuum hose and the power brake booster check valve (Fig. 75).

As the brake pedal is depressed, the power brake booster's input rod moves forward (Fig. 75). This opens and closes valves in the power booster allowing atmospheric pressure to enter on one side of a diaphragm. Engine vacuum is always present on the other side. This difference in pressure forces the output rod of the power brake booster out against the primary piston of the master cylinder. As the pistons in the master cylinder move forward this creates the hydraulic pressure in the brake system.

DIAGNOSIS AND TESTING - POWER BRAKE BOOSTER

BASIC TEST

(1) With engine off, depress and release the brake pedal several times to purge all vacuum from the power brake booster.

(2) Depress and hold the pedal with light effort (15 to 25 lbs. pressure), then start the engine.

The pedal should fall slightly, then hold. Less effort should be needed to apply the pedal at this time. If the pedal fell as indicated, perform the VACUUM LEAK TEST listed after the BASIC TEST. If the pedal did not fall, continue on with this BASIC TEST.

(3) Disconnect the vacuum hose on the vacuum check valve, then place a vacuum gauge in line between the vacuum hose and the valve.

(4) Start the engine.

(5) When the engine is at warm operating temperature, allow it to idle and check the vacuum at the gauge.

If the vacuum supply is 12 inches Hg (40.5 kPa) or more, the power brake booster is defective and must be replaced. If the vacuum supply is below 12 inches Hg, continue on with this BASIC TEST.

(6) Shut off the engine.

(7) Connect the vacuum gauge to the vacuum reference port on the engine intake manifold.

(8) Start the engine and observe the vacuum gauge.

If the vacuum is still low, check the engine tune and repair as necessary. If the vacuum is above 12 inches Hg, the hose or check valve to the booster has a restriction or leak.

Once an adequate vacuum supply is obtained, repeat the BASIC TEST.

VACUUM LEAK TEST

(1) Disconnect the vacuum hose on the vacuum check valve, then place a vacuum gauge in line between the vacuum hose and the valve.

(2) Start the engine.

(3) Allow the engine to warm up to normal operating temperature and engine idle.

POWER BRAKE BOOSTER (Continued)

(4) Using vacuum line pliers, close off the vacuum supply hose near the booster, but before the vacuum gauge, then observe the vacuum gauge.

If the vacuum drop exceeds 1.0 inch Hg (3.3 kPa) in one minute, repeat the above steps to confirm the reading. The vacuum loss should be less than 1.0 inch Hg in one minute time span. If the loss is more than 1.0 inch Hg, replace the power brake booster. If it is not, continue on with this test.

(5) Remove the pliers from the hose temporarily.

(6) Apply light effort (approximately 15 lbs. of force) to the brake pedal and hold the pedal steady. Do not move the pedal once the pressure is applied or the test results may vary.

(7) Have an assistant reattach the vacuum line pliers to the vacuum supply hose.

(8) Allow 5 seconds for stabilization, then observe the vacuum gauge.

If the vacuum drop exceeds 3.0 inches Hg (10 kPa) in 15 seconds, repeat the above steps to confirm the reading. The vacuum loss should be less than 3.0 inches Hg in 15 seconds time span. If the loss is more than 3.0 inches Hg, replace the power brake booster. If it is not, the booster is not defective.

(9) Remove the pliers and vacuum gauge.

REMOVAL

REMOVAL - LHD

CAUTION: Reserve vacuum in power brake booster must be pumped down (removed) before removing master cylinder from booster. This is necessary to prevent booster from sucking in any contamination as master cylinder is removed. This can be done simply by pumping the brake pedal, with the vehicle's engine not running, until a firm feeling brake pedal is achieved.

(1) With engine not running, pump the brake pedal until a firm pedal is achieved (4-5 strokes).

(2) Remove negative battery cable terminal from battery.

(3) Remove positive battery cable terminal from battery.

(4) Remove battery thermal guard shield.

(5) Remove battery clamp, nut and battery from the battery tray.

(6) Remove screw securing engine coolant filler tube to battery tray.

(7) If the vehicle is equipped with speed control, disconnect the vacuum hose at the vacuum tank built into the battery tray.

(8) Remove the two nuts and one bolt securing battery tray in place. Remove battery tray.

(9) If vehicle is equipped with speed control:

(a) Disconnect wiring harness connector from the speed control servo.

(b) Remove the two servo mounting nuts.

(c) Lay speed control servo off to the side, out of the way.

(10) Remove the wiper module (unit). (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL)

(11) Disconnect wiring harness connector from brake fluid level switch in master cylinder fluid reservoir (Fig. 77).

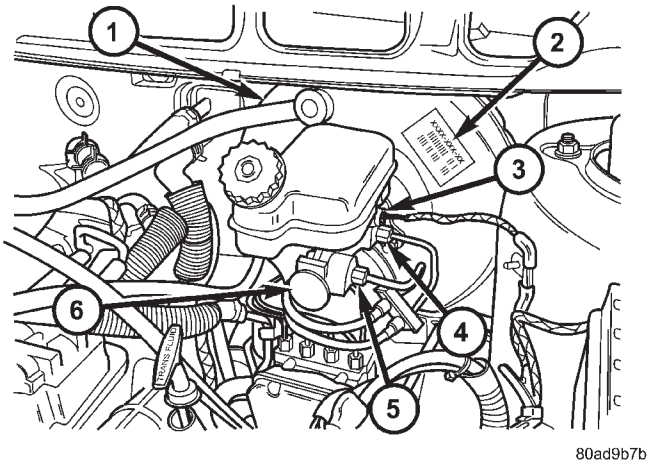

Fig. 77 Master Cylinder And Booster

1 - POWER BRAKE BOOSTER
2 - BOOSTER IDENTIFICATION LABEL
3 - FLUID LEVEL SWITCH CONNECTOR
4 - PRIMARY BRAKE TUBE NUT
5 - SECONDARY BRAKE TUBE NUT
6 - MASTER CYLINDER

CAUTION: Before removing the master cylinder from the power brake vacuum booster, the master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into the power brake vacuum booster.

(12) Clean area where master cylinder assembly attaches to power brake booster. Use only a solvent such as Mopar® Brake Parts Cleaner or equivalent.

(13) Disconnect primary and secondary brake tubes from ABS integrated control unit or non-ABS junction block (Fig. 78). Install sealing plugs in the now open brake tube ports and install caps on ends of tubes.

NOTE: It is not necessary to remove the brake tubes from the master cylinder when removing the master cylinder from the vacuum booster.

(14) Remove two nuts attaching master cylinder to power brake booster (Fig. 78).

POWER BRAKE BOOSTER (Continued)

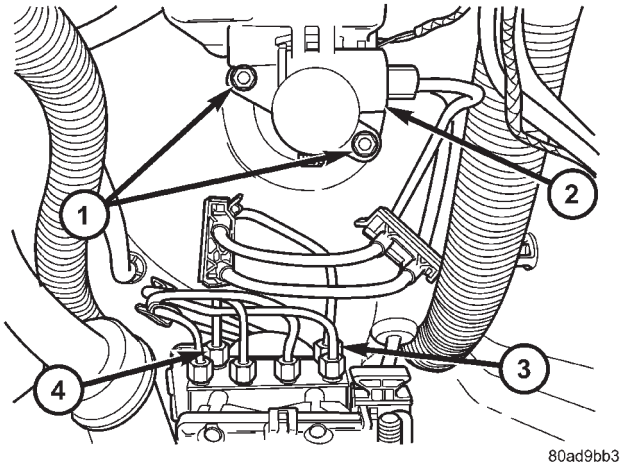

Fig. 78 Master Cylinder Mounting

1 - MASTER CYLINDER MOUNTING NUTS
2 - MASTER CYLINDER
3 - SECONDARY TUBE NUT AT ICU
4 - PRIMARY TUBE NUT AT ICU

(15) Slide master cylinder straight out of power brake booster. Remove master cylinder with primary and secondary tubes from vehicle.

CAUTION: A seal on the rear of the master cylinder is used to create the seal for holding vacuum in the power brake vacuum booster. The vacuum seal on the master cylinder MUST be replaced whenever the master cylinder is removed from the power brake vacuum booster.

(16) Disconnect vacuum hose from check valve located on vacuum booster. **DO NOT REMOVE CHECK VALVE FROM POWER BRAKE BOOSTER.**

(17) Inside vehicle, remove silencer panel under instrument panel below steering column.

(18) Locate the booster input rod to brake pedal connection under the instrument panel. Position a small screwdriver between the center tang on the power brake booster input rod to brake pedal pin retaining clip (Fig. 79).

(19) Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin. Then pull retaining clip off brake pedal pin. **Discard retaining clip. It is not to be reused. Replace only with a new retaining clip when assembling.**

(20) Slide booster input rod off pedal pin.

(21) Remove the four nuts attaching power brake booster to dash panel (Fig. 80).

(22) Slide power brake booster forward and remove through engine compartment (Fig. 81).

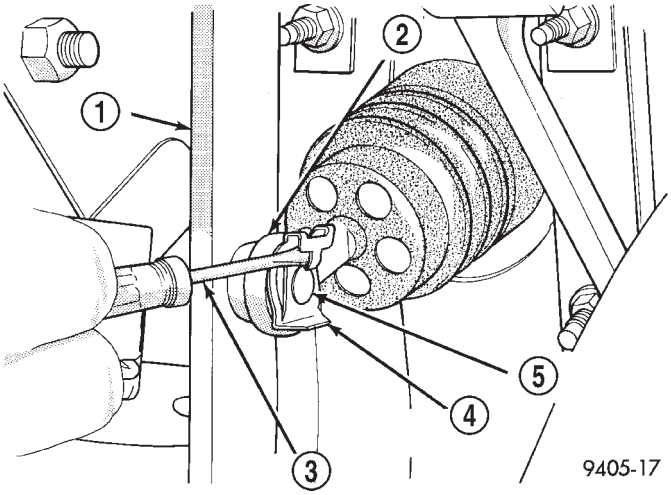

Fig. 79 Vacuum Booster Input Rod Retaining Pin

3 - BRAKE PEDAL ASSEMBLY

CAUTION: Do not attempt to disassemble the power brake vacuum booster. It is serviced ONLY as a complete assembly.

POWER BRAKE BOOSTER (Continued)

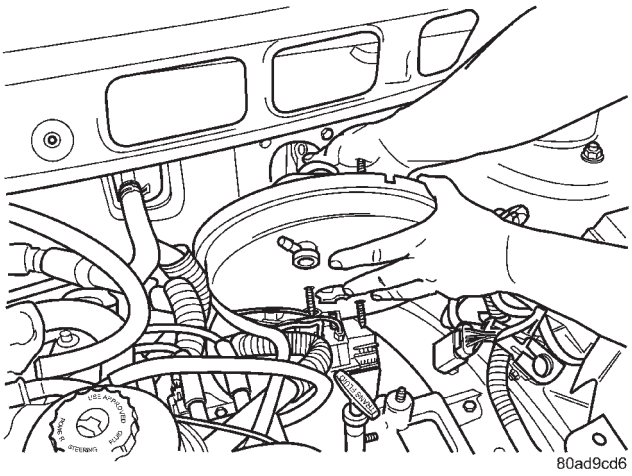

Fig. 81 Booster Removal/Installation

REMOVAL - RHD

CAUTION: Reserve vacuum in power brake booster must be pumped down (removed) before removing master cylinder from booster. This is necessary to prevent booster from sucking in any contamination as master cylinder is removed. This can be done simply by pumping the brake pedal, with the vehicle's engine not running, until a firm feeling brake pedal is achieved.

(1) With engine not running, pump the brake pedal until a firm pedal is achieved (4 or 5 strokes).
(2) Remove negative battery cable terminal from battery.
(3) Remove positive battery cable terminal from battery.
(4) Remove battery thermal guard shield.
(5) Remove battery clamp, nut and battery from the battery tray.
(6) If the vehicle is equipped with speed control, disconnect the vacuum hose at the vacuum tank built into the battery tray.
(7) Remove the two nuts and one bolt securing battery tray in place. Remove battery tray.
(8) If vehicle is equipped with speed control:
(a) Disconnect wiring harness connector from the speed control servo.
(b) Remove the two servo mounting nuts.
(c) Lay speed control servo off to the side, out of the way.
(9) If the vehicle is equipped with the 2.5L diesel engine, remove the coolant recovery pressure container and bracket. (Refer to 7 - COOLING/ENGINE/ COOLANT RECOVERY PRESS CONTAINER - REMOVAL)
(10) Disconnect wiring harness connector from brake fluid level switch in master cylinder fluid reservoir (Fig. 82).

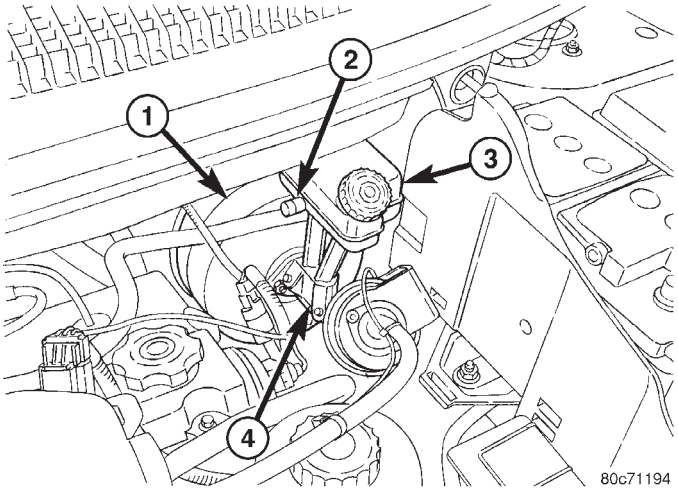

Fig. 82 RHD Master Cylinder And Power Brake Booster

1 - POWER BRAKE BOOSTER
2 - BRAKE FLUID LEVEL SWITCH
3 - FLUID RESERVOIR
4 - MASTER CYLINDER

CAUTION: Before removing the master cylinder from the power brake vacuum booster, the master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into the power brake vacuum booster.

(11) Clean area where master cylinder assembly attaches to power brake booster. Use only a solvent such as Mopar® Brake Parts Cleaner or equivalent.

NOTE: It is not necessary to remove the brake tubes from the master cylinder when removing the master cylinder from the booster.

(12) Remove two nuts attaching master cylinder to power brake booster (Fig. 83).
(13) Slide master cylinder straight out of power brake booster. Lay master cylinder with primary and secondary tubes to the side, out of the way.

CAUTION: A seal on the rear of the master cylinder is used to create the seal for holding vacuum in the power brake vacuum booster. The vacuum seal on the master cylinder MUST be replaced whenever the master cylinder is removed from the power brake vacuum booster.

(14) Disconnect vacuum hose from check valve located on booster. **DO NOT REMOVE CHECK VALVE FROM POWER BRAKE BOOSTER.**
(15) Under the instrument panel, remove booster input rod trim cover.
(16) Locate the booster input rod to brake pedal torque shaft connection under the instrument panel.

POWER BRAKE BOOSTER (Continued)

8 - BOOSTER BRACKET MOUNTING NUT

(20) Slide power brake booster forward and remove through engine compartment (Fig. 86).

CAUTION: Do not attempt to disassemble the power brake vacuum booster. It is serviced ONLY as a complete assembly.

INSTALLATION

INSTALLATION - LHD

(1) Position power brake booster on dash panel using the reverse procedure of its removal (Fig. 81). It may be necessary to push in on booster input rod as it is guided through the dash panel.

(2) Install the four nuts mounting the booster to the dash panel (Fig. 80). Tighten the mounting nuts to a torque of 29 N·m (250 in. lbs.).

POWER BRAKE BOOSTER (Continued)

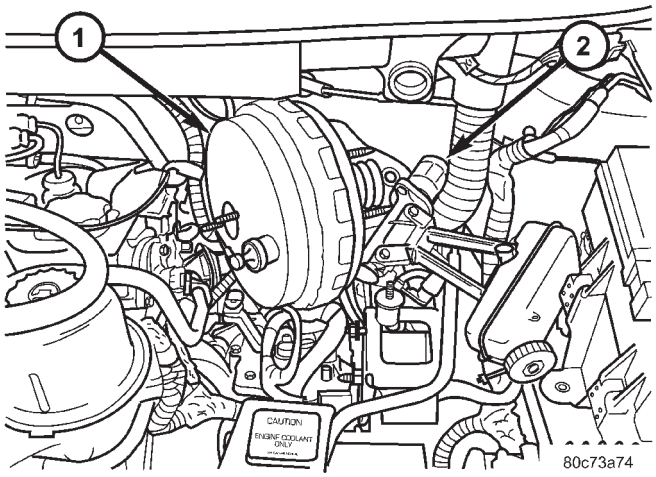

Fig. 86 RHD Booster Removal/Installation

1 - POWER BRAKE BOOSTER
2 - MASTER CYLINDER

(3) Using lubriplate, or equivalent, coat the surface of the brake pedal pin where it contacts the booster input rod.

CAUTION: When installing the brake pedal pin on the power brake booster input rod, do not re-use the old retaining clip.

(4) Install booster input rod on brake pedal pin and install a NEW retaining clip (Fig. 87).

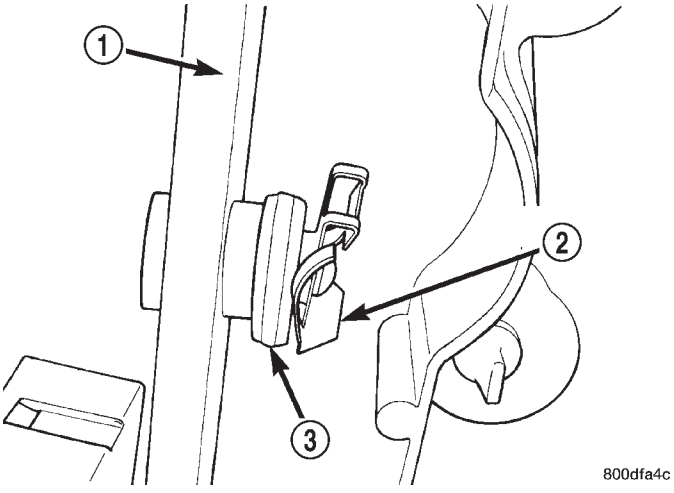

Fig. 87 Retaining Pin Installed On Brake Pedal Pin

1 - BRAKE PEDAL
2 - RETAINING CLIP
3 - BOOSTER INPUT ROD

CAUTION: Do not reuse the original brake lamp switch. The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

(5) Remove and replace the brake lamp switch with a NEW switch. (Refer to 8 - ELECTRICAL/ LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL), (Refer to 8 - ELECTRICAL/ LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION)

(6) Install the silencer panel below the steering column.

(7) Connect vacuum hose to check valve on power brake booster.

CAUTION: The master cylinder (and its rear seal) is used to create the seal for holding vacuum in the vacuum booster. The vacuum seal on the master cylinder MUST be replaced with a NEW seal whenever the master cylinder is removed from the vacuum booster.

CAUTION: When removing the vacuum seal from the master cylinder do not use a sharp tool.

(8) Using a soft tool such as a trim stick, remove the vacuum seal from the master cylinder mounting flange.

(9) Install a NEW vacuum seal on rear mounting flange of the master cylinder (Fig. 88).

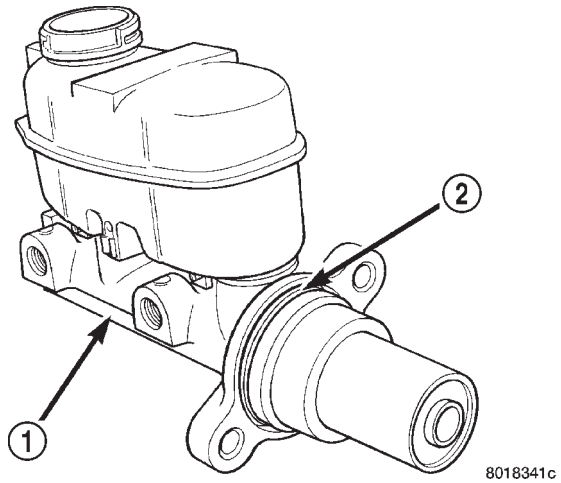

Fig. 88 Vacuum Seal (Typical)

1 - MASTER CYLINDER ASSEMBLY
2 - VACUUM SEAL

(10) Position master cylinder on studs of booster, aligning push rod on booster with master cylinder piston.

(11) Install the two nuts mounting the master cylinder to the booster (Fig. 78). Tighten both mounting nuts to a torque of 25 N·m (225 in. lbs.).

POWER BRAKE BOOSTER (Continued)

(12) Connect wiring harness connector to brake fluid level switch in the master cylinder fluid reservoir (Fig. 77).

(13) Connect primary and secondary brake tubes to ABS ICU or non-ABS junction block (Fig. 78). Tighten the tube nuts to 17 N·m (145 in lbs.).

(14) Install wiper module (unit). (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION)

(15) If equipped with speed control, install speed control servo and connect wiring connector. Tighten the mounting nuts to a torque of 14 N·m (124 in. lbs.).

(16) Install the battery tray. Install the two nuts and one bolt attaching the battery tray to the vehicle. Tighten the bolt and nuts to a torque of 14 N·m (124 in. lbs.).

(17) If vehicle is equipped with speed control, connect the servo vacuum hose to the vacuum tank on the battery tray.

(18) Install the air inlet resonator and hoses as an assembly on the throttle body and air cleaner housing. Securely tighten hose clamp at air cleaner housing and throttle body.

(19) Secure the engine coolant filler neck to the battery tray with its mounting screw.

(20) Install the battery, clamp and mounting nut.

(21) Install the positive battery cable on the battery.

(22) Install the negative battery cable on the battery.

(23) Install the battery thermal guard shield.

(24) Bleed the base brakes as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(25) Road test vehicle to ensure operation of the brakes.

INSTALLATION - RHD

(1) Position power brake booster on dash panel using the reverse procedure of its removal (Fig. 86).

(2) Below instrument panel, first install the two upper nuts mounting the booster to the dash panel, drawing it into place, then install the two lower mounting nuts. Tighten the mounting nuts to a torque of 29 N·m (250 in. lbs.).

(3) Using lubriplate, or equivalent, coat the surface of the brake pedal torque shaft pin where it contacts the booster input rod.

CAUTION: When installing the brake pedal torque shaft pin on the power brake booster input rod, do not re-use the old retaining clip.

(4) Install booster input rod on brake pedal torque shaft pin and install a NEW retaining clip (Fig. 89).

(5) Install booster input rod trim cover.

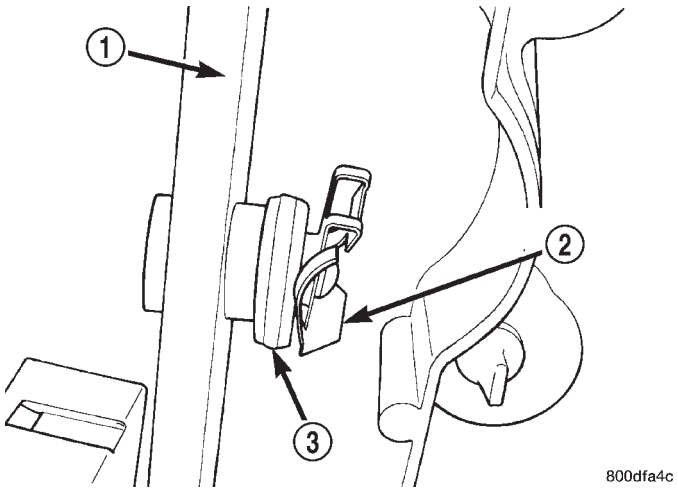

Fig. 89 Retaining Pin Installed On Brake Pedal Pin (Typical)

1 - BRAKE PEDAL
2 - RETAINING CLIP
3 - BOOSTER INPUT ROD

(6) Connect vacuum hose to check valve on power brake booster.

CAUTION: The master cylinder (and its rear seal) is used to create the seal for holding vacuum in the vacuum booster. The vacuum seal on the master cylinder MUST be replaced with a NEW seal whenever the master cylinder is removed from the vacuum booster.

CAUTION: When removing the vacuum seal from the master cylinder, do not use a sharp tool.

(7) Using a soft tool such as a trim stick, remove the vacuum seal from the master cylinder mounting flange.

(8) Install a NEW vacuum seal on rear mounting flange of the master cylinder (Fig. 90).

(9) Position master cylinder on studs of booster, aligning push rod on booster with master cylinder piston.

(10) Install the two nuts mounting the master cylinder to the booster (Fig. 83). Tighten both mounting nuts to a torque of 25 N·m (225 in. lbs.).

(11) Connect wiring harness connector to brake fluid level switch in the master cylinder fluid reservoir (Fig. 82).

(12) If the vehicle is equipped with the 2.5L diesel engine, install the coolant recovery pressure container and bracket. (Refer to 7 - COOLING/ENGINE/ COOLANT RECOVERY PRESS CONTAINER - INSTALLATION)

(13) If equipped with speed control, install speed control servo and connect wiring connector. Tighten

POWER BRAKE BOOSTER (Continued)

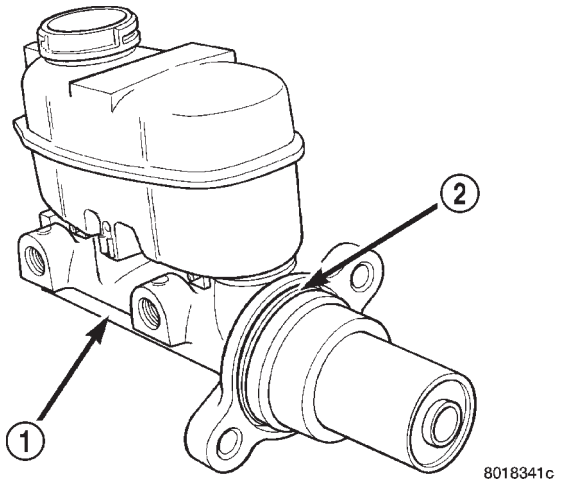

Fig. 90 Vacuum Seal (Typical)

1 - MASTER CYLINDER ASSEMBLY
2 - VACUUM SEAL

the mounting nuts to a torque of 14 N·m (124 in. lbs.).

(14) Install the battery tray. Install the two nuts and one bolt attaching the battery tray to the vehicle. Tighten the bolt and nuts to a torque of 14 N·m (124 in. lbs.).

(15) If vehicle is equipped with speed control, connect the servo vacuum hose to the vacuum tank on the battery tray.

(16) Install the battery, clamp and mounting nut.

(17) Install the positive battery cable on the battery.

(18) Install the negative battery cable on the battery.

(19) Install the battery thermal guard shield.

CAUTION: Do not reuse the original brake lamp switch. The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

(20) Remove and replace the brake lamp switch with a NEW switch. (Refer to 8 - ELECTRICAL/ LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL), (Refer to 8 - ELECTRICAL/ LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION)

(21) Bleed the base brakes as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(22) Road test vehicle to ensure proper operation of the brakes.

PROPORTIONING VALVE

DESCRIPTION - PROPORTIONING VALVE (HEIGHT SENSING)

NOTE: Only vehicles without antilock brakes (ABS) have a proportioning valve. Vehicles with ABS utilize electronic brake distribution which is controlled through the ABS integrated control unit.

Vehicles not equipped with ABS use a height sensing proportioning valve. It is mounted to the body of the vehicle above the rear axle (Fig. 91). It has an actuator lever that attaches to the rear axle and moves with the axle to help the valve sense the vehicle height.

CAUTION: The height sensing proportioning valve is not adjustable. No attempt should be made to adjust it. It is replaced as a complete assembly.

CAUTION: The use of after-market load leveling or load capacity increasing devices on this vehicle are prohibited. Using air shock absorbers or helper springs on this vehicle will cause the height sensing proportioning valve to inappropriately reduce the hydraulic pressure to the rear brakes. This inappropriate reduction in hydraulic pressure potentially could result in increased stopping distance of the vehicle.

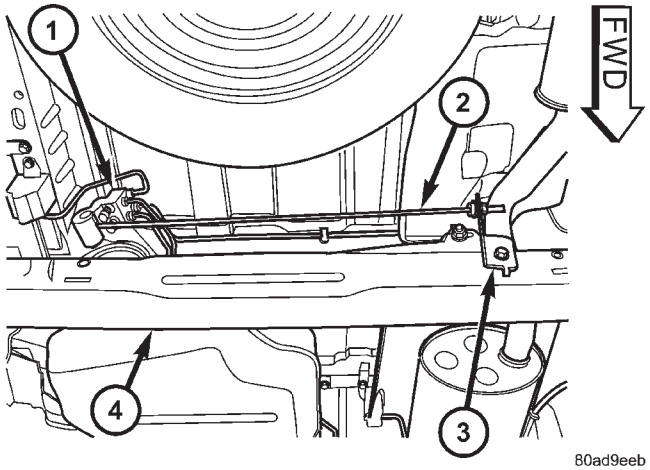

Fig. 91 HEIGHT SENSING PROPORTIONING VALVE

1 - PROPORTIONING VALVE
2 - ACTUATOR LEVER
3 - AXLE BRACKET
4 - REAR AXLE

PROPORTIONING VALVE (Continued)

OPERATION - PROPORTIONING VALVE (HEIGHT SENSING)

Vehicles not equipped with ABS use a height sensing proportioning valve.

The height sensing proportioning valve operates similarly to a standard proportioning valve in the following way. As hydraulic pressure is applied to the valve, full input hydraulic pressure is supplied to the rear brakes up to a certain pressure point, called the split point. Beyond the split point, the proportioning valve reduces the amount of hydraulic pressure to the rear brakes according to a given ratio. Thus, on light brake applications, approximately equal hydraulic pressure will be transmitted to both the front and rear brakes. Upon heavier brake applications, the hydraulic pressure transmitted to the rear brakes will be lower than the front brakes. This will prevent premature rear wheel lockup and skid.

Here is how the height sensing proportioning valve differs from a standard proportioning valve. As the height of the rear suspension changes, the height sensing portion of the proportioning valve changes the split point of the proportioning valve. When the height of the rear suspension is low, the proportioning valve interprets this as extra load and the split point of the proportioning valve is raised to a higher pressure to allow for more rear braking. When the height of the rear suspension is high, the proportioning valve interprets this as a light load and the split point of the proportioning valve is lowered to a lower pressure and rear braking is reduced.

The height sensing proportioning valve regulates the pressure by sensing the load condition of the vehicle through the movement of the proportioning valve actuator lever (Fig. 91). As the position of the rear axle changes, depending on the load the vehicle is carrying, the movement is transferred to the proportioning valve. The proportioning valve adjusts the hydraulic pressure accordingly.

The height sensing proportioning valve allows the brake system to maintain the optimal front to rear brake balance regardless of the vehicle load condition. Under a light load condition, hydraulic pressure to the rear brakes is minimized. As the rear load condition increases, so does the hydraulic pressure to the rear brakes.

DIAGNOSIS AND TESTING - PROPORTIONING VALVE (HEIGHT SENSING)

CAUTION: The use of aftermarket load leveling or load capacity increasing devices on this vehicle is prohibited. Using air shock absorbers or helper springs on this vehicle will cause the height sensing proportioning valve to inappropriately reduce the hydraulic pressure to the rear brakes. This inappropriate reduction in hydraulic pressure potentially could result in increased stopping distance of the vehicle.

When a premature rear wheel skid is obtained on a brake application, it may be an indication that the hydraulic pressure to the rear brakes is above the specified output from the proportioning valve. This condition indicates a possible malfunction of the height sensing proportioning valve, which will require testing to verify that it is properly controlling the hydraulic pressure allowed to the rear brakes. Premature rear wheel skid may also be caused by contaminated front or rear brake linings.

Prior to testing a proportioning valve for function, check that all tire pressures are correct. Also, ensure the front and rear brake linings are in satisfactory condition. **It is also necessary to verify that the brakes shoe assemblies on a vehicle being tested are either original equipment manufacturers (OEM) or original replacement brake shoe assemblies meeting the OEM lining material specification. This vehicles brake system is not balanced for aftermarket brake shoe assembly lining material.**

If both front and rear brakes check OK, proceed with the following test procedure for the height sensing proportioning valve.

(1) Road test the vehicle to determine which rear wheel brake is exhibiting premature wheel skid.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove the chassis brake tube going to the rear brake in question at the proportioning valve. Remove the chassis brake tube coming from the junction block at the proportioning valve (Fig. 92).

(4) Install the appropriate fittings from Pressure Test Fittings, Special Tool 6833, into the open ports of the proportioning valve.

(5) Install the previously removed brake lines into the Pressure Test Fittings. Tighten all tube nuts to 17 N·m (145 in. lbs.).

(6) Install a pressure gauge from Gauge Set, Special Tool C-4007-A into the open port on each pressure test fitting. Bleed air out of hose from pressure test fittings to pressure gauges at the pressure gauges. Then bleed air out of the brake line being tested at that rear wheel brake bleeder.

NOTE: Actuator rod is a linear spring and is meant to flex by design. When rod is raised, it will have some curvature to it.

(7) Remove the screw fastening the proportioning valve actuator rod bracket to the rear axle. Raise the actuator lever to the full-upward position and hold it there.

PROPORTIONING VALVE (Continued)

(8) With the aid of a helper, apply pressure to the brake pedal until a pressure of 6895 kPa (1000 psi) is obtained on the proportioning valve inlet gauge. Then, based on the type of brake system the vehicle is equipped with and the pressure specification shown on the following table, compare the pressure reading on the outlet gauge to the specification. If outlet pressure at the proportioning valve is not within specification when required inlet pressure is obtained, replace the proportioning valve. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PROPORTIONING VALVE - REMOVAL)

CAUTION: Do not attempt to adjust the height sensing proportioning valve. If found to be defective, replace the valve.

(9) Remove the pressure test fittings and pressure gauges from the proportioning valve.

(10) Install the chassis brake lines in the correct ports of the proportioning valve. Tighten all tube nuts to 17 N·m (145 in. lbs.).

(11) If necessary, repeat the above steps on the remaining side of the proportioning valve which control the other rear wheel brake.

(12) Attach the actuator lever and bracket to the rear axle.

(13) Bleed rear brakes. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(14) Road test vehicle.

PROPORTIONING VALVE SPECIFICATIONS

WHEEL BASE	DRIVE TRAIN	SALES CODE	BRAKE SYSTEM	SPLIT POINT	SLOPE	INLET PRESSURE PSI	OUTLET PRESSURE PSI
SWB	FWD	BRB-BGF	15″ DISC/DRUM W/O ANTILOCK	VAR.	.59	1000 PSI	675-875 PSI

REMOVAL - PROPORTIONING VALVE (HEIGHT SENSING)

(1) Using a brake pedal depressor, move and lock the brake pedal to a position past its first 1 inch of travel. This will prevent brake fluid from draining out of the master cylinder when the brake tubes are removed from the proportioning valve.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

CAUTION: Before removing the brake tubes from the proportioning valve, the proportioning valve and the brake tubes must be thoroughly cleaned. This is required to prevent contamination from entering the proportioning valve or the brake tubes.

(3) Remove the four brake tubes from the inlet and outlet ports of the proportioning valve (Fig. 92).

(4) Remove the two bolts attaching the proportioning valve and bracket to the vehicle (Fig. 92).

(5) Slide the bracket out from under rear track bar bracket. Lower the valve down enough to pull its actuator rod out of the axle bracket and remove the proportioning valve from the vehicle.

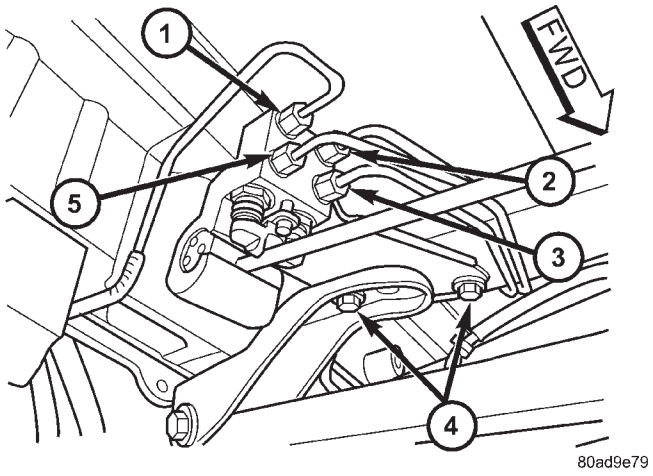

Fig. 92 PROPORTIONING VALVE MOUNTING

1 - LEFT REAR OUTLET TUBE
2 - RIGHT REAR OUTLET TUBE
3 - RIGHT REAR INLET TUBE
4 - MOUNTING BOLTS
5 - LEFT REAR INLET TUBE

PROPORTIONING VALVE (Continued)

INSTALLATION - PROPORTIONING VALVE (HEIGHT SENSING)

(1) Install the end of the actuator rod through the axle bracket grommet and slide the proportioning valve bracket under the rear track bar body bracket (Fig. 92).

(2) Install the proportioning valve attaching bolts (Fig. 92). Tighten the attaching bolts to a torque of 54 N·m (40 ft. lbs.).

(3) Install the four chassis brake lines into the inlet and outlet ports of the proportioning valve (Fig. 92). Tighten all tube nuts to a torque of 17 N·m (145 in. lbs.).

CAUTION: The height sensing proportioning valve is not adjustable. No attempt should be made to adjust it.

(4) Bleed the brake system thoroughly to ensure that all air has been expelled from the hydraulic system. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE).

(5) Lower the vehicle to the ground.

(6) Road test the vehicle to verify proper operation of the brake system.

ROTOR

DIAGNOSIS AND TESTING - BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be checked and inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE).

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Minimum thickness specifications are cast on the rotor's unmachined surface (Fig. 93). Limits can also be found in this section's specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

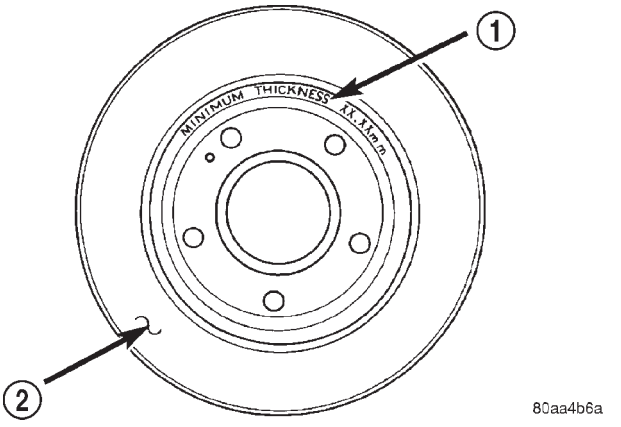

Fig. 93 Minimum Brake Rotor Thickness Markings (Typical)

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

ROTOR THICKNESS VARIATION

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor at 12 equal points around the rotor braking surface with a micrometer at a radius approximately 25 mm (1 inch) from edge of rotor (Fig. 94). If thickness measurements vary beyond the specification listed in the specifaction table (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS), the rotor should be refaced or replaced. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE).

ROTOR (Continued)

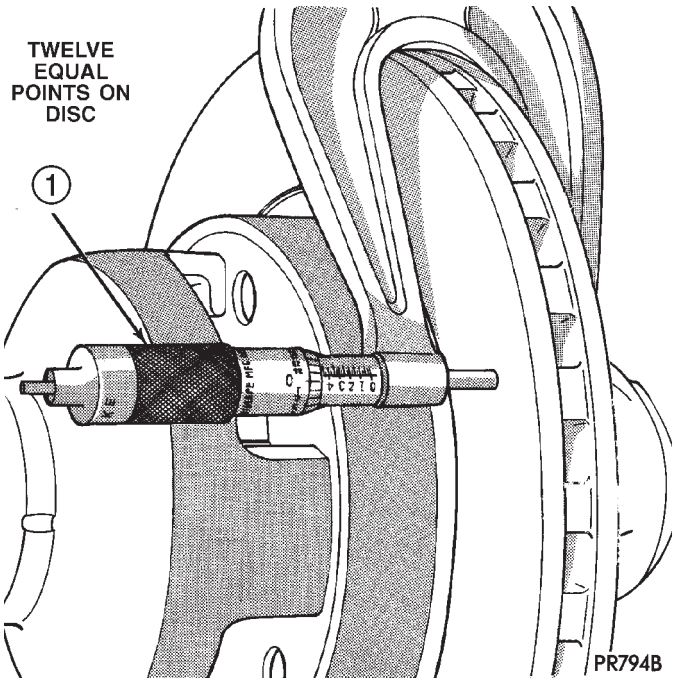

Fig. 94 Checking Rotor For Thickness

1 - CALIPER

ROTOR RUNOUT

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the rotor. (The hub and rotor runouts are separable). To measure rotor runout on the vehicle, first remove the tire and wheel assembly. Reinstall the wheel mounting nuts on the studs, tightening the rotor to the hub. Mount the Dial Indicator, Special Tool C-3339, with Mounting Adaptor, Special Tool SP-1910 on steering arm. The dial indicator plunger should contact braking surface of rotor approximately ten millimeters from edge of rotor (Fig. 95). Check lateral runout on both sides of the rotor, marking the low and high spots on both. Runout limits can be found in the specification table in this section. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

If runout is in excess of the specification, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor and the one wheel stud closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed (Fig. 96).

Remove the rotor from the hub.

NOTE: Clean the hub face surface before checking runout. This provides a clean surface to get an accurate indicator reading.

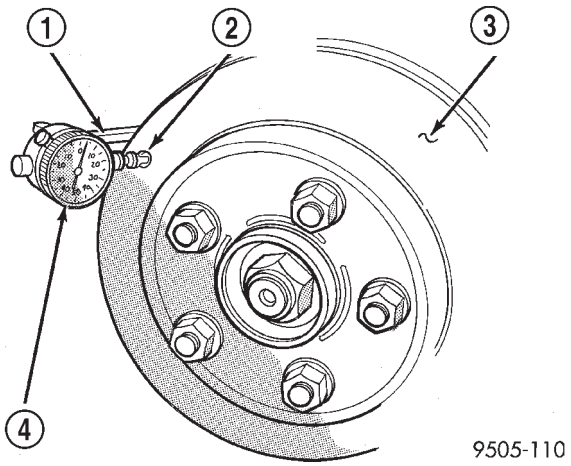

Fig. 95 Checking Rotor Runout

1 - SPECIAL TOOL SP-1910
2 - 10 MILLIMETERS FROM EDGE
3 - DISC SURFACE
4 - SPECIAL TOOL C-3339

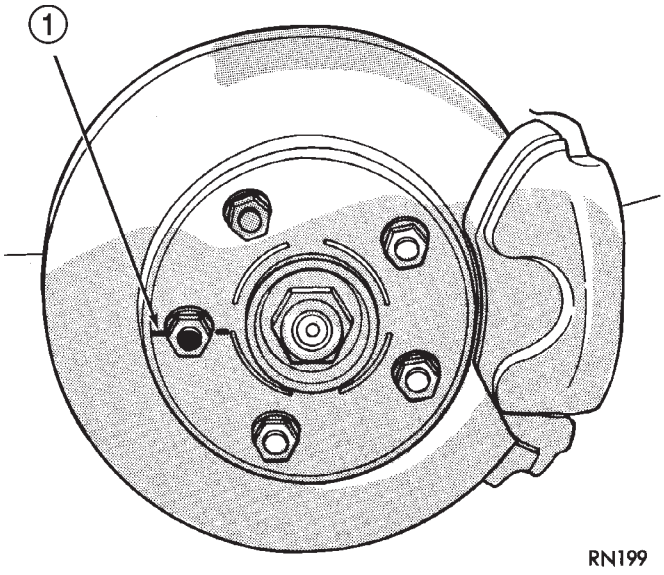

Fig. 96 Marking Rotor and Wheel Stud

1 - CHALK MARK

Mount Dial Indicator, Special Tool C-3339, and Mounting Adaptor, Special Tool SP-1910, to the steering knuckle. Position the indicator stem so it contacts the hub face near the outer diameter. Care must be taken to position stem outside of the stud circle, but inside of the chamfer on the hub rim (Fig. 97).

Hub runout should not exceed 0.03 mm (0.0012 inch). If runout exceeds this specification, the hub must be replaced. (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - REMOVAL)(Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)

ROTOR (Continued)

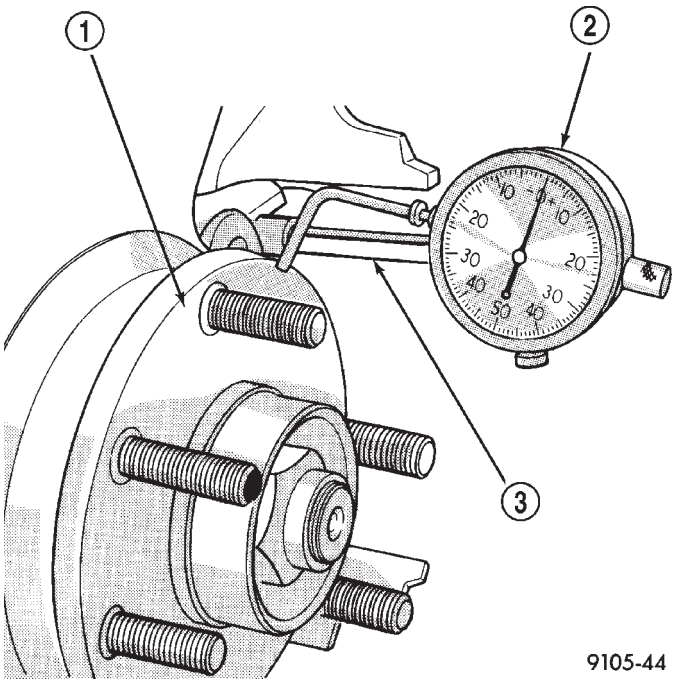

Fig. 97 Checking Hub Runout

1 - HUB SURFACE
2 - SPECIAL TOOL C-3339
3 - SPECIAL TOOL SP-1910

If the hub runout does not exceed this specification, install the rotor back on the hub, aligning the chalk marks on the rotor with a wheel mounting stud, two studs apart from the original stud (Fig. 98). Tighten nuts in the proper sequence and torque to specifications.

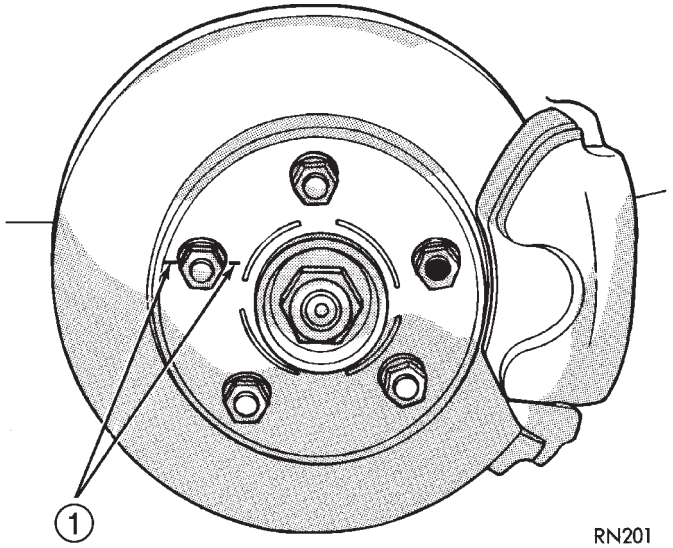

Fig. 98 Index Rotor And Wheel Stud

1 - CHALK MARK

Recheck brake rotor runout to see if the runout is now within specifications. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

If runout is not within specifications, reface or replace the brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE)

STANDARD PROCEDURE - BRAKE ROTOR MACHINING

NOTE: Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (Fig. 99), or replaced.

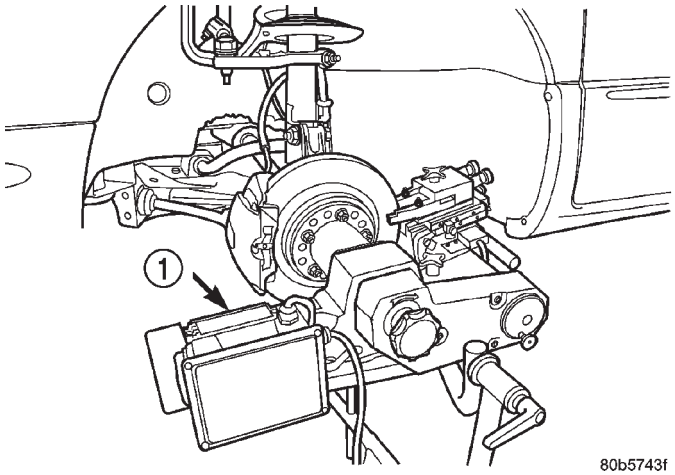

Fig. 99 On-Car Brake Lathe

1 - ON-CAR BRAKE LATHE

The use of a hub-mounted on-car brake lathe is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

NOTE: All rotors have markings for minimum allowable thickness cast on an un-machined surface of the rotor (Fig. 100) (Fig. 101). Minimum thickness specifications can also be found in the specification table in this section. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

ROTOR (Continued)

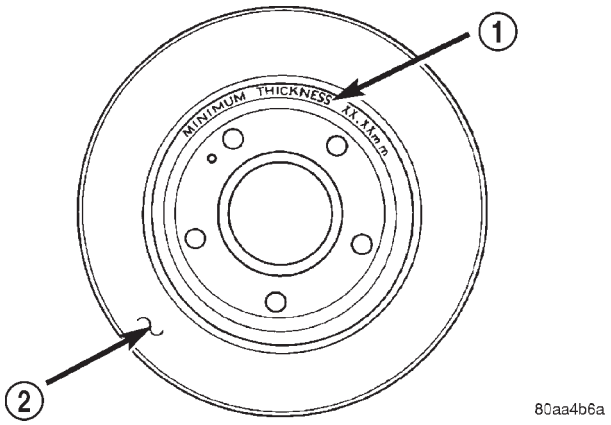

Fig. 100 Front Brake Rotor

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

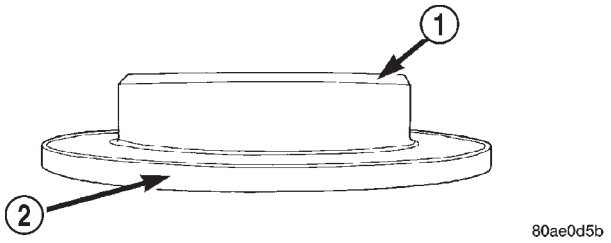

Fig. 101 Rear Brake Rotor Minimum Thickness Markings

1 - ROTOR MINIMUM THICKNESS AND DRUM MAXIMUM DIAMETER SPECIFICATIONS ARE SHOWN ON THIS SURFACE
2 - REAR ROTOR

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Before installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning equipment is required. Specifications for brake rotor machining can be found in this section's specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

REMOVAL - FRONT BRAKE ROTOR

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the front wheel and tire assembly.

(3) Remove the two mounting bolts securing the disc brake caliper adapter with brake caliper to the steering knuckle (Fig. 102).

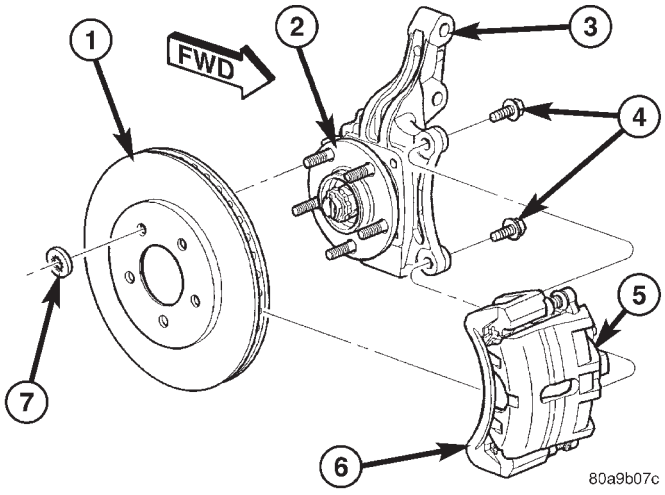

Fig. 102 Front Brake Mounting

1 - BRAKE ROTOR
2 - HUB AND BEARING
3 - STEERING KNUCKLE
4 - ADAPTER MOUNTING BOLTS
5 - BRAKE CALIPER
6 - ADAPTER
7 - CLIP

(4) Remove the disc brake caliper and adapter as an assembly from the steering knuckle (Fig. 102). Hang the assembly out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.

(5) Remove any retainer clips from the wheel mounting studs.

(6) Remove brake rotor from hub by pulling it straight off wheel mounting studs (Fig. 102).

INSTALLATION - FRONT BRAKE ROTOR

(1) Install the brake rotor back on the hub and bearing (Fig. 102).

(2) Install brake caliper and adapter back over brake rotor aligning adapter with mounting holes on steering knuckle (Fig. 102).

(3) Install the two adapter mounting bolts securing the adapter to the steering knuckle. Tighten the mounting bolts to 169 N·m (125 ft. lbs.) torque.

(4) Install wheel and tire assembly on vehicle. Tighten the wheel mounting lug nuts in proper sequence until all nuts are torqued to half specifica-

ROTOR (Continued)

tion, then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(5) Lower vehicle to the ground.

SPECIFICATIONS

BRAKE ROTOR

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning equipment is required.

SUPPORT PLATE - DRUM BRAKE

REMOVAL

(1) Using a brake pedal depressor, move and secure brake pedal to a position past its first 1 inch of travel. This will prevent brake fluid from draining out of master cylinder when brake tube is remove from wheel cylinder.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(3) Remove wheel and tire assembly.

(4) Disconnect brake tube from rear of wheel cylinder. Cap open ends

(5) Remove brake drum.

(6) Remove brake shoes from brake support plate. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL).

(7) Remove the 2 bolts attaching the wheel cylinder to the brake support plate.

(8) Remove the wheel cylinder from the brake support plate.

(9) Disconnect the park brake cable from the park brake actuation lever.

(10) Using a suitable tool such as a 14 mm box wrench (Fig. 103) or an aircraft type hose clamp, compress the flared legs on park brake cable retainer. Then pull the park brake cable out of brake support plate.

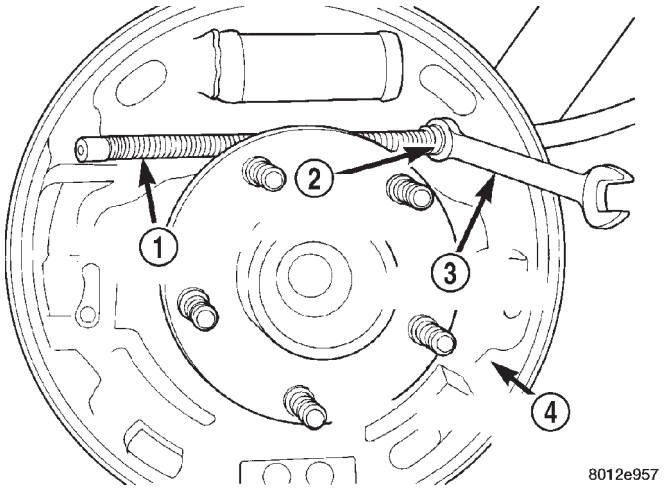

Fig. 103 Removing Park Brake Cable From Brake Support Plate

1 - PARK BRAKE CABLE
2 - CABLE RETAINER
3 - 14 mm BOX WRENCH
4 - BRAKE SUPPORT PLATE

(11) Remove the rear hub and bearing. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)

(12) Remove the rear brake support plate from the rear axle.

INSTALLATION

(1) Install the 4 hub and bearing to axle mounting bolts into the mounting holes in the flange of the rear axle.

(2) Install the rear brake support plate on the 4 mounting bolts installed in the flange of the rear axle (Fig. 104).

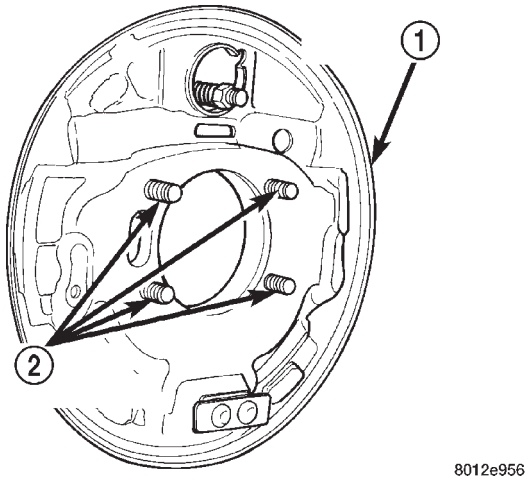

Fig. 104 Brake Support Plate Mounted On Bearing Attaching Bolts

1 - REAR BRAKE SUPPORT PLATE
2 - HUB/BEARING MOUNTING BOLTS

(3) Install the rear hub and bearing (and connect wheel speed sensor where applicable) stopping short of installing the brake drum. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)

(4) Install the rear park brake cable into its mounting hole in the rear brake support plate.

(5) Install the park brake cable on the park brake actuation lever.

(6) Apply sealant such as Mopar Gasket-In-A-Tube or equivalent around the wheel cylinder opening in the brake support plate.

(7) Install wheel cylinder onto brake support. Install and tighten the wheel cylinder to brake support plate attaching bolts to 8 N·m (75 in. lbs.) torque.

(8) Install brake tube into wheel cylinder. Tighten tube nut to a torque of 17 N·m (145 in. lbs.) torque.

(9) Install the rear brake shoes on the brake support plate. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).

(10) Install brake drum.

SUPPORT PLATE - DRUM BRAKE (Continued)

(11) Install wheel and tire.
(12) Tighten wheel stud nuts to 135 N·m (100 ft. lbs.).
(13) Adjust drum brake shoes. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - ADJUSTMENTS)
(14) Remove brake pedal depressor tool.
(15) Bleed the brake system as necessary. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE).
(16) Lower the vehicle.

WHEEL CYLINDERS

REMOVAL

(1) Using a brake pedal depressor, move and secure brake pedal to a position past its first 1 inch of travel. This will prevent brake fluid from draining out of master cylinder when brake tube is remove from wheel cylinder.
(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
(3) Remove wheel and tire assembly.
(4) Disconnect brake tube from rear of wheel cylinder. Cap open ends
(5) Remove brake drum.
(6) Remove brake shoes from brake support plate (Discard if contaminated).(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL)
(7) Remove the 2 bolts attaching the wheel cylinder to the brake support plate.
(8) Remove the wheel cylinder from the brake support plate.

INSPECTION

With brake drums removed, inspect the wheel cylinder boots for evidence of a brake fluid leak. Visually check the boots for cuts, tears, or heat cracks. If any of these conditions exist, the wheel cylinders should be completely cleaned, inspected and new parts installed.
If a wheel cylinder is leaking and the brake lining material is saturated with brake fluid, the brake shoes must be replaced.

INSTALLATION

(1) Apply sealant such as Mopar Gasket-In-A-Tube or equivalent around the wheel cylinder opening in the brake support plate.
(2) Install wheel cylinder onto brake support. Install and tighten the wheel cylinder to brake support plate attaching bolts to 8 N·m (75 in. lbs.) torque.
(3) Install brake tube into wheel cylinder. Tighten tube nut to a torque of 17 N·m (145 in. lbs.) torque.
(4) Install the rear brake shoes on the brake support plate. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).
(5) Install brake drum.
(6) Install wheel and tire. Install and tighten wheel lug nuts to 135 N·m (100 ft. lbs.).
(7) Adjust drum brake shoes. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - ADJUSTMENTS)
(8) Remove brake pedal depressor tool.
(9) Bleed the brake system as necessary. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE).
(10) Lower vehicle.

PARKING BRAKE

DESCRIPTION

DESCRIPTION

The parking brake system is operated by a foot operated parking brake lever. The parking brake lever is mounted on the body of the vehicle to the left of the brake pedal (Fig. 105). It is a automatic-adjusting type lever.

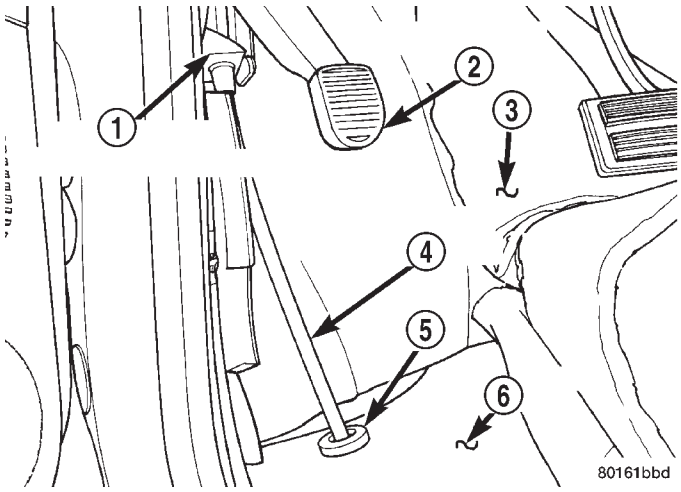

Fig. 105 Parking Brake Lever (Pedal)

1 - PARK BRAKE PEDAL ASSEMBLY
2 - PARK BRAKE PEDAL
3 - CARPET
4 - FRONT PARK BRAKE CABLE
5 - SEAL
6 - FLOOR PAN

PARKING BRAKE (Continued)

The vehicle has four flexible steel parking brake cables. They are:

- Front
- Intermediate
- Left rear
- Right rear

The front parking brake cable extends from the parking brake lever. A steel equalizer bracket connects the front parking brake cable to the left rear and intermediate cable. The intermediate cable is connected to the right rear cable using a parking brake cable connector.

On vehicles equipped with rear drum brakes, the rear service brakes also act as the vehicle's parking brakes.

Vehicles equipped with rear disc brakes use a small duo-servo brake assembly mounted to the each rear disc brake caliper adapter as the parking brake. The inside of the brake rotor (hat section of drum-in-hat style brake rotor) is used as the parking brake drum.

DESCRIPTION - EXPORT

The parking brake system on this vehicle features a hand-operated parking brake lever. The lever is located between the two front seats and requires a special front cable.

OPERATION

The automatic-adjusting feature in the foot operated parking brake lever continuously applies minimal tension to the parking brake cables when the parking brake lever is in the released position to keep them in adjustment at all times. Due to this feature, the parking brake cables require no periodic adjustment.

When the parking brake lever is applied, the cables are pulled, thus applying the brake shoes (rear drum brakes) or parking brake shoes (rear disc brakes) at each rear wheel.

The brake shoes are mechanically operated by an internal lever and strut connected to the rear parking brake cables.

An equalizer bracket is used at the rear end of the front parking brake cable to distribute tension equally to each parking brake cable.

STANDARD PROCEDURE

STANDARD PROCEDURE - PARKING BRAKE AUTOMATIC ADJUSTER TENSION RELEASE

The parking brake lever (pedal) mechanism used in this vehicle is designed so that the automatic adjuster is not required to be locked out when servicing the parking brake lever (pedal) or the parking brake cables.

This parking brake lever (pedal) mechanism is designed so that the adjuster mechanism will rotate only half a turn when the tension is released from the parking brake cable. This eliminates the requirement to lock out the automatic adjuster when servicing the parking brake lever (pedal) mechanism and cables.

Use the following procedure to release the tension from the parking brake cables and the automatic adjuster in the parking brake lever (pedal) mechanism.

(1) Grasp the exposed section of the front parking brake cable and pull rearward on it. While holding the park brake in this position, install a pair of locking pliers on the front parking brake cable just rearward of the second body outrigger bracket (Fig. 106).

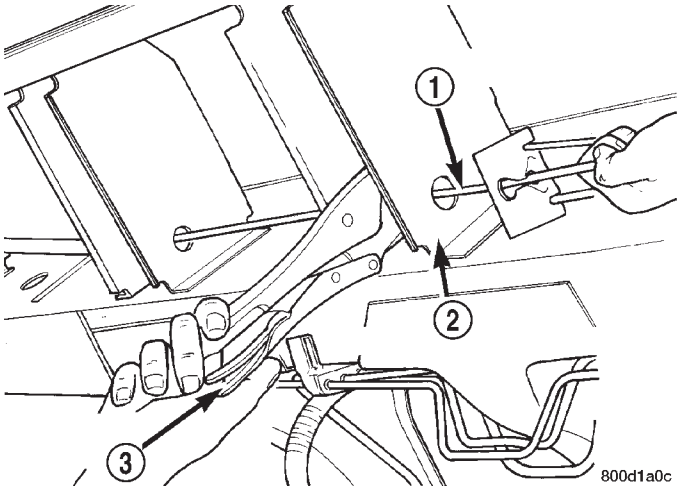

Fig. 106 Locking Out Automatic Adjuster

1 - PARK BRAKE CABLE
2 - REAR BODY OUTRIGGER BRACKET
3 - LOCKING PLIERS

(2) Remove the left rear and intermediate parking brake cables from the parking brake cable equalizer (Fig. 107).

(3) Remove the equalizer from the front parking brake cable.

(4) Remove the locking pliers from the front parking brake cable. This will allow the adjuster in the parking brake lever (pedal) mechanism to rotate around to its stop. This will remove the tension from the adjuster and front park brake cable (Refer to 5 - BRAKES/PARKING BRAKE - STANDARD PROCEDURE).

PARKING BRAKE (Continued)

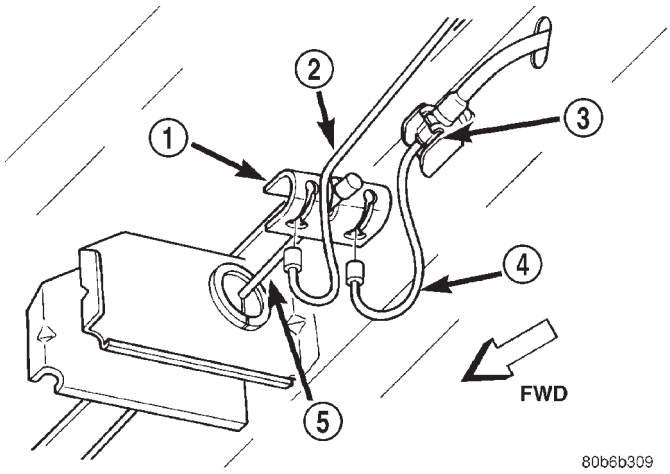

Fig. 107 Parking Brake Cable Attachment To Equalizer

1 - EQUALIZER
2 - LEFT REAR PARKING BRAKE CABLE
3 - LOCKING NUT
4 - INTERMEDIATE PARKING BRAKE CABLE
5 - FRONT PARKING BRAKE CABLE

STANDARD PROCEDURE - PARKING BRAKE AUTOMATIC ADJUSTER TENSION RESET

The parking brake lever (pedal) mechanism used in this vehicle is designed so that the automatic adjuster is not required to be locked out when servicing the parking brake lever (pedal) or the parking brake cables.

(1) Grasp the exposed section of the front parking brake cable and pull rearward on it. While holding the park brake in this position, install a pair of locking pliers on the front parking brake cable just rearward of the second body outrigger bracket (Fig. 106).

(2) Install the equalizer on the front parking brake cable.

(3) Install the left rear and intermediate park brake cable in the correct location on the parking brake cable equalizer (Fig. 107).

(4) Remove the locking pliers from the front parking brake cable. This will allow the adjuster in the park brake lever (pedal) mechanism to tension the park brake cables.

(5) Apply and release the parking brake lever (pedal) one time. This will seat the parking brake cables and allow the auto adjuster in the parking brake lever (pedal) mechanism to correctly tension the parking brake cables.

CABLES - PARKING BRAKE

REMOVAL

REMOVAL - PARKING BRAKE CABLE (FRONT)

(1) Raise vehicle on jackstands or centered on a hoist. (Refer to LUBRICATION & MAINTENANCE/ HOISTING - STANDARD PROCEDURE).

(2) Manually release the automatic self-adjusting mechanism tension of the parking brake lever (pedal) assembly. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

(3) Remove the intermediate and left rear park brake cable from the park brake cable equalizer (Fig. 108).

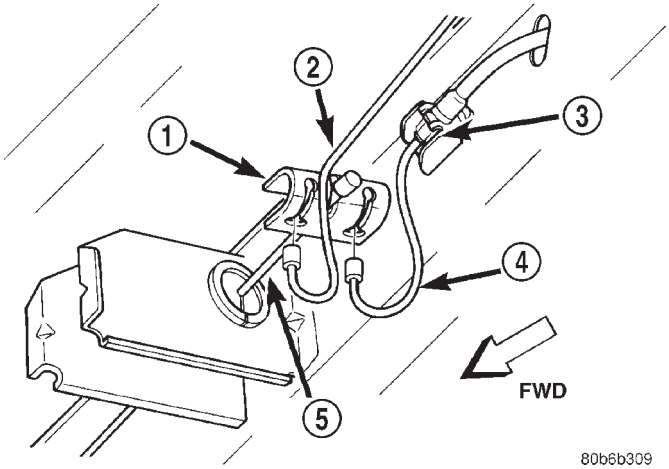

Fig. 108 Park Brake Cable Attachment To Equalizer

1 - EQUALIZER
2 - LEFT REAR PARKING BRAKE CABLE
3 - LOCKING NUT
4 - INTERMEDIATE PARKING BRAKE CABLE
5 - FRONT PARKING BRAKE CABLE

(4) Remove the front park cable housing retainer from body outrigger bracket (Fig. 109). Cable is removable by sliding a 14 mm box wrench over cable retainer and compressing the three retaining fingers. Alternate method is to use an aircraft type hose clamp and screwdriver.

(5) Lower vehicle.

(6) Remove the left front door sill molding.

(7) Remove the left front kick panel for access to the park brake cable and park brake pedal assembly.

(8) Lift floor mat for access to park brake cable and floor pan. Pull the seal and the park brake cable (Fig. 110) out of the floor pan of vehicle.

(9) Pull parking brake cable strand end forward and disconnect button from clevis. Tap cable housing end fitting out of pedal assembly bracket.

CABLES - PARKING BRAKE (Continued)

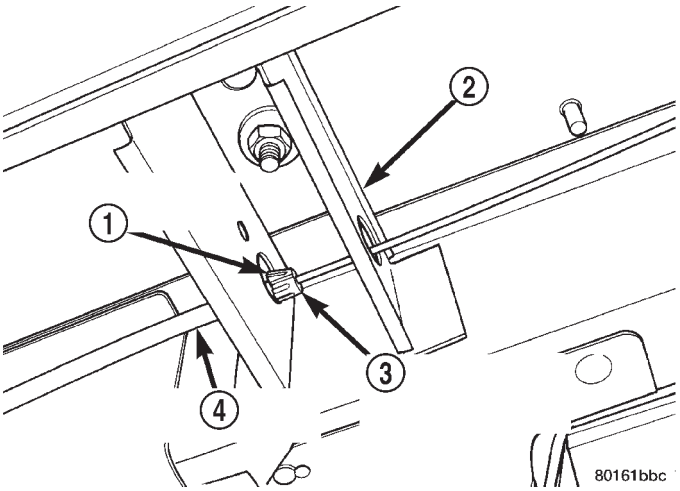

Fig. 109 Front Park Brake Cable Attachment To Body

1 - PARK BRAKE PEDAL ASSEMBLY
2 - PARK BRAKE PEDAL
3 - CARPET
4 - FRONT PARK BRAKE CABLE
5 - SEAL
6 - FLOOR PAN

(10) Remove cable retainer from the parking brake lever (pedal) assembly bracket.

(11) Pull front parking brake cable assembly out of vehicle through hole in floor pan.

REMOVAL - PARKING BRAKE CABLE (INTERMEDIATE)

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Manually lock out the automatic self-adjusting mechanism tension of the parking brake lever (pedal) assembly. (Refer to 5 - BRAKES - STANDARD PROCEDURE). Once the cable is released from the equalizer, do not remove the locking pliers until reinstallation of the cable is complete.

(3) Remove the intermediate parking brake cable from the parking brake cable equalizer (Fig. 111).

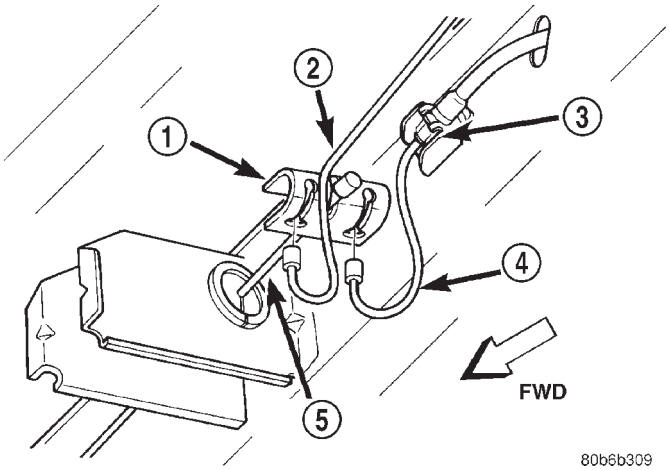

Fig. 111 Parking Brake Cable Attachment To Equalizer

1 - EQUALIZER
2 - LEFT REAR PARKING BRAKE CABLE
3 - LOCKING NUT
4 - INTERMEDIATE PARKING BRAKE CABLE
5 - FRONT PARKING BRAKE CABLE

(4) Remove the locking nut securing the intermediate cable housing to the side bracket on the frame rail (Fig. 111).

(5) Remove the intermediate parking brake cable from the cable connector attaching it to the right rear parking brake cable (Fig. 112). Remove the locking nut securing the intermediate cable housing to the side bracket on the frame rail (Fig. 112).

(6) If the vehicle is a short-wheel-base model, it will be necessary to loosen and lower the fuel tank far enough to remove the intermediate parking brake cable. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL).

(7) Remove the intermediate parking brake cable from the side brackets and vehicle.

CABLES - PARKING BRAKE (Continued)

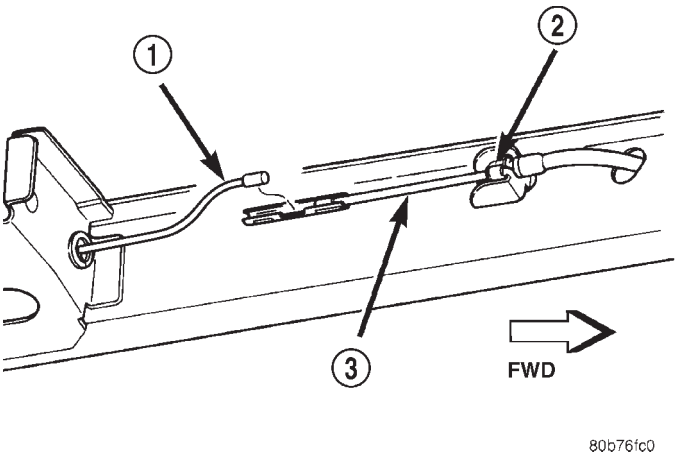

Fig. 112 Intermediate Cable Attachment To Right

1 - RIGHT REAR PARKING BRAKE CABLE
2 - LOCKING NUT
3 - INTERMEDIATE PARKING BRAKE CABLE

REMOVAL - PARKING BRAKE CABLE (RIGHT REAR)

(1) Raise vehicle on jackstands or centered on a hoist. (Refer to LUBRICATION & MAINTENANCE/ HOISTING - STANDARD PROCEDURE).

(2) Remove rear tire and wheel assembly.

(3) Remove rear brake drum from the rear wheel of the vehicle requiring service to the rear park brake cable.

(4) Create slack in the rear parking brake cables by locking out the automatic adjuster as described here. Grasp an exposed section of front parking brake cable near the equalizer and pull down on it. At this time install a pair of locking pliers on the cable just rearward of the second body outrigger bracket (Fig. 113).

(5) Disconnect the right rear parking brake cable from the connector on the intermediate cable (Fig. 114).

(6) To remove the right parking brake cable housing from the body bracket, slide a 14 mm box end wrench over the end of cable retainer to compress the retaining fingers (Fig. 115). The alternate method using an aircraft type hose clamp will not work on the right side of the vehicle.

(7) Remove the brake shoes from the brake support plate. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL).

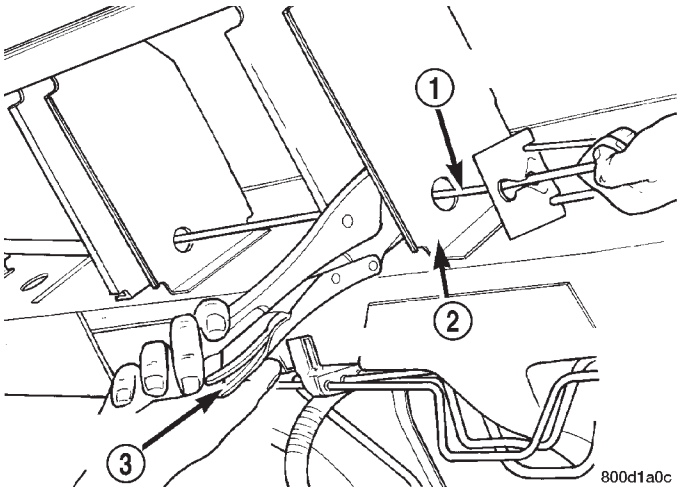

Fig. 113 Locking Out Automatic Adjuster

4 - BRAKE SUPPORT PLATE

REMOVAL - PARKING BRAKE CABLE (LEFT REAR)

(1) Raise vehicle on jackstands or centered on a hoist. (Refer to LUBRICATION & MAINTENANCE/ HOISTING - STANDARD PROCEDURE).

(2) Remove rear tire and wheel assembly.

(3) Remove rear brake drum from the rear wheel of the vehicle requiring service to the rear park brake cable.

(4) Create slack in rear park brake cables by locking out the automatic adjuster as described here. Grasp an exposed section of front park brake cable near the equalizer and pull down on it. Then install a pair of locking pliers on the cable just rearward of the second body outrigger bracket (Fig. 117).

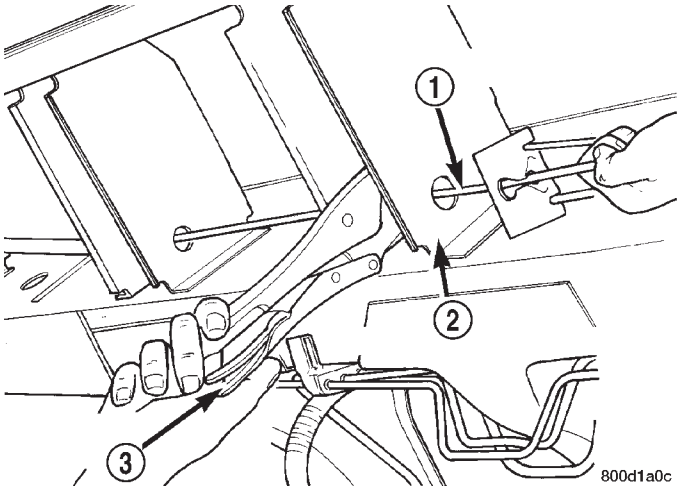

Fig. 117 Locked Out Park Brake Automatic Adjuster

1 - PARK BRAKE CABLE
2 - REAR BODY OUTRIGGER BRACKET
3 - LOCKING PLIERS

(5) Disconnect the left rear parking brake cable from the parking brake cable equalizer (Fig. 118).

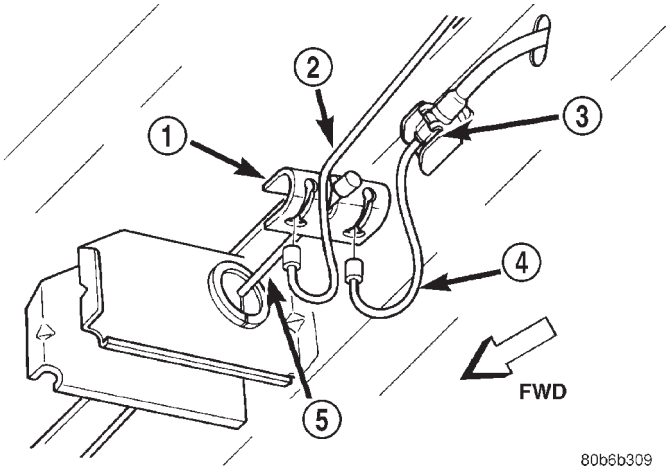

Fig. 118 Parking Brake Cables At Equalizer

1 - EQUALIZER
2 - LEFT REAR PARKING BRAKE CABLE
3 - LOCKING NUT
4 - INTERMEDIATE PARKING BRAKE CABLE
5 - FRONT PARKING BRAKE CABLE

(6) To remove parking brake cable housing from the body bracket, slide a 14 mm box end wrench over retainer end compressing the three fingers (Fig. 119). Alternate method is to use an aircraft type hose clamp.

CABLES - PARKING BRAKE (Continued)

4 - BRAKE SUPPORT PLATE

INSTALLATION

INSTALLATION - PARKING BRAKE CABLE (FRONT)

(1) Pass front parking brake cable assembly through hole in floor pan from the inside of the vehicle.

(2) Pass cable strand button through the hole in the lever (pedal) assembly bracket.

(3) Install cable retainer onto the park brake cable and then install cable retainer into pedal assembly bracket.

(4) Install the end of the park brake cable into the retainer previously installed into the park brake pedal bracket.

(5) Install cable strand button into the clevis on the park brake pedal mechanism.

(6) Install the front park brake cable floor pan seal into hole in floor pan. Seal is to be installed so the flange on the seal is flush with the floor pan (Fig. 110). Fold carpeting back down on floor.

(7) Raise vehicle.

(8) Insert brake cable and housing into body outrigger bracket making certain that housing retainer fingers lock the housing firmly into place (Fig. 109).

(9) Manually reset the automatic self-adjusting mechanism tension of the parking brake lever (pedal) assembly. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

(10) Assemble the park brake cables onto the park brake cable equalizer (Fig. 108).

(11) Lower vehicle and apply the park brake pedal 1 time. This will seat the parking brake cables.

INSTALLATION - PARKING BRAKE CABLE (INTERMEDIATE)

(1) Install the ends of the park brake cables through the frame rails and into the side brackets.

(2) Install the locking nuts at each end of the cable and securely tighten (Fig. 111) (Fig. 112).

(3) If the vehicle is a short-wheel-base model, it will be necessary to reinstall the fuel tank to its normal mounting position. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION).

(4) Install the intermediate parking brake cable on the cable connector at the right rear parking brake cable (Fig. 112).

(5) Install the intermediate park brake cable on the cable equalizer (Fig. 111).

(6) Remove the locking pliers from the front park brake cable. This will activate the automatic adjuster and correctly adjust the parking brake cables.

(7) Install and position the foam collar on the parking brake cable to prevent it from rattling against the vehicle's floor.

(8) Lower the vehicle and apply the park brake pedal 1 time, this will seat the park brake cables.

INSTALLATION - PARKING BRAKE CABLE (RIGHT REAR)

(1) Install the rear parking brake cable in the brake support plate. Insert cable housing retainer into brake support plate making certain that cable housing retainer fingers lock the housing and retainer firmly into place.

(2) Attach the parking brake cable onto the parking brake actuator lever.

(3) Install the brake shoes on the rear brake support plate. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).

(4) Insert cable housing retainer into body outrigger bracket making certain that cable housing retainer fingers lock the housing firmly into place.

(5) Connect the right rear parking brake cable to the connector on the intermediate parking brake cable (Fig. 114).

(6) Install the brake drum, then the wheel and tire assembly.

(7) Remove the locking pliers from the front park brake cable. This will automatically adjust the park brake cables.

(8) Lower the vehicle.

(9) Apply and release park brake pedal 1 time. This will seat the park brake cables.

INSTALLATION - PARKING BRAKE CABLE (LEFT REAR)

(1) Install the rear parking brake cable in the brake support plate. Insert cable housing retainer into brake support plate making certain that cable housing retainer fingers lock the housing and retainer firmly into place.

(2) Attach the parking brake cable onto the park brake actuator lever.

(3) Install the brake shoes on the rear brake support plate. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).

(4) Insert cable housing retainer into body outrigger bracket making certain that cable housing retainer fingers lock the housing firmly into place.

(5) Connect rear parking brake cable to the equalizer bracket (Fig. 118).

(6) Install brake drum, and wheel and tire assembly.

(7) Remove the locking pliers from the front park brake cable. This will automatically adjust the park brake cables.

(8) Apply and release park brake pedal 1 time. This will seat the park brake cables.

ADJUSTMENTS

ADJUSTMENT - PARKING BRAKE CABLES

The park brake cables on this vehicle have an automatic self adjuster built into the park brake pedal mechanism. When the foot operated park brake pedal is in its released (upward most) position, a clock spring automatically adjusts the park brake cables. The park brake cables are adjusted (tensioned) just enough to remove all the slack from the cables. The automatic adjuster system will not over adjust the cables causing rear brake drag.

Due to the automatic adjust feature of the park brake pedal, adjustment of the parking brake cables on these vehicles relies on proper drum brake and park brake shoe adjustment. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - ADJUSTMENTS) and (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).

When the park brake pedal is applied the self adjuster is by-passed and the pedal operates normally to engage the park brakes.

When a service procedure needs to be performed on the park brake pedal or the park brake cables, the automatic self adjuster can be manually locked out by the service technician.

CABLES - PARKING BRAKE (EXPORT)

REMOVAL - FRONT CABLE

(Refer to 5 - BRAKES - BASE/PARKING BRAKE/LEVER - REMOVAL)

INSTALLATION - FRONT CABLE

(Refer to 5 - BRAKES - BASE/PARKING BRAKE/LEVER - INSTALLATION)

LEVER - PARKING BRAKE

REMOVAL

(1) Manually release the automatic self-adjusting mechanism tension of the parking brake lever (pedal) assembly. (Refer to 5 - BRAKES/PARKING BRAKE - STANDARD PROCEDURE).

(2) Disconnect negative (ground) cable from the battery and isolate cable from battery terminal.

LEVER - PARKING BRAKE (Continued)

(3) Remove sill scuff plate from left door sill.
(4) Remove the left side kick panel.
(5) Remove the silencer panel under the instrument panel.
(6) Remove the steering column cover from the lower instrument panel.
(7) Remove the reinforcement from the lower instrument panel.
(8) Remove the front parking brake cable from the parking brake cable equalizer (Fig. 121).

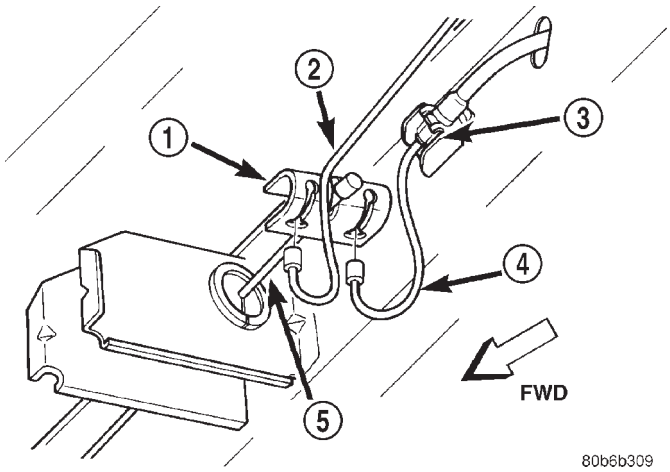

Fig. 121 Parking Brake Cable Equalizer

1 - EQUALIZER
2 - LEFT REAR PARKING BRAKE CABLE
3 - LOCKING NUT
4 - INTERMEDIATE PARKING BRAKE CABLE
5 - FRONT PARKING BRAKE CABLE

(9) Remove tension from front park brake cable. Tension is removed by releasing the locking pliers from the front park brake cable.
(10) Remove the 3 bolts mounting the wiring junction block to the instrument panel.

NOTE: When removing the lower mounting bolt, push the park brake pedal down 5 clicks to access the lower mounting bolt.

(11) Remove the lower bolt mounting the park brake pedal to the body (Fig. 122).
(12) Remove the forward nut mounting the park brake pedal to the body (Fig. 122).
(13) Remove the upper bolt mounting the park brake pedal to the body (Fig. 122).
(14) Pull downward on front park brake cable while rotating park brake pedal mechanism out from behind junction block.
(15) Remove park brake pedal release link from park brake mechanism.
(16) Remove the warning lamp ground switch connector from the park brake pedal mechanism (Fig. 122).

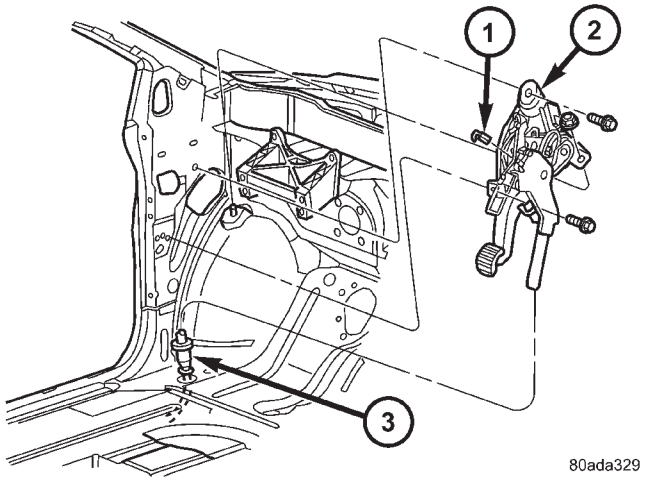

Fig. 122 PARKING BRAKE LEVER MOUNTING

1 - WIRE HARNESS CONNECTOR
2 - LEVER MECHANISM
3 - FRONT CABLE

(17) Remove front park brake cable button from park brake pedal mechanism. Tap end housing for front park brake cable out of park brake pedal mechanism.

INSTALLATION

(1) Install park brake cable end housing into park brake pedal mechanism.
(2) Install cable retainer onto the park brake cable strand and then install retainer into pedal bracket.
(3) Install cable strand button into the clevis on the park brake pedal mechanism.
(4) Install wiring harness connector on warning indicator lamp ground switch.
(5) Install the park brake release rod on the release mechanism of the park brake pedal.
(6) Position the park brake pedal mechanism into its installed position on the body of the vehicle.
(7) Loosely install the top bolt mounting the park brake pedal mechanism to the body (Fig. 122).
(8) Loosely install the forward nut mounting the park brake pedal mechanism to the body (Fig. 122).
(9) Loosely install the lower bolt mounting the park brake pedal mechanism to the body (Fig. 122).
(10) Tighten pedal mechanism attaching bolts and nut to 28 N·m (250 in. lbs.).
(11) Verify that the park brake pedal is in the fully released (full up) position.
(12) Raise vehicle.
(13) Install the front park brake cable on the park brake cable equalizer (Fig. 121).

LEVER - PARKING BRAKE (Continued)

NOTE: If the original lever assembly is being used, the lever mechanism auto adjuster spring tension will need to be reset. (Refer to 5 - BRAKES/PARKING BRAKE - STANDARD PROCEDURE)

(14) Lower vehicle.
(15) Remove the lock-out pin (if a new lever has been installed) from the automatic cable adjuster on the park brake pedal mechanism.
(16) Install the electrical junction block on the instrument panel.
(17) Install the reinforcement on the lower instrument panel.
(18) Install the steering column lower cover on the lower instrument panel.
(19) Install the silencer panel under the instrument panel.
(20) Install the left side kick panel.
(21) Install the sill scuff plate on the lower sill of the left door.
(22) Install the negative (ground) cable on the battery.
(23) Cycle the park brake pedal one time. This will seat the park brake cables and will allow the automatic self adjuster to properly tension the park brake cables.

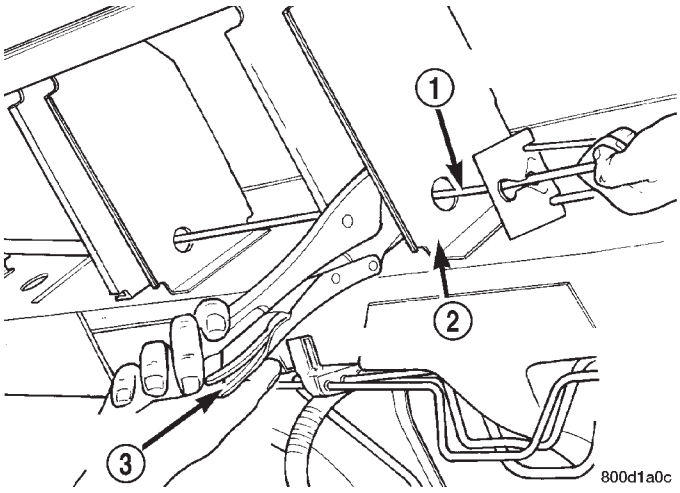

Fig. 123 Locking Out Automatic Adjuster

1 - PARK BRAKE CABLE
2 - REAR BODY OUTRIGGER BRACKET
3 - LOCKING PLIERS

LEVER - PARKING BRAKE (EXPORT)

REMOVAL - PARKING BRAKE LEVER AND FRONT CABLE

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
(2) Grasp the exposed section of the front parking brake cable and pull rearward on it. While holding the park brake in this position, install a pair of locking pliers on the front parking brake cable just rearward of the second body outrigger bracket (Fig. 123).
(3) Remove the left rear and intermediate parking brake cables from the parking brake cable equalizer (Fig. 124).
(4) Remove the equalizer from the front parking brake cable.
(5) Remove the locking pliers from the front parking brake cable. This will allow the adjuster in the parking brake lever mechanism to rotate around to its stop and remove the tension from the adjuster and front park brake cable.
(6) Remove the front parking brake cable housing from body outrigger bracket. Cable is removable by sliding a 14 mm box wrench over the cable retainer and compressing the three retaining fingers. **Alternate method:** Use an aircraft type hose clamp and screwdriver.

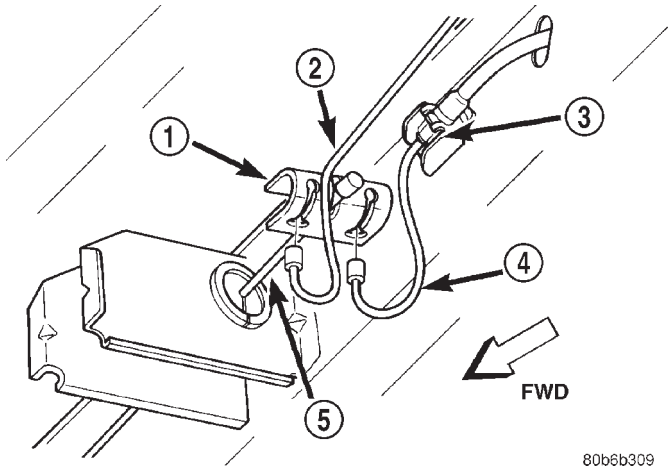

Fig. 124 Parking Brake Cable Equalizer

1 - EQUALIZER
2 - LEFT REAR PARKING BRAKE CABLE
3 - LOCKING NUT
4 - INTERMEDIATE PARKING BRAKE CABLE
5 - FRONT PARKING BRAKE CABLE

(7) Remove the four mounting nuts from the bottom of the parking brake lever bracket.
(8) Lower vehicle.
(9) Remove the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
(10) If equipped with a manual transaxle, remove the gearshift mechanism. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/SHIFT MECHANISM - REMOVAL)
(11) Unhook the end of the parking brake cable from the lever mechanism.

LEVER - PARKING BRAKE (EXPORT) (Continued)

(12) Compress the parking brake cable retainer by sliding a 14 mm wrench over the cable retainer and compress the three (3) retaining fingers.

(13) Remove the three screws from the parking brake grommet on the floor pan of the passenger compartment.

(14) Lift the parking brake lever and slide the parking brake cable out.

(15) Pull the cable through the floor pan from inside the vehicle.

INSTALLATION - PARKING BRAKE LEVER AND FRONT CABLE

(1) Pass the parking brake cable down through the hole in the floor pan from inside of vehicle.

(2) Pass cable end button through the hole in the lever bracket and press the cable housing into the hole until all three retaining fingers lock the cable to the lever bracket.

(3) Hook the end of the parking brake cable on the parking brake lever mechanism.

(4) Press the cable grommet into the hole in the floor pan and install the three screws securing it to the floor pan.

(5) If equipped with a manual transaxle, install the gearshift mechanism. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/SHIFT MECHANISM - INSTALLATION)

(6) Install the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

(7) Raise the vehicle.

(8) Install the four mounting nuts securing the parking brake lever bracket in place.

(9) Install the front park cable housing retainer to the body outrigger bracket. Press the cable housing into the outrigger hole until all three retaining fingers lock the cable in place.

(10) Grasp the exposed section of the front parking brake cable and pull rearward on it. While holding the park brake in this position, install a pair of locking pliers on the front parking brake cable just rearward of the second body outrigger bracket.

(11) Install the equalizer on the front parking brake cable and install the left rear and intermediate park brake cable in the correct location on the parking brake cable equalizer (Fig. 124).

(12) Remove the locking pliers from the front parking brake cable. This will allow the adjuster in the park brake lever mechanism to tension the parking brake cables.

(13) Lower the vehicle.

(14) Apply and release the parking brake lever one time. This will seat the parking brake cables and allow the auto adjuster in the parking brake lever mechanism to correctly tension the parking brake cables.

SHOES - PARKING BRAKE

REMOVAL

(1) AWD only - Set the parking brake. **The parking brake is set to keep the hub/bearing and axle shaft from rotating when loosening the hub nut.**

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(3) Remove the wheel and tire assembly.

(4) AWD only - Remove the cotter pin and nut retainer (Fig. 125) from the stub shaft of the outer C/V joint.

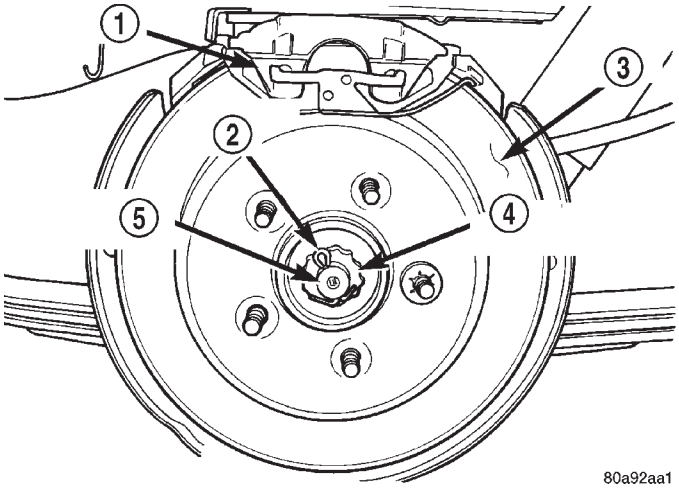

Fig. 125 Cotter Pin And Nut Retainer

1 - CALIPER
2 - COTTER PIN
3 - ROTOR
4 - NUT RETAINER
5 - OUTER C/V JOINT

SHOES - PARKING BRAKE (Continued)

(5) AWD only - Remove the spring washer (Fig. 126) from the stub shaft of the outer C/V joint.

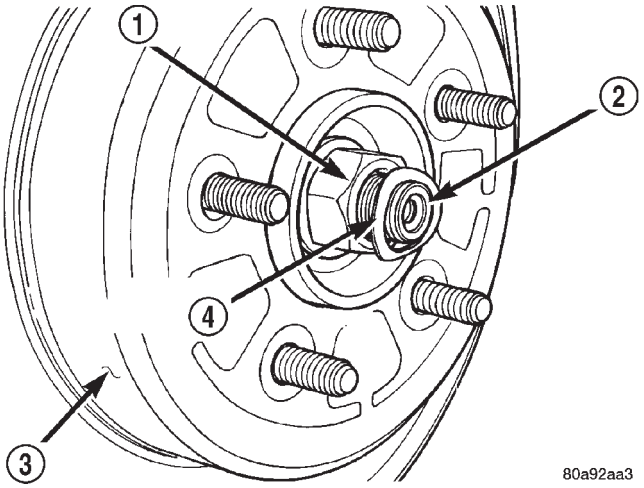

Fig. 126 Spring Washer

1 - HUB NUT
2 - STUB SHAFT
3 - ROTOR
4 - SPRING WASHER

(6) AWD only - Remove the hub nut and washer (Fig. 127) from the stub shaft of the outer C/V joint.

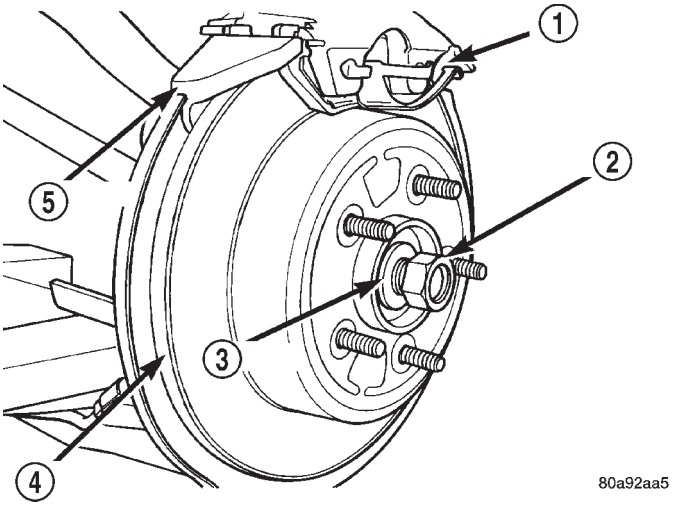

Fig. 127 Hub Nut And Washer

1 - CALIPER
2 - HUB NUT
3 - WASHER
4 - ROTOR
5 - ADAPTER

(7) Release the parking brake.

(8) Create slack in the rear park brake cables by locking the out the automatic adjuster as described. Grasp the exposed section of front park brake cable and pull downward on it. Then install a pair of locking pliers on the front park brake cable just rearward of the second body outrigger bracket (Fig. 128).

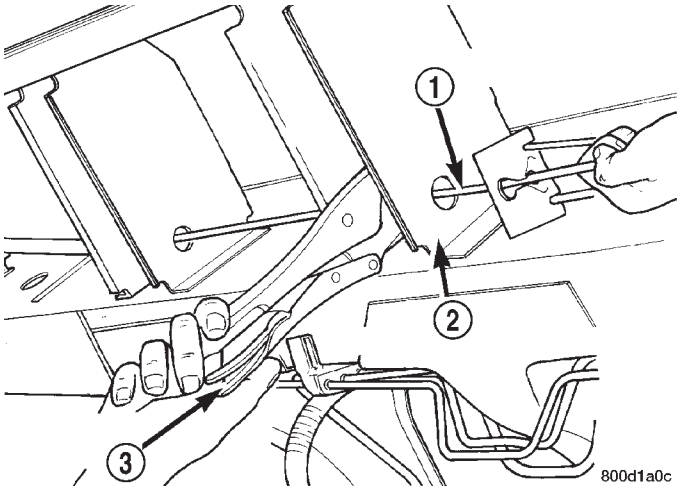

Fig. 128 Locking Out Automatic Adjuster

1 - PARK BRAKE CABLE
2 - REAR BODY OUTRIGGER BRACKET
3 - LOCKING PLIERS

(9) Remove the disc brake caliper to adapter guide pin bolts (Fig. 129).

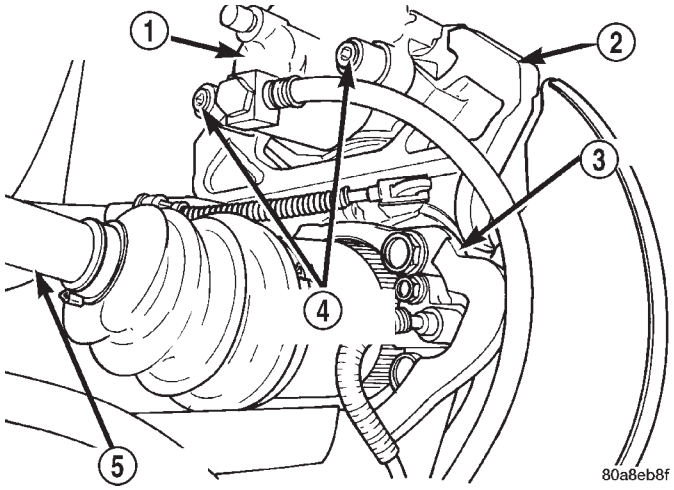

Fig. 129 Removing Caliper Guide Pin Bolts

1 - DISC BRAKE CALIPER
2 - ADAPTER
3 - AXLE
4 - GUIDE PIN BOLTS
5 - DRIVESHAFT (AWD MODELS ONLY)

(10) Remove rear caliper from adapter using the following procedure. First rotate front of caliper up from the adapter. Then pull the rear of the caliper and the outboard brake shoe anti-rattle clip out from under the rear abutment on the adapter (Fig. 130).

SHOES - PARKING BRAKE (Continued)

2 - TONE WHEEL
3 - WHEEL SPEED SENSOR
4 - AXLE
5 - BOLT
6 - DRIVESHAFT

(17) FWD only - Remove the ABS wheel speed sensor from the hub/bearing in the following fashion:

(a) Remove secondary (yellow) retaining clip at rear of wheel speed sensor head (Fig. 135).

(b) Push up on metal retaining clip (Fig. 135) until it bottoms. This will release wheel speed sensor head from hub and bearing. While holding metal clip up, pull back on wheel speed sensor head removing it from hub and bearing.

(c) Remove wheel speed sensor from hub/bearing.

(18) Remove the hub/bearing-to-axle mounting bolts (Fig. 136).

(19) Remove the hub/bearing (Fig. 137).

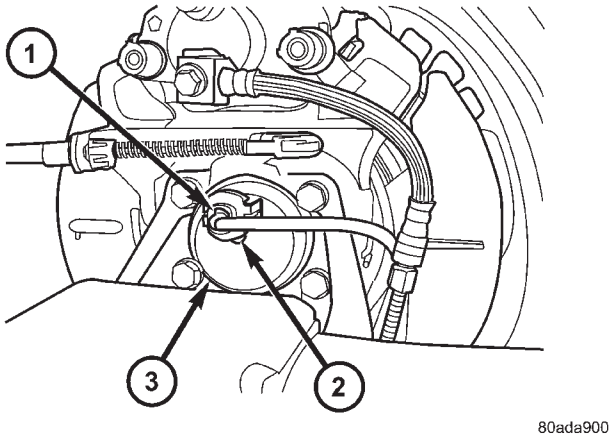

Fig. 135 Sensor Connection At Hub And Bearing

5 - ADAPTER

SHOES - PARKING BRAKE (Continued)

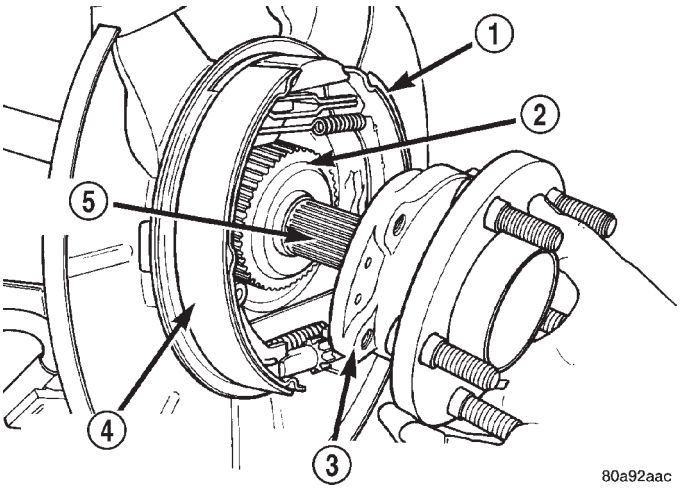

Fig. 137 Hub/Bearing Removal/Installation (AWD Shown)

1 - PARK BRAKE BRAKE SHOE
2 - OUTER C/V JOINT
3 - HUB/BEARING
4 - PARK BRAKE BRAKE SHOE
5 - STUB SHAFT

CAUTION: Corrosion may occur between the hub/bearing and the axle flange. If this occurs, the hub/bearing will be difficult to remove from the axle and disc brake caliper adapter. If the hub/bearing will not come out by pulling on it by hand, don't not pound on it with a hammer. Pounding on the hub/bearing will damage it. To remove a hub/bearing that is corroded in place, lightly tap the disc brake caliper adapter using a soft-face hammer. This will remove both the caliper adapter and hub/bearing together from the axle. With a helper supporting the caliper adapter in his hands, position Remover, Special Tool 8214-1, on the cast housing of hub/bearing (Fig. 138). Do not position the special tool on the inner race of hub/bearing. Lightly strike the Remover with a hammer to remove the hub/bearing from the caliper adapter.

(20) Remove the adapter from the rear axle.

(21) Mount the adapter in a vise using the anchor boss for the park brake cable (Fig. 139).

4 - TRAILING PARK BRAKE SHOE
5 - ALLEN WRENCH

(28) Remove the trailing park brake shoe from the adapter.

(29) Remove the park brake shoe actuator from the adapter and inspect for signs of abnormal wear and binding at the pivot point.

INSTALLATION

(1) Install park brake shoe actuator into adapter.

(2) Install the trailing brake shoe on the adapter.

NOTE: When the hold down pin is installed, the long part of the hold down pin is to be positioned strait up and down. This will ensure that the hold down pin is correctly engaged with the adapter.

(3) Install the hold down spring and pin (Fig. 145) on the trailing park brake shoe.

(4) Install the upper return springs (Fig. 144) on the trailing park brake shoe.

(5) Install the upper return springs on the leading park brake shoe (Fig. 143). Then position the top of the leading park brake shoe at the upper anchor and rotate the bottom of the shoe outward until correctly installed on the adapter.

(6) Install the adjuster (Fig. 142) between the leading and trailing park brake shoe.

NOTE: When the hold down pin is installed, the long part of the hold down pin is to be positioned strait up and down. This will ensure that the hold down pin is correctly engaged with the adapter.

(7) Install the hold down spring and pin (Fig. 141) on the leading park brake shoe.

(8) Install the lower return spring (Fig. 140) on the leading and trailing park brake shoes.**When installing the return spring, it is to be installed behind the park brake shoes (Fig. 140).**

(9) Install the 4 mounting bolts for the adapter and hub/bearing into the bolt holes in the axle.

(10) Position the adapter on the 4 mounting bolts installed in the rear axle (Fig. 146).

SHOES - PARKING BRAKE (Continued)

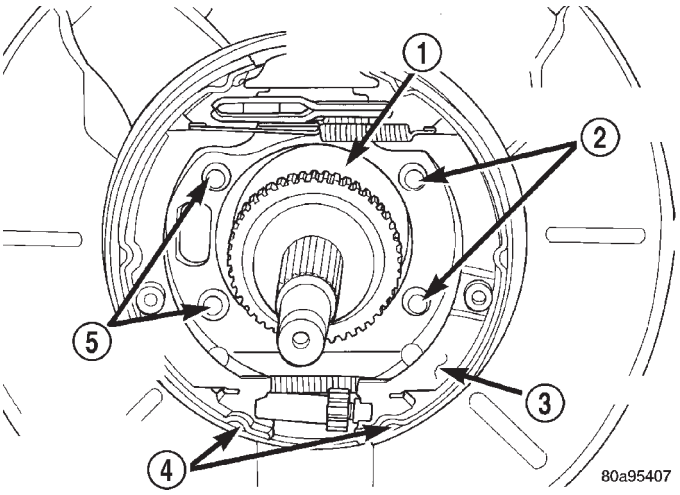

Fig. 146 Adapter Installed On Mounting Bolts (AWD Shown)

1 - DRIVESHAFT OUTER C/V JOINT
2 - MOUNTING BOLTS
3 - ADAPTER
4 - PARK BRAKE SHOES
5 - MOUNTING BOLTS

(11) Install the hub/bearing on the stub shaft of outer C/V joint (AWD only) and into the end of the axle. (Fig. 137).

(12) In a progressive crisscross pattern, tighten the 4 hub/bearing mounting bolts until the hub/bearing is squarely seated against the axle. Then tighten the hub/bearing mounting bolts to a torque of 129 N·m (95 ft. lbs.).

(13) AWD only - Install the wheel speed sensor on the hub/bearing and adapter. Install the wheel speed sensor attaching bolt (Fig. 134). Tighten the wheel speed sensor attaching bolt to a torque of 12 N·m (105 in. lbs).

(14) FWD only - Install the wheel speed sensor in the following fashion:

(a) If metal wheel speed sensor retaining clip is not in the neutral installed position on hub and bearing cap, install from the bottom, if necessary, and push clip upward until it snaps into position.

(b) Install wheel speed sensor head into rear of hub and bearing aligning index tab with the notch in the top of the mounting hole. Push the sensor in until it snaps into place on the metal retaining clip.

(c) Install secondary (yellow) retaining clip over wheel speed sensor head and engage the tabs on each side.

(15) Install the park brake cable into its mounting hole in the adapter. **Be sure all the locking tabs on the park brake cable retainer are expanded out to ensure the cable will not pull out of the adapter.**

(16) Install the end of the park brake cable on the park brake actuator lever (Fig. 132).

(17) Attach park brake cable to adapter using mounting bolt.

(18) Remove the locking pliers (Fig. 128) from the front park brake cable.

(19) Adjust the park brake drum-in-hat brake shoes. (Refer to 5 - BRAKES/PARKING BRAKE/ SHOES - ADJUSTMENTS).

(20) Install the rotor on the hub/bearing.

(21) Carefully lower caliper and brake shoes over rotor and onto the adapter using the reverse procedure for removal (Fig. 130).

CAUTION: When installing guide pin bolts extreme caution should be taken not to crossthread the caliper guide pin bolts.

(22) Install the caliper guide pin bolts (Fig. 129). Tighten the guide pin bolts to a torque of 35 N·m (26 ft. lbs.).

(23) AWD only - Clean all foreign material off the threads of the outer C/V joint stub shaft. Install the washer and hub nut (Fig. 127) on the stub shaft of the outer C/V joint.

(24) AWD only - Set the parking brake.

(25) AWD only - Tighten the hub nut to a torque of 244 N·m (180 ft. lbs.).

(26) AWD only - Install the spring washer (Fig. 126) on the stub shaft of the outer C/V joint.

(27) AWD only - Install the nut retainer and cotter pin (Fig. 125) on the stub shaft of the outer C/V joint.

(28) Install the wheel and tire assembly. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(29) Lower vehicle.

(30) Fully apply and release the park brake pedal one time. This will seat and correctly adjust the park brake cables.

CAUTION: Before moving vehicle, pump the brake pedal several times to insure the vehicle has a firm brake pedal to adequately stop vehicle.

(31) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

SHOES - PARKING BRAKE (Continued)

ADJUSTMENTS

ADJUSTMENT - PARKING BRAKE SHOES

CAUTION: Before adjusting the park brake shoes be sure that the park brake pedal is in the fully released position. If park brake pedal is not in the fully released position, the park brake shoes can not be accurately adjusted.

(1) Raise vehicle.
(2) Remove tire and wheel.
(3) Remove disc brake caliper from caliper adapter (Fig. 147). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

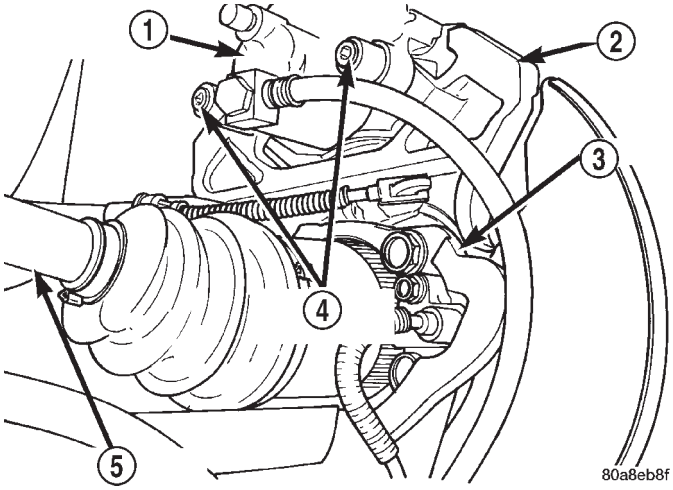

Fig. 147 Disc Brake Caliper

1 - DISC BRAKE CALIPER
2 - ADAPTER
3 - AXLE
4 - GUIDE PIN BOLTS
5 - DRIVESHAFT (AWD MODELS ONLY)

(4) Remove rotor from hub/bearing.

NOTE: When measuring the brake drum diameter, the diameter should be measured in the center of the area in which the park brake shoes contact the surface of the brake drum.

(5) Using Brake Shoe Gauge, Special Tool C-3919, or equivalent, **accurately** measure the inside diameter of the park brake drum portion of the rotor (Fig. 148).

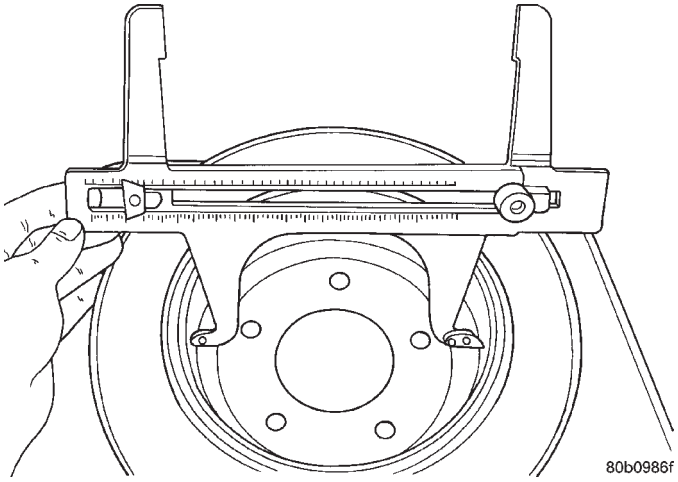

Fig. 148 Measuring Park Brake Drum Diameter

(6) Using a ruler that reads in 64th of an inch, accurately read the measurement of the inside diameter of the park brake drum from the special tool (Fig. 149).

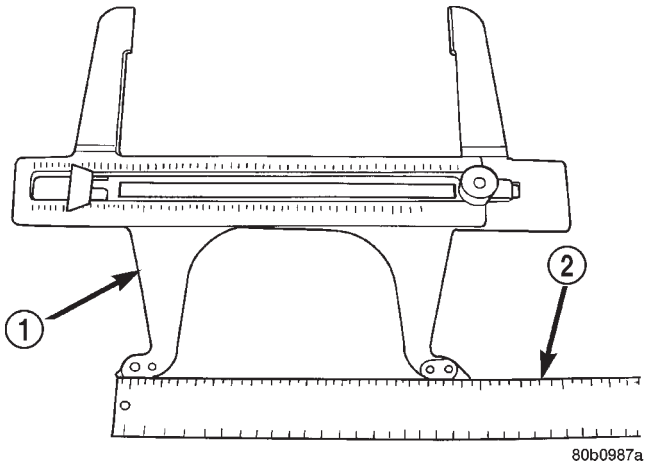

Fig. 149 Reading Park Brake Drum Diameter

1 - SPECIAL TOOL C-3919
2 - RULER

SHOES - PARKING BRAKE (Continued)

(7) Reduce the inside diameter measurement of the brake drum that was taken using Special Tool C-3919 by 1/64 of an inch. Reset Gauge, Brake Shoe, Special Tool C-3919 or the equivalent used, so that the outside measurement jaws are set to the reduced measurement (Fig. 150).

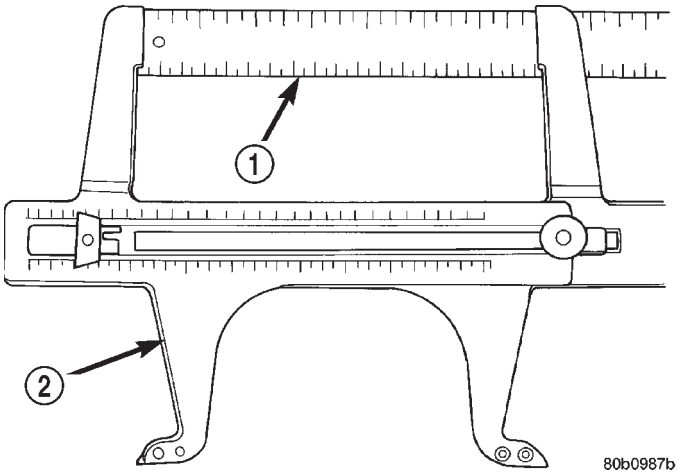

Fig. 150 Setting Gauge To Park Brake Shoe Measurement

1 - RULER
2 - SPECIAL TOOL C-3919

(8) Place Gauge, Brake Shoe, Special Tool C-3919, or equivalent over the park brake shoes. The special tool must be located diagonally across at the top of one shoe and bottom of opposite shoe (widest point) of the park brake shoes.

(9) Using the star wheel adjuster, adjust the park brake shoes until the lining on the park brake shoes just touches the jaws on the special tool.

(10) Repeat step 8 above and measure shoes in both directions.

(11) Install brake rotor on hub and bearing.

(12) Rotate rotor to verify that the park brake shoes are not dragging on the brake drum. If park brake shoes are dragging, remove rotor and back off star wheel adjuster one notch and recheck for brake shoe drag against drum. Continue with the previous step until brake shoes are not dragging on brake drum.

(13) Install disc brake caliper on caliper adapter (Fig. 147). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

(14) Install wheel and tire.

(15) Tighten the wheel mounting nuts in the proper sequence until all nuts are torqued to half the specified torque. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).

(16) Lower vehicle.

(17) Apply and release the park brake pedal one time. This will seat and correctly adjust the park brake cables.

CAUTION: Before moving vehicle, pump brake pedal several times to ensure the vehicle has a firm enough pedal to stop the vehicle.

(18) Road test the vehicle to ensure proper function of the vehicle's brake system.

BRAKES - ABS

DESCRIPTION

DESCRIPTION - ANTILOCK BRAKE SYSTEM

This section covers the physical and operational descriptions and the on-car service procedures for the Mark 20e Antilock Brake System and the Mark 20e Antilock Brake System with traction control.

The purpose of the antilock brake system (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

DESCRIPTION - ANTILOCK BRAKE SYSTEM (EXPORT)

Four-wheel disc antilock brakes are standard on all models. The Mark 20e antilock brake system is used on all models. Depending on whether the vehicle is a left-hand drive (LHD) or right-hand drive (RHD) model, the integrated control unit (ICU) is located in one of two locations. On LHD models, the ICU is mounted above the front suspension cradle/crossmember below the master cylinder. On RHD models, the ICU is located behind the front suspension cradle/crossmember on the left side of the vehicle.

DESCRIPTION - ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use electronic variable brake proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

DESCRIPTION - TRACTION CONTROL SYSTEM

Traction control reduces wheel slip and maintains traction at the driving wheels at speeds below 56 km/h (35 mph) when road surfaces are slippery. The traction control system reduces wheel slip by braking the wheel that is losing traction.

HYDRAULIC SHUTTLE VALVES

Two pressure relief hydraulic shuttle valves are included on vehicles with traction control. These valves are located inside the HCU and cannot be serviced separately from the HCU.

TRACTION CONTROL LAMP

The traction control function lamp is located in the transmission range indicator display of the instrument cluster, displaying TRAC, TRAC OFF or neither depending on system mode.

The TRAC OFF lamp is controlled by a Traction Control Off switch that is a momentary contact type switch. The Traction Control Off switch is located on the steering column upper shroud.

OPERATION

OPERATION - ANTILOCK BRAKE SYSTEM

There are a few performance characteristics of the Mark 20e Antilock Brake System that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 3–5 mph. If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation, although for vehicle stability, both rear wheel solenoids receive the same electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS stop, the brakes hydraulic system is still diagonally split. However, the brake system pressure is further split into three control channels. During antilock operation of the vehicle's brake system, the front wheels are controlled independently and are on two separate control channels, and the rear wheels of the vehicle are controlled together.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the controller antilock brake (CAB).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3–4 mph. There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25–30 percent. This means that the wheel rolling velocity is 25–30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark

black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP CYCLE

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on. When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 20–40 kph (12–25 mph). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE warning lamp, nor the amber ABS warning lamp, illuminate and no fault codes are stored in the CAB.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a DRB scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged tone wheels; incorrect tone wheels; damaged steering knuckle wheel speed sensor mounting bosses; loose wheel speed sensor mounting bolts; excessive tone wheel runout; or an excessively large tone wheel-to-wheel speed sensor air gap. Give special attention to these components when diagnosing a vehicle exhibiting premature ABS cycling.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

OPERATION - ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the hydraulic control unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the outlet valve and draining through the inlet valve check valve. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

OPERATION - TRACTION CONTROL SYSTEM

The traction control module monitors wheel speed. During acceleration, if the module detects front (drive) wheel slip and the brakes are not applied, the module enters traction control mode. Traction control operation proceeds in the following order:

(1) Close the normally open isolation valves.

(2) Start the pump/motor and supply volume and pressure to the front (drive) hydraulic circuit. (The pump/motor runs continuously during traction control operation.)

(3) Open and close the build and decay valves to maintain minimum wheel slip and maximum traction.

The cycling of the build and decay valves during traction control is similar to that during antilock braking, except the valves work to control wheel spin by applying the brakes, whereas the ABS function is to control wheel skid by releasing the brakes.

If the brakes are applied at anytime during a traction control cycle, the brake lamp switch triggers the controller to switch off traction control.

HYDRAULIC SHUTTLE VALVES

Two pressure relief hydraulic shuttle valves allow pressure and volume to return to the master cylinder reservoir when not consumed by the build and decay valves. These valves are necessary because the pump/motor supplies more volume than the system requires.

TRACTION CONTROL LAMP

The traction control system is enabled at each ignition cycle. It may be turned off by depressing the Traction Control Off switch button when the ignition is in the ON position. The traction control function lamp (TRAC OFF) illuminates immediately upon depressing the button.

The traction control function lamp illuminates during a traction control cycle, displaying TRAC.

If the CAB calculates that the brake temperatures are high, the traction control system becomes inoperative until a time-out period has elapsed. During this

"thermo-protection mode," the traction control function lamp illuminates TRAC OFF; note that no trouble code is registered.

CAUTION

CAUTIONS

The ABS uses an electronic control module, the CAB. This module is designed to withstand normal current draws associated with vehicle operation. Care must be taken to avoid overloading the CAB circuits.

CAUTION: In testing for open or short circuits, do not ground or apply voltage to any of the circuits unless instructed to do so for a diagnostic procedure.

CAUTION: These circuits should only be tested using a high impedance multi-meter or the DRBIII® scan tool as described in this section. Power should never be removed or applied to any control module with the ignition in the ON position. Before removing or connecting battery cables, fuses, or connectors, always turn the ignition to the OFF position.

CAUTION: The CAB 24-way connector should never be connected or disconnected with the ignition switch in the ON position.

CAUTION: This vehicle utilizes active wheel speed sensors. Do not apply voltage to wheel speed sensors at any time.

CAUTION: Use only factory wiring harnesses. Do not cut or splice wiring to the brake circuits. The addition of aftermarket electrical equipment (car phone, radar detector, citizen band radio, trailer lighting, trailer brakes, etc.) on a vehicle equipped with antilock brakes may affect the function of the antilock brake system.

CAUTION: When performing any service procedure on a vehicle equipped with ABS, do not apply a 12-volt power source to the ground circuit of the pump motor in the HCU. Doing this will damage the pump motor and will require replacement of the entire HCU.

CAUTION: An attempt to remove or disconnect certain system components may result in improper system operation. Only those components with approved removal and installation procedures in this manual should be serviced.

CAUTION: If welding work is to be performed on the vehicle, using an electric arc welder, the CAB connector should be disconnected during the welding operation.

CAUTION: Many components of the ABS System are not serviceable and must be replaced as an assembly. Do not disassemble any component which is not designed to be serviced.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle. Failure to raise a vehicle from the recommended locations could result in lifting a vehicle by the hydraulic control unit mounting bracket. Lifting a vehicle by the hydraulic control unit mounting bracket will result in damage to the mounting bracket and the hydraulic control unit.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surface, wash off with water immediately.

STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS though, particularly the ICU (HCU), should only be bled when the HCU is replaced or removed from the vehicle. The ABS must always be bled anytime it is suspected that the HCU has ingested air. Under most circumstances that require the bleeding of the brakes hydraulic system, only the base brake hydraulic system needs to be bled.

It is important to note that excessive air in the brake system will cause a soft or spongy feeling brake pedal.

During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add DOT 3 brake fluid as required.

The ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

BRAKES - ABS (Continued)

The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.

BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

(1) Make sure all hydraulic fluid lines are installed and properly torqued.

(2) Connect the DRBIII® scan tool to the diagnostics connector. The diagnostic connector is located under the lower steering column cover to the left of the steering column.

(3) Using the DRB, check to make sure the CAB does not have any fault codes stored. If it does, clear them using the DRB.

WARNING: WHEN BLEEDING THE BRAKE SYSTEM WEAR SAFETY GLASSES. A CLEAR BLEED TUBE MUST BE ATTACHED TO THE BLEEDER SCREWS AND SUBMERGED IN A CLEAR CONTAINER FILLED PART WAY WITH CLEAN BRAKE FLUID. DIRECT THE FLOW OF BRAKE FLUID AWAY FROM YOURSELF AND THE PAINTED SURFACES OF THE VEHICLE. BRAKE FLUID AT HIGH PRESSURE MAY COME OUT OF THE BLEEDER SCREWS WHEN OPENED.

(4) Bleed the base brake system using the standard pressure or manual bleeding procedure. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)

(5) Using the DRB, select ANTILOCK BRAKES, followed by MISCELLANEOUS, then BLEED BRAKES. Follow the instructions displayed. When the scan tool displays TEST COMPLETED, disconnect the scan tool and proceed.

(6) Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.

(7) Fill the master cylinder reservoir to the full level.

(8) Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

SPECIFICATIONS

ABS FASTENER TORQUE

(Refer to 5 - BRAKES - BASE - SPECIFICATIONS)

TONE WHEEL RUNOUT

DESCRIPTION	SPECIFICATION
Front Tone Wheel Maximum Runout	0.15 mm (0.006 in.)
Rear Tone Wheel Maximum Runout	0.15 mm (0.006 in.)

WHEEL SPEED SENSOR AIR GAP

DESCRIPTION	SPECIFICATION
Front Sensor	0.35 – 1.20 mm 0.014 – 0.047 in.
Rear Sensor	0.40 – 1.20 mm 0.016 – 0.047 in.

FRONT WHEEL SPEED SENSOR

REMOVAL

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the tire and wheel assembly.

(3) Remove the sensor cable routing clamp screws.

CAUTION: When disconnecting the wheel speed sensor from vehicle wiring harness, be careful not to damage pins on connector

(4) Remove speed sensor cable grommets from intermediate bracket on strut.

(5) Disconnect speed sensor cable from vehicle wiring harness behind fender well shield.

(6) Remove the wheel speed sensor head mounting bolt (Fig. 1).

(7) Remove sensor head from steering knuckle. If sensor has seized due to corrosion, **DO NOT USE PLIERS ON SENSOR HEAD.** Use a hammer and a punch and tap edge of sensor ear, rocking the sensor side-to-side until free.

(8) Remove front wheel speed sensor from vehicle.

INSTALLATION

CAUTION: Proper installation of wheel speed sensor cables is critical to continued system operation. Be sure that cables are installed in retainers. Failure to install cables in retainers as shown in this section may result in contact with moving parts and over extension of cables, resulting in an open circuit.

FRONT WHEEL SPEED SENSOR (Continued)

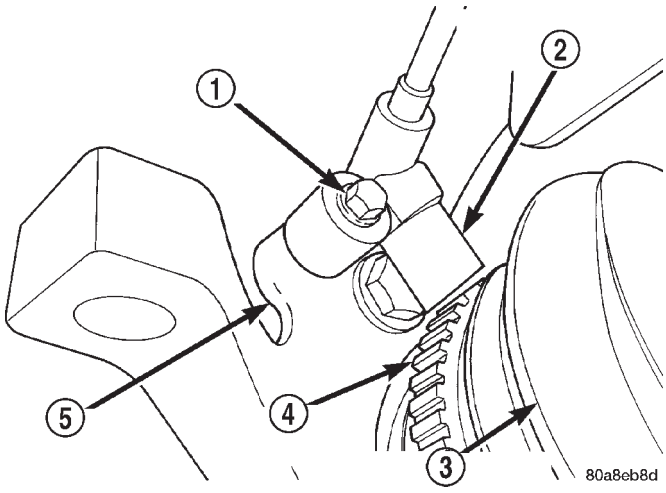

Fig. 1 Front Wheel Speed Sensor Attaching Bolt

1 - MOUNTING BOLT
2 - WHEEL SPEED SENSOR
3 - DRIVESHAFT
4 - TONE WHEEL
5 - STEERING KNUCKLE

(1) Connect the front wheel speed sensor cable to the vehicle wiring harness connector. Be sure speed sensor cable connector is fully seated and locked into vehicle wiring harness connector.

(2) Install the bolts attaching the routing clamps to the body of the vehicle. Tighten the bolts to a torque of 14 N·m (125 in. lbs.).

(3) Insert speed sensor cable grommets into intermediate bracket on strut.

(4) Install the wheel speed sensor head mounting bolt (Fig. 1). Tighten the bolt to a torque of 13 N·m (115 in. lbs.)

(5) Install the wheel and tire assembly on vehicle.

(6) Lower vehicle.

(7) Road test vehicle to ensure proper operation of the base and ABS brake systems.

REAR WHEEL SPEED SENSOR - AWD

REMOVAL

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

CAUTION: When disconnecting speed sensor cable from vehicle wiring harness be careful not to damage pins on the electrical connectors. Also, inspect connectors for any signs of previous damage.

(2) Remove grommet from floor pan of vehicle and disconnect speed sensor cable connector from vehicle wiring harness.

CAUTION: When removing rear wheel speed sensor cable from routing clips, be sure not to damage the routing clips. Routing clips that are molded onto the brake hose will require replacement of the brake hose if damaged during removal or installation of the speed sensor cable.

(3) Carefully remove speed sensor cable from press-in routing clips along brake hose and tubing.

(4) Remove bolt securing wheel speed sensor cable metal clip to rear of axle. Remove metal clip from cable if necessary.

CAUTION: If speed sensor head has seized due to corrosion, do not use pliers on speed sensor head in an attempt to remove it. Use a hammer and a punch and tap mounting flange edge side-to-side, rocking the sensor until free.

(5) Remove wheel speed sensor head attaching bolt.

(6) Remove wheel speed sensor head from the axle, and remove sensor from vehicle.

INSTALLATION

CAUTION: Proper installation of wheel speed sensor cables is critical to continued system operation. Be sure that cables are installed in retainers. Failure to install cables in retainers as indicated may result in contact with moving parts or over-extension of cables, resulting in an open circuit.

(1) Install wheel speed sensor head in axle flange.

CAUTION: Prior to installing the speed sensor head attaching bolt, the plastic anti-rotation pin must be fully seated into the bearing flange.

(2) Install wheel speed sensor head attaching bolt. Tighten bolt to a torque 10 N·m (90 in. lbs.).

(3) Check the air gap between the face of the wheel speed sensor and the top surface of the tone wheel. (Refer to 5 - BRAKES - SPECIFICATIONS)

CAUTION: When installing wheel speed sensor cable in the routing clips on rear brake flex hose, be sure not to damage the routing clips. Routing clips are molded onto the hose and will require replacement of the brake hose if damaged.

(4) Install speed sensor cable under leaf spring onto brake hose and tubing utilizing routing clips to secure it in place.

REAR WHEEL SPEED SENSOR - AWD (Continued)

(5) Install metal routing clip on speed sensor cable and mount it to rear of axle with mounting bolt. Tighten mounting bolt to 16 N·m (140 in. lbs.).

(6) Connect wheel speed sensor cable to vehicle wiring harness.**Be sure speed sensor cable connector is fully seated and locked into vehicle wiring harness connector.**

(7) Install speed sensor cable grommet into the floor pan, being sure the grommet is fully seated into the access hole.

(8) Lower vehicle.

(9) Road test vehicle to ensure proper operation of the base and ABS braking systems.

REAR WHEEL SPEED SENSOR - FWD

REMOVAL

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

CAUTION: When disconnecting speed sensor cable from vehicle wiring harness be careful not to damage pins on the electrical connectors. Also, inspect connectors for any signs of previous damage.

(2) Remove grommet from floor pan of vehicle and disconnect speed sensor cable connector from vehicle wiring harness (Fig. 2).

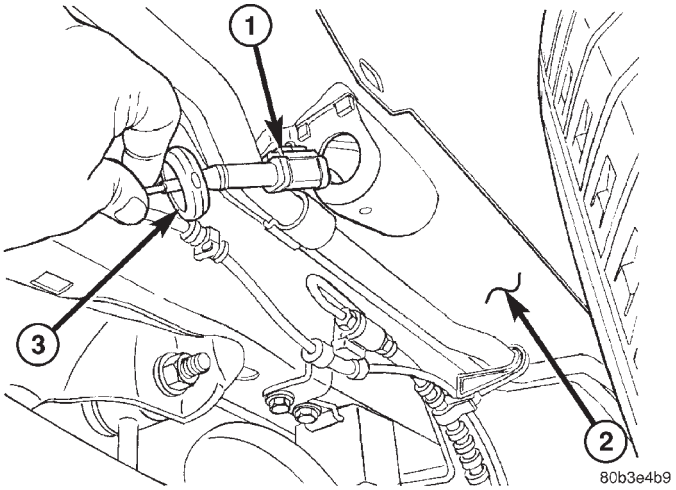

Fig. 2 Wheel Speed Sensor Connector

1 - CONNECTOR
2 - FLOOR PAN
3 - GROMMET

CAUTION: When removing rear wheel speed sensor cable from routing clips, be sure not to damage the routing clips. Routing clips that are molded onto the brake hose will require replacement of the brake hose if damaged during removal or installation of the speed sensor cable.

(3) Carefully remove speed sensor cable from press-in routing clips (Fig. 3).

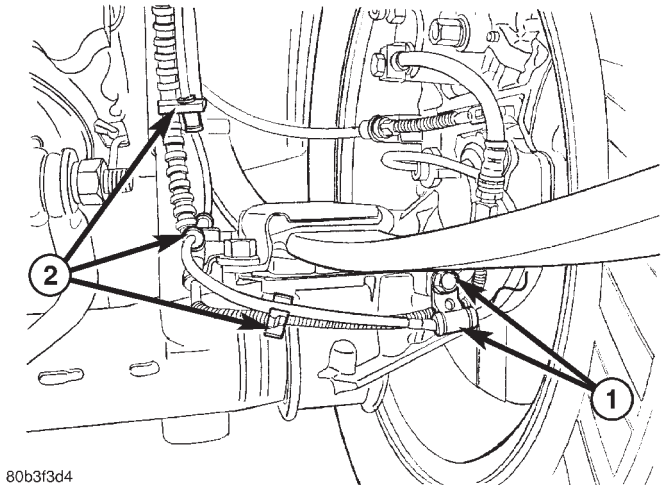

Fig. 3 SPEED SENSOR CABLE ROUTING

1 - METAL CLIP AND MOUNTING BOLT
2 - ROUTING CLIPS

(4) Remove bolt securing metal routing clip to rear of axle and remove sensor cable from metal clip (Fig. 3).

(5) Remove secondary (yellow) retaining clip at rear of wheel speed sensor head (Fig. 4).

(6) Push up on metal retaining clip (Fig. 4) until it bottoms. This will release wheel speed sensor head from hub and bearing. While holding metal clip up, pull back on wheel speed sensor head removing it from hub and bearing.

(7) Remove wheel speed sensor assembly from vehicle.

INSTALLATION

CAUTION: Proper installation of wheel speed sensor cable is critical to continued system operation. Be sure that cable is installed in routing retainers/ clips. Failure to install cable in retainers may result in contact with moving parts or over extension of cable, resulting in an open circuit.

NOTE: Make sure wheel speed sensor stays clean and dry as it is installed into the hub and bearing cap.

(1) If metal sensor retaining clip is not in the neutral installed position on hub and bearing cap, install from the bottom, if necessary, and push clip upward until it snaps into position.

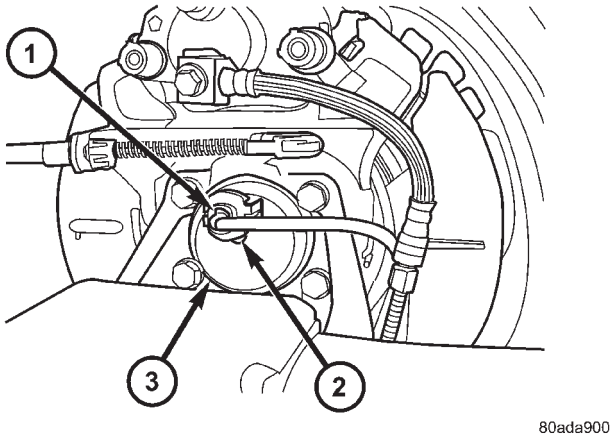

Fig. 4 SENSOR CONNECTION AT HUB AND BEARING

1 - SECONDARY SENSOR RETAINING CLIP
2 - METAL SENSOR RETAINING CLIP
3 - HUB AND BEARING

(2) Install wheel speed sensor head into rear of hub and bearing aligning index tab with the notch in the top of the mounting hole. Push the sensor in until it snaps into place on the metal retaining clip.

(3) Install secondary (yellow) retaining clip over wheel speed sensor head and engage the tabs on each side.

(4) Route sensor cable under leaf spring along rear of axle. Install speed sensor cable into routing clips on rear brake flex hose (Fig. 3).

(5) Install cable into metal routing clip and attach it to the rear axle with mounting bolt (Fig. 3). Tighten mounting bolt to 16 N·m (140 in. lbs.).

(6) Connect wheel speed sensor cable to vehicle wiring harness (Fig. 2). **Be sure speed sensor cable connector is fully seated and locked into vehicle wiring harness connector.**

(7) Install speed sensor cable grommet into hole in floor pan making sure grommet is fully seated into hole.

(8) Lower vehicle.

(9) Road test vehicle to ensure proper operation of the base and ABS braking systems.

TONE WHEEL

INSPECTION - TONE WHEEL

NOTE: Rear tone wheels for front-wheel-drive vehicles are sealed within the hub and bearing assembly and cannot be inspected or replaced. Replacement of the hub and bearing is necessary.

Tone wheels can cause erratic wheel speed sensor signals. Inspect tone wheels for the following possible causes.

- missing, chipped, or broken teeth
- contact with the wheel speed sensor
- wheel speed sensor to tone wheel alignment
- wheel speed sensor to tone wheel clearance
- excessive tone wheel runout
- tone wheel loose on its mounting surface

If a front tone wheel is found to need replacement, the drive shaft must be replaced. No attempt should be made to replace just the tone wheel. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

If a rear tone wheel is found to need replacement on an all-wheel-drive model, the drive shaft must be replaced. No attempt should be made to replace just the tone wheel. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

If wheel speed sensor to tone wheel contact is evident, determine the cause and correct it before replacing the wheel speed sensor or tone wheel.

Check the gap between the speed sensor head and the tone wheel to ensure it is within specifications. (Refer to 5 - BRAKES - ABS/ELECTRICAL - SPECIFICATIONS)

Excessive wheel speed sensor runout can cause erratic wheel speed sensor signals. Refer to SPECIFICATIONS in this section of the service manual for the maximum allowed tone wheel runout (Refer to 5 - BRAKES - ABS/ELECTRICAL - SPECIFICATIONS). If tone wheel runout is excessive, determine if it is caused by a defect in the driveshaft assembly or hub and bearing. Replace as necessary.

Tone wheels are pressed onto their mounting surfaces and should not rotate independently from the mounting surface. Replacement of the front driveshaft, rear driveshaft (AWD only) or rear hub and bearing is necessary.

TRACTION CONTROL SWITCH

DIAGNOSIS AND TESTING - TRACTION CONTROL SWITCH

(1) Remove lower column shroud.

(2) Disconnect traction control switch harness from column harness below column.

(3) Using an ohmmeter, check for continuity reading between pins. Refer to TRACTION CONTROL SWITCH CONTINUITY test table and (Fig. 5).

TRACTION CONTROL SWITCH (Continued)

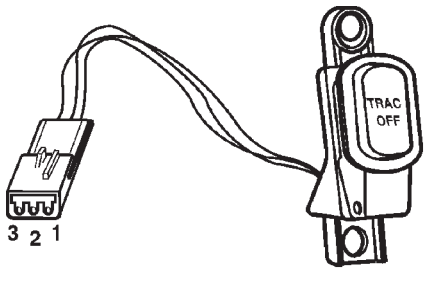

Fig. 5 TRACTION CONTROL SWITCH CONNECTOR

TRACTION CONTROL SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
ACTUATED	PINS 1 AND 2
ILLUMINATION	PINS 1 AND 3

HYDRAULIC/MECHANICAL

OPERATION - HYDRAULIC CIRCUITS AND VALVES

The hydraulic fluid control valves control the flow of pressurized brake fluid to the wheel brakes during the different modes of ABS braking. The following paragraphs explain how this works. For purposes of explanation only, it is assumed that only the right front wheel is experiencing antilock braking; the following diagrams show only the right front wheel in an antilock braking operation.

NORMAL BRAKING HYDRAULIC CIRCUIT AND SOLENOID VALVE FUNCTION

The hydraulic diagram (Fig. 6) shows the vehicle in the normal braking mode of the base brake hydraulic system. The diagram shows no wheel spin or slip occurring relative to the speed of the vehicle. The driver is applying the brake pedal which builds pressure in the brake hydraulic system to engage the brakes and stop the vehicle.

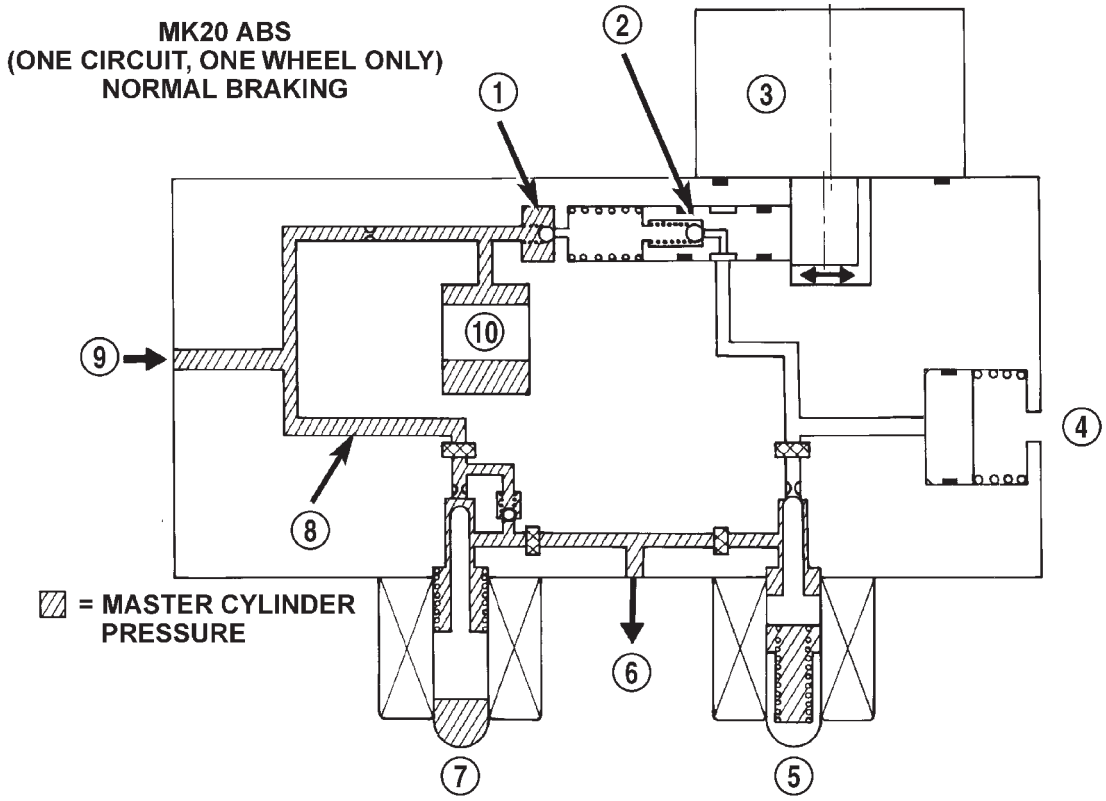

Fig. 6 Normal Braking Hydraulic Circuit

1 - OUTLET VALVE
2 - PUMP PISTON
3 - PUMP MOTOR (OFF)
4 - LOW PRESSURE ACCUMULATOR
5 - NORMALLY CLOSED VALVE (OFF)
6 - TO RIGHT FRONT WHEEL
7 - NORMALLY OPEN VALVE (OFF)
8 - MASTER CYLINDER PRESSURE
9 - FROM MASTER CYLINDER
10 - NOISE DAMPER CHAMBER

HYDRAULIC/MECHANICAL (Continued)

ABS PRIMARY HYDRAULIC CIRCUIT AND SOLENOID VALVE FUNCTION (ABS WITHOUT TRACTION CONTROL)

The hydraulic diagram (Fig. 7) shows the vehicle in the ABS braking mode. The diagram shows one wheel is slipping because the driver is attempting to stop the vehicle at a faster rate than is allowed by the surface on which the tires are riding.

- The normally open and normally closed valves modulate (build/decay) the brake hydraulic pressure as required.
- The pump/motor is switched on so that the brake fluid from the low pressure accumulators is returned to the master cylinder circuits.
- The brake fluid is routed to either the master cylinder or the wheel brake depending on the position of the normally open valve.

12 - PUMP INTERSTAGE PRESSURE
13 - NOISE DAMPER CHAMBER

HYDRAULIC/MECHANICAL (Continued)

ABS SECONDARY HYDRAULIC CIRCUIT AND SOLENOID VALVE FUNCTION (ABS WITHOUT TRACTION CONTROL)

The hydraulic diagram (Fig. 8) shows the vehicle in the ABS braking mode. The diagram shows one wheel is slipping because the driver is attempting to stop the vehicle at a faster rate than is allowed by the surface on which the tires are riding.

- The normally open and normally closed valves modulate (build/decay) the brake hydraulic pressure as required.
- The pump/motor is switched on so that the brake fluid from the low pressure accumulators is returned to the master cylinder circuits.
- The brake fluid will then be routed to either the master cylinder or the wheel brake depending on the position of the normally open valve.
- In the secondary circuit, 1.2 cc brake fluid is taken in by the lip seal saver to protect the lip seals on the master cylinder piston.

HYDRAULIC/MECHANICAL (Continued)

NORMAL BRAKING HYDRAULIC CIRCUIT, SOLENOID VALVE, AND SHUTTLE VALVE FUNCTION (ABS WITH TRACTION CONTROL)

The hydraulic diagram (Fig. 9) shows a vehicle with traction control in the normal braking mode. The diagram shows no wheel spin or slip occurring relative to the speed of the vehicle. The driver is applying the brake pedal which builds pressure in the brake hydraulic system to engage the brakes and stop the vehicle. the hydraulic shuttle valve closes with every brake pedal application so pressure is not created at the inlet to the pump/motor.

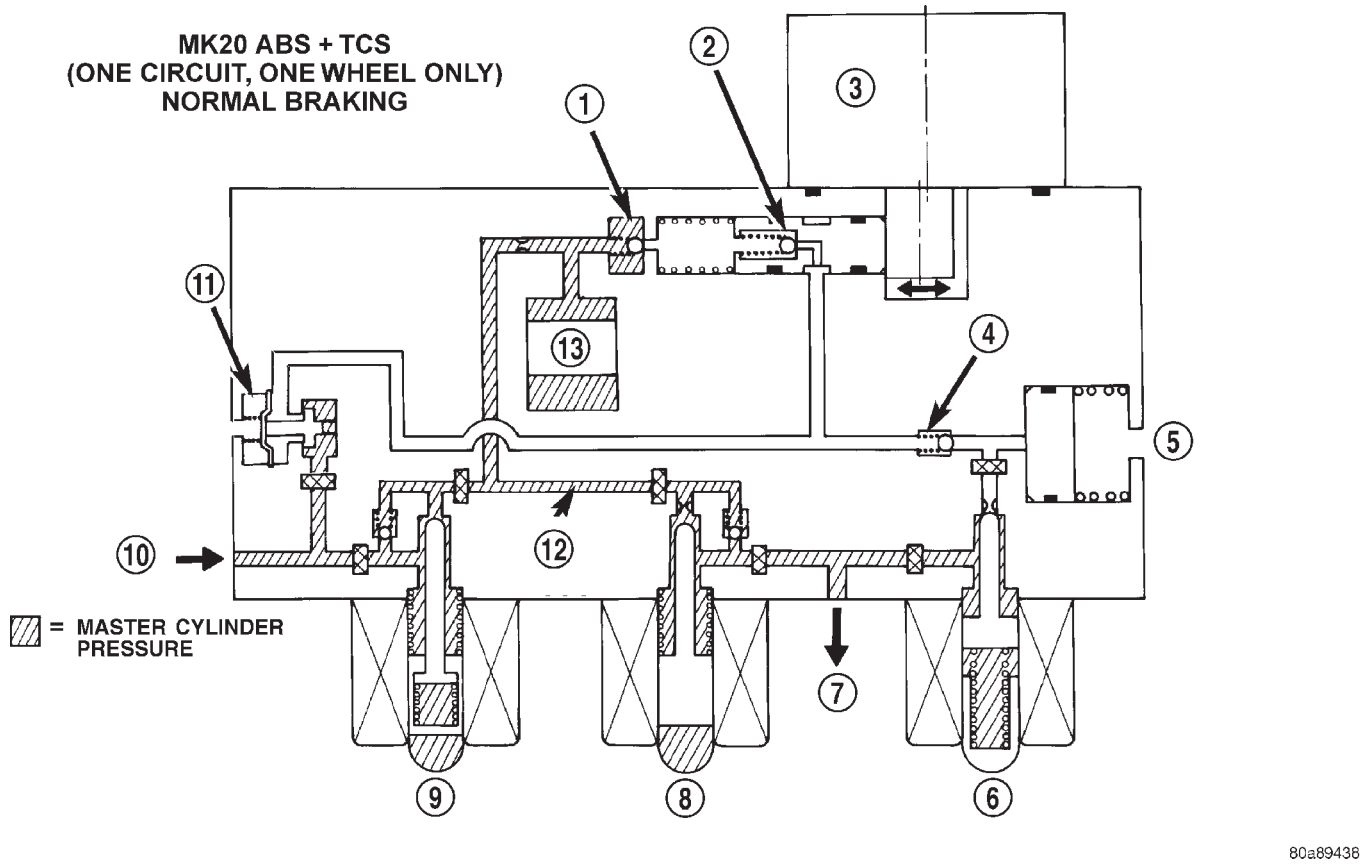

Fig. 9 ABS With Traction Control - Normal Braking Hydraulic Circuit

13 - NOISE DAMPER CHAMBER

HYDRAULIC/MECHANICAL (Continued)

ABS BRAKING HYDRAULIC CIRCUIT, SOLENOID VALVE, AND SHUTTLE VALVE FUNCTION (ABS WITH TRACTION CONTROL)

The hydraulic diagram (Fig. 10) shows the vehicle in the ABS braking mode. The diagram shows one wheel is slipping because the driver is attempting to stop the vehicle at a faster rate than is allowed by the surface on which the tires are riding.

- The hydraulic shuttle valve closes upon brake application so that the pump/motor cannot siphon brake fluid from the master cylinder.
- The normally open and normally closed valves modulate (build/decay) the brake hydraulic pressure as required.
- The pump/motor is switched on so that the brake fluid from the low pressure accumulators is returned to the master cylinder circuits.
- The brake fluid is routed to either the master cylinder or the wheel brake depending on the position of the normally open valve.

HYDRAULIC/MECHANICAL (Continued)

ABS TRACTION CONTROL HYDRAULIC CIRCUIT, SOLENOID VALVE, AND SHUTTLE VALVE FUNCTION (ABS WITH TRACTION CONTROL)

The hydraulic diagram (Fig. 11) shows the vehicle in the ABS braking mode. The diagram shows a drive wheel is spinning and brake pressure is required to reduce its speed.

- The normally open ASR valve is energized to isolate the brake fluid being pumped from the master cylinder and to isolate the driven wheel.
- The normally open ASR valve bypasses the pump output back to the master cylinder at a fixed pressure setting.
- The normally open and normally closed valves modulate (build/decay) the brake pressure as required to the spinning wheel.

HCU (HYDRAULIC CONTROL UNIT)

DESCRIPTION

The hydraulic control unit (HCU) is mounted to the CAB as part of the ICU (Fig. 22). The HCU controls the flow of brake fluid to the brakes using a series of valves and accumulators. A pump/motor is mounted on the HCU to supply build pressure to the brakes during an ABS stop.

The HCU on a vehicle equipped with ABS and traction control has a valve block housing that is approximately 1 inch longer on the low pressure fluid accumulators side than a HCU on a vehicle that is equipped with only ABS.

For more information, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DESCRIPTION)

OPERATION

For information on the operation of the HCU as a whole, refer to Hydraulic Circuits And Valve Operation which can be found elsewhere in this section. For information on the operation of the components within the HCU, refer to the following three topics.

VALVES AND SOLENOIDS

The valve block contains four inlet valves and four outlet valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring-loaded in the closed position during normal braking. The fluid is allowed to flow from the master cylinder to the wheel brakes.

During an ABS stop, these valves cycle to maintain the proper slip ratio for each wheel. The inlet valve closes preventing further pressure increase and the outlet valve opens to provide a path from the wheel brake to the HCU accumulators and pump/motor. This releases (decays) pressure from the wheel brake, thus releasing the wheel from excessive slippage. Once the wheel is no longer slipping, the outlet valve is closed and the inlet valve is opened to reapply (build) pressure.

On vehicles with traction control, there is an extra set of valves and solenoids. The ASR valves, mounted in the HCU valve block, are normally in the open position and close only when the traction control is applied.

These isolator valves are used to isolate the rear (non-driving) wheels of the vehicle from the hydraulic pressure that the HCU pump/motor is sending to the front (driving) wheels when traction control is being applied. The rear brakes need to be isolated from the master cylinder when traction control is being applied so the rear wheels do not drag. For more information, refer to Traction Control System in this section.

BRAKE FLUID ACCUMULATORS

There are two fluid accumulators in the HCU–one for the primary hydraulic circuit and one for the secondary hydraulic circuit. Each hydraulic circuit uses a 5 cc accumulator.

The fluid accumulators temporarily store brake fluid that is removed from the wheel brakes during an ABS cycle. This stored fluid is used by the pump/motor to provide build pressure for the brake hydraulic system. When the antilock stop is complete, the accumulators are drained by the pump/motor.

On ABS-only vehicles, there is a mini-accumulator on the secondary hydraulic circuit that protects the master cylinder seals during an ABS stop, and there is a noise dampening chamber on the primary circuit.

On ABS with traction control vehicles, there are two noise dampening chambers in the HCU.

PUMP/MOTOR

There are two pump assemblies in the HCU—one for the primary hydraulic circuit and one for the secondary hydraulic circuit. Both pumps are driven by a common electric motor. This DC-type motor is integral to the HCU and is controlled by the CAB.

The pump/motor provides the extra amount of brake fluid needed during antilock braking. Brake fluid is released to the accumulators when the outlet valve is opened during an antilock stop. The pump mechanism consists of two opposing pistons operated by an eccentric camshaft. In operation, one piston draws fluid from the accumulators, and the opposing piston pumps fluid to the master cylinder circuits. When the antilock stop is complete, the pump/motor drains the accumulators.

The CAB may turn on the pump/motor when an antilock stop is detected. The pump/motor continues to run during the antilock stop and is turned off after the stop is complete. Under some conditions, the pump/motor runs to drain the accumulators during the next drive-off.

The pump/motor is not a serviceable item; if it requires replacement, the HCU must be replaced.

ICU (INTEGRATED CONTROL UNIT)

DESCRIPTION

The hydraulic control unit (HCU) and the controller antilock brake (CAB) used with this antilock brake system are combined (integrated) into one unit, which is called the integrated control unit (ICU) (Fig. 12). The ICU is located below the master cylinder in the engine compartment (Fig. 13).

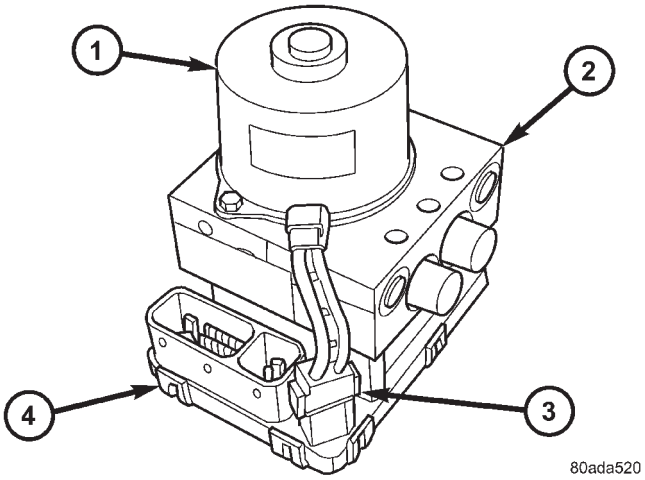

Fig. 12 INTEGRATED CONTROL UNIT (ICU)

1 - PUMP/MOTOR
2 - HCU
3 - PUMP/MOTOR CONNECTOR
4 - CAB

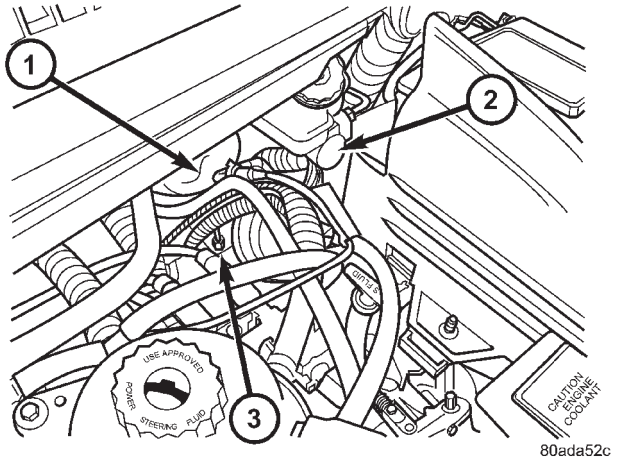

Fig. 13 ICU LOCATION IN VEHICLE

1 - POWER BRAKE BOOSTER
2 - MASTER CYLINDER
3 - ICU

Two different ICU's (HCU and CAB) are used on this vehicle depending on whether or not the vehicle is equipped with traction control. The HCU on a vehicle equipped with traction control has a valve block that is approximately one inch longer than a HCU on a vehicle that is equipped with ABS only.

The ABS-only ICU consists of the following components: the CAB, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), valve block, fluid accumulators, a pump, and an electric motor.

The ABS-with traction control ICU consists of the following components: the CAB, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), two traction control (ASR) valves, two hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric motor.

The replaceable components of the ICU are the HCU and the CAB. No attempt should be made to service any individual components of the HCU or CAB. For information on the CAB, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/CONTROLLER ANTILOCK BRAKE - DESCRIPTION).

OPERATION

For information of the ICU, refer to these individual components of the ICU:

- CONTROLLER ANTILOCK BRAKE (CAB) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/CONTROLLER ANTILOCK BRAKE - OPERATION)
- HYDRAULIC CONTROL UNIT (HCU) (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - OPERATION)

For information on the ICU's hydraulic circuits, refer to HYDRAULIC CIRCUITS AND VALVE OPERATION. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL - OPERATION)

REMOVAL

REMOVAL - LHD

(1) Disconnect the negative (ground) cable from the battery and isolate cable.

(2) Remove the battery shield.

(3) Remove the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(4) Disconnect the vacuum hose connector at the tank built into the battery tray.

(5) Remove the screw securing the engine coolant filler neck to the battery tray.

(6) Remove the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

ICU (INTEGRATED CONTROL UNIT) (Continued)

(7) Using a brake pedal depressor, move and lock the brake pedal to a position past the first inch of pedal travel. **This will prevent brake fluid from draining out of the master cylinder once the brake tubes are removed from the HCU.**

CAUTION: Do not apply a 12–volt power source to any terminals of the 24-way CAB connector when disconnected.

(8) Disconnect the wiring harness connector from the speed control servo.

(9) Remove the speed control servo mounting nuts and move the servo out of the way.

(10) Disconnect the 24–way connector from the CAB. To disconnect the 24–way connector, grasp the lock on the 24–way connector and pull it as far up as possible. This will unlock the 24–way connector from the socket on the CAB.

CAUTION: Before removing the brake tubes from the HCU, the HCU must be thoroughly cleaned. This must be done to prevent dirt particles from falling into the ports of HCU or entering the brake tubes.

(11) Thoroughly clean all surfaces of the ICU and brake tube nuts. Use only a solvent such as Mopar® Brake Parts Cleaner or equivalent to clean the ICU.

(12) Remove the brake tubes (4) from the outlet ports on the HCU (Fig. 14).

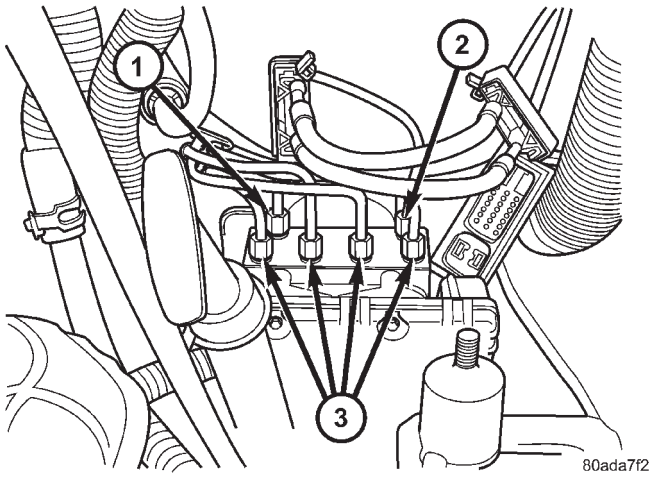

Fig. 14 BRAKE TUBE NUTS AT ICU

1 - PRIMARY BRAKE TUBE
2 - SECONDARY BRAKE TUBE
3 - CHASSIS BRAKE TUBES

(13) Remove the primary and secondary brake tubes from the inlet ports on the HCU (Fig. 14).

(14) Center and prop the steering wheel.

(15) Remove the silencer panel under the instrument panel, below the steering column.

(16) Remove the pinch bolt and disconnect the steering shaft coupling.

(17) Remove the two clips securing silencer to dash seal (Fig. 15).

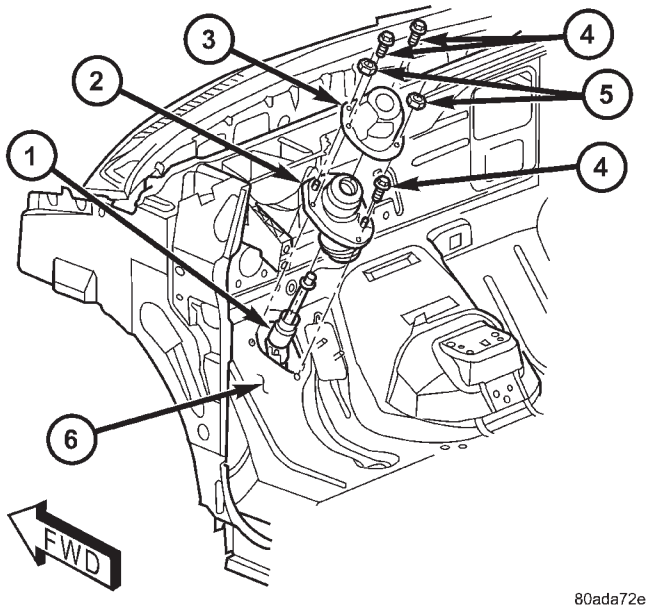

Fig. 15 LOWER COUPLING AND DASH SEAL

1 - COUPLING
2 - DASH SEAL
3 - SILENCER
4 - MOUNTING SCREWS
5 - RETAINING CLIPS
6 - DASH

(18) Remove the three screws securing the dash seal (Fig. 15).

(19) Remove the 3 bolts attaching the ICU to its mounting bracket (Fig. 16).

(20) Remove ICU from the vehicle through engine compartment.

(21) If required, to separating the CAB from the HCU, (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DISASSEMBLY).

REMOVAL - RHD

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION)

(1) Disconnect the negative (ground) cable from the battery and isolate cable.

(2) Using a brake pedal depressor, move and lock the brake pedal to a position past the first inch of pedal travel. **This will prevent brake fluid from**

ICU (INTEGRATED CONTROL UNIT) (Continued)

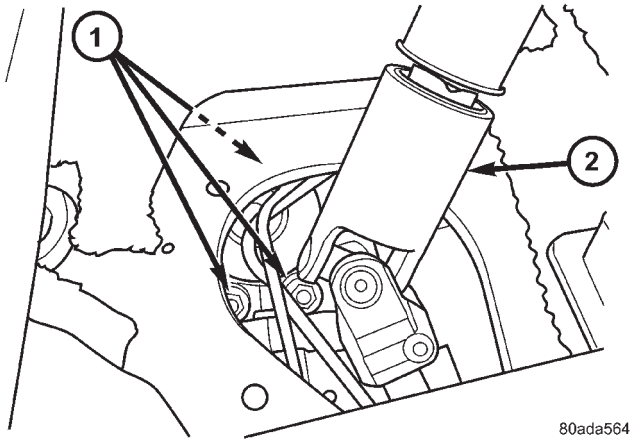

Fig. 16 ICU MOUNTING BOLTS

1 - ICU MOUNTING BOLTS
2 - COUPLER

draining out of the master cylinder when the brake tubes are removed from the HCU.

(3) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove the routing clip attaching the ICU wiring harness to the ICU mounting bracket (Fig. 17).

CAUTION: Do not apply a 12 volt power source to any terminals of the HCU connector when disconnected.

(5) Remove the 24-way connector (Fig. 17) from the CAB. The 24-way connector is removed from the CAB using the following procedure. Grasp the lock on the 24-way connector (Fig. 17) and pull it as far out as possible (Fig. 18). This will raise and unlock the 24-way connector from the socket on the CAB.

CAUTION: Before removing the brake tubes from the HCU, the HCU must be thoroughly cleaned. This must be done to prevent dirt particles from falling into the ports of HCU or entering the brake tubes.

(6) Thoroughly clean all surfaces of the HCU, and all brake tube nuts located on the HCU. Use only a solvent such as Mopar Brake Parts Cleaner or an equivalent to clean the HCU.

3 - CAB
4 - HCU MOUNTING BRACKET
5 - HCU

(9) Remove ICU and the mounting bracket as a unit from the vehicle.

(10) Remove the 3 bolts (Fig. 21) mounting the ICU to the mounting bracket. Separate the ICU from the mounting bracket.

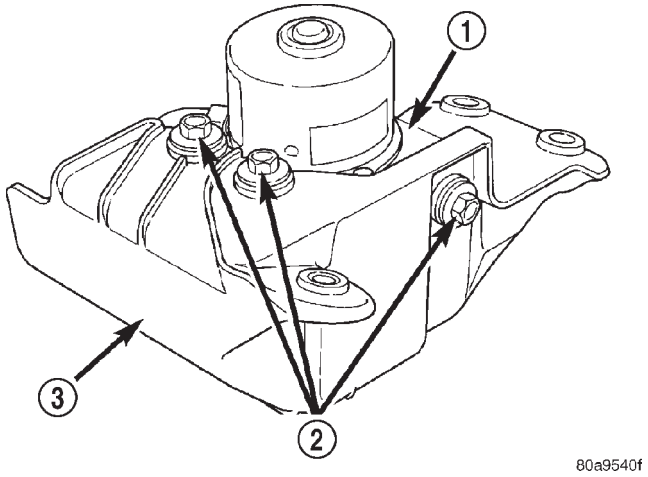

Fig. 21 ICU Mounting Bolts

1 - HCU
2 - HCU MOUNTING BOLTS
3 - HCU MOUNTING BRACKET

(11) For the procedure on separating and attaching the CAB to the HCU, refer to DISASSEMBLY.

DISASSEMBLY - ICU

(1) Remove the ICU from the vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - REMOVAL)

(2) Disconnect the pump/motor wiring harness from the CAB (Fig. 22).

(3) Remove the 4 bolts (Fig. 23) attaching the CAB to the HCU.

(4) Remove the CAB from the HCU (Fig. 24).

ASSEMBLY - ICU

(1) Install the CAB (Fig. 24) on the HCU.

(2) Install the 4 bolts mounting the CAB (Fig. 23) to the HCU. Tighten the CAB mounting bolts to a torque of 2 N·m (17 in. lbs.).

(3) Plug the pump/motor wiring harness into the CAB.

(4) Install the ICU in the vehicle and bleed the base and ABS hydraulic systems. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - INSTALLATION)

ICU (INTEGRATED CONTROL UNIT) (Continued)

3 - PUMP/MOTOR CONNECTOR
4 - CAB

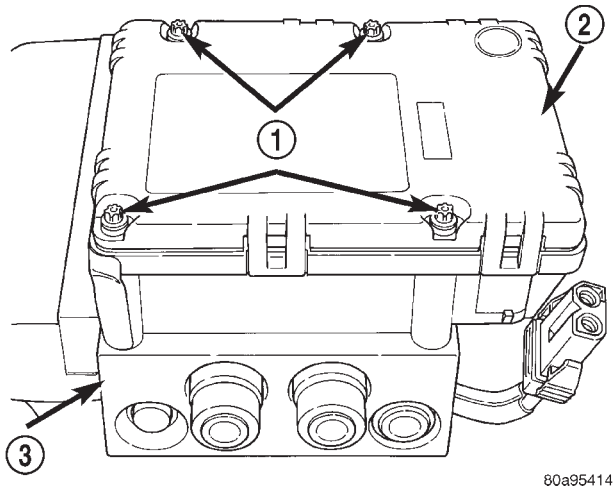

Fig. 23 (TYPICAL) CAB Attaching Bolts

1 - MOUNTING BOLTS
2 - CAB
3 - HCU VALVE BLOCK

INSTALLATION

INSTALLATION - LHD

(1) Place the ICU in its bracket below the master cylinder. Start the upper mounting bolt to hold it in place.

(2) Inside the vehicle, install the remaining 2 mounting bolts attaching the ICU to the mounting bracket (Fig. 16). Tighten all 3 mounting bolts to a torque of 11 N·m (97 in. lbs.).

(3) Install the dash seal and three mounting screws (Fig. 15).

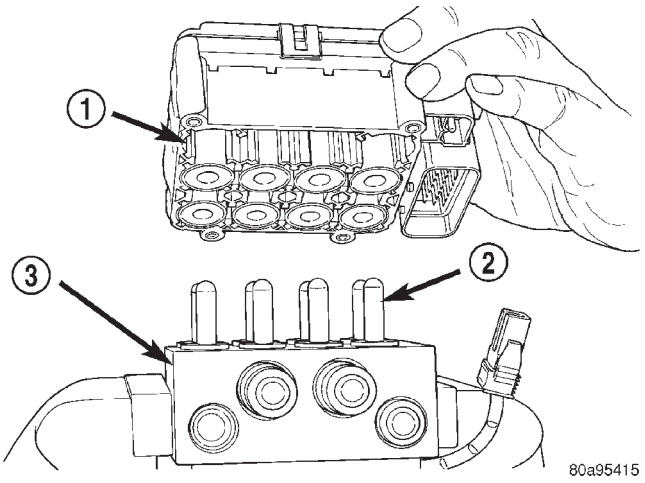

Fig. 24 (TYPICAL) Remove/Install CAB

1 - CAB
2 - HCU VALVES
3 - HCU VALVE BLOCK

(4) Install the silencer on top of the dash seal (Fig. 15).

(5) Connect the steering shaft coupling and install the pinch bolt (Fig. 15). Tighten the pinch bolt to 28 N·m (250 in. lbs.).

(6) Install the silencer panel below the steering column under the instrument panel.

(7) Remove the steering wheel holder.

CAUTION: Because of the flexible section in the primary and secondary brake tubes, the brake tubes must be held in proper orientation when tightened and torqued. These tubes must not contact each other or other vehicle components when installed. Also, after the brake tubes are installed on the HCU, ensure all spacer clips are reinstalled on the brake tubes.

(8) Install the primary and secondary brake tubes into their correct port locations on the HCU valve block (Fig. 14). Tighten the tube nuts to a torque of 17 N·m (145 in. lbs.).

CAUTION: When installing the chassis brake tubes on the HCU valve block, they must be located correctly in the valve block to ensure proper ABS operation.

NOTE: The chassis brake tube attachment locations to the HCU, are marked on the bottom of the CAB.

(9) Install the (4) chassis brake tubes into their correct port locations on the HCU valve block as shown (Fig. 14). Tighten the tube nuts to a torque of 17 N·m (145 in. lbs.).

ICU (INTEGRATED CONTROL UNIT) (Continued)

NOTE: Before installing the 24–way connector in the CAB be sure the seal is properly installed in the connector.

(10) Install the 24–way connector on the CAB by, first, positioning the 24–way connector in the socket of the CAB and carefully pushing it down as far as possible. Once connector is fully seated by hand into the CAB socket, push down on connector lock. This will pull the connector into the socket of the CAB and lock it in the installed position.

(11) Install any routing clips on the brake tubes.

(12) Remove the brake pedal holder.

(13) Install the speed control servo with its mounting nuts.

(14) Connect the wiring harness to the speed control servo.

(15) Install the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).

(16) Install the screw securing the coolant filler neck to the battery tray.

(17) Reconnect the vacuum hose connector at the tank built into the battery tray.

(18) Install the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

(19) Install the battery shield.

(20) Remove the brake pedal holder.

(21) Connect negative cable back on negative post of the battery.

(22) Bleed the Base and ABS brake hydraulic systems (Refer to 5 - BRAKES - STANDARD PROCEDURE).

(23) Road test vehicle to ensure proper operation of the base and antilock brake systems.

INSTALLATION - RHD

(1) Install the ICU on the mounting bracket (Fig. 21). Install the 3 bolts (Fig. 21) attaching the ICU to the mounting bracket. Tighten the 3 mounting bolts to a torque of 11 N·m (97 in. lbs.).

CAUTION: The ICU mounting bracket to front suspension cradle mounting bolts have a unique corrosion protection coating and a special aluminum washer. For this reason, only the original, or original equipment Mopar replacement bolts can be used to mount the ICU bracket to the front suspension crossmember.

(2) Install the ICU and its mounting bracket as an assembly on the front suspension crossmember. Install the 3 bolts attaching the ICU bracket to the crossmember (Fig. 20). Tighten the 3 mounting bolts to a torque of 28 N·m (250 in. lbs.).

CAUTION: Because of the flexible section in the primary and secondary brake tubes, and the brake tubes between the HCU and the proportioning valve, the brake tubes must be held in proper orientation when tightened and torqued. These tubes must not contact each other or other vehicle components when installed. Also, after the brake tubes are installed on the HCU, ensure all spacer clips are reinstalled on the brake tubes.

CAUTION: When installing the chassis brake tubes on the HCU valve block, they must be located correctly in the valve block to ensure proper ABS operation. Refer to (Fig. 19) for the correct chassis brake tube locations.

NOTE: The chassis brake tube attachment locations to the HCU, are marked on the bottom of the ICU mounting bracket.

(3) Install the 6 chassis brake tubes into their correct port locations on the HCU valve block as shown in (Fig. 19). Tighten the tube nuts to a torque of 17 N·m (145 in. lbs.).

NOTE: Before installing the 24-way connector in the CAB be sure the seal is properly installed in the connector.

(4) Install the 24-way connector (Fig. 17) on the CAB using the following procedure. Position the 24-way connector in the socket of the CAB and carefully push it down as far as possible. When connector is fully seated by hand into the CAB socket, push in the connector lock (Fig. 18). This will pull the connector into the socket of the CAB and lock it in the installed position.

NOTE: The CAB wiring harness must be clipped to the ICU mounting bracket. This will ensure the wiring harness is properly routed and does not contact the brake tubes or the body of the vehicle.

ICU (INTEGRATED CONTROL UNIT) (Continued)

(5) Clip the cab wiring harness (Fig. 17) to the ICU mounting bracket.

(6) Install the routing clips (Fig. 25) on the brake tubes.

(7) Lower the vehicle.

(8) Connect negative cable back on negative post of the battery.

(9) Bleed the base and ABS hydraulic systems. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(10) Road test vehicle to ensure proper operation of the base and antilock brake systems.

CLUTCH

DESCRIPTION

CLUTCH COMPONENTS

Models equipped with a 2.4L Gas engine utilize a modular clutch assembly (Fig. 1). The modular clutch consists of a single, dry-type clutch disc, a diaphragm style clutch cover, and an integrated flywheel. The clutch cover (pressure plate) is riveted to the flywheel, and therefore can only be serviced as an assembly.

Models equipped with the 2.5L Turbo Diesel engine utilize a conventional clutch system (Fig. 2). This system consists of a flywheel, clutch disc, and clutch cover (pressure plate), which is fastened to the flywheel, capturing the clutch disc within. Each component is individually serviceable, however it is **highly recommended that the clutch cover and disc be replaced as a set**.

2 - DISC
3 - PRESSURE PLATE

RELEASE SYSTEM

All models utilize a hydraulic clutch release system, conisting of a clutch master cylinder attached to the clutch pedal (Fig. 3), and a slave cylinder fastened to the transaxle which operates the clutch release lever (Fig. 4). When the driver depresses the clutch pedal, the master cylinder pushrod travels through the cylinder bore, displacing fluid through the master cylinder plumbing. This fluid displacement forces the slave cylinder piston to travel, forcing the clutch release bearing into the clutch diaphragm spring via the release lever and leverage (Fig. 5). This releases the clamping force on the clutch disc, allowing the engine crankshaft to rotate independently from the transaxle input shaft.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CLUTCH SYSTEM

Clutch problem diagnosis will generally require a road test to determine the type of fault. Component inspection will then determine the problem after road testing.

Drive the vehicle at normal speeds during road test. Shift the transaxle through all gear ranges and observe clutch action. If chatter, grab, slip, or improper release is experienced, remove and inspect the clutch components. If the problem is noise or hard shifting, further diagnosis may be needed. The transaxle or other driveline components may actually be at fault.

SERVICE DIAGNOSIS - CLUTCH GRAB/CHATTER

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH DISC FACING COVERED WITH OIL OR GREASE	Oil leak at engine rear main or transaxle input shaft seal.	Correct leak and replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
	Too much grease applied to splines of disc and input shaft.	Apply lighter coating of grease to splines.
NO FAULT FOUND WITH CLUTCH COMPONENTS	Problem actually related to suspension or driveline component.	Further diagnosis required. Check engine/transmission mounts, suspension attaching parts and other driveline components as needed.
	Engine related problems.	Check EFI and ignition systems.
PARTIAL ENGAGEMENT OF CLUTCH DISC	Clutch cover, spring, or release fingers bent, distorted (rough handling, improper assembly).	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).

CLUTCH (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	Clutch disc damaged or distorted.	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
	Clutch misalignment.	Verify modular clutch pilot plate alignment to crankshaft. Replace the modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD) if the pilot plate is loose or bent.
	Improper transaxle-to-engine installation.	Verify transaxle is properly installed to engine.

SERVICE DIAGNOSIS - CLUTCH SLIPS

CONDITION	POSSIBLE CAUSES	CORRECTION
DISC FACING WORN OUT	Normal wear.	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
	Driver frequently rides (slips) clutch, results in rapid wear, overheating.	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
	Insufficient clutch cover diaphragm spring tension	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
CLUTCH DISC FACING CONTAMINATED WITH OIL OR GREASE	Leak at rear main oil seal or transaxle input shaft seal	Replace leaking seals. Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
	Excessive amount of grease applied to input shaft splines	Apply less grease to input shaft. Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
	Road splash, water entering housing	Seal housing. Inspect clutch assembly.
CLUTCH IS RUNNING PARTIALLY DISENGAGED	Release bearing sticking or binding, does not return to normal running position.	Verify that bearing is actually binding. Then, replace bearing and transmission front bearing retainer if sleeve surface is damaged.
	Clutch pedal not returning to static position.	Inspect pedal assembly for damage and/or obstructions. Replace componnents as necessary.
	Clutch master cylinder or pushrod damaged causing high preload.	Replace clutch master cylinder assembly.
	Slave cylinder binding or stuck.	Replace slave cylinder.
CLUTCH DISC FACINGS HAVE FRACTURED INTO SMALL PIECES	Leak at rear main or transaxle input shaft seal	Replace seal. Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD)..
	Excessive heat from slippage	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).

CLUTCH (Continued)

SERVICE DIAGNOSIS - IMPROPER CLUTCH RELEASE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH DISC BINDS ON INPUT SHAFT SPLINES	Clutch disc hub splines damaged during installation	Clean, smooth, and lubricate disc and shaft splines. Replace modular clutch assembly, or clutch disc, and/or input shaft if splines are severely damaged.
	Input shaft splines rough, damaged.	Clean input shaft splines. Then lube.
	Corrosion or rust formations on splines of input shaft and disc	Clean input shaft splines and disc splines, then lube
CLUTCH DISC RUSTED TO FLYWHEEL AND/OR PRESSURE PLATE	Occurs in vehicles stored or not driven for extended period of time. Also occurs after steam cleaning if vehicle is not used for extended period.	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
CLUTCH WILL NOT DISENGAGE PROPERLY	Disc bent, distorted during transaxle installation	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
	Clutch cover diaphragm spring damaged during transaxle installation	Replace modular clutch assembly (2.4L Gas) or clutch cover and disc (2.5L TD).
	Release fork bent, loose, or damaged	Replace fork if worn or damaged
	Air in clutch hydraulic circuit.	Allow system to self-bleed or replace hydraulic components.
	Leak in clutch hydraulic circuit.	Replace worn/damaged/leaking hydraulic components.
Clutch pedal requires excessive force (high release load).	Clutch disc is worn.	Replace modular clutch assembly (2.4L models) or clutch cover and disc (2.5L TD models).

SERVICE DIAGNOSIS - CLUTCH PEDAL NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH PEDAL SQUEAKS WHEN DEPRESSED TO FLOOR	Pedal bushings worn out or inadequate lubrication	Replace or lubricate bushings at clutch pedal pivot or master cylinder pushrod.
	Clutch pedal return spring worn out	Lubricate or replace return spring
CLUTCH PEDAL SQUEAKS DURING OPERATION	Clutch release lever pivot stud has inadequate lubrication	Lubricate or replace clutch release lever

DIAGNOSIS AND TESTING - DRIVE PLATE MISALIGNMENT

Common causes of misalignment are:

- Heat warping
- Mounting drive plate on a dirty crankshaft flange
- Incorrect bolt tightening
- Improper seating on the crankshaft shoulder
- Loose crankshaft bolts

Clean the crankshaft flange before mounting the drive plate. Dirt and grease on the flange surface may misalign the flywheel, causing excessive runout. Use new bolts when mounting drive plate to crankshaft. Tighten drive plate bolts to specified torque only. Over-tightening can distort the drive plate hub causing excessive runout.

CLUTCH (Continued)

DIAGNOSIS AND TESTING - CLUTCH COVER AND DISC RUNOUT

Check condition of the clutch cover before installation. A warped cover or diaphragm spring will cause grab and/or incomplete release or engagement. Use care when handling the clutch assembly. Impact can distort the cover, diaphragm spring, and release fingers.

DIAGNOSIS AND TESTING - CLUTCH CHATTER COMPLAINTS

For all clutch chatter complaints, perform the following:

(1) Check for loose, misaligned, or broken engine and transmission mounts. If present, they should be corrected at this time. Test vehicle for chatter. If chatter is gone, there is no need to go any further.

(2) If chatter persists, check hydraulic clutch release system is functioning properly.

(3) Check for loose connections in drivetrain. Correct any problems and determine if clutch chatter complaints have been satisfied. If not:

(a) Remove transaxle.

(b) Check to see if the release bearing is sticky or binding. Replace bearing, if needed.

(c) Check linkage for excessive wear on the pivot stud and fork fingers. Replace all worn parts.

(d) Check clutch assembly for contamination (dirt, oil). Replace clutch assembly, if required.

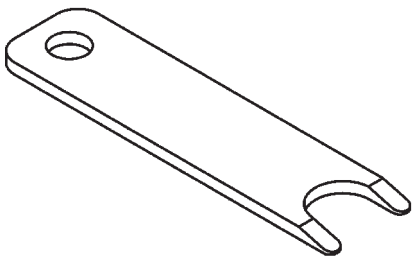
(e) Check to see if the clutch disc hub splines are damaged. Replace with new clutch assembly, if necessary.

(f) Check input shaft splines for damage. Replace, if necessary.

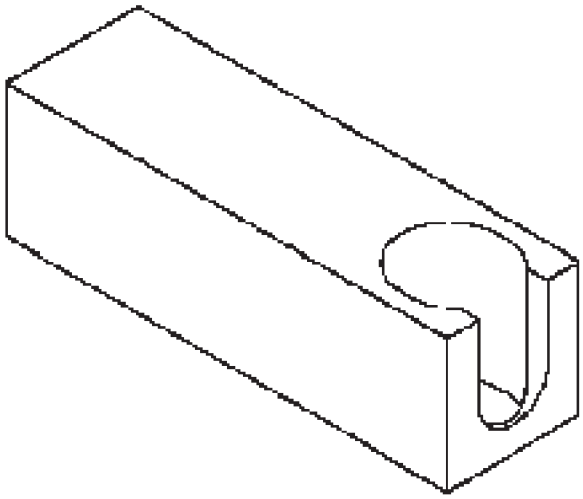
(g) Check for uneven wear on clutch fingers.

(h) Check for broken clutch cover diaphragm spring fingers. Replace with new clutch assembly, if necessary.

SPECIAL TOOLS - T850 TRANSAXLE



Disconnect Tool, 6638A



Remover/Installer, 6891

CLUTCH RELEASE LEVER AND BEARING

REMOVAL

(1) Remove transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL)

(2) Remove modular clutch assembly from input shaft (2.4L Gas models only).

(3) Grasp clutch release lever and bearing (Fig. 6) with both hands and pull outward using moderate pressure to release lever from pivot ball.

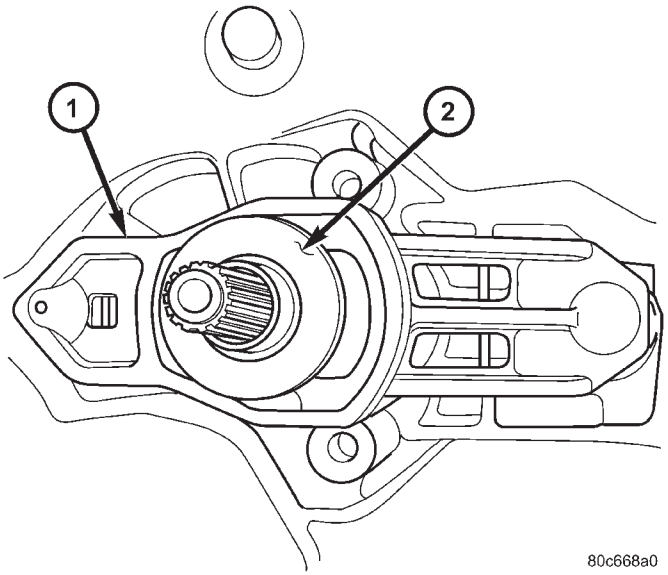


Fig. 6 Release Bearing and Lever

1 - RELEASE LEVER
2 - RELEASE BEARING

CLUTCH RELEASE LEVER AND BEARING (Continued)

(4) Separate release bearing from lever.

NOTE: Remove release lever pivot ball(s) ONLY if replacement is necessary.

(5) Remove pivot ball(s) using slide hammer C-3752 and remover/installer 6891 (Fig. 7).

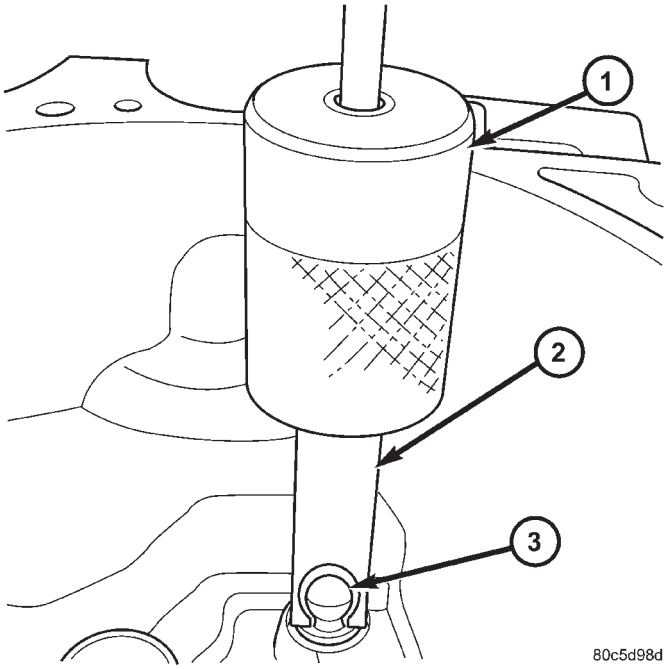

Fig. 7 Pivot Ball Removal/Installation

1 - C-3752 SLIDE HAMMER
2 - REMOVER/INSTALLER 6891
3 - PIVOT BALL

INSTALLATION

(1) If removed, install **new** release lever pivot ball(s) using slide hammer C-3752 and remover/installer 6891 (Fig. 8) (Fig. 9).

(2) Install clutch release bearing to lever. Apply grease to interface points. Make sure release bearing retainers engage lever pocket as shown in (Fig. 10).

(3) Apply grease to pivot ball, and on release lever at slave cylinder contact point.

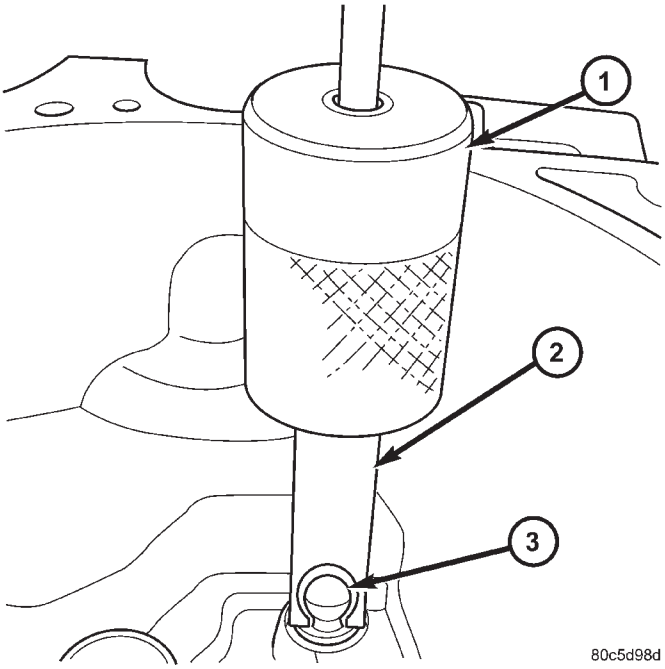

Fig. 8 Pivot Ball Removal/Installation

1 - C-3752 SLIDE HAMMER
2 - REMOVER/INSTALLER 6891
3 - PIVOT BALL

CLUTCH RELEASE LEVER AND BEARING (Continued)

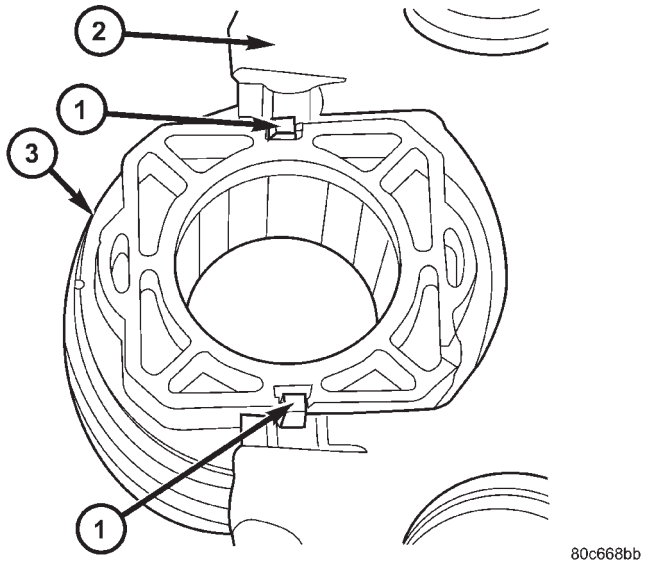

Fig. 10 Release Bearing-to-Lever

1 - RETAINER (2)
2 - RELEASE LEVER
3 - RELEASE BEARING

(4) Install clutch release bearing/lever assembly into position by sliding bearing onto input bearing retainer, and using moderate hand pressure to seat release lever to pivot ball(s) (Fig. 11). A “pop” sound should be heard. Verify proper engagement by lightly pulling outward on lever at pivot ball location, and then actuating lever and bearing to ensure proper operation.

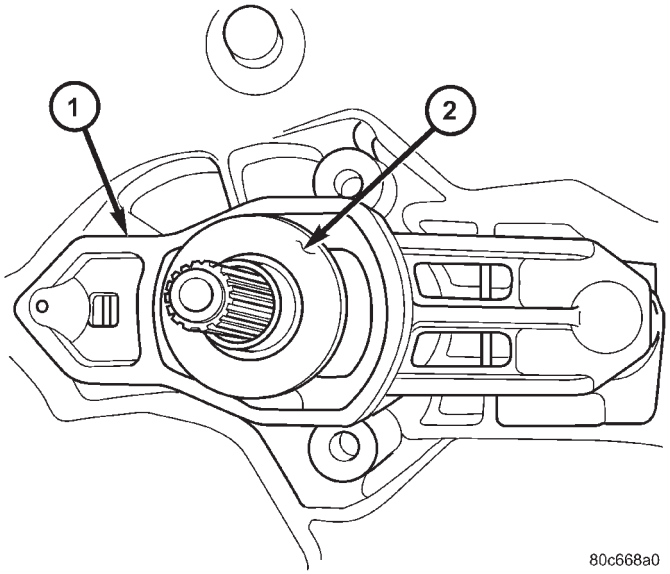

Fig. 11 Release Bearing and Lever

1 - RELEASE LEVER
2 - RELEASE BEARING

MASTER CYLINDER - RHD

REMOVAL

(1) Disconnect battery negative cable.
(2) Remove master cylinder to clutch pedal pin retainer clip. Disengage pushrod from clutch pedal pin (Fig. 13).
(3) Disengage master cylinder grommet from cowl panel.
(4) Remove battery and tray.
(5) **Diesel models:** Remove windshield wiper module assembly. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL)
(6) Discharge Air Conditioning system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE)
(7) Remove suction/discharge line from evaporator junction block.
(8) Using tool 6638A, disconnect clutch hydraulic “quick-connect” fitting (Fig. 12).

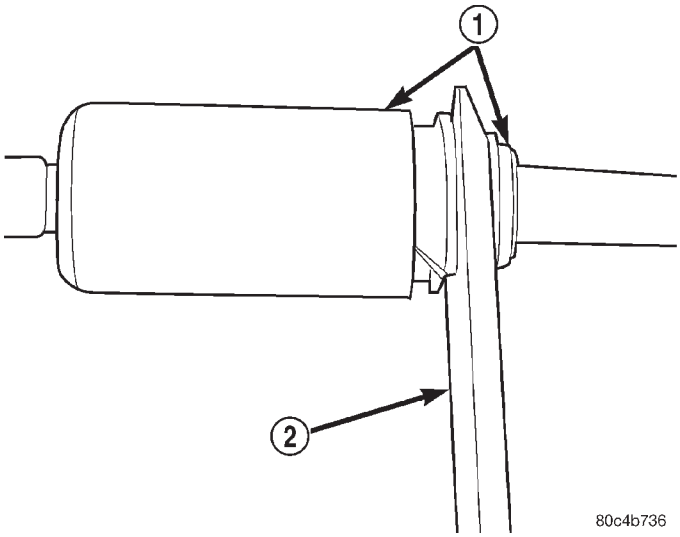

Fig. 12 Disconnect Quick-Connect Using Tool 6638A

1 - QUICK CONNECT FITTING
2 - TOOL 6638A

(9) Remove clutch master cylinder tubing from retainers in engine compartment.
(10) Remove clutch master cylinder from dash panel/clutch pedal bracket by rotating 45° clockwise and pulling outward towards engine (Fig. 13).
(11) Carefully guide clutch master cylinder and hydraulic plumbing from engine compartment.

INSTALLATION

(1) Carefully route master cylinder plumbing into engine compartment as removed and position master cylinder to dash panel hole.
(2) Rotate master cylinder 45° clockwise, insert into dash panel hole, engaging clutch pedal bracket.

MASTER CYLINDER - RHD (Continued)

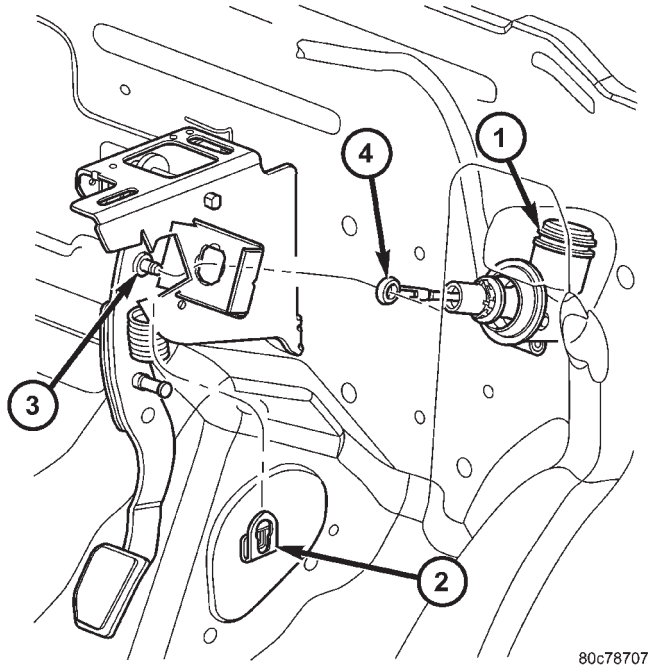

Fig. 13 Clutch Master Cylinder at Pedal Bracket

1 - CLUTCH MASTER CYLINDER
2 - RETAINER CLIP
3 - CLUTCH PEDAL PIN
4 - PUSH ROD

Rotate master cylinder 45° counter-clockwise, securing it to pedal bracket (Fig. 13).

(3) Install and secure grommet to dash panel.

(4) Connect pushrod to clutch pedal pin. Install retainer clip (Fig. 13).

(5) Secure master cylinder plumbing to retainers in engine compartment.

(6) Connect clutch master cylinder plumbing to slave cylinder “quick connect” fitting. An audible “click” should be heard. Verify connection by pulling outward.

(7) Connect A/C suction/discharge line to evaporator junction block.

(8) **Diesel models:** Install wiper module assembly. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION)

(9) Install battery and tray.

(10) Connect battery negative cable

(11) Charge Air Conditioning system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE)

MASTER CYLINDER - LHD

REMOVAL

(1) Disconnect battery cables.

(2) Remove instrument panel lower silencer (Fig. 14).

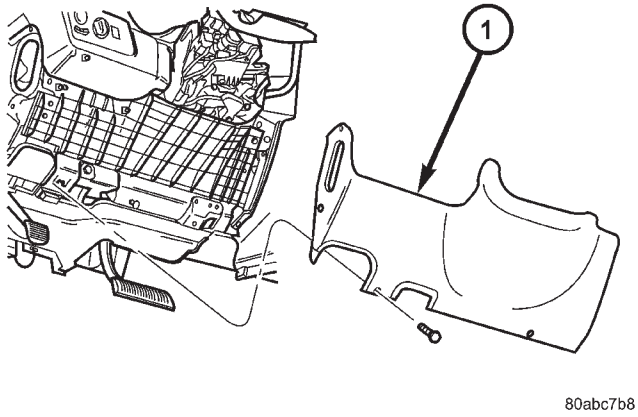

Fig. 14 Instrument Panel Lower Silencer

1 - INSTRUMENT PANEL LOWER SILENCER

(3) Remove knee bolster (Fig. 15).

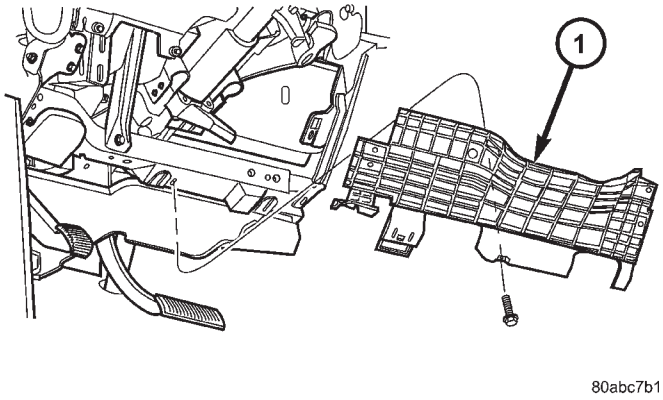

Fig. 15 Knee Bolster

1 - KNEE BOLSTER

MASTER CYLINDER - LHD (Continued)

(4) Remove clutch master cylinder pushrod retainer clip (Fig. 16).

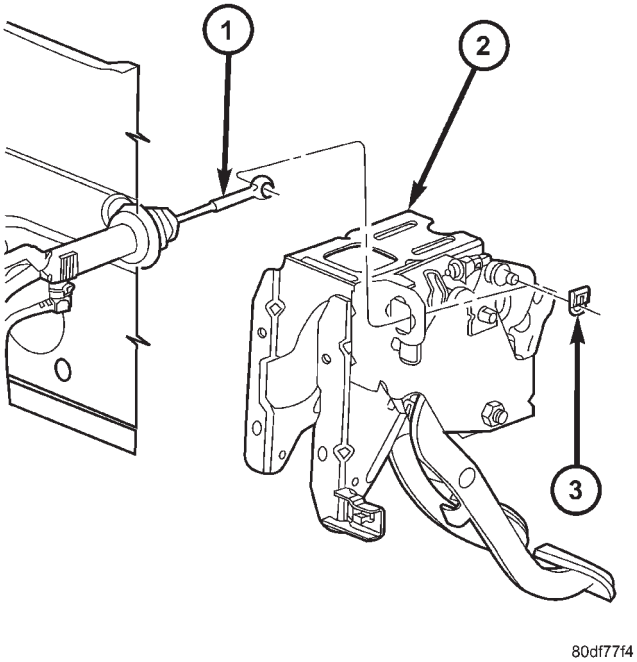

Fig. 16 Master Cylinder Pushrod at Pedal

1 - MASTER CYLINDER PUSHROD
2 - CLUTCH/BRAKE PEDAL ASSEMBLY
3 - PUSHROD RETAINER

(5) Disconnect pushrod from clutch pedal (Fig. 16).
(6) Remove battery shield.
(7) Remove battery.
(8) Remove battery tray.
(9) Remove windshield wiper module assembly (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/ WIPER MODULE - REMOVAL).
(10) Using Tool 6638A, disconnect clutch master cylinder "quick connect" fitting (Fig. 17). Disengage plumbing retainer from body stud.
(11) Remove master cylinder reservoir-to-strut tower nuts (Fig. 18). Reposition reservoir off to side.
(12) Remove clutch master cylinder from dash panel by rotating clockwise 45° and removing from dash panel (Fig. 18).
(13) Remove master cylinder and plumbing from engine compartment. Use care not to bend or kink plumbing. Note plumbing routing to aid in installation.

INSTALLATION

(1) Install master cylinder into position, while routing plumbing as originally installed.
(2) Insert master cylinder pushrod through dash panel (Fig. 18) and rotate 45° counter-clockwise to secure.

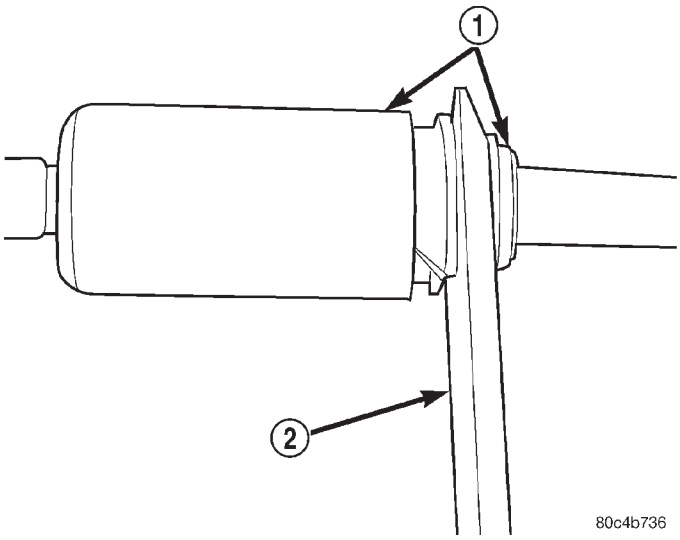

Fig. 17 Disconnect Quick-Connect Using Tool 6638A

1 - QUICK CONNECT FITTING
2 - TOOL 6638A

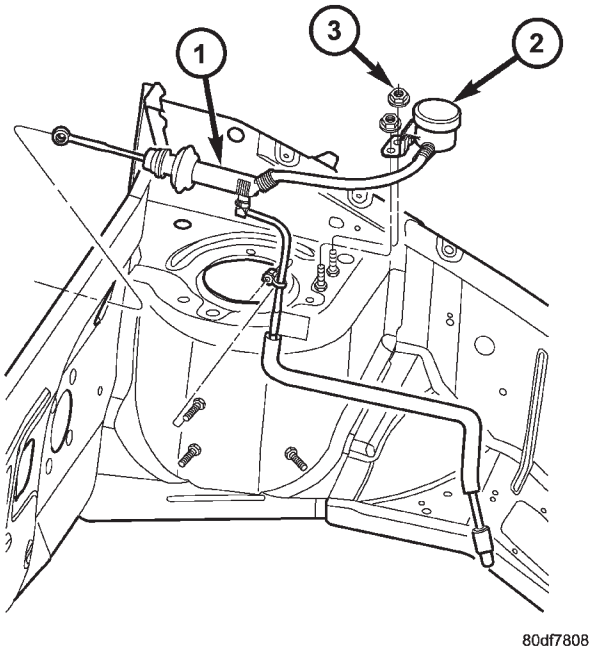

Fig. 18 Clutch Master Cylinder Removal/Installation

1 - CLUTCH MASTER CYLINDER
2 - RESERVOIR
3 - NUT (2)

(3) Connect master cylinder plumbing quick-connect fitting. An audible "click" should be heard. Verify connection by pulling outward.
(4) Install master cylinder reservoir onto strut tower. Install and tighten two (2) master cylinder reservoir-to-strut tower nuts (Fig. 18).

MASTER CYLINDER - LHD (Continued)

(5) Install windshield wiper module assembly (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/ WIPER MODULE - INSTALLATION).
(6) Install battery tray.
(7) Install battery.
(8) Install battery shield.
(9) Connect master cylinder pushrod to clutch pedal lever (Fig. 16). Install retainer clip.
(10) Install knee bolster and instrument panel lower silencer (Fig. 15) (Fig. 14).
(11) Connect battery cables.

MODULAR CLUTCH ASSY - 2.4L GAS

REMOVAL

(1) Remove transaxle from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL)
(2) Remove modular clutch assembly from input shaft (Fig. 19).

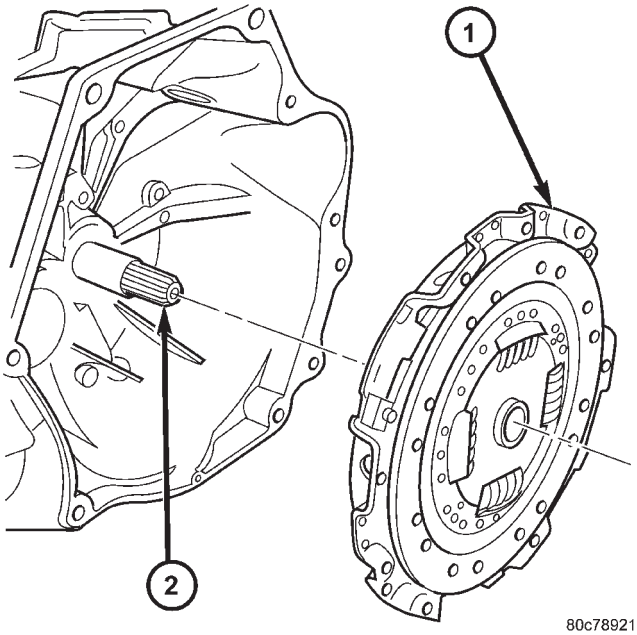

Fig. 19 Modular Clutch Assembly

1 - MODULAR CLUTCH ASSEMBLY
2 - INPUT SHAFT

INSTALLATION

(1) Install modular clutch assembly to transaxle input shaft (Fig. 19).
(2) Install transaxle to vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION)

SLAVE CYLINDER

REMOVAL

(1) Raise vehicle on hoist. **Diesel models:** Remove underbody splash shield.
(2) Using Tool 6638A, disconnect hydraulic clutch circuit quick connect fitting.
(3) Remove clutch slave cylinder (Fig. 20) by lifting nylon tab with a small screwdriver, and then depressing cylinder inward towards case and rotating cylinder 60° counter-clockwise.

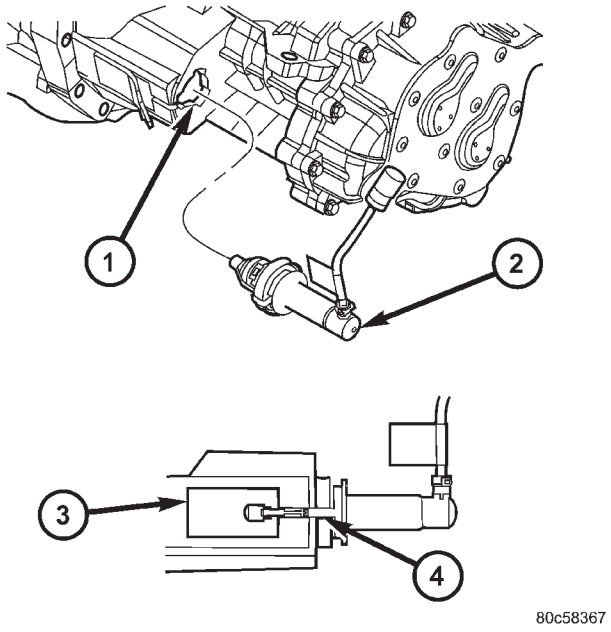

Fig. 20 Slave Cylinder Removal/Installation

1 - MOUNTING HOLE
2 - SLAVE CYLINDER
3 - ACCESS HOLE
4 - NYLON ANTI-ROTATION TAB

INSTALLATION

(1) Install clutch slave cylinder into position, noting orientation of different sized lugs. While depressing inward, rotate slave cylinder clockwise until nylon locating tab rests in transaxle case cutout, and the hydraulic tube is vertical (Fig. 20).
(2) Connect “quick-connect” connection until an audible “click” is heard. Verify connection by pulling outward on connection.
(3) **Diesel models:** Install underbody splash shield.
(4) Lower vehicle.

CLUTCH DISC AND PRESSURE PLATE - 2.5L TD

REMOVAL

(1) Remove transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL)

(2) Remove six (6) clutch pressure plate-to-flywheel bolts. Remove pressure plate and disc from flywheel (Fig. 21).

(3) Inspect flywheel. Resurface/replace as necessary.

(4) Inspect clutch release bearing and lever. Replace as necessary. (Refer to 6 - CLUTCH/CLUTCH RELEASE BEARING - REMOVAL)

INSTALLATION

(1) Install clutch release bearing and lever (if removed). (Refer to 6 - CLUTCH/CLUTCH RELEASE BEARING - INSTALLATION)

(2) Install clutch disc and pressure plate to flywheel (Fig. 21). Install clutch alignment tool, and install and torque pressure plate-to-flywheel bolts to 28 N·m (250 in. lbs.).

(3) Install transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION)

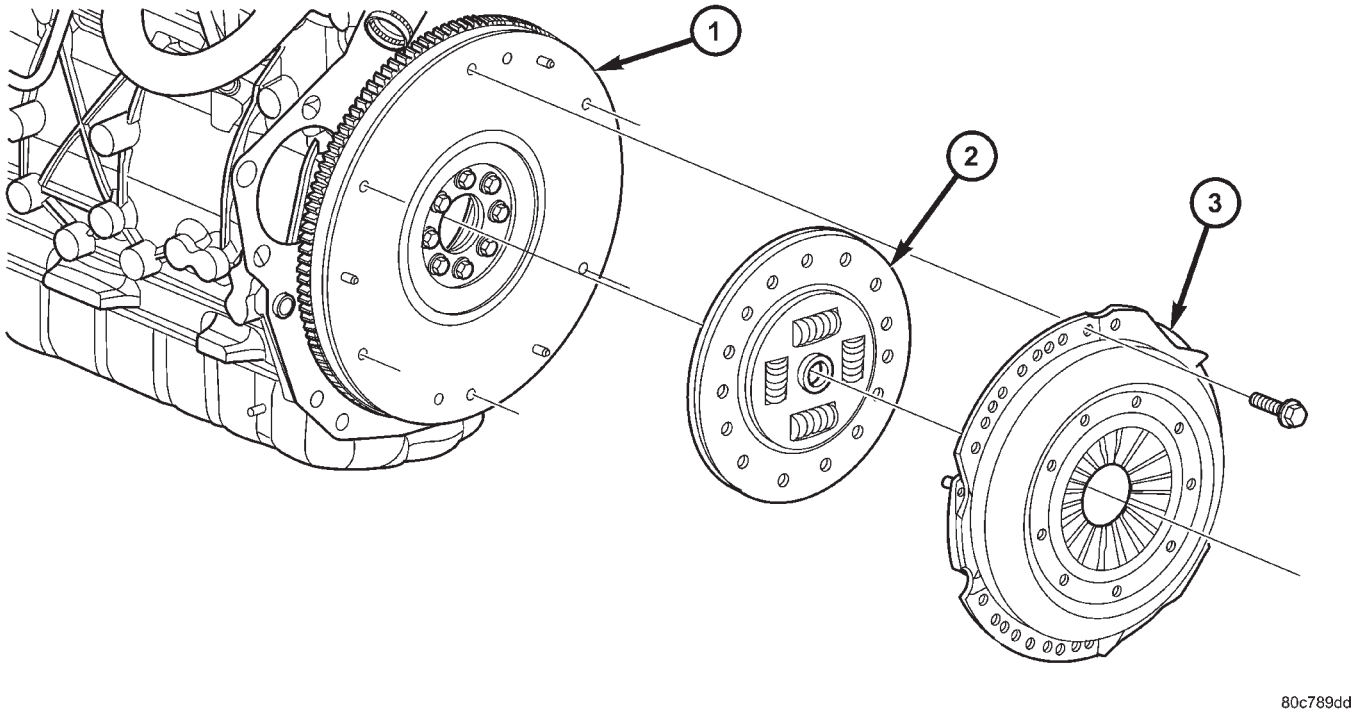

Fig. 21 Clutch Disc and Pressure Plate

1 - FLYWHEEL
2 - DISC
3 - PRESSURE PLATE

FLYWHEEL

REMOVAL

(1) Remove transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL)

(2) Remove clutch pressure plate and disc. (Refer to 6 - CLUTCH/CLUTCH DISC - REMOVAL)

(3) Remove flywheel assembly (Fig. 22).

INSTALLATION

(1) Install NEW flywheel-to-crankshaft bolts by hand.

(2) Torque bolts in a criss-cross sequence to 25 N·m (18 ft. lbs.) (Fig. 22).

(3) Torque bolts in a criss-cross sequence an additional 60°.

(4) Install clutch pressure plate and disc. (Refer to 6 - CLUTCH/CLUTCH DISC - INSTALLATION)

(5) Install transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION)

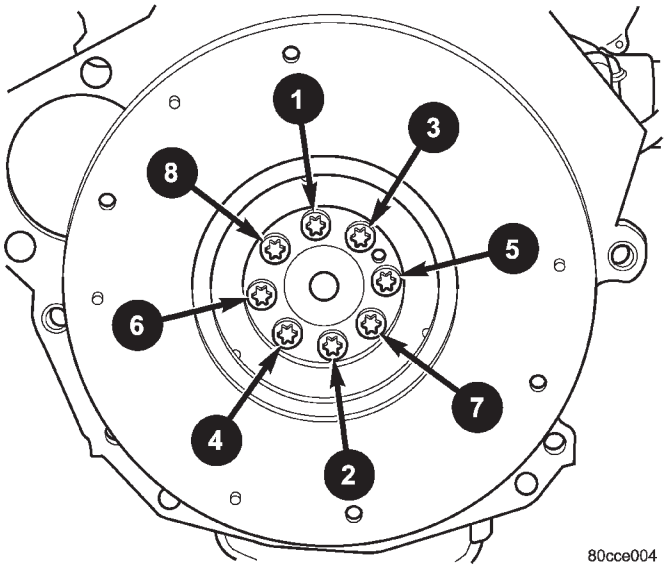

Fig. 22 Flywheel Bolt Torque Sequence

COOLING

DESCRIPTION

DESCRIPTION - COOLING SYSTEM

The cooling system components consist of a radiator, electric fan motors, shroud, pressure cap, thermostat, transmission oil cooler, water pump, hoses, clamps, coolant, and a coolant reserve system to complete the circuit.

DESCRIPTION - HOSE CLAMPS

The cooling system uses spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only a original equipment clamp with matching number or letter (Fig. 1).

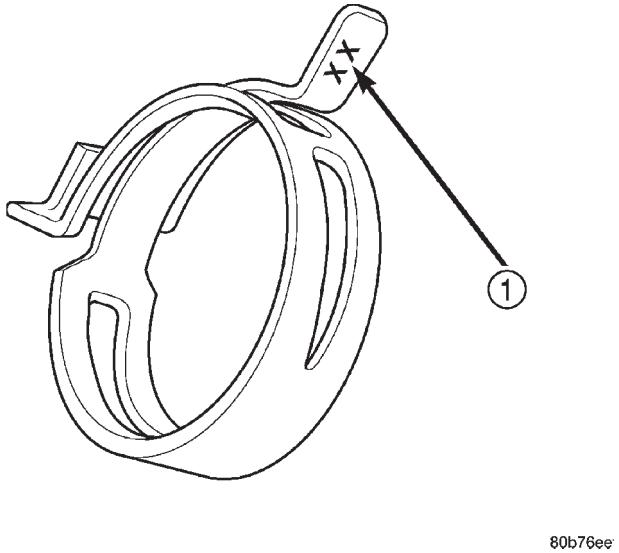

Fig. 1 Spring Clamp Size Location

1 - SPRING CLAMP SIZE LOCATION

COOLING (Continued)

OPERATION

OPERATION - COOLING SYSTEM

The engine cooling systems primary purpose is to maintain engine temperature in a range that will provide satisfactory engine performance and emission levels under all expected driving conditions. It also provides hot water (coolant) for heater performance and cooling for automatic transmission oil. It does this by transferring heat from engine metal to coolant, moving this heated coolant to the radiator, and then transferring this heat to the ambient air.

- When engine is cold: thermostat is closed, cooling system has no flow through the radiator. The coolant bypass flows through the engine only.
- When engine is warm: thermostat is open, cooling system has bypass flow and coolant flow through radiator.

Coolant flow circuits for the 2.4L and 3.3/3.8L engines are shown in (Fig. 2).

OPERATION - HOSE CLAMPS

The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, use Special Tool 6094 or equivalent, constant tension clamp pliers (Fig. 3) to compress the hose clamp.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLING SYSTEM LEAK TEST

WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE RADIATOR PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE RADIATOR CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT OR UNDER PRESSURE.

COOLING (Continued)

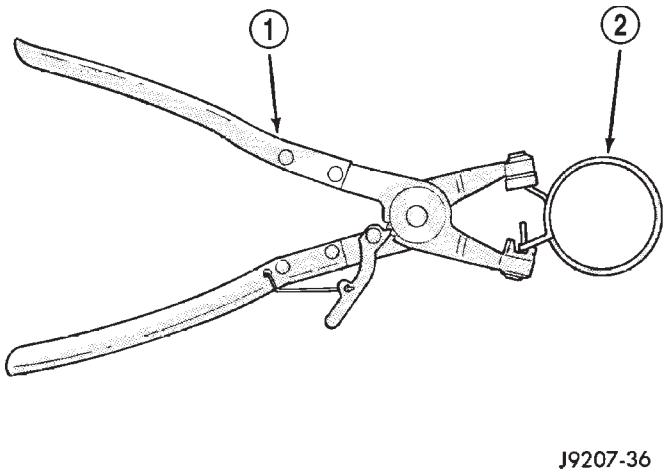

Fig. 3 Hose Clamp Tool

1 - HOSE CLAMP TOOL 6094
2 - HOSE CLAMP

With engine not running, remove radiator pressure cap and wipe the radiator filler neck sealing seat clean. The radiator should be full.

Attach the Cooling System Tester 7700 or equivalent to the radiator, as shown in (Fig. 4) and apply 104 kPa (15 psi) pressure. If the pressure drops more than 13.8 kPa (2 psi) in 2 minutes, inspect all points for external leaks.

All radiator and heater hoses should be shaken while at 104 kPa (15 psi), since some leaks occur only while driving due to engine movement.

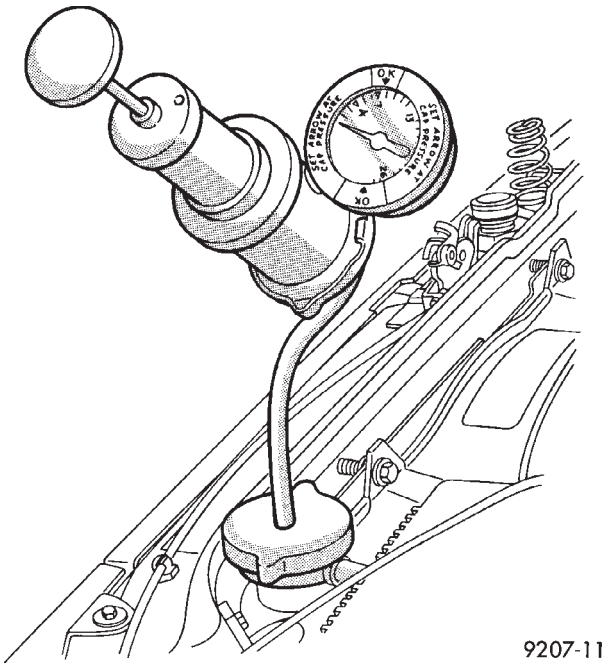

Fig. 4 Pressure Testing

If there are no external leaks, after the gauge dial shows a drop in pressure, detach the tester. Start engine and run until the thermostat opens, allowing the coolant to expand. Reattach the cooling system tester. If the needle on the dial fluctuates it indicates a combustion leak, usually a head gasket leak.

WARNING: WITH TOOL IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

If the needle on the dial does not fluctuate, raise the engine rpm a few times. If an abnormal amount of coolant or steam emits from the tailpipe, it may indicate a coolant leak caused by a faulty head gasket, cracked engine block, or cracked cylinder head.

There may be internal leaks that can be determined by removing the oil dipstick. If water globules appear intermixed with the oil it will indicate an internal leak in the engine. If there is an internal leak, the engine must be disassembled for repair.

DIAGNOSIS AND TESTING - COOLING SYSTEM FLOW CHECK

To determine whether coolant is flowing through the cooling system, use one of the following procedures:

PREFERRED METHOD

WARNING: DO NOT REMOVE THE COOLING SYSTEM PRESSURE CAP OR ANY HOSE WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

- Remove pressure cap when engine is cold. Remove small amount of coolant. Idle engine until thermostat opens. You should observe coolant flow while looking down the filler neck. Once flow is detected install the pressure cap. Replace removed coolant into coolant recovery container.

ALTERNATIVE METHOD

- If engine is cold, idle engine until normal operating temperature is reached. Feel the upper radiator hose. If it is hot, coolant is circulating.

COOLING (Continued)

DIAGNOSIS AND TESTING - COOLING SYSTEM AERATION

Low coolant level in a cross flow radiator will equalize in both tanks with engine off. With engine at running and at operating temperature, the high pressure inlet tank runs full and the low pressure outlet tank drops, resulting in cooling system aeration. Aeration will draw air into the water pump resulting in the following:

- High reading shown on the temperature gauge.
- Loss of coolant flow through the heater core.
- Corrosion in the cooling system.
- Water pump seal may run dry, increasing the risk of premature seal failure.
- Combustion gas leaks into the coolant can also cause the above problems.

DIAGNOSIS AND TESTING - COOLING SYSTEM DEAERATION

Air can only be removed from the system by gathering under the pressure cap. On the next heat up it will be pushed past the pressure cap into the coolant recovery bottle by thermal expansion of the coolant. It then escapes to the atmosphere in the coolant recovery bottle and is replaced with coolant on cool down.

To effectively deaerate the system, multiple thermal cycles of the system may be required.

NOTE: Deaeration does not occur at engine idle—higher engine speeds are required. Normal driving will deaerate cooling system.

STANDARD PROCEDURE

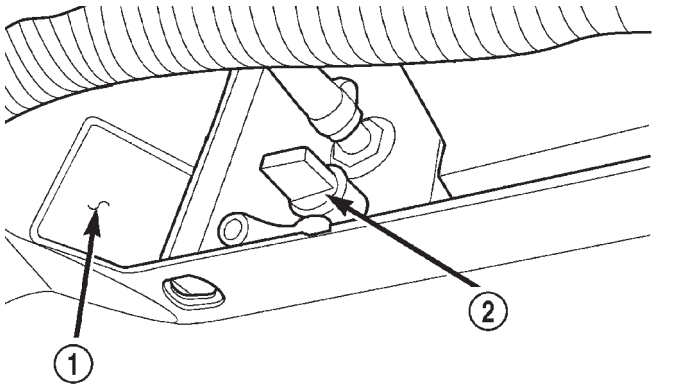
STANDARD PROCEDURE - COOLING SYSTEM DRAINING

WARNING: DO NOT REMOVE OR LOOSEN THE COOLANT PRESSURE CAP, CYLINDER BLOCK DRAIN PLUGS, OR THE DRAINCOCK WHEN THE SYSTEM IS HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(1) **Without removing radiator pressure cap and with system not under pressure**, open the draincock. The draincock is located on the lower left side of radiator (Fig. 5).

(2) After the coolant recovery/reserve container is empty, then remove coolant pressure cap (Fig. 6).

(3) Remove the cylinder block drain plug(s).



80c07121

Fig. 5 Draincock Location

1 - LEFT SIDE FRAME RAIL
2 - DRAINCOCK

STANDARD PROCEDURE - COOLING SYSTEM FILLING

Remove radiator pressure cap (Fig. 6) and fill system, using a 50/50 mix of Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula and distilled water.

Continue filling system until full. **Be careful not to spill coolant on drive belts or the generator.**

Fill coolant recovery/reserve container (Fig. 6) to at least the MAX mark with 50/50 solution. It may be necessary to add coolant to the recovery/reserve container after three or four warm up/cool down cycles to maintain coolant level between the MAX and MIN mark. This will allow trapped air to be removed from the system.

STANDARD PROCEDURE - ADDING ADDITIONAL COOLANT

The radiator cap should not be removed. When additional coolant is needed to maintain this level, it should be added to the coolant recovery/reserve container (Fig. 6). Use only 50/50 mix of ethylene glycol type antifreeze and distilled water. For the recommeded antifreeze/coolant type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

CAUTION: Do not use well water, or suspect water supply in cooling system. A 50/50 ethylene glycol and distilled water mix is recommended. For the recommeded antifreeze/coolant type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

COOLING (Continued)

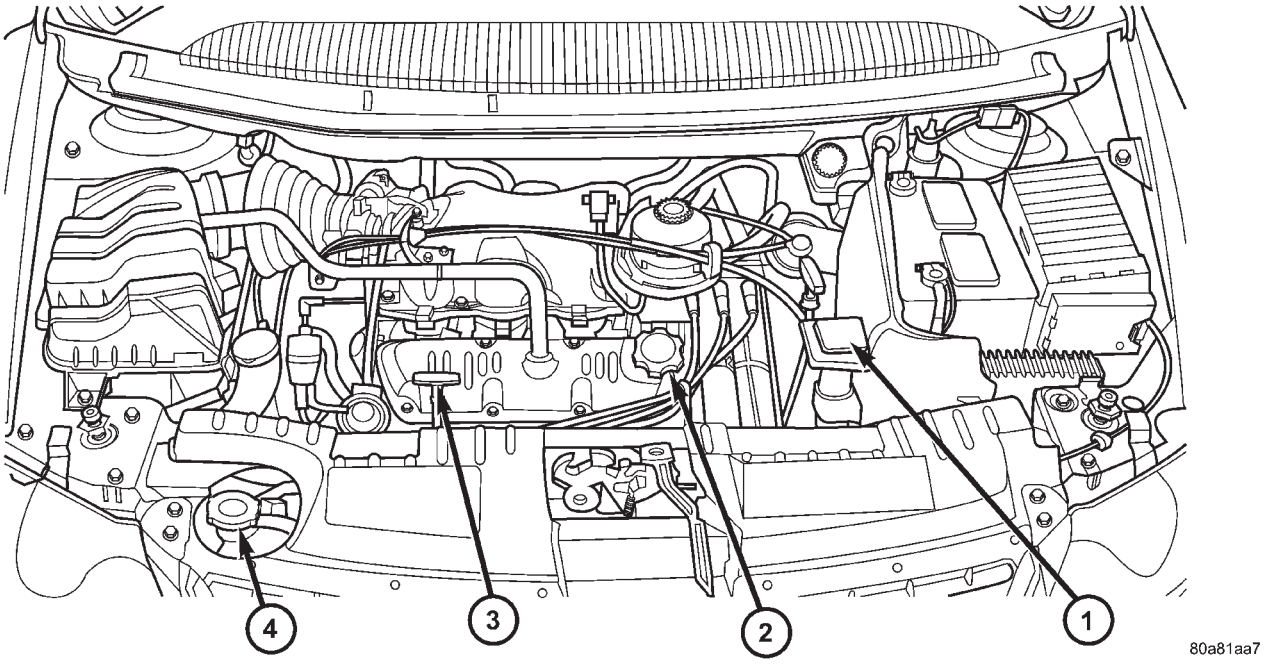


Fig. 6 Cooling System Service Locations

1 - COOLANT RECOVERY CONTAINER
2 - ENGINE OIL FILL CAP
3 - ENGINE OIL LEVEL DIPSTICK
4 - RADIATOR PRESSURE CAP

STANDARD PROCEDURE - COOLANT LEVEL CHECK

NOTE: Do not remove radiator cap for routine coolant level inspections.

The coolant reserve system provides a quick visual method for determining the coolant level without removing the radiator cap. **With the engine cold and not running,** simply observe the level of the coolant in the recovery/reserve container (Fig. 7). The coolant level should be between the MIN and MAX marks.

BELT TENSIONER - 2.4L

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove the drive belt shield.
(3) Remove the generator/A/C drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
(4) Remove the belt tensioner (Fig. 1).

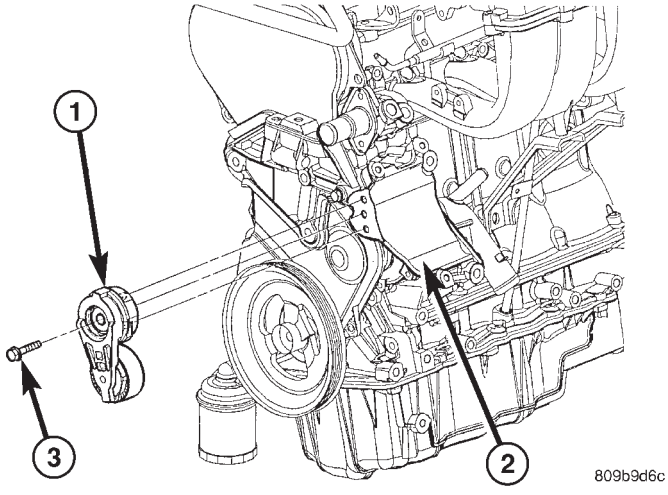

Fig. 1 Belt Tensioner - 2.4L

1 - BELT TENSIONER
2 - GENERATOR BRACKET
3 - BOLT

INSTALLATION

(1) Install belt tensioner and bolt (Fig. 1). Tighten bolt to 54 N·m (40 ft. lbs.).
(2) Install generator/A/C compressor drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
(3) Install splash shield.
(4) Lower the vehicle.

BELT TENSIONER - 3.3/3.8L

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove the drive belt shield.
(3) Remove the drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
(4) Remove the belt tensioner (Fig. 2).

INSTALLATION

(1) Install the belt tensioner and bolt (Fig. 2). Tighten bolt to 28 N·m (250 in. lbs.).
(2) Install the drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
(3) Install the drive belt shield.
(4) Lower the vehicle.

DRIVE BELTS

DESCRIPTION

The drive belts are a Poly-V type belt. Belt widths vary depending on the various engine and accessory packages. Satisfactory performance of these belts depends on belt condition and proper belt tension.

OPERATION

The accessory drive belts form the link between the engine crankshaft and the engine driven accessories.

DIAGNOSIS AND TESTING - ACCESSORY DRIVE BELT

CONDITION	POSSIBLE CAUSES	CORRECTIONS
INSUFFICIENT ACCESSORY OUTPUT DUE TO BELT SLIPPAGE	1. Belt too loose	1. (a) Replace belt (auto-tensioned belts) (b) Adjust power steering belt tension (4 cyl. engine)
	2. Belt excessively glazed or worn	2. Replace and tighten as specified
BELT SQUEAL WHEN ACCELERATING ENGINE	1. Belts too loose	1. (a) Replace belt (auto-tensioned belts) (b) Adjust power steering belt tension (4 cyl. engine)
	2. Belt glazed	2. Replace belts
BELT SQUEAK AT IDLE	1. Belts too loose	1. (a) Replace belt (auto-tensioned belts) (b) Adjust power steering belt tension (4 cyl. engine)
	2. Dirt or paint imbedded in belt	2. Replace belt
	3. Non-uniform belt	3. Replace belt
	4. Misaligned pulleys	4. Align accessories
	5. Non-uniform groove or eccentric pulley	5. Replace pulley

DRIVE BELTS (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTIONS
BELT ROLLED OVER IN GROOVE OR BELT JUMPS OFF	1. Broken cord in belt	1. Replace belt
	2. Belt too loose, or too tight	2. (a) Replace belt (auto-tensioned belts.) (b) Adjust power steering belt tension (4 cyl. engine)
	3. Misaligned pulleys	3. Align accessories
	4. Non-uniform groove or eccentric pulley	4. Replace pulley

DRIVE BELTS - 2.4L

STANDARD PROCEDURE - CHECKING POWER STEERING BELT TENSION

WARNING: DO NOT CHECK BELT TENSION WITH ENGINE RUNNING.

Accessory drive belt tension can be measured with Special Tool 8371 – Belt Tension Gauge Adapter, and the DRBIII® using the following procedures:

(1) Connect 8371 to the DRBIII® following the instructions provided with tool.

(2) Place end of microphone probe approximately 2.54 cm (1 in.) from belt at belt center span location shown in (Fig. 3).

(3) Pluck the belt a minimum of 3 times. (Use your finger or other suitable tool) The frequency of the belt in hertz (Hz) will display on DRBIII® screen.

(4) Adjust belt to obtain proper frequency (tension). Refer to ACCESSORY DRIVE BELT TENSION CHART for belt tension specifications.

ACCESSORY DRIVE BELT TENSION CHART - 2.4L

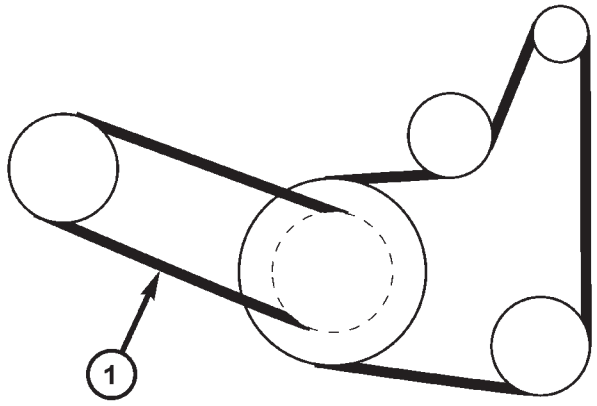
Accessory Drive Belt	Belt Tension	
Air Conditioning Compressor/Generator	Dynamic Tensioner	
Power Steering Pump	New	183 - 218 Hz
	Used*	150 - 183 Hz
*A belt is considered used after 15 minutes of run-in time.		

REMOVAL

GENERATOR AND AIR CONDITIONING BELT

(1) Raise vehicle on hoist.

(2) Remove the drive belt shield (Fig. 8).



80cad8d9

Fig. 3 Power Steering Belt - Center Span Location

1 - POWER STEERING BELT CENTER SPAN LOCATION

WARNING: DO NOT ALLOW DRIVE BELT TENSIONER TO SNAP BACK, AS DAMAGE TO TENSIONER AND/OR PERSONAL INJURY COULD RESULT.

(3) Position a wrench on the belt tensioner lug (Fig. 4).

(4) Release belt tension by rotating the tensioner clockwise (Fig. 4).

(5) Remove belt.

(1) Carefully return tensioner to its relaxed position.

POWER STEERING PUMP

(1) From top of the vehicle, loosen locking nuts (D) and (F) (Fig. 5).

DRIVE BELTS - 2.4L (Continued)

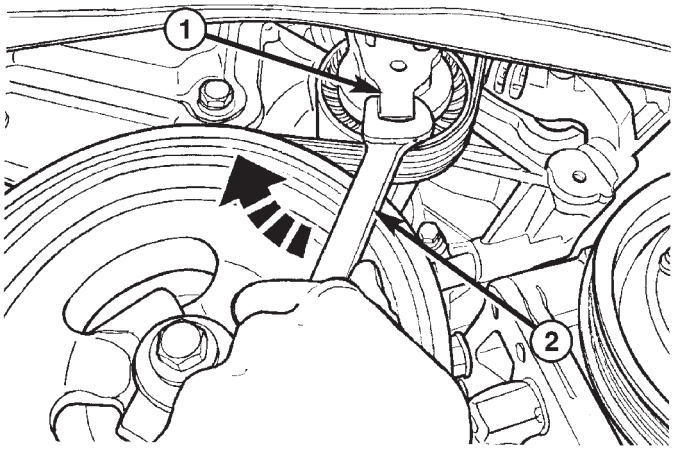


Fig. 4 A/C & GENERATOR BELT TENSION RELEASE

1 - BELT TENSIONER
2 - WRENCH

(2) From under the vehicle, loosen the pivot bolt (E). Loosen adjusting bolt (G) until belt can be removed.

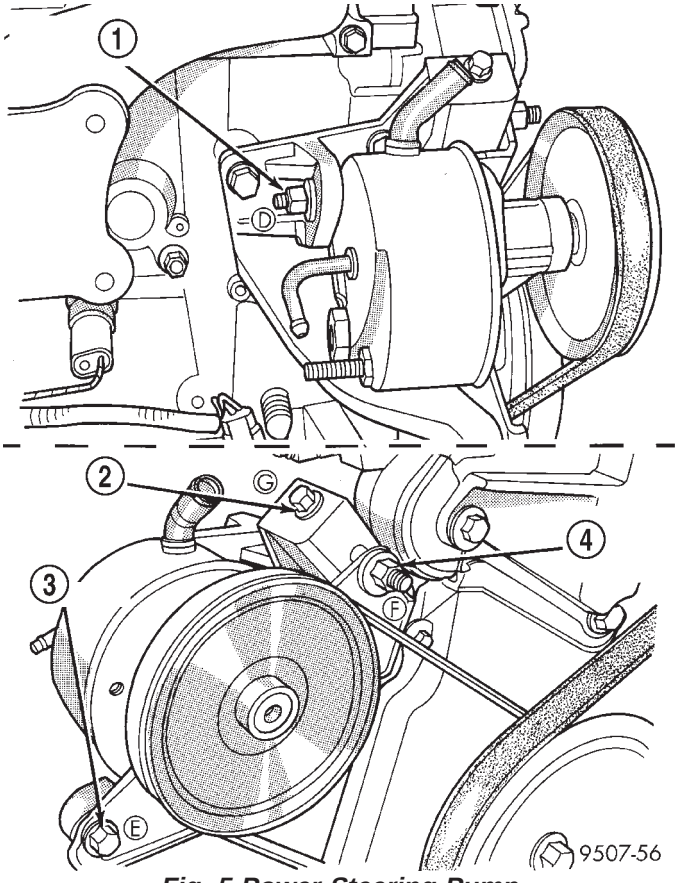

Fig. 5 Power Steering Pump

1 - REAR LOCKING NUT
2 - ADJUSTING BOLT
3 - PIVOT BOLT
4 - FRONT LOCKING NUT

CLEANING

Clean all foreign debris from belt pulley grooves. The belt pulleys must be free of oil, grease, and coolants before installing the drive belt.

INSPECTION

Belt replacement under any or all of the following conditions is required:

- Excessive wear
- Frayed cords
- Severe glazing

Poly-V Belt system may develop minor cracks across the ribbed side (due to reverse bending). These minor cracks are considered normal and acceptable. Parallel cracks are not (Fig. 6).

NOTE: Do not use any type of belt dressing or restorer on Poly-V Belts.

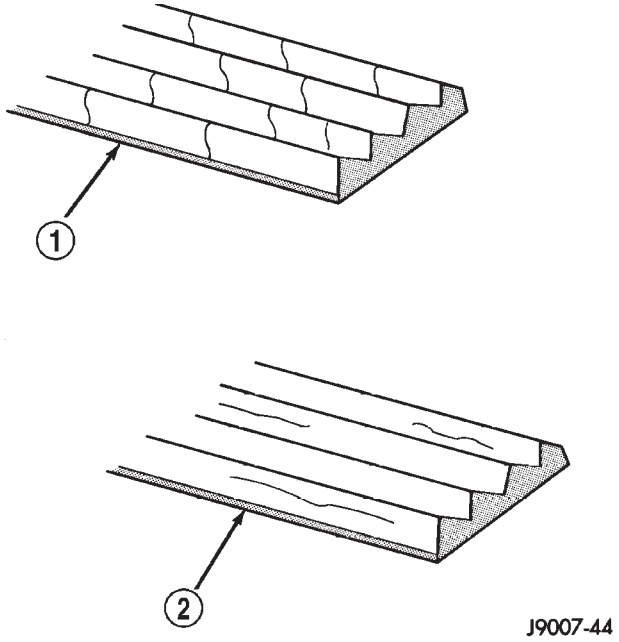

Fig. 6 Drive Belt Wear Pattern

1 - NORMAL CRACKS - BELT OK
2 - NOT NORMAL CRACKS - REPLACE BELT

INSTALLATION

GENERATOR AND AIR CONDITIONING BELT

(1) Install belt onto all pulleys except for the crankshaft (Fig. 7).

(2) Rotate belt tensioner clockwise until belt can be installed onto the crankshaft pulley (Fig. 4). Slowly release belt tensioner.

(3) Verify belt is properly routed and engaged on all pulleys (Fig. 7).

(4) Install drive belt shield (Fig. 8) and lower vehicle.

DRIVE BELTS - 2.4L (Continued)

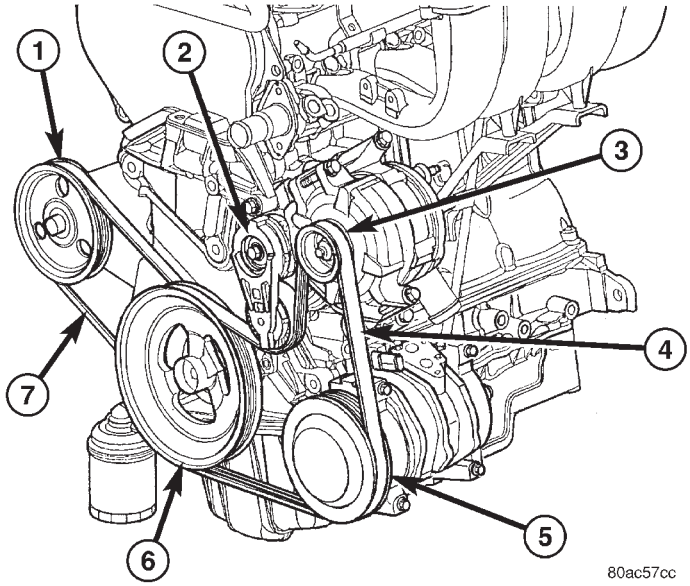

Fig. 7 Accessory Drive Belts - 2.4L

3 - GENERATOR PULLEY
4 - BELT - A/C AND GENERATOR
5 - A/C COMPRESSOR PULLEY
6 - CRANKSHAFT PULLEY
7 - BELT - POWER STEERING

POWER STEERING PUMP

(1) Install belt over crankshaft and power steering pump pulleys (Fig. 7).

(2) Apply an initial snug torque to fasteners (E) and (F) (Fig. 5).

(3) Tighten adjusting bolt (G) until proper belt tension is obtained (Fig. 5). For belt tension check procedure, (Refer to 7 - COOLING/ACCESSORY DRIVE/ DRIVE BELTS - STANDARD PROCEDURE - CHECKING POWER STEERING BELT TENSION).

(4) Tighten locking nuts (D) and (F) to 54 N·m (40 ft. lbs.) (Fig. 5).

(5) Tighten pivot bolt (E) to 54 N·m (40 ft. lbs.) (Fig. 5).

ADJUSTMENTS

Satisfactory performance of the belt driven accessories depends on proper belt tension. Belt tensioning should be performed with the aid of Special Tool 7198. Because of space limitations in the engine compartment, the use of this gauge may be restricted. Raise the vehicle on a hoist and the remove the splash shield to gain access to the drive belts, if necessary. Adjust belt tension for either a **New** or **Used** belt. For specifications, (Refer to 7 - COOLING/ACCESSORY DRIVE - SPECIFICATIONS).

DRIVE BELTS - 3.3/3.8L

REMOVAL

(1) Raise vehicle on hoist.

(2) Remove the drive belt shield (Fig. 8).

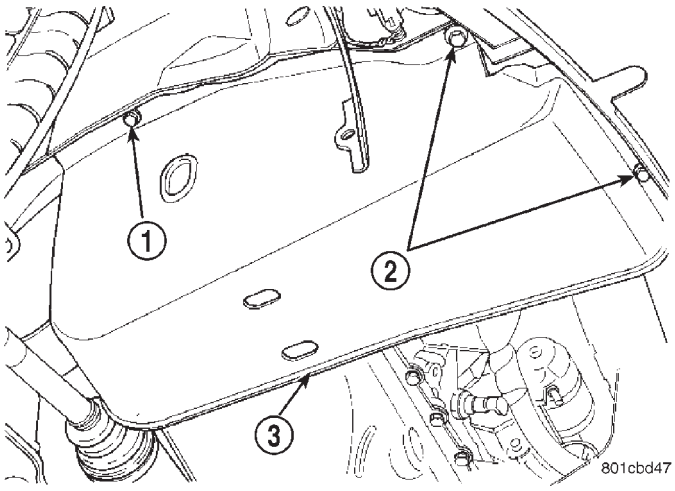

Fig. 8 Accessory Drive Belt Shield

1 - ATTACHING SCREW
2 - ATTACHING SCREWS
3 - SPLASH SHIELD

WARNING: DO NOT ALLOW DRIVE BELT TENSIONER TO SNAP BACK, AS DAMAGE TO TENSIONER AND/OR PERSONAL INJURY COULD RESULT.

(3) Position a wrench on the belt tensioner lug (Fig. 9).

(4) Release belt tension by rotating the tensioner counterclockwise (Fig. 9).

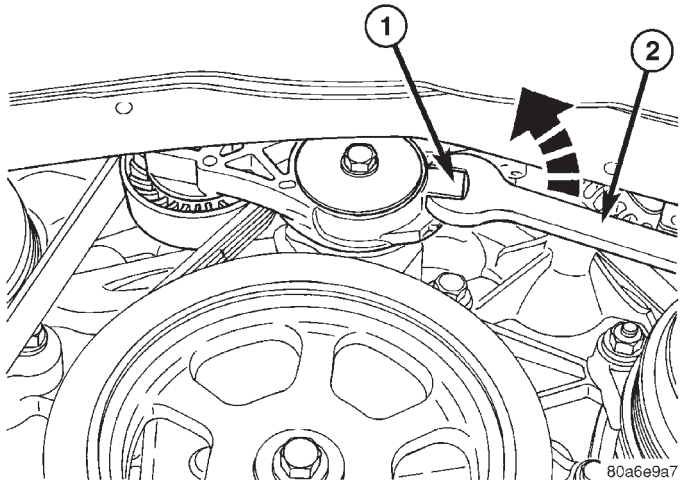

Fig. 9 DRIVE BELT TENSION RELEASE

1 - BLET TENSIONER LUG
2 - WRENCH

DRIVE BELTS - 3.3/3.8L (Continued)

(5) Remove the drive belt (Fig. 11).

(6) Carefully return tensioner to its relaxed position.

CLEANING

Clean all foreign debris from belt pulley grooves. The belt pulleys must be free of oil, grease, and coolants before installing the drive belt.

INSPECTION

Belt replacement under any or all of the following conditions is required:

- Excessive wear
- Frayed cords
- Severe glazing

Poly-V Belt system may develop minor cracks across the ribbed side (due to reverse bending). These minor cracks are considered normal and acceptable. Parallel cracks are not (Fig. 10).

NOTE: Do not use any type of belt dressing or restorer on Poly-V Belts.

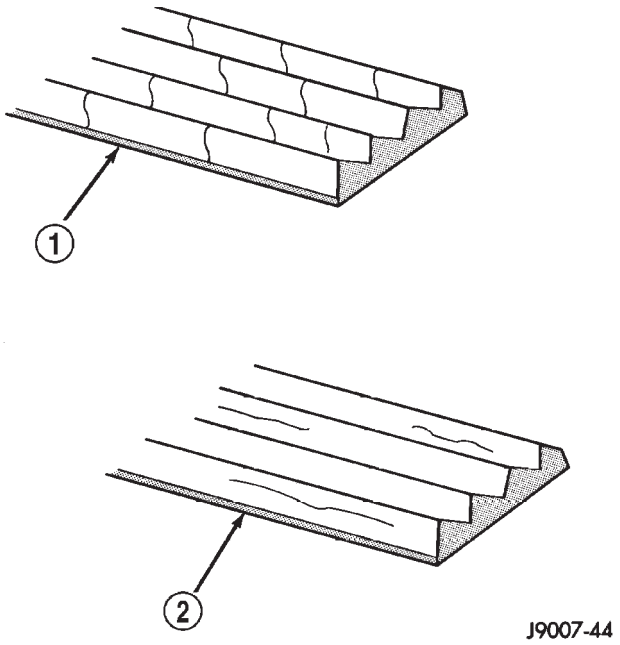

Fig. 10 Drive Belt Wear Pattern

1 - NORMAL CRACKS - BELT OK
2 - NOT NORMAL CRACKS - REPLACE BELT

INSTALLATION

(1) Route and position the drive belt onto all pulleys, except for the crankshaft (Fig. 11).

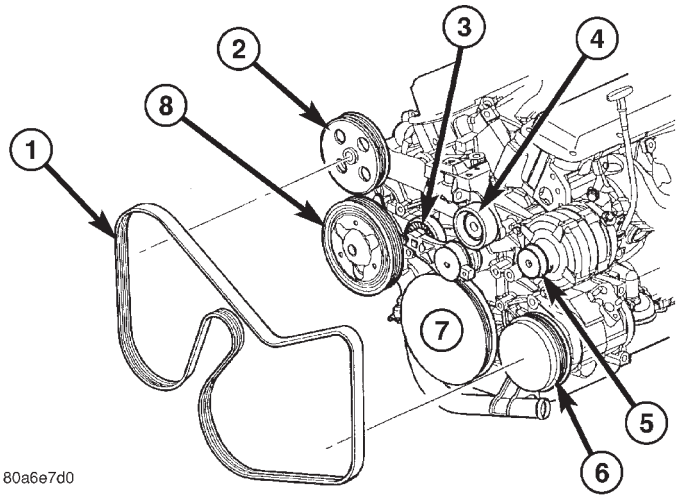

Fig. 11 ACCESSORY DRIVE BELT

1 - DRIVE BELT
2 - POWER STEERING PUMP PULLEY
3 - BELT TENIONER PULLEY
4 - IDLER PULLEY
5 - GENERATOR PULLEY
6 - AIR CONDITIONING COMPRESSOR PULLEY
7 - CRANKSHAFT PULLEY
8 - WATER PUMP PULLEY

(2) Rotate belt tensioner counterclockwise until belt can be installed onto the crankshaft pulley (Fig. 9). Slowly release belt tensioner.

(3) Verify belt is properly routed and engaged on all pulleys.

(4) Install drive belt shield (Fig. 8) and lower vehicle.

ENGINE

DIAGNOSIS AND TESTING - ENGINE COOLING SYSTEM

Establish what driving condition caused the cooling system complaint. The problem may be caused by an abnormal load on the system such as the following: prolonged idle, very high ambient temperature, slight tail wind at idle, slow traffic speed, traffic jam, high speed, steep grade.

DRIVING TECHNIQUES

To avoid overheating the cooling system:

(1) Idle with A/C off when temperature gauge is at end of normal range.

(2) Do not increase engine speed for more air flow and coolant flow because the electric motor fan systems are not responsive to engine RPM. The added cooling from higher coolant flow rate is more than offset by increased heat rejection (engine heat added to coolant).

TRAILER TOWING

Consult the owner's manual under Trailer Towing and do not exceed specified limits.

VISUAL INSPECTION

If the cooling system problem is not caused by a driving condition, perform a visual inspection to determine if there was a recent service or accident repair, including the following:

- Loose/damaged water pump drive belt
- Incorrect cooling system refilling (trapped air or low level)
- Brakes possibly dragging
- Damaged hoses
- Loose/damaged hose clamps
- Damaged/incorrect engine thermostat
- Damaged cooling fan motor, fan blade and fan shroud
- Damaged head gasket
- Damaged water pump
- Damaged radiator
- Damaged coolant recovery system
- Damaged heater core
- Open/shorted electrical circuits

If the visual inspection reveals none of the above as cause for a cooling system complaint, refer to the following diagnostic charts.

COOLING SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/ OVERFLOW TANK.	1. Pressure relief valve in radiator cap is defective, or was not properly seated.	1. Check condition of radiator cap and cap seal. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING) Replace cap as necessary.
	2. Incorrect cap was installed.	2. Replace cap as necessary.
	3. Incorrect coolant mixture.	3. Check concentration level of the coolant. (Refer to 7 - COOLING/ ENGINE/COOLANT - DIAGNOSIS AND TESTING) Adjust the ethylene glycol-to-water ratio as required.
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE IS READING HIGH OR HOT.	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING)

ENGINE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY NOT BE READING HIGH.	1. Engine overheating.	1. Check reason for overheating and repair as necessary.
	2. Freeze point of coolant not correct. Mixture too concentrated or too diluted.	2. Check concentration level of the coolant. (Refer to 7 - COOLING/ ENGINE/COOLANT - DIAGNOSIS AND TESTING) Adjust the ethylene glycol-to-water ratio as required.
	3. Incorrect cooling system pressure cap.	3. Install correct pressure cap.
HOSE(S) COLLAPSE AS ENGINE COOLS DOWN.	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant recovery system.	1. (a) Pressure cap relief valve stuck. (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING) Replace as necessary. (b) Hose between the radiator and overflow container is plugged or pinched. Clean and repair as necessary. (c) Vent at coolant reserve/overflow container is plugged. Clean vent and repair as necessary. (d) Reserve/overflow container is internally blocked. Clean and repair as necessary.
INADEQUATE AIR CONDITIONER PERFORMANCE (COOLING SYSTEM SUSPECTED).	1. Radiator and/or A/C condenser is restricted, obstructed, or dirty (insects, leaves, etc.).	1. Remove restriction and/or clean as necessary.
	2. Electrical radiator fan not operating when A/C is operated.	2. For test procedure (Refer to appropriate Diagnostic Information). Repair as necessary.
	3. Engine is overheating (heat may be transferred from radiator to A/C condenser). High underhood temperatures due to engine overheating may also transfer heat to A/C components.	3. Correct overheating condition.
	4. All models are equipped with air seals at the radiator and/or A/C condenser. If these seals are missing or damaged, not enough air flow will be pulled through the radiator and A/C condenser.	4. Check for missing or damaged air seals and repair as necessary.
INADEQUATE HEATER PERFORMANCE.	1. Check for a Diagnostic trouble code (DTC).	1. For procedures, (Refer to appropriate Diagnostic Information). Repair as necessary.
	2. Coolant level low.	2. (Refer to 7 - COOLING - STANDARD PROCEDURE) Repair as necessary.

ENGINE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Obstructions in heater hose fitting at engine or at heater core.	3. Remove heater hoses at both ends and check for obstructions. Repair as necessary.
	4. Heater hose kinked.	4. Locate kinked area and repair as necessary.
	5. Water pump is not pumping coolant to heater core.	5. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly. Replace components as necessary.
	6. Air trapped in heater core.	6. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING - COOLING SYSTEM DEAERATION)
HEAT ODOR	1. Various heat shields are used at certain driveline components. One or more of these shields may be missing.	1. Locate missing shields and replace or repair as necessary.
	2. Temperature gauge reading above the normal range.	2. Refer to Gauge Is Reading High in Temperature Gauge Indicatication Diagnosis Chart.
	3. Radiator fan operating incorrectly.	3. (Refer to 7 - COOLING/ENGINE/ RADIATOR FAN - OPERATION) Repair as necessary.
	4. Undercoating been applied to an unnecessary component.	4. Clean undercoating as necessary.
	5. Engine may be running rich, causing the catalytic converter to overheat	5. (Refer to Appropriate Diagnostic Information) Repair as necessary.
POOR DRIVEABILITY (THERMOSTAT POSSIBLY STUCK OPEN). GAUGE MAY BE READING LOW.	1. The engine thermostat must be operating correctly for proper driveability, clean vehicle emissions, and the prevention of sludge buildup in the engine oil. Check for a diagnostic trouble code.	1. (Refer to Appropriate Diagnostic Information) Replace thermostat, if necessary.
STEAM IS COMING FROM FRONT OF VEHICLE NEAR GRILL AREA WHEN WEATHER IS WET, ENGINE WARMED UP AND RUNNING WITH VEHICLE STATIONARY, OR JUST SHUT OFF. TEMPERATURE GAUGE IS NORMAL.	1. During wet weather, moisture (snow, ice, rain, or condensation) on the radiator will evaporate when the thermostat opens. The thermostat opening allows heated coolant into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or air flow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.

ENGINE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. Check the freeze point of the coolant. (Refer to 7 - COOLING/ ENGINE/COOLANT - DIAGNOSIS AND TESTING) Adjust the ethylene glycol-to-water ratio as necessary.
COOLANT LEVEL CHANGES IN COOLANT BOTTLE. TEMPERATURE GAUGE IS IN NORMAL RANGE.	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. The coolant level will also drop as the system removes air from a recent filling.	1. A normal condition. No repair is necessary.

Refer to (Fig. 1) when using the TEMPERATURE GAUGE INDICATION DIAGNOSIS CHART.

TEMPERATURE GAUGE INDICATION DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC).	1. Normal reaction to fan and/or thermostat cycle (Fig. 1), Examples B and C. During cold weather operation with the heater blower in the high position, the gauge reading may drop slightly (Fig. 1), Example D. Fluctuation is also influenced by outside temperature and heavy loads (Fig. 1), Example E.	1. A normal condition. No correction is necessary.
	2. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running) (Fig. 1), Example F.	2. A normal condition. No correction is necessary. Gauge reading should return to normal range (Fig. 1), Example A, after vehicle is driven.
	3. Gauge reading high after restarting a warmed-up (hot) engine.	3. A normal condition. No correction is necessary. The gauge should return to normal range (Fig. 1), Example A, after a few minutes of engine operation.
	4. Temperature gauge or engine coolant temperature sensor defective or shorted. Also, corroded or loose wiring in the electrical circuit.	4. Check operation of gauge or engine coolant temperature sensor and repair, if necessary.

ENGINE (Continued)

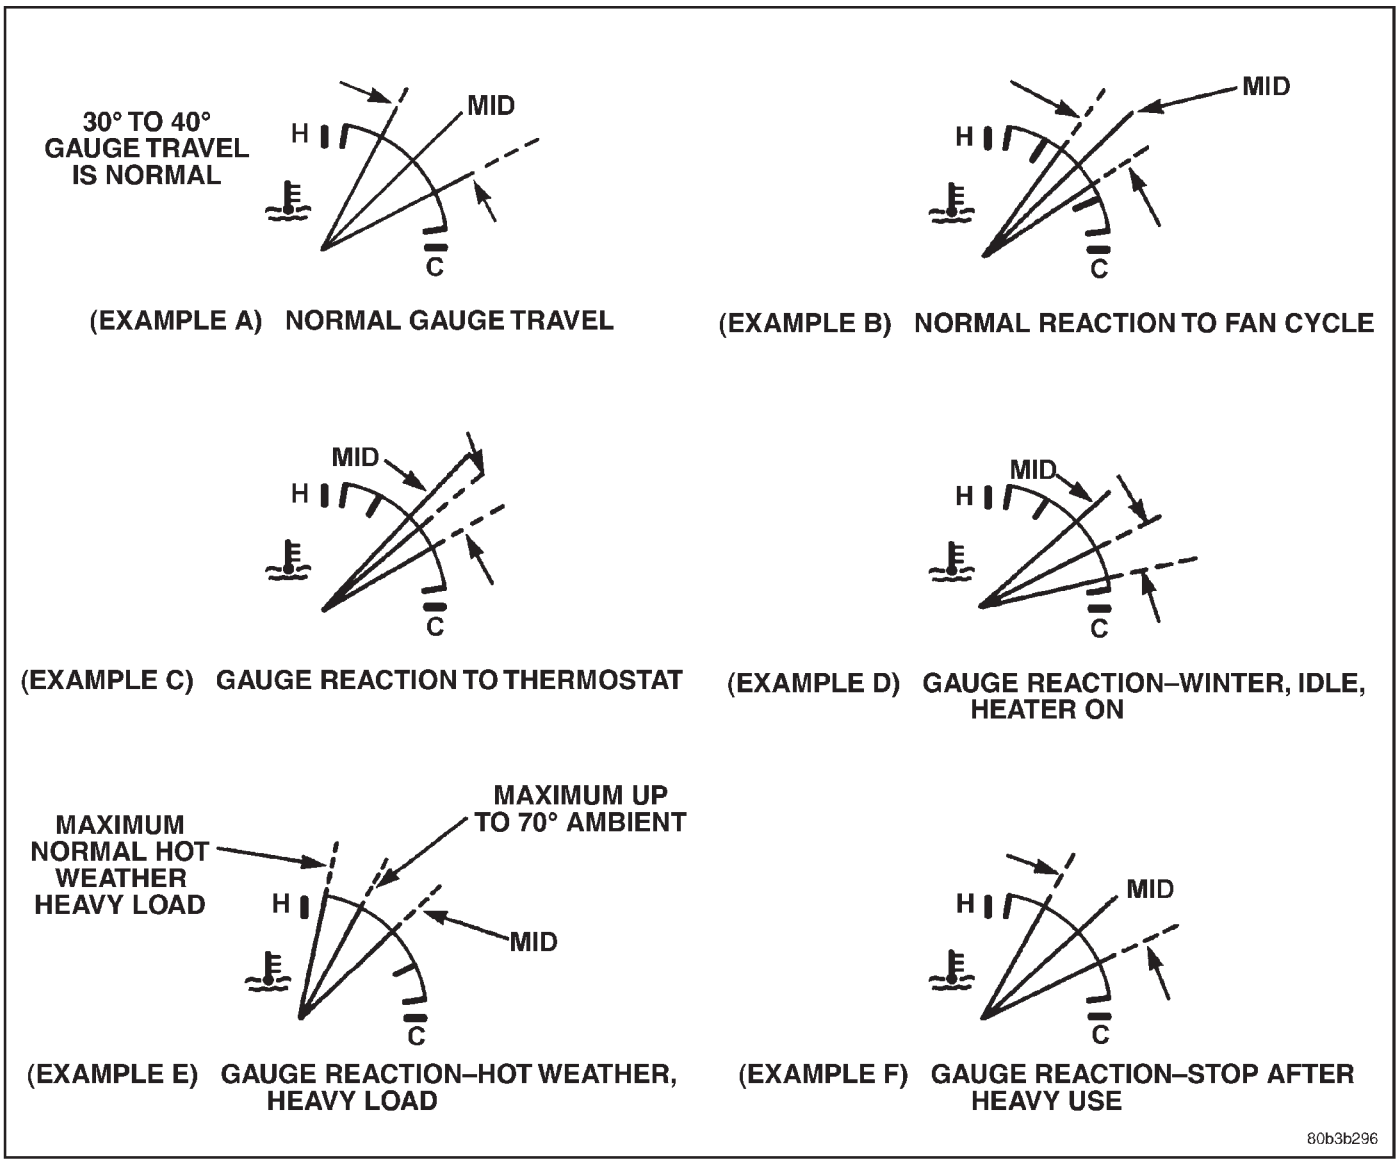

Fig. 1 Temperature Gauge Indications

CLEANING

Drain cooling system and refill with clean water. Refer to drain and fill procedures in this section. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty; fill, run, and drain system again, until water runs clear. Refill cooling system with a 50/50 mixture of the recommended ethylene glycol and distilled water (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

INSPECTION

After performing a cleaning/flush procedure, inspect all hoses, clamps and connections for deterioration and leaks. Inspect radiator and heater core for leaks.

COOLANT

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -46°C (-50°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and

COOLANT (Continued)

higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer (Special Tool 8286)(Refer to 7 - COOLING - SPECIAL TOOLS) will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant—corrosion protection will be severely reduced.

STANDARD PROCEDURE - COOLANT SERVICE

For engine coolant recommended service schedule, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

COOLANT RECOVERY CONTAINER

DESCRIPTION

The coolant recovery/reserve system cotainer is mounted in the engine compartment (Fig. 2). The container is made of plastic.

OPERATION

The coolant recovery system works with the radiator pressure cap to use thermal expansion and contraction of the coolant to keep the coolant free of trapped air. Provides a convenient and safe method for checking coolant level and adjusting level at atmospheric pressure without removing the radiator pressure cap. It also provides some reserve coolant to cover deaeration, evaporation, or boiling losses.

DIAGNOSIS AND TESTING - COOLANT RECOVERY SYSTEM

The cooling system is closed and designed to maintain coolant level to the top of the radiator.

(1) With the engine **off** and cooling system **not** under pressure, drain several ounces of coolant from the radiator draincock while observing the coolant recovery container. Coolant level in the container should drop.

(2) Remove the radiator pressure cap. The coolant level should be full to the top radiator neck. If not, and the coolant level in the container is at or above the MIN mark, there is an air leak in the coolant recovery system.

(3) Check hose and hose connections to the container, radiator filler neck or the pressure cap seal to the radiator filler neck for leaks.

REMOVAL

(1) Raise the vehicle on hoist.

(2) Remove the lower attaching screws (Fig. 2).

(3) Lower the vehicle.

(4) Remove the upper attaching screw (Fig. 2).

(5) Disconnect recovery hose from container (Fig. 2).

(6) Remove the recovery container.

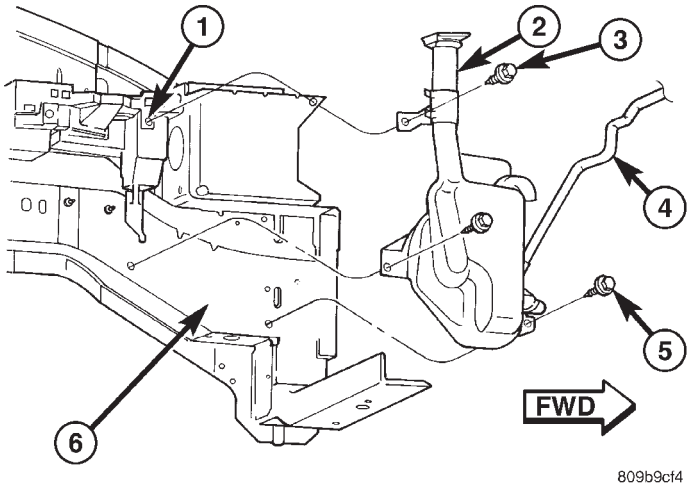

Fig. 2 Coolant Recovery Container

1 - UPPER BOLT ATTACHING TO BATTERY TRAY
2 - COOLANT RECOVERY CONTAINER
3 - UPPER BOLT
4 - HOSE
5 - LOWER BOLT (QTY. 2)
6 - LEFT SIDE FRAME RAIL

INSTALLATION

(1) Connect the recovery hose to container (Fig. 2).

(2) Position the recovery container on the frame rail (Fig. 2).

(3) Install the upper attaching screw and tighten to 7 N·m (60 in. lbs.) (Fig. 2).

(4) Raise the vehicle on hoist.

(5) Install the lower attaching screws and tighten to 8.5 N·m (75 in. lbs.) (Fig. 2).

(6) Lower the vehicle.

(7) Add coolant to container as necessary. (Refer to 7 - COOLING - STANDARD PROCEDURE)

ENGINE BLOCK HEATER

DESCRIPTION

The engine block heater is available as an optional accessory on all models. The heater is operated by ordinary house current (110 Volt A.C.) through a power cord located behind the radiator grille. This provides easier engine starting and faster warm-up when vehicle is operated in areas having extremely low temperatures. The heater is mounted in a core hole (in place of a core hole plug) in the engine block, with the heating element immersed in coolant.

OPERATION

The block heater element is submerged in the cooling system's coolant. When electrical power (110 volt A.C.) is applied to the element, it creates heat. This heat is transferred to the engine coolant. This provides easier engine starting and faster warm-up when vehicle is operated in areas having extremely low temperatures.

DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER TESTING

If unit does not operate, trouble can be in either the power cord or the heater element. Test power cord for continuity with a 110-volt voltmeter or 110-volt test light; test heater element continuity with an ohmmeter or 12-volt test light.

REMOVAL

(1) Drain coolant from radiator and cylinder block. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(2) Disconnect the power cord plug from heater.

(3) Loosen screw in center of heater. Remove the heater assembly.

INSTALLATION

(1) Clean block core hole and heater seat.

(2) Insert heater assembly with element loop positioned **upward.**

(3) With heater seated, tighten center screw securely to assure a positive seal.

(4) Install power cord plug to heater.

(5) Fill cooling system with coolant to the proper level. (Refer to 7 - COOLING - STANDARD PROCEDURE)

ENGINE COOLANT TEMPERATURE SENSOR - 2.4L

DESCRIPTION

The engine coolant temperature sensor threads into the top of the thermostat housing (Fig. 3). New sensors have sealant applied to the threads.

REMOVAL

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.

(1) Drain the cooling system below thermostat level. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(2) Disconnect coolant temperature sensor electrical connector.

(3) Remove coolant temperature sensor (Fig. 3).

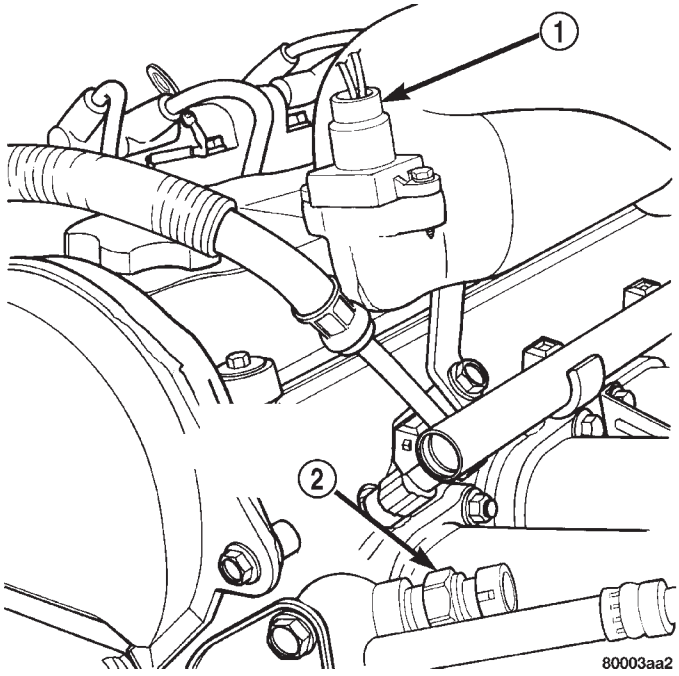

Fig. 3 Engine Coolant Temperature Sensor - 2.4L

1 - MAP SENSOR
2 - COOLANT TEMPERATURE SENSOR

INSTALLATION

(1) Install coolant temperature sensor (Fig. 3). Tighten sensor to 7 N·m (60 in. lbs.).

(2) Connect electrical connector to sensor.

(3) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

ENGINE COOLANT TEMPERATURE SENSOR - 3.3/3.8L

DESCRIPTION

The engine coolant temperature sensor threads into a coolant passage on lower intake manifold near the thermostat (Fig. 6). New sensors have sealant applied to the threads.

REMOVAL

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.

(1) Drain cooling system below engine coolant temperature sensor level. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(2) Remove power steering reservoir and relocate (Fig. 4). Do not disconnect hoses.

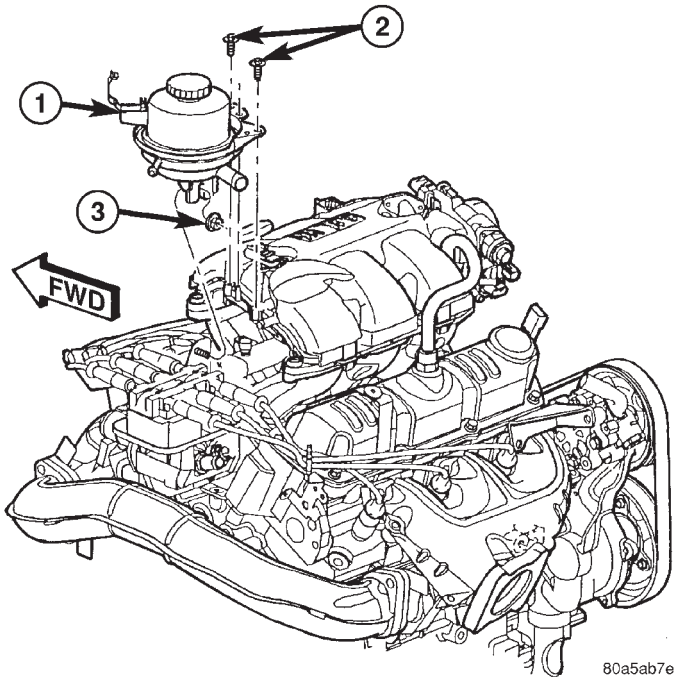

Fig. 4 Power Steering Fluid Reservoir

1 - POWER STEERING RESERVOIR

(4) Disconnect coolant sensor electrical connector (Fig. 6).

(5) Remove coolant sensor (Fig. 6).

INSTALLATION

(1) Install engine coolant temperature sensor (Fig. 6). Tighten sensor to 7 N·m (60 in. lbs.).

(2) Connect electrical connector to sensor (Fig. 6).

(3) Install ignition coil bracket (Fig. 5).

(4) Install ignition coil (Fig. 5).

(5) Install power steering reservoir (Fig. 4).

(6) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

ENGINE COOLANT THERMOSTAT

DESCRIPTION

The engine cooling thermostats are a wax pellet driven, reverse poppet choke type. The thermostat is mounted in a housing on the coolant outlet of the engine (Fig. 8) or (Fig. 10).

OPERATION

The engine cooling thermostat is a wax pellet driven, reverse poppet choke type. The thermostat is designed to provide the fastest warm up possible by preventing leakage through it and to guarantee a minimum engine operating temperature of 88 to 93°C (192 to 199°F). The thermostat also will automatically reach wide open so it will not restrict flow to the radiator as temperature of the coolant rises in hot weather to around 104°C (220°F). Above this temperature the coolant temperature is controlled by the radiator, fan, and ambient temperature, not the thermostat.

The thermostat is operated by a wax filled container (pellet) which is sealed. When heated coolant reaches a predetermined temperature, the wax expands enough to overcome the closing spring and water pump pressure, which forces the valve to open.

DIAGNOSIS AND TESTING - ENGINE COOLANT THERMOSTAT

The thermostat is operated by a wax filled chamber (pellet) which is sealed. When heated coolant reaches a predetermined temperature the wax pellet expands enough to overcome the closing spring and water pump pressure, which forces the valve to open. Coolant leakage into the pellet will cause a thermostat to fail open. Do not attempt to free up a thermostat with a screwdriver.

Thermostat diagnostics is included in powertrain control module's (PCM) programing for on-board diagnosis. The malfunction indicator light (MIL) will illuminate and a diagnostic trouble code (DTC) will be set when an "open too soon" condition occurs. Do not change a thermostat for lack of heater performance or temperature gauge position, unless a DTC is present. For other probable causes, (Refer to 7 - COOLING/ENGINE - DIAGNOSIS AND TESTING). Thermostat failing shut is the normal long term mode of failure, and normally, only on high mileage vehicles. The temperature gauge will indicate this (Refer to 7 - COOLING/ENGINE - DIAGNOSIS AND TESTING).

ENGINE COOLANT THERMOSTAT - 2.4L

REMOVAL

(1) Drain cooling system below the thermostat level. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(2) Remove radiator upper hose from the coolant outlet housing (Fig. 7).

(3) Remove coolant outlet housing bolts and housing (Fig. 8).

(4) Remove thermostat. Discard gasket and clean both gasket sealing surfaces.

INSTALLATION

(1) Place a new gasket (dipped in clean water) on the coolant outlet connector surface. Position thermostat with air bleed at the 12 o'clock position in thermostat housing (Fig. 8).

(2) Position the coolant outlet connector and gasket over the thermostat, making sure thermostat is seated in the thermostat housing.

(3) Position outlet connector to thermostat housing and install bolts (Fig. 8). Tighten bolts to 28 N·m (250 in. lbs.).

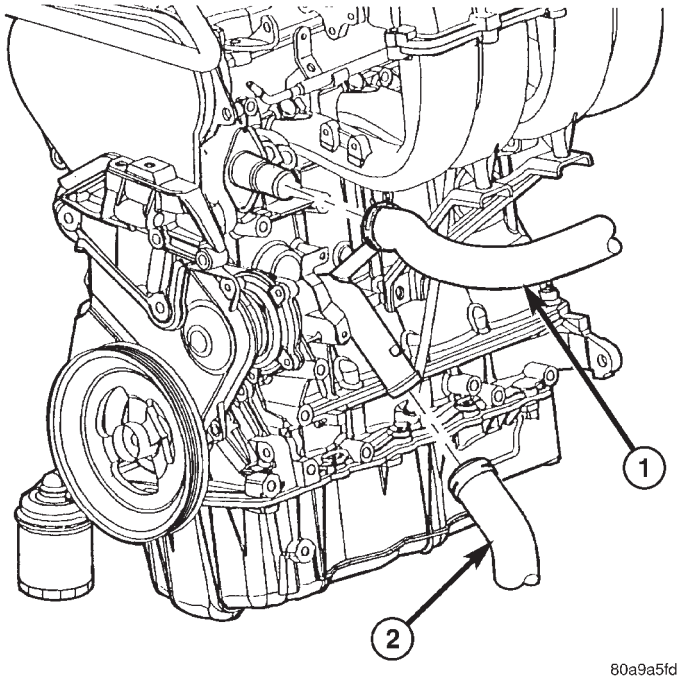

Fig. 7 RADIATOR HOSES TO ENGINE - 2.4L

2 - LOWER HOSE

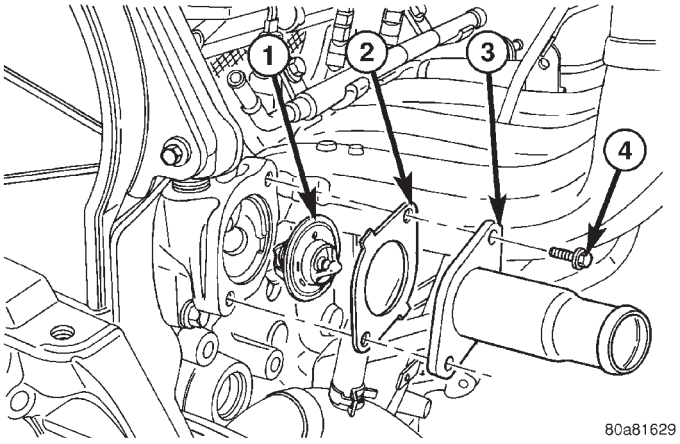

Fig. 8 Thermostat and Outlet Connector - 2.4L Engine

1 - THERMOSTAT
2 - GASKET
3 - COOLANT OUTLET CONNECTOR
4 - BOLT

(4) Install the radiator upper hose to coolant outlet housing (Fig. 7).

(5) Refill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

ENGINE COOLANT THERMOSTAT - 3.3/3.8L

REMOVAL

(1) Drain cooling system down below the thermostat level. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(2) Remove radiator upper hose from coolant outlet connector (Fig. 9).

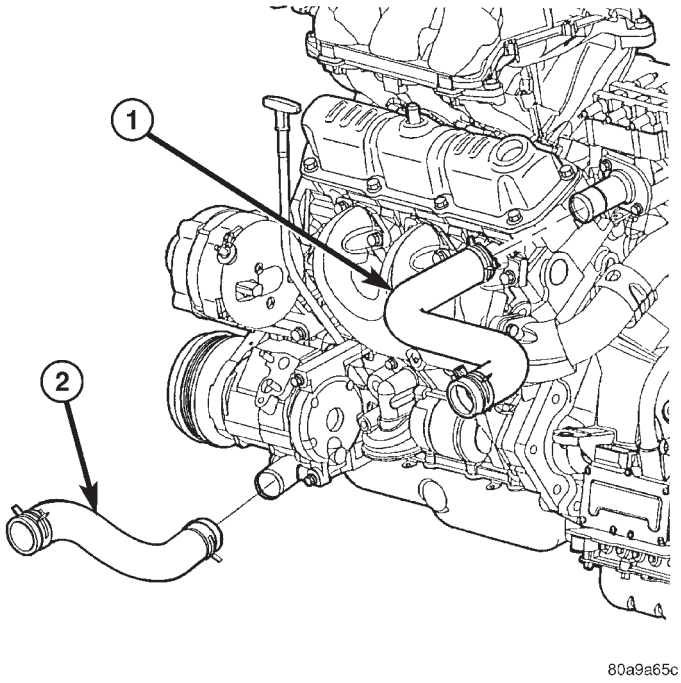

Fig. 9 RADIATOR HOSES TO ENGINE - 3.3/3.8L

1 - UPPER HOSE
2 - LOWER HOSE

(3) Remove coolant outlet connector bolts and connector (Fig. 10).

(4) Remove thermostat from outlet connector.

(5) Discard gasket and clean both gasket sealing surfaces.

INSTALLATION

(1) To ensure proper seating of replacement thermostat, carefully remove the bulged metal from the wall of the outlet connector recess that was created during the staking procedure that held the OEM thermostat in place (Fig. 11). It is not necessary to restake the replacement thermostat into the connector.

(2) Position thermostat to coolant outlet connector. Align the two locating notches on thermostat to the connector (Fig. 12). This position will ensure proper location of the thermostat air bleed.

RADIATOR

DESCRIPTION

The radiator is a cross-flow type (horizontal tubes) with design features that provide greater strength along with sufficient heat transfer capabilities to keep the engine satisfactorily cooled. The radiator has plastic side tanks and aluminum cooling tubes.

OPERATION

The radiator functions as a heat exchanger, using air flow across the exterior of the radiator tubes. This heat is then transferred from the coolant and into the passing air.

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove radiator upper crossmember support. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)

WARNING: DO NOT REMOVE THE CYLINDER BLOCK PLUG OR THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(3) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(4) Remove the radiator fans. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

(5) Disconnect coolant reserve/recovery hose.

RADIATOR (Continued)

(6) Remove vapor purge solenoid from mounting bracket.

(7) Disconnect upper and lower hoses from the radiator (Fig. 13) or (Fig. 14).

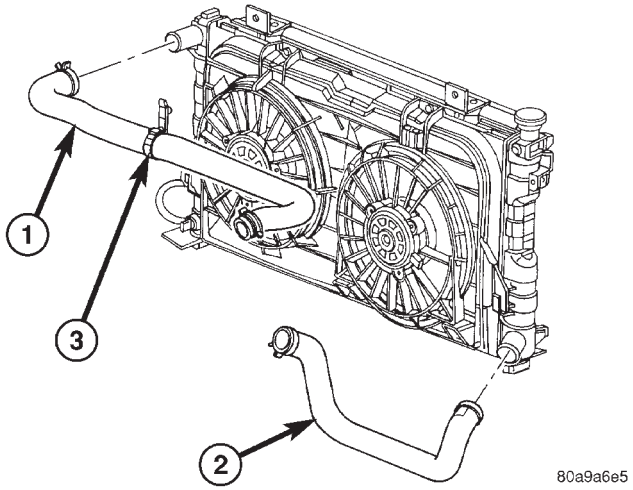

Fig. 13 Radiator Hoses to Radiator - 2.4L

1 - UPPER HOSE
2 - LOWER HOSE
3 - HOSE SUPPORT CLIP

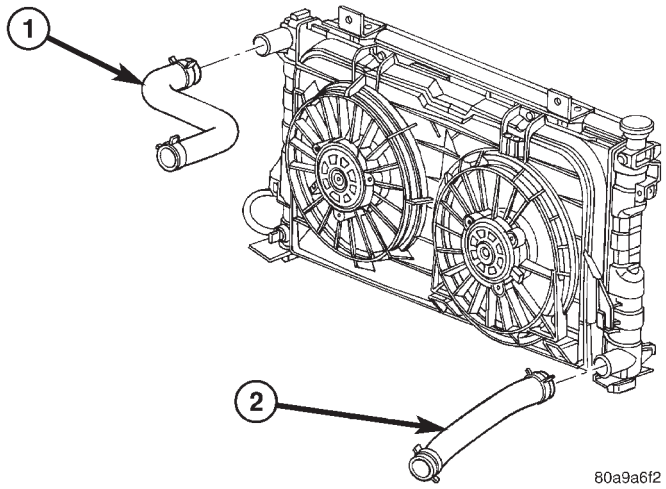

Fig. 14 Radiator Hoses to Radiator - 3.3/3.8L

1 - UPPER HOSE
2 - LOWER HOSE

(8) Remove the A/C condenser side brackets to radiator attaching screws (Fig. 15). Separate the condenser from the radiator by lifting upward to disengage from lower mounts (Fig. 15). Allow the condenser to rest in front of radiator.

(9) Radiator can now be lifted free from engine compartment. **Care should be taken not to damage radiator cooling fins or water tubes during removal.**

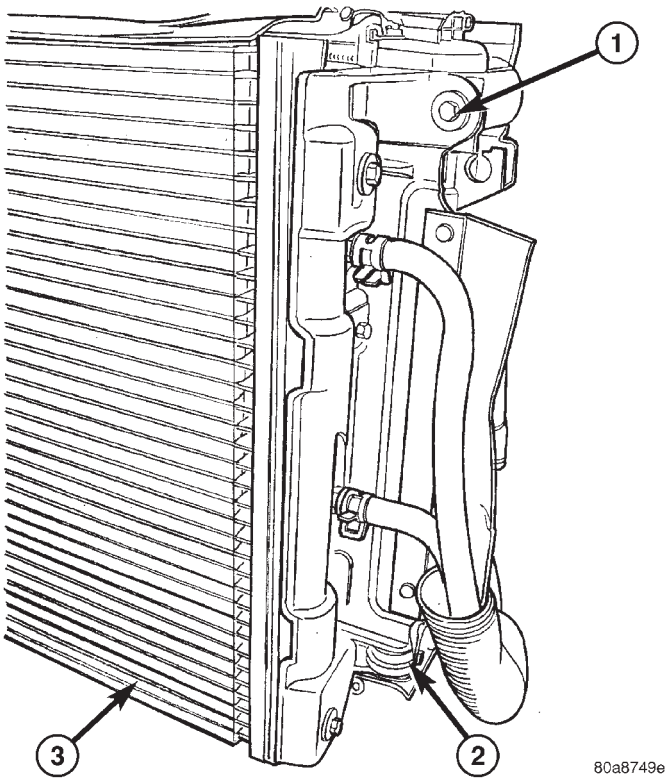

Fig. 15 Radiator to A/C Condenser Mounting (left mount shown, right similar)

1 - SCREW - A/C CONDENSER SIDE BRACKET TO RADIATOR
2 - LOWER MOUNT
3 - A/C CONDENSER

INSTALLATION

(1) **Be sure the air seal is in position before radiator is installed.** Slide radiator down into position. Seat the radiator with the rubber isolators into the mounting holes provided, with a 10 lbs. force.

(2) Position air conditioning condenser onto the radiator lower mounts and install upper screws (Fig. 15). Tighten fasteners to 5 N·m (45 in. lbs.).

(3) Install the radiator upper and lower hoses (Fig. 13) or (Fig. 14).

(4) Connect the coolant reserve/recovery hose.

(5) Connect the vapor purge solenoid to the mounting bracket.

(6) Install the radiator fans. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(7) Install the radiator upper crossmember support. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)

(8) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(9) Connect negative cable to battery.

RADIATOR DRAINCOCK

REMOVAL

CAUTION: Use of pliers on draincock is not recommended. Damage may occur to radiator or draincock.

NOTE: It is not necessary to remove draincock during a routine coolant drain.

(1) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
(2) Open the draincock by turning it counterclockwise until it stops.
(3) Turn the draincock back (clockwise) 1/8 turn.
(4) Pull the draincock (Fig. 16) from the radiator tank.

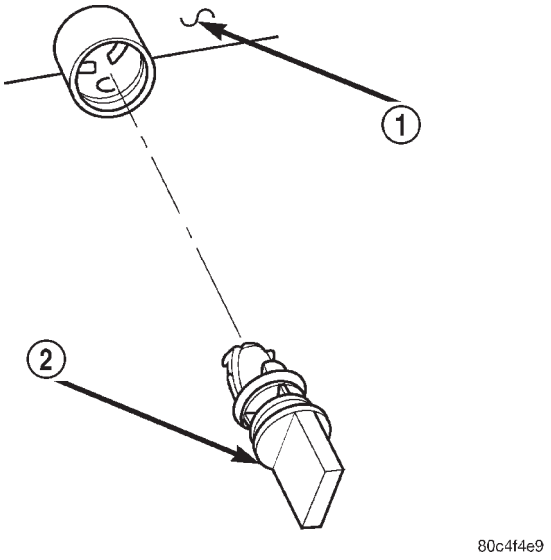

Fig. 16 Draincock

1 - RADIATOR TANK
2 - DRAINCOCK

INSTALLATION

(1) Align draincock stem to radiator tank opening.
(2) Push draincock into the radiator tank opening.
(3) Tighten the draincock by turning clockwise until it stops.
(4) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

RADIATOR PRESSURE CAP

DESCRIPTION

The cooling system pressure cap is located on the radiator. The cap construction includes; stainless steel swivel top, rubber seals, and retainer, main spring, and a spring loaded valve (Fig. 17).

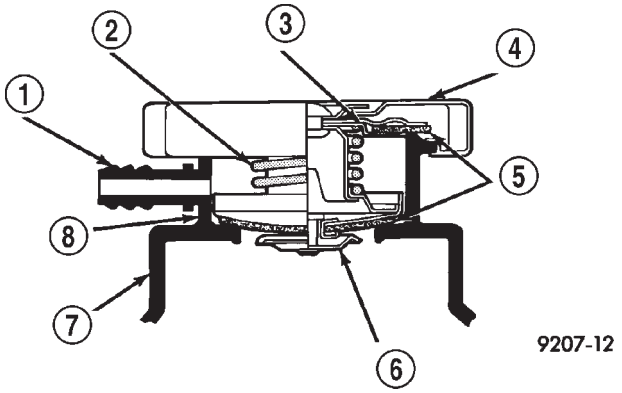

Fig. 17 Cooling System Pressure Cap Filler Neck

1 - OVERFLOW NIPPLE
2 - MAIN SPRING
3 - GASKET RETAINER
4 - STAINLESS-STEEL SWIVEL TOP
5 - RUBBER SEALS
6 - VENT VALVE
7 - RADIATOR
8 - FILLER NECK

OPERATION

The cooling system is equipped with a pressure cap that releases excessive pressure; maintaining a range of 97-124 kPa (14-18 psi).

The cooling system will operate at higher than atmospheric pressure. The higher pressure raises the coolant boiling point thus, allowing increased radiator cooling capacity.

There is also a vent valve in the center of the cap. This valve also opens when coolant is cooling and contracting, allowing the coolant to return to cooling system from coolant reserve system tank by vacuum through a connecting hose. **If valve is stuck shut, or the coolant recovery hose is pinched, the radiator hoses will be collapsed on cool down. Clean the vent valve (Fig. 17) and inspect coolant recovery hose routing, to ensure proper sealing when boiling point is reached.**

The gasket in the cap seals the filler neck, so that vacuum can be maintained, allowing coolant to be drawn back into the radiator from the reserve tank. **If the gasket is dirty or damaged, a vacuum may not be achieved, resulting is loss of coolant and eventual overheating due to low coolant level in radiator and engine.**

RADIATOR PRESSURE CAP (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLING SYSTEM PRESSURE CAP TESTING

Dip the pressure cap in water. Clean any deposits off the vent valve or its seat and apply cap to end of the Pressure Cap Test Adaptor that is included with the Cooling System Tester 7700 (Fig. 18). Working the plunger, bring the pressure to 104 kPa (15 psi) on the gauge. If the pressure cap fails to hold pressure of at least 97 kPa (14 psi), replace the pressure cap.

CAUTION: The Cooling System Tester Tool is very sensitive to small air leaks that will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to the tool. Turn tool upside down and recheck pressure cap to confirm that cap is bad.

If the pressure cap tests properly while positioned on Cooling System Tester (Fig. 18), but will not hold pressure or vacuum when positioned on the filler neck. Inspect the filler neck and cap top gasket for irregularities that may prevent the cap from sealing properly.

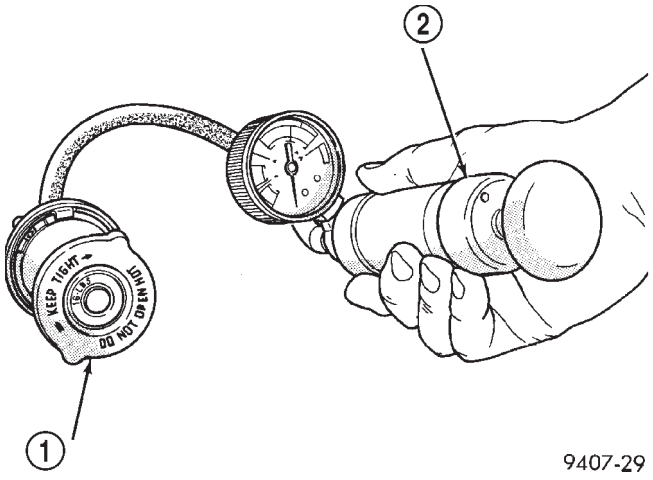

Fig. 18 Testing Cooling System Pressure Cap

1 - PRESSURE CAP
2 - PRESSURE TESTER

DIAGNOSIS AND TESTING - RADIATOR CAP TO FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be checked by removing the overflow hose at the radiator filler neck nipple (Fig. 19). Attach the Radiator Pressure Tool to the filler neck nipple and pump air into the radiator. Pressure cap upper gasket should relieve at 69-124 kPa (10-18 psi) and hold pressure at 55 kPa (8 psi) minimum.

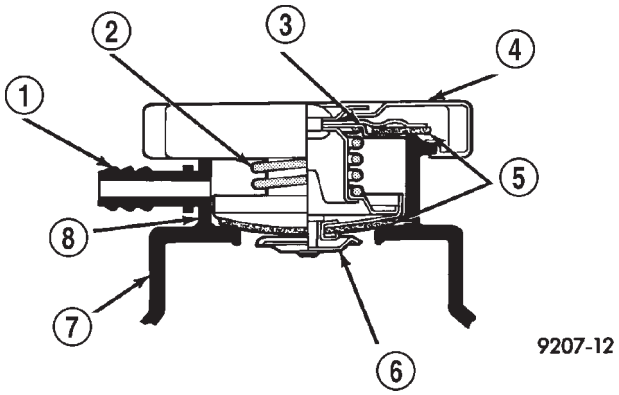

Fig. 19 Radiator Pressure Cap Filler Neck

1 - OVERFLOW NIPPLE
2 - MAIN SPRING
3 - GASKET RETAINER
4 - STAINLESS-STEEL SWIVEL TOP
5 - RUBBER SEALS
6 - VENT VALVE
7 - RADIATOR
8 - FILLER NECK

WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE RADIATOR PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE RADIATOR CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT OR UNDER PRESSURE.

There is no need to remove the radiator cap at any time **except** for the following purposes:

(1) Check and adjust coolant freeze point.
(2) Refill system with new coolant.
(3) Conducting service procedures.
(4) Checking for vacuum leaks.

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT 15 MINUTES BEFORE REMOVING CAP. THEN PLACE A SHOP TOWEL OVER THE CAP AND WITHOUT PUSHING DOWN ROTATE COUNTERCLOCKWISE TO THE FIRST STOP. ALLOW FLUIDS TO ESCAPE THROUGH THE OVERFLOW TUBE AND WHEN THE SYSTEM STOPS PUSHING COOLANT AND STEAM INTO THE CRS TANK AND PRESSURE DROPS PUSH DOWN AND REMOVE THE CAP COMPLETELY. SQUEEZING THE RADIATOR INLET HOSE WITH A SHOP TOWEL (TO CHECK PRESSURE) BEFORE AND AFTER TURNING TO THE FIRST STOP IS RECOMMENDED.

RADIATOR PRESSURE CAP (Continued)

CLEANING

Use only a mild soap to clean the pressure cap.

INSPECTION

Hold the cap in your hand, **top side up** (Fig. 20). The vent valve at the bottom of the cap should open. If the rubber gasket has swollen, preventing the valve from opening, replace the cap.

Hold the cleaned cap in your hand, **upside down.** If any light can be seen between vent valve and the rubber gasket, replace the cap. **Do not use a replacement cap that has a spring to hold the vent shut.**

A replacement cap must be of the type designed for coolant reserve systems. This design ensures coolant return to the radiator.

8 - FILLER NECK

RADIATOR FAN

DESCRIPTION

The dual radiator fans are mounted to the back side of the radiator (Fig. 21). The radiator fan consist of the fan blade, electric motor and a support shroud which are all serviced as an assembly.

OPERATION

RADIATOR FAN OPERATION CHART

COOLANT TEMPERATURE			A/C PRESSURE		TRANSAXLE OIL TEMPERATURE	
Fan Operation Speeds:	Initial	Max	Initial	Max	Initial	Max
Fan On:	104°C (220°F)	110°C (230°F) Fan Speed Duty-Cycles (Ramps-up) from 30% to 99%	1,724 Kpa (250 psi)	2,068 Kpa (300 psi) Fan Speed Duty-Cycles (Ramps-up) from 30% to 99%	96°C (204°F)	111°C (232°F) Fan Speed Duty Cycles (Ramps-up) from 30% to 99%
Fan Off:	101°C (214°F)	Fan Speed Duty-Cycles (Ramps-down) from 99% to 30%	1,710 Kpa (248 psi)	Fan Speed Duty-Cycles (Ramps-down) from 99% to 30%	89°C (192°F)	Fan Speed Duty Cycles (Ramps-down) from 99% to 30%

RADIATOR FAN (Continued)

DIAGNOSIS AND TESTING - RADIATOR FAN MOTOR

RADIATOR FAN DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY RADIATOR FAN	1. Fan blade loose.	1. Replace fan assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
	2. Fan blade striking a surrounding object.	2. Locate point of fan blade contact and repair as necessary.
	3. Air obstructions at radiator or A/C condenser.	3. Remove obstructions and/or clean debris.
	4. Electric fan motor defective.	4. Replace fan assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
ELECTRIC FAN MOTOR DOES NOT OPERATE	1. Fan relay, powertrain control module (PCM), coolant temperature sensor, or wiring defective.	1. (Refer to Appropriate Diagnostic Information) Repair as necessary.
	2. Defective A/C pressure transducer.	2. (Refer to Appropriate Diagnostic Information) Repair as necessary.
ELECTRIC RADIATOR FAN OPERATES ALL THE TIME	1. Fan relay, powertrain control module (PCM), coolant temperature sensor or wiring defective.	1. (Refer to Appropriate Diagnostic Information) Repair as necessary.
	2. Check for low coolant level.	2. Add coolant as necessary.
	3. Defective A/C pressure transducer.	3. (Refer to Appropriate Diagnostic Information) Repair as necessary.

REMOVAL

There are no repairs to be made to the fan or shroud assembly. If the fan is warped, cracked, or otherwise damaged, it must be replaced as an assembly (Fig. 21).

(1) Remove the radiator upper crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)

(2) Disconnect the radiator fan electrical connectors.

(3) Remove radiator fan(s) retaining screw (Fig. 21).

(4) Remove the radiator fan(s) by lifting upward to release from mounts.

INSTALLATION

(1) Install the radiator fan(s) into mounts and attaching clips on the radiator.

(2) Install radiator fan(s) attaching screws (Fig. 21). Tighten to 5 N·m (45 in. lbs.).

(3) Connect the radiator fan(s) electrical connectors.

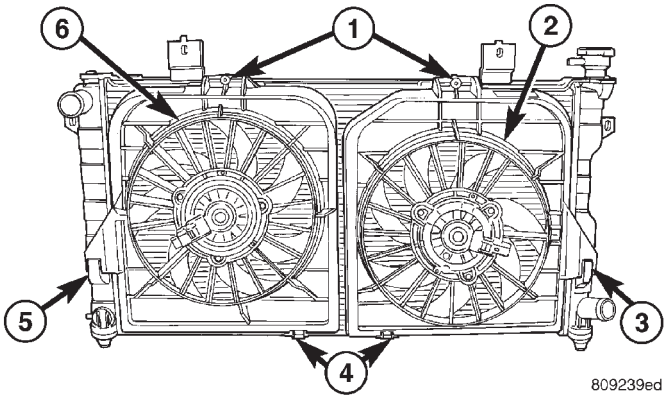

Fig. 21 Radiator Fans

1 - SCREWS - RADIATOR FAN ATTACHING
2 - RADIATOR FAN - RIGHT
3 - MOUNT - RIGHT RADIATOR FAN
4 - CLIPS - RADIATOR FAN LOWER
5 - MOUNT - LEFT RADIATOR FAN
6 - RADIATOR FAN - LEFT

(4) Install the radiator upper support crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)

(5) Install the upper radiator mounts to the crossmember bolts, if removed. Tighten to 8 N·m (70 in. lbs.).

(6) Install the radiator upper hose to the support clip (2.4L engine).

RADIATOR FAN RELAY

DESCRIPTION

The radiator fan relay is a solid state type and is located on the front bumper reinforcment (Fig. 22). Refer to WIRING DIAGRAMS for a circuit schematic.

OPERATION

The solid state radiator fan relay is controlled by the Powertrain Control Module (PCM) by way of a Pulse Width Modulated (PWM) signal. The relay control circuit supplies a 12 volt signal to the PCM. The PCM then pulses the ground circuit to achieve fan on time. The relay provides a voltage to the fan motors which is proportional to the pulse width it receives from the PCM. The duty cycle ranges from 30% for low speed operation, then ramps-up to 100% for high speed operation. This fan control system provides infinitely variable fan speeds, allowing for improved fan noise, A/C performance, better engine cooling, and additional vehicle power.

To control operation of the relay, the PCM looks at inputs from:

- Engine coolant temperature
- A/C pressure transducer
- Ambient temperature from the body controller
- Vehicle speed
- Transmission oil temperature

The PCM uses these inputs to determine when the fan should operate and at what speed. For further information on fan operation, (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - OPERATION).

REMOVAL

(1) Open hood.

(2) Disconnect and isolate the battery negative cable.

(3) Remove the radiator crossmember to front fascia closure panel.

(4) Disconnect the relay electrical connector (Fig. 22).

(5) Remove the rivet attaching the relay to the front bumper beam (Fig. 22).

(6) Remove the relay.

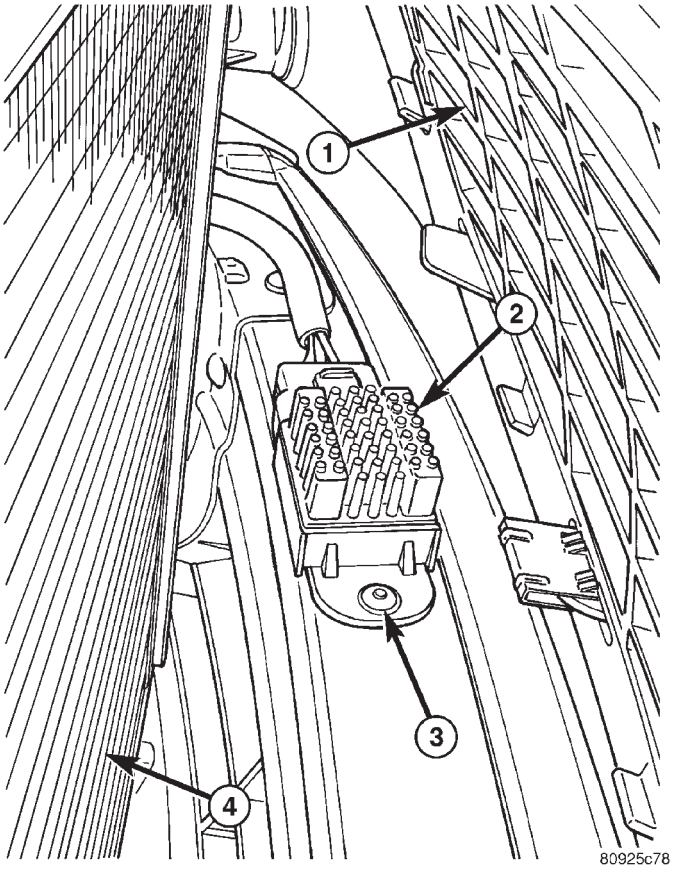

Fig. 22 Radiator Fan Relay

1 - FRONT FASCIA
2 - FAN RELAY
3 - RIVET
4 - A/C CONDENSER (FRONT SIDE)

INSTALLATION

CAUTION: The relay mounting location is designed to dissipate heat. Ensure the relay is securely attached to prevent relay “thermal” shutdown and relay damage, resulting in possible engine overheating.

(1) Position relay and install a new rivet (Fig. 22).

(2) Connect electrical connector to relay.

(3) Install closure panel and attaching screws.

(4) Connect negative cable to battery.

WATER PUMP - 2.4L

DESCRIPTION

The water pump has a cast aluminum body and housing with a stamped steel impeller. The water pump bolts directly to the block (Fig. 23). The cylinder block to water pump seal is provided by a rubber O-ring. The water pump is driven by the engine timing belt.

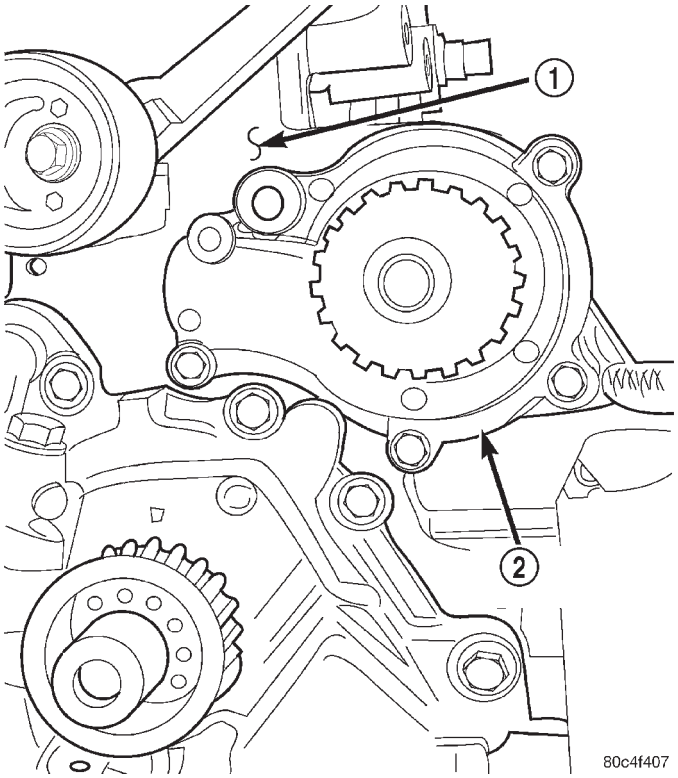

Fig. 23 Water Pump

1 - CYLINDER BLOCK
2 - WATER PUMP

OPERATION

The water pump is the heart of the cooling system. The coolant is pumped through the engine block, cylinder head, heater core, and radiator.

REMOVAL

(1) Disconnect negative cable from battery.
(2) Raise vehicle on a hoist.
(3) Remove the right inner splash shield.
(4) Remove the accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(5) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(6) Support engine from the bottom and remove right engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).
(7) Remove right engine mount bracket (Fig. 24).
(8) Remove the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKET(S) - REMOVAL).
(9) Remove timing belt idler pulley.
(10) Hold camshaft sprocket with Special tool C-4687 and adaptor C-4687-1 while removing bolt. Remove both cam sprockets.
(11) Remove the timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).
(12) Remove the generator and bracket (Fig. 24).
(13) Remove water pump to engine attaching screws (Fig. 25).

CLEANING

Clean gasket mating surfaces as necessary.

INSPECTION

Replace water pump body assembly if it has any of these defects:
(1) Cracks or damage on the body.
(2) Coolant leaks from the shaft seal, evident by wet coolant traces on the pump body.
(3) Loose or rough turning bearing.
(4) Impeller rubs either the pump body or the engine block.
(5) Impeller loose or damaged.
(6) Sprocket or sprocket flange loose or damaged.

INSTALLATION

(1) Install new O-ring gasket in water pump body O-ring locating groove (Fig. 26).

CAUTION: Make sure O-ring is properly seated in water pump groove before tightening screws. An improperly located O-ring may be damaged and cause a coolant leak.

(2) Assemble pump body to block and tighten screws to 12 N·m (105 in. lbs.) (Fig. 25). Pressurize cooling system to 103.4 Kpa (15 psi) with pressure tester and check water pump shaft seal and O-ring for leaks.
(3) Rotate pump by hand to check for freedom of movement.
(4) Install the timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).
(5) Install camshaft sprockets and torque bolts to 101 N·m (75 ft. lbs.) while holding camshaft sprocket with Special tool C-4687 and adaptor C-4687-1.
(6) Install timing belt idler pulley and torque mounting bolt to 61 N·m (45 ft. lbs.).

WATER PUMP - 2.4L (Continued)

(7) Install the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKET(S) - INSTALLATION).

(8) Install the generator mount bracket. (Fig. 24)

(9) Install the generator.

(10) Install right engine mount bracket and engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(11) Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(12) Install the accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Lower vehicle and connect battery cable.

WATER PUMP - 3.3/3.8L

DESCRIPTION

The water pump has a die-cast aluminum body and a plastic impeller. It bolts directly to the timing chain case cover, using a rubber seal for sealing (Fig. 27). It is driven by the accessory drive belt.

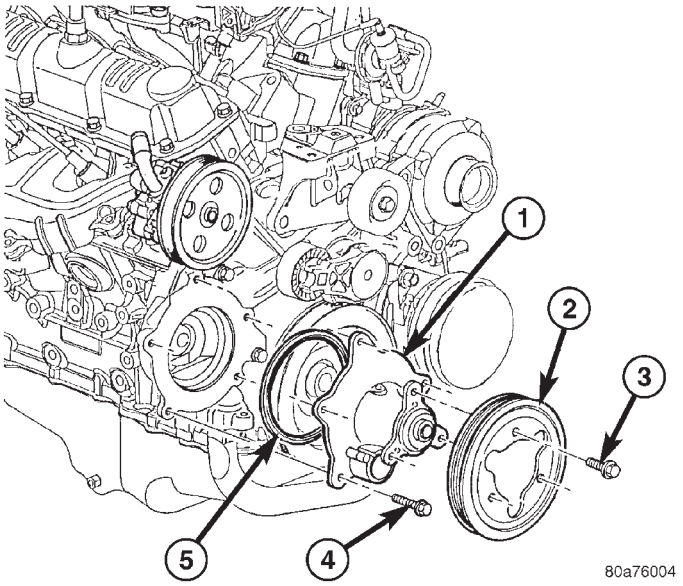

Fig. 27 Water Pump - 3.3/3.8L Engine

1 - WATER PUMP
2 - PULLEY - WATER PUMP
3 - BOLT - PULLEY
4 - BOLT - WATER PUMP
5 - SEAL - WATER PUMP

OPERATION

The water pump is the heart of the cooling system. The coolant is pumped through the engine block, cylinder head, heater core, and radiator.

REMOVAL

(1) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(2) Remove the accessory drive belt shield.

(3) Remove the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(4) Remove water pump pulley bolts (Fig. 27).

NOTE: To remove the water pump pulley, it MUST first be positioned between water pump housing and drive hub. The pulley can then be removed with the water pump assembly.

(5) Rotate pulley until openings in pulley align with water pump drive hub spokes (Fig. 28). Move pulley inward between pump housing and hub (Fig. 28).

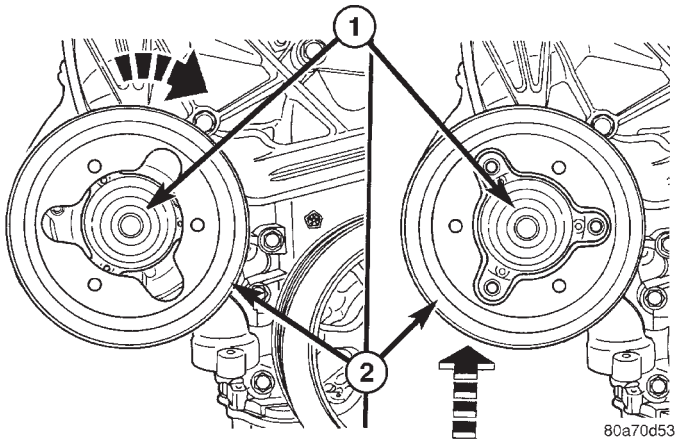

Fig. 28 Water Pump Pulley Positioning

1 - HUB - WATER PUMP
2 - PULLEY - WATER PUMP

(6) Position pulley to allow access to water pump mounting bolts. Remove water pump mounting bolts (Fig. 29).

(7) Remove water pump with the pulley loosely positioned between hub and the pump body.

(8) Remove and discard the seal.

WATER PUMP - 3.3/3.8L (Continued)

(9) Clean seal groove and sealing surfaces on pump and timing chain case cover. Take care not to scratch or gouge sealing surfaces.

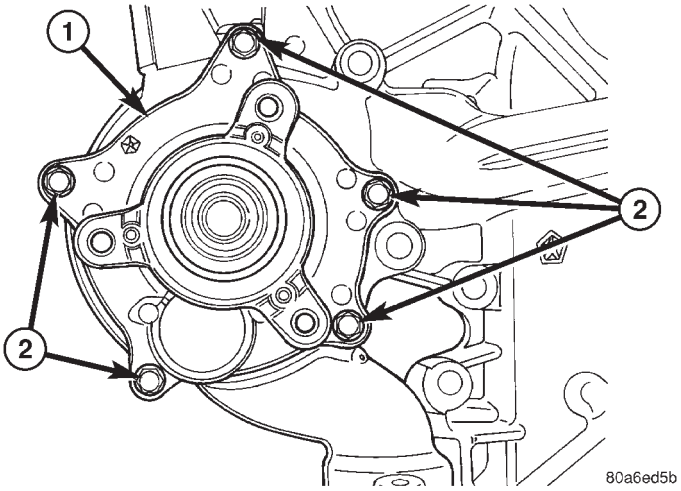

Fig. 29 Water Pump Bolts - 3.3/3.8L Engine (Shown Without Pulley)

1 - WATER PUMP
2 - BOLTS

CLEANING

Clean gasket mating surfaces as necessary.

INSPECTION

Replace the water pump if it has any of the following defects.

(1) Damage or cracks on the pump body.

(2) Coolant leaks; this will be evident by a wet stream of coolant running down the pump body and components below. A thin stain below the weep hole reservoir slot (Fig. 30) is considered normal operation.

(3) Impeller rubs inside of chain case cover.

(4) Excessively loose or rough turning bearing.

NOTE: A weepage stain that is black, brown, or grey is considered normal, if it is dry. If the weep appears wet; pressure test the cooling system at 15–18 psi and observe the weep area. If weep area remains unchanged, do not replace the water pump for this condition. Replace the water pump, if a steady flow of engine coolant is evident from the weep hole/reservoir slot (Fig. 30) (shaft seal failure). Be sure to perform a thorough analysis before replacing water pump.

INSTALLATION

(1) Install new seal into water pump housing groove (Fig. 31).

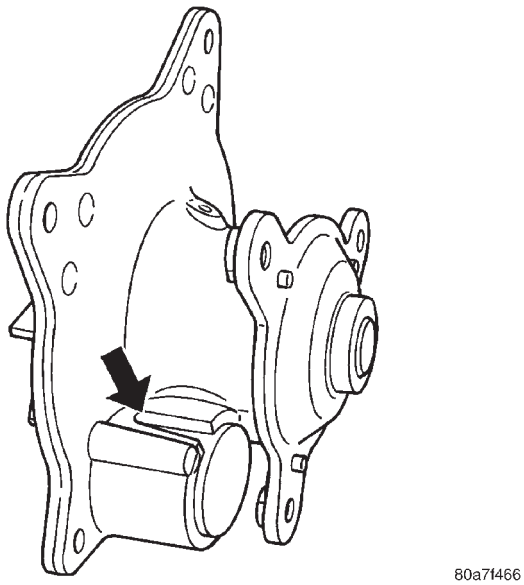

Fig. 30 Water Pump Inspection - 3.3/3.8L Engine

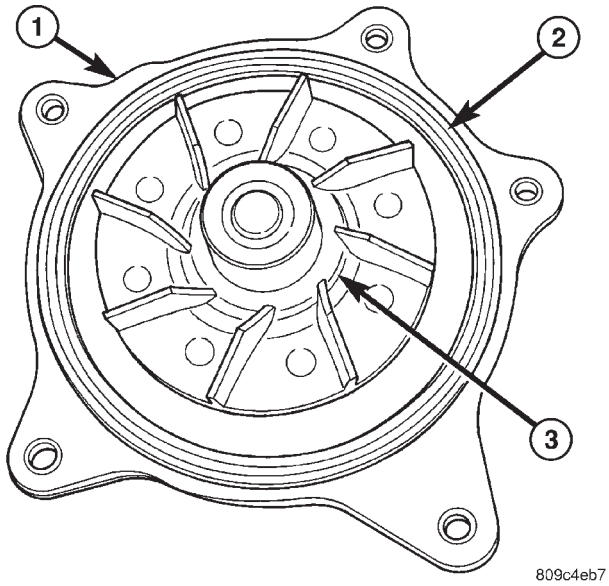

Fig. 31 Water Pump Seal

1 - WATER PUMP HOUSING
2 - SEAL
3 - IMPELLER

NOTE: The water pump pulley MUST be positioned loosely between the pump housing and drive hub BEFORE water pump installation.

(2) Position the water pump pulley loosely between pump housing and drive hub (Fig. 28).

(3) Install water pump and pulley to the timing chain case cover (Fig. 27). Tighten water pump bolts to 12 N·m (105 in. lbs.).

(4) Position pulley on water pump hub. Install bolts and tighten to 28 N·m (250 in. lbs.) (Fig. 27).

WATER PUMP - 3.3/3.8L (Continued)

(5) Rotate pump by hand to check for freedom of movement.

(6) Install the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(7) Install drive belt shield.

(8) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

WATER PUMP INLET TUBE - 2.4L

DESCRIPTION

The 2.4L engine uses a metal tube to connect the engine block to the lower radiator hose and heater return (Fig. 32). The tube has an O-ring for block to tube sealing and bolts attach the tube to the engine block.

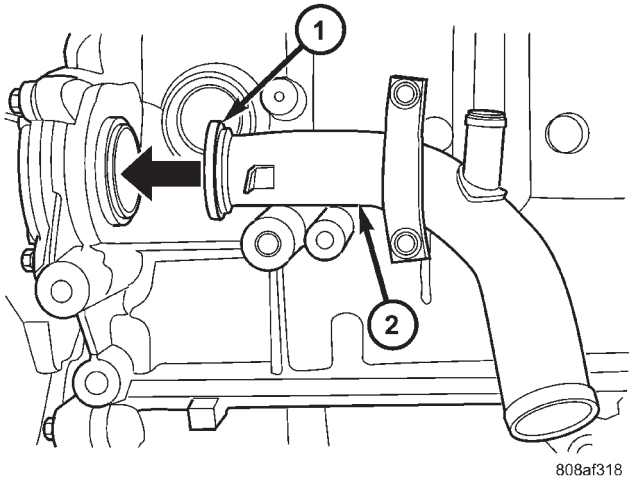

Fig. 32 Water Pump Inlet Tube—2.4L Engine

1 - O-RING
2 - WATER PUMP INLET TUBE

REMOVAL

(1) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(2) Remove radiator upper hose to access the hose connections at the inlet tube.

(3) Remove radiator lower (Fig. 7) and heater hoses from the inlet tube (Fig. 33).

(4) Remove the two fasteners that hold the inlet tube to the block.

(5) Rotate tube while removing the tube from the engine block.

INSTALLATION

(1) Inspect the O-ring for damage before installing the tube into the cylinder block (Fig. 32).

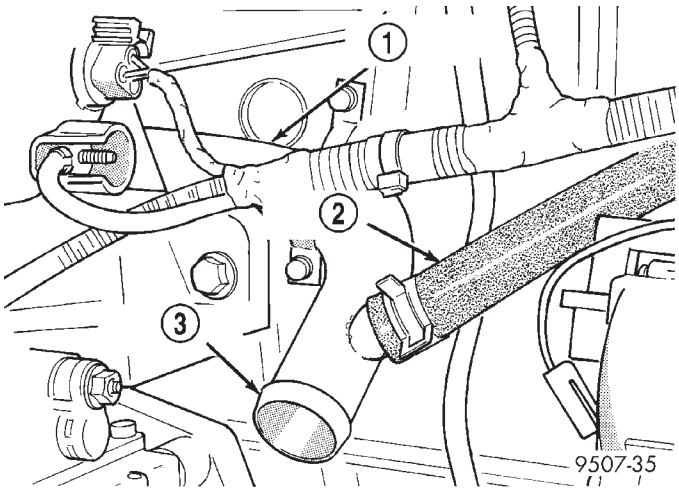

Fig. 33 Water Pump Inlet Tube Hose Connections

1 - WATER PUMP INLET TUBE
2 - HOSE - HEATER RETURN
3 - COOLANT INLET

(2) Lube O-ring with coolant and install inlet tube into the cylinder block opening (Fig. 32).

(3) Install the two inlet tube fasteners and tighten to 12 N·m (105 in. lbs.).

(4) Connect the radiator lower hose (Fig. 7) and heater hose to inlet tube (Fig. 33).

(5) Install the radiator upper hose.

(6) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

WATER PUMP INLET TUBE - 3.3/3.8L

REMOVAL

(1) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(2) Raise vehicle on hoist and remove the belt splash shield.

(3) Remove the radiator lower hose from inlet tube (Fig. 34).

(4) Remove the oil cooler outlet/heater return hose from inlet tube (only if equipped with engine oil cooler) (Fig. 35).

(5) Remove the inlet tube bolts (Fig. 36).

(6) Remove the inlet tube (Fig. 36). Discard the O-ring seal.

INSTALLATION

(1) Clean the inlet tube O-ring sealing surfaces on the timing cover housing and tube.

(2) Apply Mopar® Dielectric Grease or equivalent to the O-ring before installation.

(3) Position new O-ring seal on inlet tube (Fig. 36).

WATER PUMP INLET TUBE - 3.3/3.8L (Continued)

TRANSMISSION

STANDARD PROCEDURE - FLUSHING COOLERS AND TUBES

The recommended procedure for cooler flushing is to use Tool 6906 Cooler Flusher.

WARNING: WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1–1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES. KEEP LIT CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

WARNING: KEEP THE AREA WELL VENTILATED. DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

(1) Remove cover plate filler plug on Tool 6906. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Use Mopar® Transmission Cooler Flush (MS-552) or equivalent solution conforming to MS-552. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

(4) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(5) Connect the CLEAR return line to the INLET (To) cooler line

(6) Turn pump ON for two to three minutes to flush cooler and lines.

(7) Turn pump OFF.

(8) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(9) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(10) Place CLEAR suction line into a one quart container of Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602).

(11) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(12) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

TRANSMISSION OIL COOLER

DESCRIPTION

The transmission oil cooler is an oil-to-air type cooler that is mounted between the front of the radiator and back side of the A/C condenser (Fig. 2). Use only approved transmission oil cooler hoses that are molded to fit the space available.

REMOVAL

(1) Remove the radiator. (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL)

(2) Disconnect lines from oil cooler (Fig. 1).

(3) Remove oil cooler attaching screws (Fig. 2).

(4) Remove the oil cooler.

TRANSMISSION OIL COOLER (Continued)

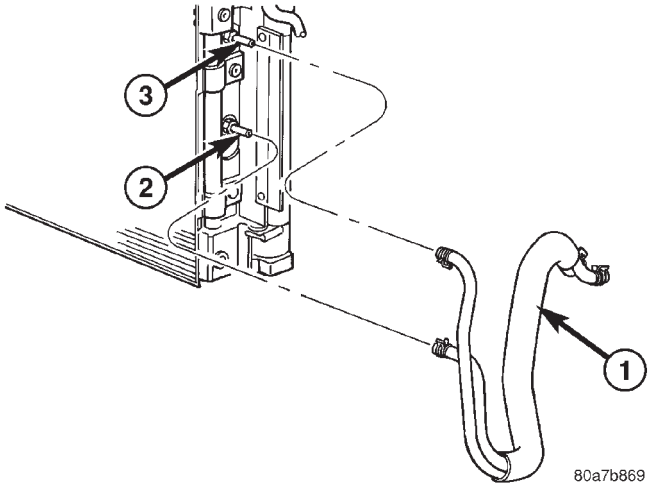

Fig. 1 TRANSMISSION COOLER HOSES

1 - TRANSAXLE COOLER HOSES

3 - FITTING - COOLER INLET

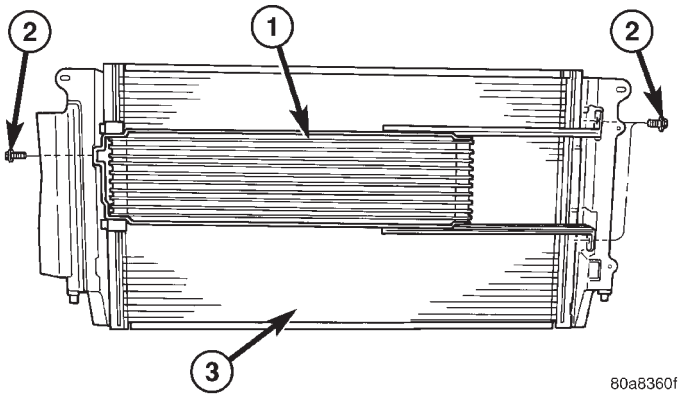

Fig. 2 Transmission Oil Cooler

1 - TRANSAXLE OIL COOLER
2 - SCREWS
3 - A/C CONDENSER (REAR SIDE)

CLEANING

Check the external cooler for debris on the cooling fin surfaces. Clean as necessary. For internal cleaning/flushing procedures, (Refer to 7 - COOLING/ TRANSMISSION - STANDARD PROCEDURE).

INSPECTION

Inspect all hoses, tubes, clamps and connections for leaks, cracks, or damage. Replace as necessary. Use only approved transmission oil cooler hoses that are molded to fit the space available.

Inspect external coolers for leaks, loose mounts, or damage. Replace as necessary.

INSTALLATION

(1) Install transaxle oil cooler and mounting screws (Fig. 2).

NOTE: When replacing the transmission oil cooler, the cooler hoses must be replaced.

(2) Connect the new cooler hoses and install clamps (Fig. 1).
(3) Install the radiator. (Refer to 7 - COOLING/ ENGINE/RADIATOR - INSTALLATION)
(4) Start engine. Check and adjust the fluid level as necessary.

TRANSMISSION OIL COOLER LINES

REMOVAL

(1) Using appropriate hose clamp pliers, release tension on clamps and move off fittings.

NOTE: When the transaxle cooler lines are removed from the rolled-groove type fittings at the cooler and transaxle, damage to the inner wall of hose will occur. To prevent potential leakage, the cooler hoses must be replaced.

(2) Remove the hoses (Fig. 3) or (Fig. 4).

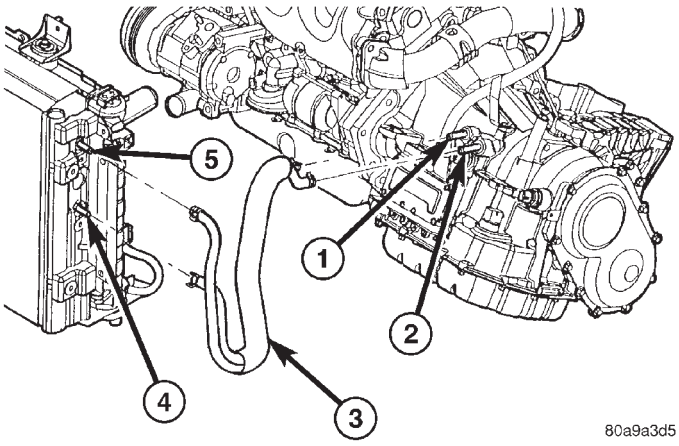

Fig. 3 TRANS OIL COOLER LINES - 41TE

1 - FITTING - COOLER RETURN
2 - FITTING - COOLER SUPPLY
3 - HOSES - TRANSAXLE COOLER
4 - FITTING - COOLER OUTLET
5 - FITTING - COOLER INLET

INSTALLATION

NOTE: When the transaxle cooler lines are removed from the rolled-groove type fittings at the cooler and transaxle, damage to the inner wall of hose will occur. To prevent potential leakage, the cooler hoses must be replaced.

(1) Connect hoses to cooler and transaxle fittings (Fig. 3) or (Fig. 4).

(2) Using appropriate pliers, position clamps over fittings and release tension.

(3) Start engine and check transaxle fluid level. Adjust fluid level as necessary.

COOLING 2.5L TURBO DIESEL

DESCRIPTION - COOLING SYSTEM

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted, pressurized coolant tank using a pressure/vent cap is used.

COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Charge Air Cooler
- Electric Cooling Fans
- A aluminum-core radiator with plastic side tanks
- A separate pressurized coolant tank
- A pressure/vent cap on the coolant tank
- Fan shroud
- Thermostat
- Coolant
- Low coolant warning lamp
- Coolant temperature gauge
- Water pump
- Hoses and hose clamps

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLING SYSTEM

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

(1) PROLONGED IDLE, VERY HIGH AMBIENT TEMPERATURE, SLIGHT TAIL WIND AT IDLE, SLOW TRAFFIC, TRAFFIC JAMS, HIGH SPEED OR STEEP GRADES.

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increasing engine speed for more air flow is recommended.

(2) TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

(3) RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt
- Brakes (possibly dragging)
- Changed parts (incorrect water pump)
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to following Cooling System Diagnosis charts.

These charts are to be used as a quick-reference only.

COOLING 2.5L TURBO DIESEL (Continued)

COOLING SYSTEM DIAGNOSIS-DIESEL ENGINE

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Diesel engines, due to their inherent effiency are slower to warm up than gasoline powered engines, and will operate at lower temperatures when the vehicle is unloaded.	1. The low gauge reading may be normal. Refer to thermostats in the manual text for information. See Thermostat Diagnosis-Diesel Engine.
	2. Is the temperature gauge connected to the temperature gauge coolant sensor on the engine?	2. Check, the engine temperature sensor connector in the engine compartment.
	3. Is the temperature gauge operating OK?	3. Check gauge operation. Repair as necessary.
	4. Coolant level low in cold ambient temperatures accompanied with poor heater performance.	4. Check coolant level in the coolant tank. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant section for WARNINGS and precautions before removing the pressure cap.
	5. Improper operation of internal heater doors or heater controls.	5. Inspect heater and repair as necessary. Refer to Heating and Air Conditioning for procedures.
TEMPERATURE GAUGE READS HIGH. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM COOLING SYSTEM	1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperature and the air conditioning is on. Higher altitudes could aggravate these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to normal range, determine the cause for the overheating and repair.
	2. Temperature gauge reading incorrectly.	2. Check gauge. Refer to I/P group.
	3. Coolant low in coolant tank and radiator.	3. Check for coolant leaks and repair as necessary.
	4. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered.	4. Tighten cap.
	5. Poor seals at pressure/vent cap.	5. (a) Check condition of cap and cap seals. (b) Check condition of coolant tank filler neck. Make sure it does not leak pressure.

COOLING 2.5L TURBO DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	6. Freeze point of antifreeze not correct. Mixture may be too rich.	6. Check antifreeze. Adjust antifreeze-to-water ratio as required.
	7. Coolant not flowing through system.	7. Check for coolant flow in coolant tank with engine warm and thermostat open. Coolant should be observed flowing through the tank. If flow is not observed, determine reason for lack of flow and repair as necessary.
	8. Radiator or A/C condensor fins are dirty or clogged.	8. Clean debris from radiator or A/C condensor
	9. Radiator core is corroded or plugged.	9. Have radiator re-cored or replaced.
	10. Aftermarket A/C installed without proper A/C condensor.	10. Install proper A/C condensor.
	11. Dragging Brakes.	11. Check and correct as necessary.
	12. Non-factory bug screen is being used reducing airflow.	12. Only a factory screen should be used.
	13. Thermostat partially or completely shut. This is more prevalent on high mileage vehicles.	13. Check thermostat and replace if necessary.
	14. Cylinder head gasket leaking.	14. Check cylinder head gasket for leaks.
	15. Heater core leaking.	15. Check heater cor for leaks. Repair as necessary.
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly. Fluctuation is also influenced by loads, outside temperature and extended idle time with diesel engines.	1. A normal condition. No correction is necessary.
	2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit.	2. Check operation of gauge and repair as necessary.
	3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running).	3. A normal condition. No correction needed. Gauge should return to normal range after vehicle is driven.
	4. Gauge reading high after starting a warm-iup (hot) engine.	4. A normal condition. No correction needed. Gauge should return to normal after a few minutes of engine operation.

COOLING 2.5L TURBO DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	5. Coolant level low in the coolant tank (air will build up in the cooling system causing the thermostat to open late).	5. Check and correct coolant leaks.
	6. Cylinder head gasket leaking allowing exhaust gases to enter the cooling system causing the thermostat to open late.	6. (a) Check for cylinder head gasket leaks with a commercially available leak tester. (b) Check for coolant in engine oil. Inspect for white steam emitting from exhaust system. Repair as necessary.
	7. Water pump impeller loose on shaft.	7. Check water pump and replace as necessary.
	8. Loose accessory drive belt (water pump slipping).	8. Check and correct as necessary.
	9. Air leak on the suction side of the water pump allowing air to build up in the cooling system causing the thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT TANK	1. Pressure relief valve in pressure/ vent cap is defective.	1. Check condition of pressure/vent cap and cap seals.
	2. Head gasket leak or cracked cylinder head.	2. Repair as necessary.
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE IS READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump, or engine.	1. Pressure test cooling system and repair as necessary.
HOSE OR HOSES COLLAPSE WHEN ENGINE IS COOLING	1. Vacuum created in cooling system on engine cool-down is not being relieved through pressure/vent cap.	1. Cap relief valve stuck. Replace if necessary.
NOISY FAN	1. Cooling fan blades loose.	1. Replace cooling fan assembly.
	2. Cooling fan blades striking a surrounding object.	2. Locate point of fan blade contact and repair as necessary.
	3. Air obstructions at radiator or A/C condensor.	3. Remove obstructions or clean debris from radiator or A/C condensor.

COOLING 2.5L TURBO DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
INADEQUATE AIR CONDITIONER PERFORMANCE (COOLING SYSTEM SUSPECTED)	1. Radiator and/or A/C condensor is restricted, obstructed or dirty (insects, leaves, etc.)	1. Remove restriction or clean debris from radiator or A/C condensor.
	2. Engine is overheating (heat may be transferred from radiator to A/C condensor. High underhood temperatures due to engine overheating may also transfer heat to A/C condensor).	2. Correct overheating condition.
	3. The cooling system is equipped with air seals at the radiator and/or A/C condensor. If these seals are missing or damaged, not enough air flow will be pulled through the radiator and A/C condensor.	3. Check for missing or damaged air seals. Repair as necessary.
INADEQUATE HEATER PERFORMANCE. MAY BE ACCOMPANIED BY LOW GAUGE READING	1. Diesel engines, due to their inherent efficiency are slower to warm up than gasoline powered engines, and will operate at lower temperatures when the vehicle is unloaded.	1. The lower gauge reading may be normal.
	2. Coolant level low.	2. Pressure test cooling system. Repair leaks as necessary.
	3. Obstruction in heater hose fitting at engine.	3. Remove heater hoses and check for obstructions. Repair as necessary.
	4. Heater hose kinked.	4. Locate kinked area. Repair as necessary.
	5. Water pump is not pumping water to heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot the water pump may not be operating correctly. The accessory drive belt may also be slipping causing poor water pump operation.	5. Refer to water pumps in this group. Repair as necessary. If a slipping belt is detected, refer to Engine Accessory Drive Belts in this group. Repair as necessary.
HEAT ODOR	1. Various heat shields are used at certain drive line components. One or more of these shields may be missing.	1. Locate missing shields. Repair or replace as necessary.
	2. Is temerature gauge reading above the normal range?	2. Refer to the previous Temperature Gauge Reads High in these Diagnostic Charts. Repair as necessary.
	3. Is the Cooling fan operating correctly?	3. Refer to Cooling System Fan in this group for diagnosis. Repair as necessary.

COOLING 2.5L TURBO DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Has undercoating been applied to any unnecessary components?	4. Clean undercoating as necessary.
STEAM IS COMING FROM FRONT OF VEHICLE NEAR GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. During wet weather, moisture (snow, ice, or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT ODOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. Refer to Coolant in this group for antifreeze tests. Adjust antifreeze-to-water ratio as necessary.
COOLANT LEVEL CHANGES IN COOLANT TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the HOT and COLD marks at normal engine operating temperature, the level should return to within that range after operation at elevated temperatures.	1. This a normal condition. No repair necessary.

DIAGNOSIS AND TESTING - COOLING SYSTEM LEAK TEST

WARNING: THE WARNING WORDS “DO NOT OPEN HOT” ON THE RADIATOR PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE RADIATOR CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT OR UNDER PRESSURE.

With engine not running, remove pressure/vent cap from the coolant recovery pressure container and wipe the filler neck sealing seat clean. The coolant recovery pressure container should be full.

Attach the Cooling System Tester 7700 or equivalent to the radiator, as shown in (Fig. 1) and apply 104 kPa (15 psi) pressure. If the pressure drops more than 13.8 kPa (2 psi) in 2 minutes, inspect all points for external leaks.

All radiator and heater hoses should be shaken while at 104 kPa (15 psi), since some leaks occur only while driving due to engine movement.

If there are no external leaks, after the gauge dial shows a drop in pressure, detach the tester. Start engine and run until the thermostat opens, allowing the coolant to expand. Reattach the cooling system tester. If the needle on the dial fluctuates it indicates a combustion leak, usually a head gasket leak.

WARNING: WITH TOOL IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

If the needle on the dial does not fluctuate, raise the engine rpm a few times. If an abnormal amount of coolant or steam emits from the tailpipe, it may indicate a coolant leak caused by a faulty head gasket, cracked engine block, or cracked cylinder head.

There may be internal leaks that can be determined by removing the oil dipstick. If water globules appear intermixed with the oil it will indicate an internal leak in the engine. If there is an internal leak, the engine must be disassembled for repair.

COOLING 2.5L TURBO DIESEL (Continued)

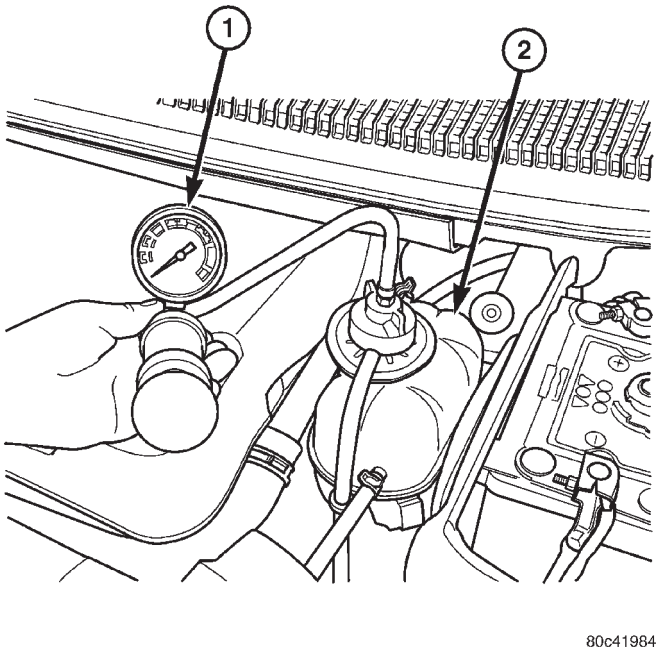

Fig. 1 PRESSURE TESTING COOLING SYSTEM

1 - COOLING SYSTEM PRESSURE TESTER
2 - COOLANT RECOVERY PRESSURE CONTAINER

DIAGNOSIS AND TESTING - COOLING SYSTEM FLOW CHECK

To determine whether coolant is flowing through the cooling system, use the following procedures:

(1) If engine is cold, idle engine until normal operating temperature is reached. Then feel the upper radiator hose. If it is hot, coolant is circulating.

WARNING: DO NOT REMOVE THE COOLING SYSTEM PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(2) Remove pressure/vent cap when engine is cold, idle engine until thermostat opens, you should observe coolant flow while looking down in the coolant recovery pressure container. Once flow is detected install the pressure/vent cap.

DIAGNOSIS AND TESTING - COOLING SYSTEM AERATION

Low coolant level in a cross flow radiator will equalize in both tanks with engine off. With engine at running and at operating temperature, the high pressure inlet tank runs full and the low pressure outlet tank drops, resulting in cooling system aeration. Aeration will draw air into the water pump resulting in the following:

- High reading shown on the temperature gauge.
- Loss of coolant flow through the heater core.
- Corrosion in the cooling system.
- Water pump seal may run dry, increasing the risk of premature seal failure.
- Combustion gas leaks into the coolant can also cause the above problems.

CLEANING

Drain cooling system and refill with clean water. Refer to procedures in this section. Run engine with pressure/vent cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty; fill, run, and drain system again, until water runs clear.

INSPECTION

After performing a cleaning/flush procedure, inspect all hoses, clamps and connections for deterioration and leaks. Inspect radiator and heater core for leaks.

7 - BELT TENSIONER
8 - ACCESSORY DRIVE BELT

DESCRIPTION - POWER STEERING BELT

The power steering belt is a serpentine type belt (Fig. 3). Satisfactory performance of this belt depends on condition of the belt.

OPERATION

OPERATION-ACCESSORY DRIVE BELT

The accessory drive belts form the link between the engine crankshaft and the engine driven accessories.

OPERATION-POWER STEERING BELT

The power steering belt forms a link between the engine crankshaft and the power steering pump.

DRIVE BELTS (Continued)

DIAGNOSIS AND TESTING - ACCESSORY DRIVE BELT

CONDITION	POSSIBLE CAUSES	CORRECTIONS
INSUFFICIENT ACCESSORY OUTPUT DUE TO BELT SLIPPAGE	1. Belt too loose	1. (a) Replace belt (auto-tensioned belts)
	2. Faulty belt tensioner	2. Replace tensioner as necessary
	3. Belt excessively glazed or worn	3. Replace belt
BELT SQUEAL WHEN ACCELERATING ENGINE	1. Belts too loose	1. Check and replace belt tensioner if necessary
	2. Belt glazed	2. Replace belt
BELT SQUEAK AT IDLE	1. Belts too loose	1. (a) Replace belt
	2. Dirt or paint imbedded in belt	2. Replace belt
	3. Non-uniform belt	3. Replace belt
	4. Misaligned pulleys	4. Align accessories
	5. Non-uniform groove or eccentric pulley	5. Replace pulley
BELT ROLLED OVER IN GROOVE OR BELT JUMPS OFF	1. Broken cord in belt	1. Replace belt
	2. Belt too loose, or too tight	2. Replace belt
	3. Misaligned pulleys	3. Align accessories
	4. Non-uniform groove or eccentric pulley	4. Replace pulley

REMOVAL

REMOVAL-ACCESSORY DRIVE BELT

(1) Remove the power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Relieve tension on belt tensioner using a suitable wrench (Fig. 4) and lock tensioner with a drift punch (Fig. 5).

(3) Remove the accessory drive belt.

REMOVAL

(1) Raise vehicle on hoist.

(2) Remove right front fender inner splash shield.

(3) Install power steering belt remover tool on crankshaft damper (Fig. 6).

(4) Rotate engine clockwise to remove belt (Fig. 7).

COOLANT

DESCRIPTION

Coolant flows through the engine water jackets and cylinder heads absorbing heat produced by the engine during operation. The coolant carries heat to the radiator and heater core. Here it is transferred to ambient air passing through the radiator and heater core fins.

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The recommended mixture of 50/50 ethylene-glycol and water will provide protection against freezing to -37 deg. C (-35 deg. F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7 deg. C (-90 deg. F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

100 Percent Ethylene-Glycol—Should Not Be Used in Chrysler Vehicles

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149 deg. C (300 deg. F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22 deg. C (-8 deg. F).

Propylene-glycol Formulations—Should Not Be Used in Chrysler Vehicles

Propylene-glycol formulations do not meet Chrysler coolant specifications. It's overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32 deg. C (-26 deg. F). 5 deg. C higher than ethylene-glycol's freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125 deg. C (257 deg. F) at 96.5 kPa (14 psi), compared to 128 deg. C (263 deg. F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up in Chrysler vehicles, which are designed for ethylene-glycol. Propylene glycol also has poorer heat transfer characteristics than ethylene glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/Ethylene-glycol Mixtures—Should Not Be Used in Chrysler Vehicles

Propylene-glycol/ethylene-glycol Mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene glycol.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -59°C (-50°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant—corrosion protection will be severely reduced.

STANDARD PROCEDURE

STANDARD PROCEDURE - COOLANT SERVICE

For engine coolant recommended service schedule, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

STANDARD PROCEDURE - ADDING ADDITIONAL COOLANT

The pressure/vent cap should not be removed from the coolant recovery pressure container when the engine is hot. When additional coolant is needed to maintain this level, it should be added to the coolant recovery pressure container (Fig. 1). Use only 50/50 mix of ethylene glycol type antifreeze and distilled water. For the recommeded antifreeze/coolant type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

CAUTION: Do not use well water, or suspect water supply in cooling system. A 50/50 ethylene glycol and distilled water mix is recommended. For the recommeded antifreeze/coolant type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

STANDARD PROCEDURE - COOLANT LEVEL CHECK

NOTE: Do not remove pressure/vent cap for routine coolant level inspections.

The coolant reserve system provides a quick visual method for determining the coolant level without removing the pressure/vent cap. **With the engine cold and not running,** simply observe the level of the coolant in the coolant recovery pressure container (Fig. 2). The coolant level should be between the MIN and MAX marks.

STANDARD PROCEDURE - COOLING SYSTEM FILLING

(1) Remove pressure vent cap from coolant recovery pressure container.

(2) Loosen air bleed screw on the thermostat housing (Fig. 9).

(3) Slowly fill the cooling through the coolant recovery pressure container until a steady stream of coolant comes out of the air bleed.

(4) Tighten the air bleed screw.

4 - BATTERY SHIELD
5 - COOLANT RECOVERY PRESSURE CONTAINER RETAING CLIP
6 - ENGINE COVER
7 - COOLANT RECOVERY PRESSURE CONTAINER

(5) Continue filling coolant recovery pressure container until level reaches the full line.

(6) Without installing the pressure/vent cap, start and run engine at idle for a couple minutes.

(7) Recheck coolant level and fill as necessary.

(8) Install pressure/vent cap and drive vehicle for approx. 10 km to reach normal operating temperatures.

(9) Allow vehicle to cool. Check and fill coolant as needed.

STANDARD PROCEDURE - COOLING SYSTEM DRAINING

WARNING: DO NOT REMOVE OR LOOSEN THE COOLANT PRESSURE/VENT CAP, CYLINDER BLOCK DRAIN PLUGS, OR THE DRAINCOCK WHEN THE SYSTEM IS HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(1) **Without removing pressure/vent cap and with system not under pressure**, open the draincock. The draincock is located on the lower right side of radiator (Fig. 3).

(2) After the coolant recovery pressure container is empty, then remove coolant pressure/vent cap.

COOLANT RECOVERY PRESS CONTAINER

DESCRIPTION

The coolant recovery pressure container is mounted in the engine compartment next to the battery. The coolant recovery pressure container is made of plastic (Fig. 4).

OPERATION

The coolant recovery pressure container works with the pressure/vent cap to use thermal expansion and contraction of the coolant to keep the coolant free of trapped air. Provides a convenient and safe method for checking coolant level and adjusting level at atmospheric pressure without removing the pressure/vent cap. It also provides some reserve coolant to cover deaeration, evaporation, or boiling losses.

REMOVAL

(1) Drain cooling system below level of coolant recovery pressure bottle. (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE)

(2) Disconnect coolant bypass and overflow hoses from coolant recovery pressure container (Fig. 6).

(3) Unclip the coolant recovery pressure container retaining clip (Fig. 5).

(4) Raise coolant recovery pressure container from mounting bracket and disconnect coolant hose from bottom of container (Fig. 6).

(5) Remove coolant recovery pressure bottle.

INSTALLATION

(1) Connect coolant hose at bottom of coolant recovery pressure container (Fig. 6) and install in mounting bracket.

(2) Connect coolant recovery pressure container retaining clip (Fig. 5).

(3) Connect coolant bypass and overflow hoses to coolant recovery pressure container.

(4) Refill cooling system. (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE)

ENGINE COOLANT TEMP SENSOR

DESCRIPTION

The engine coolant temperature sensor threads into a coolant passage in the cylinder head (Fig. 7). New sensors have sealant applied to the threads.

OPERATION

The coolant temperature (ECT) sensor is a negative temperature coefficient (NTC) thermistor (resistance varies inversley with temperature). This means at cold tempertures its resistance is high so the voltage signal will be high. As coolant temperture increases, resistance decreases and the signal voltage will be low. This allows the sensor to provide an analog voltage signal to the ECM.

REMOVAL

WARNING: DO NOT REMOVE OR LOOSEN THE COOLANT PRESSURE/VENT CAP, CYLINDER BLOCK DRAIN PLUGS, OR THE DRAINCOCK WHEN THE SYSTEM IS HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(1) Drain the cooling system. (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE)
(2) Disconnect coolant temperature sensor electrical connector (Fig. 8).
(3) Remove coolant temperature sensor from cylinder head (Fig. 8).

INSTALLATION

(1) Install coolant temperature sensor in cylinder head (Fig. 8).
(2) Connect coolant temperature sensor electrical connector (Fig. 8).
(3) Refill the cooling system. (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE)
(4) Connect the negative battery cable.

6 - EGR VALVE

ENGINE COOLANT THERMOSTAT

DESCRIPTION

A pellet-type thermostat controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator (Fig. 9).

OPERATION

The thermostat starts to open at 80°C (176°F). Above this temperature, coolant is allowed to flow to the radiator. This provides quicker engine warmup and overall temperature control.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.

REMOVAL

NOTE: The thermostat is not serviced separately. The thermostat and housing must be replaced as an assembly.

(1) Disconnect negative battery cable.
(2) Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
(3) Remove front wiper unit to gain access to thermostat housing(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).
(4) Disconnect upper radiator hose adapter tube, water pump hose, and EGR hose at thermostat housing.
(5) Remove both thermostat housing attaching bolts and housing (Fig. 10).

INSTALLATION

(1) Install thermostat housing, gasket, and retaining bolts (Fig. 10). Torque bolts to 27.5N·m.
(2) Connect upper radiator hose adapter tube, water pump hose, and EGR cooler hose to thermostat housing.

ENGINE COOLANT THERMOSTAT (Continued)

1 - THERMOSTAT HOUSING GASKET
2 - THERMOSTAT HOUSING
3 - RETAINING BOLTS
4 - CYLINDER HEAD
5 - CYLINDER HEAD COVER/INTAKE MANIFOLD

(3) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(4) Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(5) Connect negative battery cable.

RADIATOR

DESCRIPTION

The radiator is a cross-flow type (horizontal tubes) with design features that provide greater strength along with sufficient heat transfer capabilities to keep the engine satisfactorily cooled. The radiator has plastic side tanks and aluminum cooling tubes.

OPERATION

The radiator functions as a heat exchanger, using air flow across the exterior of the radiator tubes. This heat is then transferred from the coolant and into the passing air.

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove radiator upper crossmember support. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)

WARNING: DO NOT REMOVE THE CYLINDER BLOCK PLUG OR THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(3) Drain the cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(4) Remove the radiator fans. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

(5) Disconnect coolant bypass hose (Fig. 11).

(6) Disconnect upper and lower hoses from the radiator (Fig. 11).

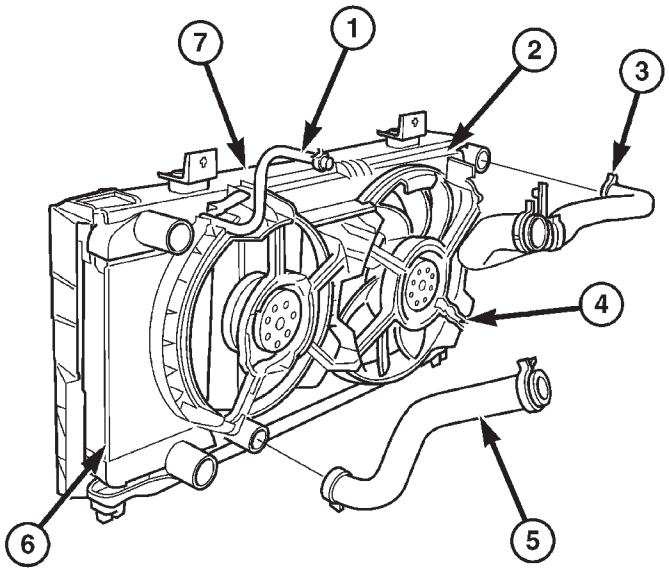

Fig. 11 UPPER AND LOWER RADIATOR HOSES

1 - COOLANT BYPASS HOSE
2 - RADIATOR ASSEMBLY
3 - UPPER RADIATOR HOSE
4 - COOLING FAN
5 - LOWER RADIATOR HOSE
6 - CHARGE AIR COOLER
7 - RADIATOR BRACKET

(7) Remove the A/C condenser side brackets to radiator attaching screws (Fig. 12). Separate the condenser from the radiator by lifting upward to disengage from lower mounts (Fig. 12). Allow the condenser to rest in front of radiator.

RADIATOR (Continued)

(8) Radiator can now be lifted free from engine compartment. **Care should be taken not to damage radiator cooling fins or water tubes during removal.**

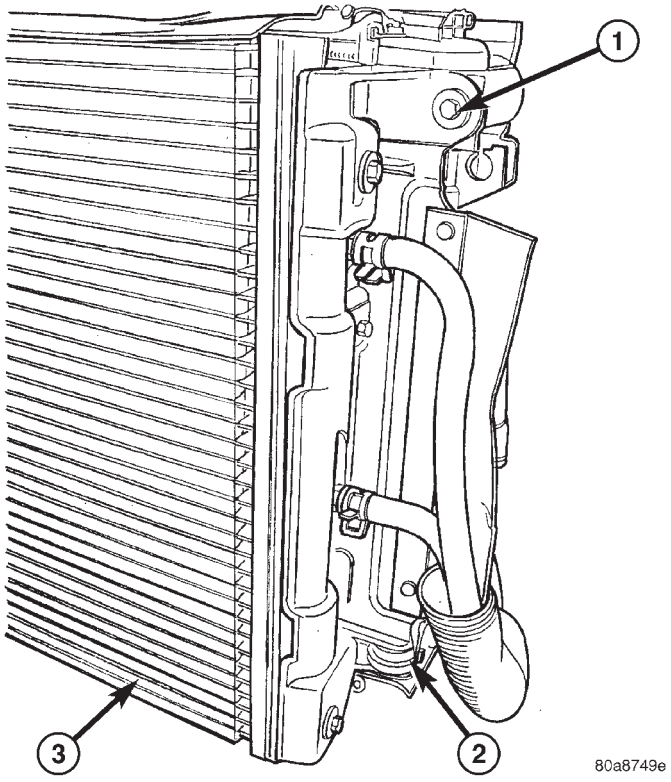

Fig. 12 Radiator to A/C Condenser Mounting (left mount shown, right similar)

1 - SCREW - A/C CONDENSER SIDE BRACKET TO RADIATOR
2 - LOWER MOUNT
3 - A/C CONDENSER

INSTALLATION

(1) **Be sure the air seal is in position before radiator is installed.** Slide radiator down into position. Seat the radiator with the rubber isolators into the mounting holes provided, with a 10 lbs. force.

(2) Position air conditioning condenser onto the radiator lower mounts and install upper screws (Fig. 12). Tighten fasteners to 5 N·m (45 in. lbs.).

(3) Install the radiator upper and lower hoses (Fig. 11).

(4) Connect the coolant bypass hose.

(5) Install the radiator fans. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(6) Install the radiator upper crossmember support. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)

(7) Fill the cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(8) Connect negative cable to battery.

RADIATOR DRAINCOCK

REMOVAL

CAUTION: Use of pliers on draincock is not recommended. Damage may occur to radiator or draincock.

NOTE: It is not necessary to remove draincock during a routine coolant drain.

(1) Drain the cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(2) Open the draincock by turning it counterclockwise until it stops.

(3) Turn the draincock back (clockwise) 1/8 turn.

(4) Pull the draincock (Fig. 13) from the radiator tank.

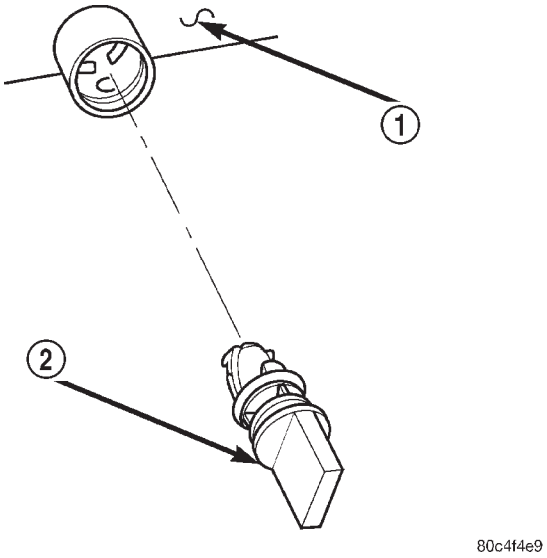

Fig. 13 Draincock

1 - RADIATOR TANK
2 - DRAINCOCK

INSTALLATION

(1) Align draincock stem to radiator tank opening.

(2) Push draincock into the radiator tank opening.

(3) Tighten the draincock by turning clockwise until it stops.

(4) Fill the cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

WATER PUMP

DESCRIPTION

The water pump on the 2.5L CRD diesel has a die cast aluminum housing. It bolts to a aluminum housing which attaches to the engine block (Fig. 14).

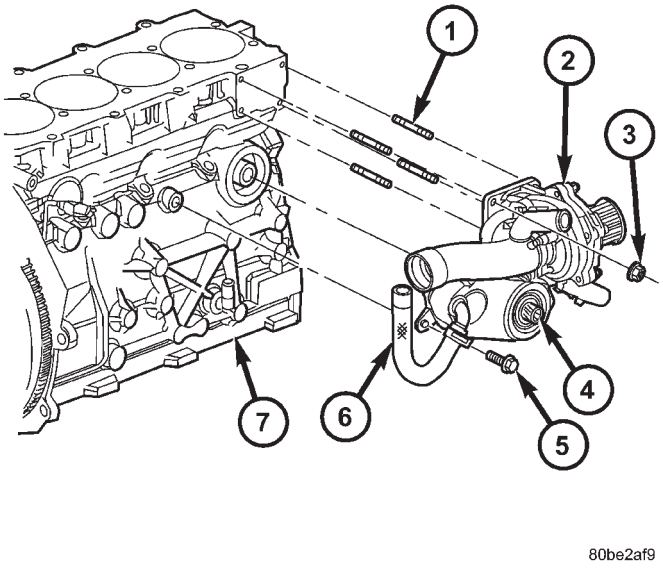

Fig. 14 WATER PUMP

1 - WATER PUMP HOUSING STUDS
2 - WATER PUMP
3 - RETAINING NUTS
4 - OIL COOLER RETAINING STUD
5 - OIL COOLER TO ENGINE BLOCK RETAINING BOLT
6 - OIL COOLER COOLANT HOSE
7 - ENGINE BLOCK

OPERATION

The water pump is used to circulate coolant through the cooling system. The coolant is pumped through the engine block, cylinder head, heater core, EGR cooler, cabin heater, and radiator.

REMOVAL

REMOVAL - WATER PUMP

(1) Disconnect negative battery cable.
(2) Drain cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(3) Remove timing belt inner and outer covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(4) Remove water pump retaining bolts and pump (Fig. 15).

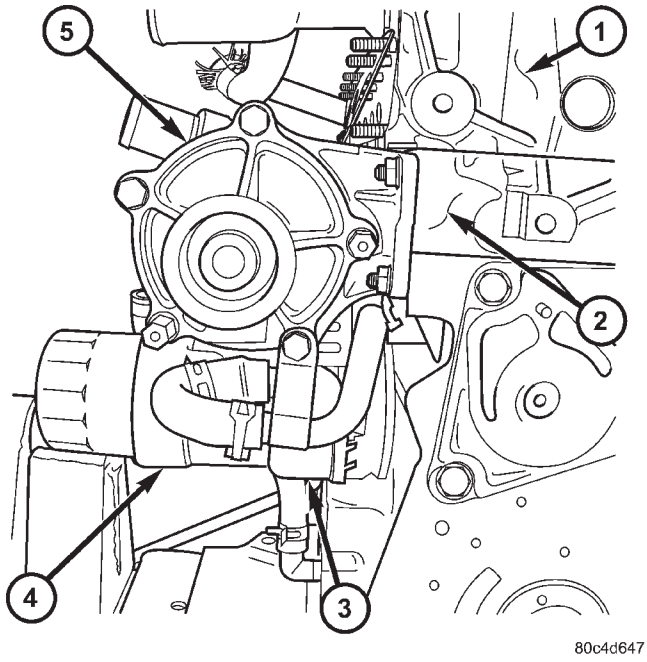

Fig. 15 WATER PUMP LOCATION

1 - CYLINDER HEAD
2 - ENGINE BLOCK
3 - OIL COOLER
4 - OIL FILTER HOUSING
5 - WATER PUMP

REMOVAL - WATER PUMP HOUSING

(1) Disconnect negative battery cable.
(2) Drain cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(3) Remove both outer and inner timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(4) Disconnect water pump housing to thermostat housing bypass hose (Fig. 16).
(5) Remove the water pump housing retaining nuts (Fig. 17).
(6) Remove water pump housing from engine block (Fig. 17).

CLEANING

Clean gasket mating surfaces as necessary.

INSTALLATION

INSTALLATION - WATER PUMP

(1) Clean gasket mating surfaces as necessary.
(2) Place water pump and gasket in place. Install water pump retaining bolts (Fig. 15). Torque bolts to 24.4N·m.

WATER PUMP (Continued)

(3) Install both inner and outer timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(4) Refill cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).

(5) Connect negative battery cable.

INSTALLATION - WATER PUMP HOUSING

(1) Clean mating serfaces of water pump housing and engine block as necessary.

(2) Place new o-ring in groove in water pump housing (Fig. 18).

(3) Be sure lower radiator hose tube o-ring is in place.

(4) Install water pump housing on lower radiator hose tube and push on mounting studs (Fig. 17). Torque retaining nuts to 24.4N·m.

(5) Connect water pump housing to thermostat housing bypass hose (Fig. 16).

(6) Install both inner and outer timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(7) Refill cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).

(8) Connect negative battery cable.

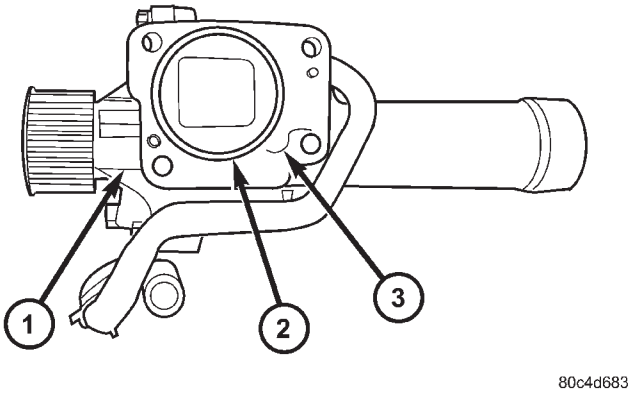

Fig. 18 WATER PUMP HOUSING O-RING

1 - WATER PUMP
2 - WATER PUMP HOUSING O-RING

RADIATOR PRESSURE CAP

DESCRIPTION

The cooling system pressure cap is located on the radiator. The cap construction includes; stainless steel swivel top, rubber seals, and retainer, main spring, and a spring loaded valve (Fig. 19).

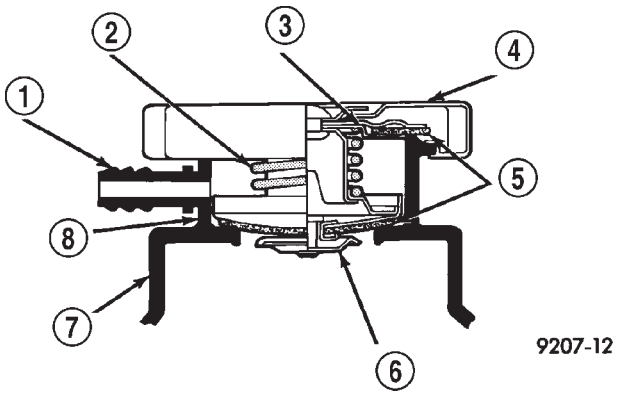

Fig. 19 Cooling System Pressure Cap Filler Neck

1 - OVERFLOW NIPPLE
2 - MAIN SPRING
3 - GASKET RETAINER
4 - STAINLESS-STEEL SWIVEL TOP
5 - RUBBER SEALS
6 - VENT VALVE
7 - PRESSURE BOTTLE
8 - FILLER NECK

OPERATION

The cooling system is equipped with a pressure cap that releases excessive pressure; maintaining a range of 97-124 kPa (14-18 psi).

The cooling system will operate at higher than atmospheric pressure. The higher pressure raises the coolant boiling point thus, allowing increased radiator cooling capacity.

There is also a vent valve in the center of the cap. This valve also opens when coolant is cooling and contracting, allowing the coolant to return to cooling system from coolant reserve system tank by vacuum through a connecting hose. **If valve is stuck shut, or the coolant recovery hose is pinched, the radiator hoses will be collapsed on cool down. Clean the vent valve (Fig. 19) and inspect coolant recovery hose routing, to ensure proper sealing when boiling point is reached.**

The gasket in the cap seals the filler neck, so that vacuum can be maintained, allowing coolant to be drawn back into the radiator from the reserve tank. **If the gasket is dirty or damaged, a vacuum may not be achieved, resulting is loss of coolant and eventual overheating due to low coolant level in radiator and engine.**

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLING SYSTEM PRESSURE CAP

Dip the pressure cap in water. Clean any deposits off the vent valve or its seat and apply cap to end of the Pressure Cap Test Adaptor that is included with the Cooling System Tester 7700. Working the plunger, bring the pressure to 104 kPa (15 psi) on the gauge. If the pressure cap fails to hold pressure of at least 97 kPa (14 psi), replace the pressure cap.

CAUTION: The Cooling System Tester Tool is very sensitive to small air leaks that will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to the tool. Turn tool upside down and recheck pressure cap to confirm that cap is bad.

If the pressure cap tests properly while positioned on Cooling System Tester (Fig. 20), but will not hold pressure or vacuum when positioned on the filler neck. Inspect the filler neck and cap top gasket for irregularities that may prevent the cap from sealing properly.

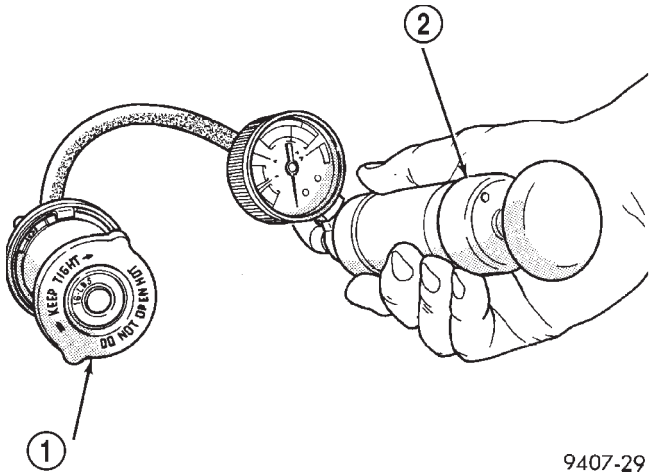

Fig. 20 Testing Cooling System Pressure Cap

1 - PRESSURE CAP
2 - PRESSURE TESTER

RADIATOR PRESSURE CAP (Continued)

DIAGNOSIS AND TESTING - PRESSURE RELIEF TEST

The pressure cap upper gasket (seal) pressure relief can be checked by removing the overflow hose at the radiator filler neck nipple (Fig. 21). Attach the Radiator Pressure Tool to the filler neck nipple and pump air into the radiator. Pressure cap upper gasket should relieve at 69-124 kPa (10-18 psi) and hold pressure at 55 kPa (8 psi) minimum.

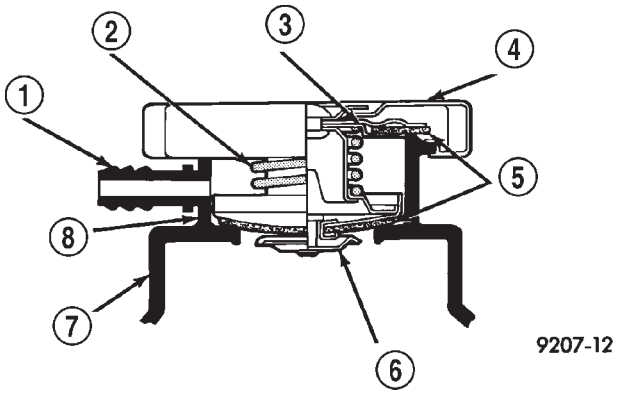

Fig. 21 Radiator Pressure Cap Filler Neck

1 - OVERFLOW NIPPLE
2 - MAIN SPRING
3 - GASKET RETAINER
4 - STAINLESS-STEEL SWIVEL TOP
5 - RUBBER SEALS
6 - VENT VALVE
7 - PRESSURE BOTTLE
8 - FILLER NECK

WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE RADIATOR PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE RADIATOR CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT OR UNDER PRESSURE.

There is no need to remove the radiator cap at any time **except** for the following purposes:

(1) Check and adjust coolant freeze point.
(2) Refill system with new coolant.
(3) Conducting service procedures.
(4) Checking for vacuum leaks.

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT 15 MINUTES BEFORE REMOVING CAP. THEN PLACE A SHOP TOWEL OVER THE CAP AND WITHOUT PUSHING DOWN ROTATE COUNTERCLOCKWISE TO THE FIRST STOP. ALLOW FLUIDS TO ESCAPE THROUGH THE OVERFLOW TUBE AND WHEN THE SYSTEM STOPS PUSHING COOLANT AND STEAM INTO THE CRS TANK AND PRESSURE DROPS PUSH DOWN AND REMOVE THE CAP COMPLETELY. SQUEEZING THE RADIATOR INLET HOSE WITH A SHOP TOWEL (TO CHECK PRESSURE) BEFORE AND AFTER TURNING TO THE FIRST STOP IS RECOMMENDED.

CLEANING

Use only a mild soap to clean the pressure cap.

INSPECTION

Hold the cap in your hand, **top side up** (Fig. 21). The vent valve at the bottom of the cap should open. If the rubber gasket has swollen, preventing the valve from opening, replace the cap.

Hold the cleaned cap in your hand, **upside down.** If any light can be seen between vent valve and the rubber gasket, replace the cap. **Do not use a replacement cap that has a spring to hold the vent shut.**

A replacement cap must be of the type designed for coolant reserve systems. This design ensures coolant return to the radiator.

RADIATOR FAN

DESCRIPTION

The dual radiator fans are mounted to the back side of the radiator (Fig. 22). The radiator fan consist of the fan blade, electric motor and a support shroud which are all serviced as an assembly.

RADIATOR FAN (Continued)

OPERATION

RADIATOR FAN OPERATION CHART

COOLANT TEMPERATURE			A/C PRESSURE	
Fan Operation Speeds:	Initial	Max	Initial	Max
Fan On:	104°C (220°F)	110°C (230°F) Fan Speed Duty-Cycles (Ramps-up) from 30% to 99%	1,724 Kpa (250 psi)	2,068 Kpa (300 psi) Fan Speed Duty-Cycles (Ramps-up) from 30% to 99%
Fan Off:	101°C (214°F)	Fan Speed Duty-Cycles (Ramps-down) from 99% to 30%	1,710 Kpa (248 psi)	Fan Speed Duty-Cycles (Ramps-down) from 99% to 30%

DIAGNOSIS AND TESTING - RADIATOR FAN MOTOR

RADIATOR FAN DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY RADIATOR FAN	1. Fan blade loose.	1. Replace fan assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
	2. Fan blade striking a surrounding object.	2. Locate point of fan blade contact and repair as necessary.
	3. Air obstructions at radiator or A/C condenser.	3. Remove obstructions and/or clean debris.
	4. Electric fan motor defective.	4. Replace fan assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
ELECTRIC FAN MOTOR DOES NOT OPERATE	1. Fan relay, powertrain control module (PCM), coolant temperature sensor, or wiring defective.	1. (Refer to Appropriate Diagnostic Information) Repair as necessary.
	2. Defective A/C pressure transducer.	2. (Refer to Appropriate Diagnostic Information) Repair as necessary.
ELECTRIC RADIATOR FAN OPERATES ALL THE TIME	1. Fan relay, powertrain control module (PCM), coolant temperature sensor or wiring defective.	1. (Refer to Appropriate Diagnostic Information) Repair as necessary.
	2. Check for low coolant level.	2. Add coolant as necessary.
	3. Defective A/C pressure transducer.	3. (Refer to Appropriate Diagnostic Information) Repair as necessary.

RADIATOR FAN (Continued)

REMOVAL

There are no repairs to be made to the fan or shroud assembly. If the fan is warped, cracked, or otherwise damaged, it must be replaced as an assembly (Fig. 22).

(1) Remove the radiator upper crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)

(2) Disconnect the radiator fan electrical connectors.

(3) Remove radiator fan(s) retaining screw (Fig. 22).

(4) Remove the radiator fan(s) by lifting upward to release from mounts.

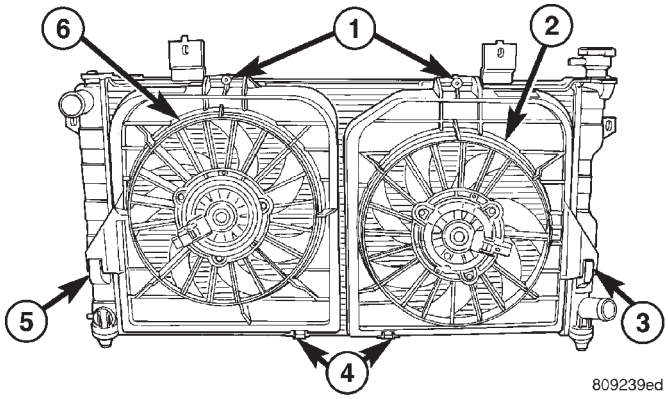

Fig. 22 Radiator Fans

1 - SCREWS - RADIATOR FAN ATTACHING
2 - RADIATOR FAN - RIGHT
3 - MOUNT - RIGHT RADIATOR FAN
4 - CLIPS - RADIATOR FAN LOWER
5 - MOUNT - LEFT RADIATOR FAN
6 - RADIATOR FAN - LEFT

INSTALLATION

(1) Install the radiator fan(s) into mounts and attaching clips on the radiator.

(2) Install radiator fan(s) attaching screws (Fig. 22). Tighten to 5 N·m (45 in. lbs.).

(3) Connect the radiator fan(s) electrical connectors.

(4) Install the radiator upper support crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)

(5) Install the upper radiator mounts to the crossmember bolts, if removed. Tighten to 8 N·m (70 in. lbs.).

(6) Install the radiator upper hose to the support clip (2.4L engine).

HOSE CLAMPS

DESCRIPTION - HOSE CLAMPS

The cooling system uses spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only a original equipment clamp with matching number or letter (Fig. 23).

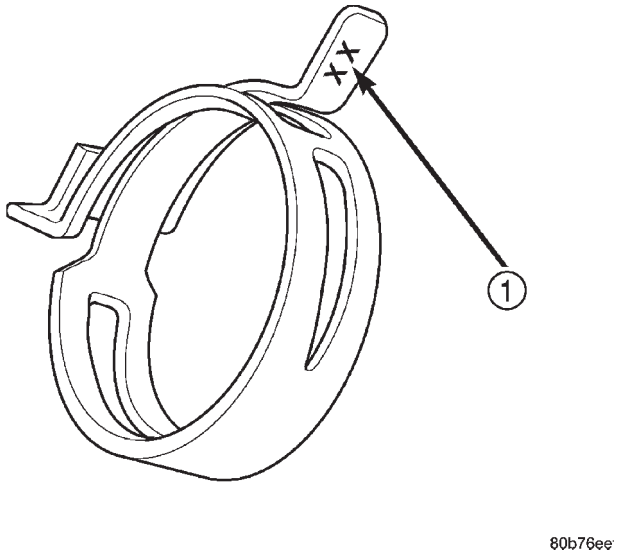

Fig. 23 Spring Clamp Size Location

1 - SPRING CLAMP SIZE LOCATION

OPERATION - HOSE CLAMPS

The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, use Special Tool 6094 or equivalent, constant tension clamp pliers (Fig. 24) to compress the hose clamp.

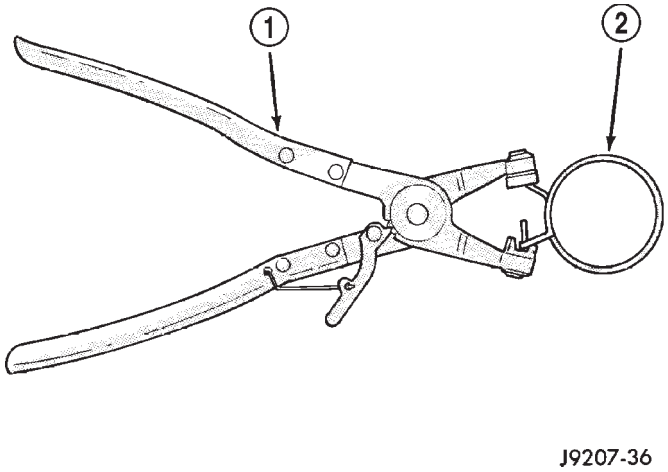

Fig. 24 Hose Clamp Tool

1 - HOSE CLAMP TOOL 6094
2 - HOSE CLAMP

RADIATOR FAN RELAY

DESCRIPTION

The low and high speed fan relays are mounted to the upper radiator support above the charge air cooler (Fig. 25).

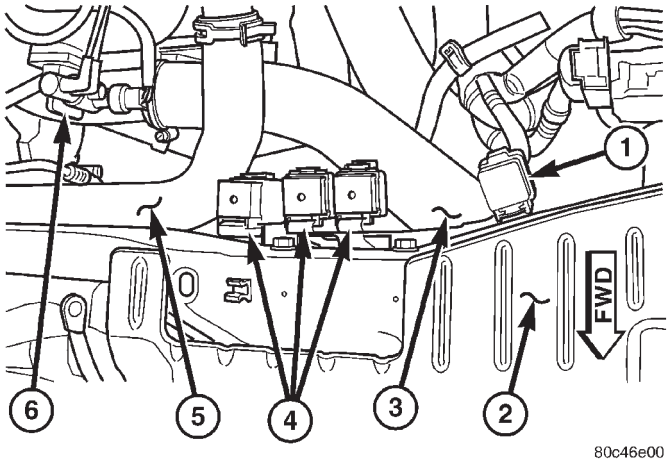

Fig. 25 RELAY LOCATIONS

1 - GLOW PLUG RELAY
2 - UPPER RADIATOR SUPPORT
3 - CHARGE AIR COOLER OUTLET HOSE
4 - RADIATOR FAN RELAYS
5 - UPPER RADIATOR HOSE
6 - EGR SOLENOID

OPERATION

The cooling system uses two fans. Both fans operate at two different speeds, low and high. Depending on engine coolant temperature and A/C system high side pressure, the fans operate at either low or high. The ignition switch supplies voltage to the coil side of the relay. When the ECM grounds the coil side of the relay, the contacts close and the battery supplies power to the fans.

COOLANT SYSTEM HOSES

REMOVAL

REMOVAL - UPPER RADIATOR HOSE

WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE RADIATOR PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE RADIATOR CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT OR UNDER PRESSURE.

(1) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).
(2) Drain cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(3) Remove upper radiator hose (Fig. 26).

REMOVAL - LOWER RADIATOR HOSE

WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE RADIATOR PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE RADIATOR CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT OR UNDER PRESSURE.

(1) Drain cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(2) Remove lower radiator hose (Fig. 26).

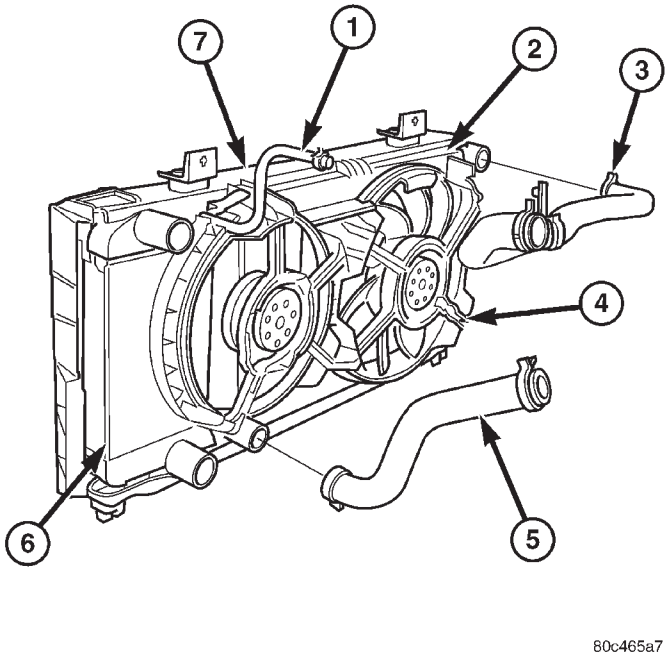

Fig. 26 UPPER AND LOWER RADIATOR HOSES

1 - COOLANT BYPASS HOSE
2 - RADIATOR ASSEMBLY
3 - UPPER RADIATOR HOSE

COOLANT SYSTEM HOSES (Continued)

REMOVAL - COOLANT BYPASS HOSE

WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE RADIATOR PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE RADIATOR CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT OR UNDER PRESSURE.

(1) Drain cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(2) Remove the coolant bypass hose (Fig. 26).

INSTALLATION

INSTALLATION - UPPER RADIATOR HOSE

(1) Install upper radiator hose (Fig. 26).
(2) Refill cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(3) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

INSTALLATION - LOWER RADIATOR HOSE

(1) Install lower radiator hose (Fig. 26).
(2) Refill cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).

INSTALLATION - COOLANT BYPASS HOSE

(1) Install cooling system bypass hose (Fig. 26).
(2) Refill cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).

AUDIO

DESCRIPTION

There are four different system combinations available on this model. The available radio options are:

- AM/FM Cassette
- AM/FM Compact Disc with Compact Disc changer controls
- AM/FM Cassette with single Compact Disc Player and Compact Disc changer controls
- AM/FM Cassette with Compact Disc changer controls
- AM/FM Cassette with Compact Disc player, rear seat audio system and Compact Disc changer controls.

The rear seat audio system allows passengers to listen to a different music source, through headphones, other than what is playing through the vehicles speaker system. A remote control is provided for functions such as changing stations, tracks, disc and modes while listening to rear seat audio. The radio must be turned ON to use the rear seat audio system.

All factory installed radio receivers are stereo Electronically Tuned Radios (ETR) and include and electronic digital clock function.

OPERATION

Operating instructions for the factory installed audio systems can be found in the Owner's Manual provided with this vehicle.

DIAGNOSIS AND TESTING - AUDIO

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out

AUDIO (Continued)

information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

AUDIO SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
NO AUDIO.	1. FUSE FAULTY.	1. CHECK RADIO FUSES IN FUSE BLOCK MODULE. REPLACE FUSES, IF REQUIRED.
	2. RADIO CONNECTOR FAULTY.	2. CHECK FOR LOOSE OR CORRODED RADIO CONNECTOR. REPAIR, IF REQUIRED.
	3. WIRING FAULTY.	3. CHECK FOR BATTERY VOLTAGE AT RADIO CONNECTOR. REPAIR WIRING, IF REQUIRED.
	4. GROUND FAULTY.	4. CHECK FOR CONTINUITY BETWEEN RADIO CHASSIS AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND, IF REQUIRED.
	5. RADIO FAULTY.	5. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
	6. SPEAKERS FAULTY.	6. SEE SPEAKER DIAGNOSIS, IN THIS GROUP.
NO DISPLAY.	1. FUSE FAULTY.	1. CHECK RADIO FUSES IN FUSE BLOCK MODULE. REPLACE FUSES, IF REQUIRED.
	2. RADIO CONNECTOR FAULTY.	2. CHECK FOR LOOSE OR CORRODED RADIO CONNECTOR. REPAIR, IF REQUIRED.
	3. WIRING FAULTY.	3. CHECK FOR BATTERY VOLTAGE AT RADIO CONNECTOR. REPAIR WIRING, IF REQUIRED.
	4. GROUND FAULTY.	4. CHECK FOR CONTINUITY BETWEEN RADIO CHASSIS AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND, IF REQUIRED.
	5. RADIO FAULTY.	5. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
NO MEMORY.	1. FUSE FAULTY.	1. CHECK IGNITION-OFF DRAW FUSE. REPLACE FUSE, IF REQUIRED.
	2. RADIO CONNECTOR FAULTY.	2. CHECK FOR LOOSE OR CORRODED RADIO CONNECTOR. REPAIR, IF REQUIRED.
	3. WIRING FAULTY.	3. CHECK FOR BATTERY VOLTAGE AT RADIO CONNECTOR. REPAIR WIRING, IF REQUIRED.
	4. GROUND FAULTY.	4. CHECK FOR CONTINUITY BETWEEN RADIO CHASSIS AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND, IF REQUIRED.
	5. RADIO FAULTY.	5. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
POOR RADIO RECEPTION.	1. ANTENNA FAULTY.	1. SEE ANTENNA DIAGNOSIS, IN THIS GROUP. REPAIR OR REPLACE ANTENNA, IF REQUIRED.

AUDIO (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
	2. GROUND FAULTY.	2. CHECK FOR CONTINUITY BETWEEN RADIO CHASSIS AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND, IF REQUIRED.
	3. RADIO FAULTY.	3. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
	4. POOR ANTENNA CONNECTION AT RADIO OR IN LINE.	4. SEAT CONNECTOR.
NO/POOR TAPE OPERATION.	1. FAULTY TAPE.	1. INSERT KNOWN GOOD TAPE AND TEST OPERATION.
	2. FOREIGN OBJECTS BEHIND TAPE DOOR.	2. REMOVE FOREIGN OBJECTS AND TEST OPERATION.
	3. DIRTY CASSETTE TAPE HEAD.	3. CLEAN HEAD WITH MOPAR CASSETTE HEAD CLEANER.
	4. FAULTY TAPE DECK.	4. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
NO COMPACT DISC OPERATION	1. FAULTY CD.	1. INSERT KNOWN GOOD CD AND TEST OPERATION.
	2. FOREIGN MATERIAL ON CD.	2. CLEAN CD AND TEST OPERATION.
	3. CONDENSATION ON CD OR OPTICS.	3. ALLOW TEMPERATURE OF VEHICLE INTERIOR TO STABILIZE AND TEST OPERATION.
	4. FAULTY CD PLAYER.	4. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
HEADPHONES WILL NOT HOLD A CHANNEL OR HAVE STATIC	1. WEAK BATTERIES IN THE HEADPHONES.	1. REPLACE BATTERIES.
	2. CLOSENESS TO RADIO TRANSMITTER SUCH AS A RADIO TOWER, AIRPORT TRANSMITTER OR SOME MOBILE RADIOS.	2. MOVE TO AN AREA AWAY FREE FROM THESE CONDITIONS.
REMOTE CONTROL INOPERATIVE	1. WEAK BATTERIES IN THE REMOTE CONTROL.	1. REPLACE BATTERIES.
	2. OPERATION CONSTRAINT OF SYSTEM	2. MAKE SURE THAT REAR AUDIO IS IN A DIFFERENT MODE THAN FRONT SPEAKERS. REMOTE CONTROL WILL NOT WORK WHEN BOTH ARE IN THE SAME MODE.

ANTENNA BODY AND CABLE

DESCRIPTION

All models use a fixed-length stainless steel rod-type antenna mast, installed at the right front fender of the vehicle. The antenna mast is connected to the center wire of the coaxial antenna cable, and is not grounded to any part of the vehicle.

OPERATION

To minimize static, the antenna base must have a good ground. The coaxial antenna cable shield (the outer wire mesh of the cable) is grounded to the antenna base and the radio chassis.

The antenna coaxial cable has an additional disconnect, located near the right end of the instrument panel. This additional disconnect allows the instrument panel assembly to be removed and installed without removing the radio.

The factory-installed Electronically Tuned Radios (ETRs) automatically compensate for radio antenna trim. Therefore, no antenna trimmer adjustment is required or possible when replacing the receiver or the antenna.

DIAGNOSIS AND TESTING - ANTENNA BODY AND CABLE

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The ohmmeter test lead connections for each test are shown in (Fig. 1).

TEST 1

Test 1 determines of the antenna mast is insulated from the base. Proceed as follows:

(1) Unplug the antenna coaxial cable from the radio chassis and isolate. Remove the antenna mast.

(2) Connect an ohmmeter test lead to the inside center of the antenna base. Connect the other test lead to a metallic portion on the outside of the antenna base. Check for continuity.

(3) There should be no continuity. If continuity is found, replace the faulty or damaged antenna base and cable assembly.

TEST 2

Test 2 checks the antenna for an open circuit as follows:

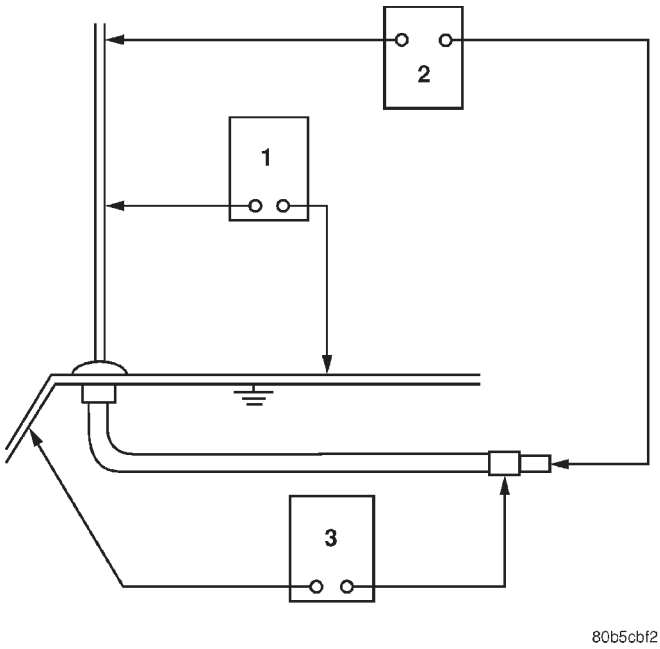

Fig. 1 Antenna Test Points

(1) Unplug the antenna coaxial cable connector from the radio chassis. Remove the antenna mast. The painted mast prevents measurement directly through the mast.

(2) Connect an ohmmeter test lead to the inside center of the antenna base. Connect the other test lead to the center pin of the antenna coaxial cable connector.

(3) Continuity should exist (the ohmmeter should only register a fraction of an ohm). High or infinite resistance indicates damage to the base and cable assembly. Replace the faulty base and cable if required.

TEST 3

Test 3 checks the condition of the ground between the antenna base and the vehicle body as follows:

(1) Connect one ohmmeter test lead to the fender on an exposed metal area (paint and e-coat must be penetrated to obtain continuity). Connect the other test lead to the outer crimp on the antenna coaxial cable connector.

(2) The resistance should be less than (1) ohm.

(3) If the resistance is more than (1) ohm, clean and/or tighten the antenna base to the fender mounting hardware.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove glove box from instrument panel, (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

ANTENNA BODY AND CABLE (Continued)

(3) Disconnect antenna cable connector from extension cable (Fig. 2).
(4) Remove right kick trim panel.
(5) Disengage rubber grommet insulator from door hinge pillar.
(6) Pull antenna cable through hinge pillar into opening between door hinges.
(7) Hoist and support vehicle on safety stands.
(8) Remove front wheel.
(9) Remove front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - REMOVAL).
(10) Remove antenna mast from antenna base (Fig. 3).
(11) Remove plastic cap from the cap nut. Using cap nut tool, remove cap nut holding antenna base to front fender (Fig. 4).
(12) Remove antenna base from under front fender.

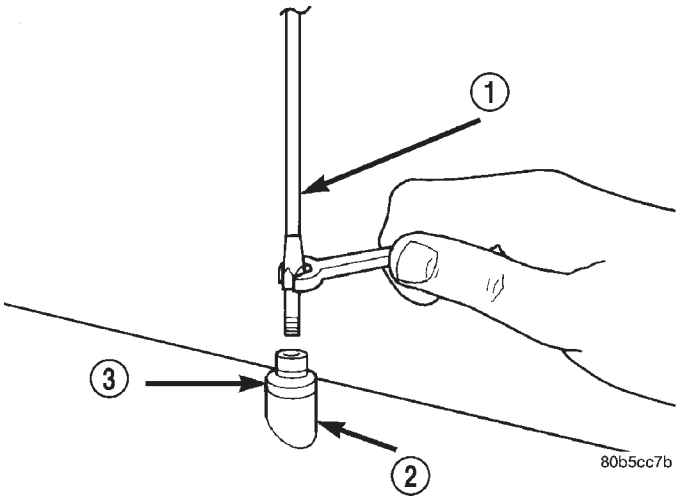

Fig. 3 Antenna Mast

1 - ANTENNA MAST
2 - ADAPTER
3 - CAP NUT

INSTALLATION

(1) Install antenna base to underside of front fender.
(2) Install cap nut holding antenna base to front fender.
(3) Install plastic cap to the cap nut.
(4) Install antenna mast to antenna base.
(5) Install front wheelhouse splash shield.
(6) Install front wheel.
(7) Lower vehicle.
(8) Push antenna cable through opening in hinge pillar.
(9) Insert rubber grommet into door hinge pillar.
(10) Install kick panel.

(11) Connect antenna cable connector to extension cable.

(12) Install glove box to instrument panel.
(13) Connect the battery negative cable.

ANTENNA MODULE - EXPORT

DESCRIPTION

The antenna module is an electromagnetic circuit component designed to capture and enhance RF (Radio Frequency) signals in both the AM and FM broadcast bands. The antenna module is mounted to the right rear roof rail under the headliner. The module is grounded through the mounting bracket and fastener. The module has a two wire electrical connector that connects to the integral radio antenna, located on the right rear quarter glass. There is also an electrical connector for battery voltage and a coax cable connector.

OPERATION

The antenna module receives both AM and FM radio signals supplied by the side window integral radio antenna system and selectively amplifies them. The amplified signal is then sent through the body length coax cable to the radio input.

DIAGNOSIS AND TESTING - ANTENNA MODULE - EXPORT

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AM RECEPTION, WEAK FM RECEPTION	1. Antenna module to antenna connector open or disconnected.	1. Repair open, reconnect antenna module connector to glass mounted antenna.
	2. Coax open or disconnected.	2. Repair open, reconnect coax.
	3. No battery power at antenna module.	3. Check fuse. if okay, repair open in battery voltage circuit.
NO AM OR FM RECEPTION	1. Coax disconnected at radio.	1. Reconnect coax.
	2. Coax shorted to ground.	2. Repair or Replace coax
WEAK OR NO AM/FM RECEPTION	1. Antenna Module faulty.	1. Substitute known good module. If reception improves, Antenna Module was faulty.

ANTENNA MODULE - EXPORT (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Lower headliner as necessary to access antenna module (Fig. 5).

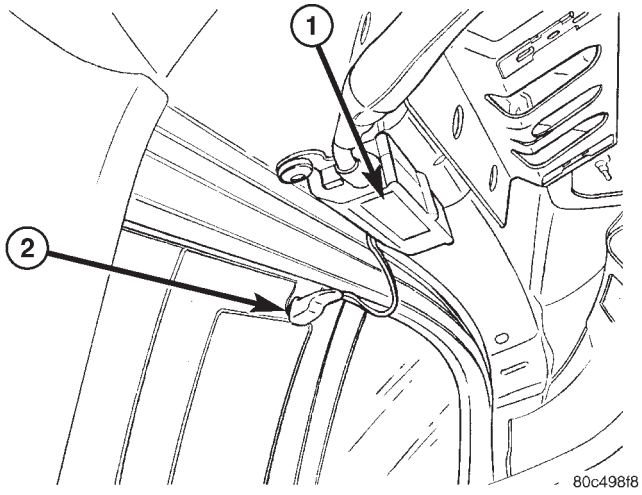

Fig. 5 ANTENNA MODULE

1 - ANTENNA MODULE
2 - ANTENNA MODULE CONNECTOR

(3) Disconnect antenna coax cable lead and electrical harness connector from antenna module.

(4) Disconnect the antenna module connector from the quarter glass.

(5) Remove the mounting screw and the antenna module.

INSTALLATION

(1) Install the antenna module and the mounting fastener.

(2) Connect the antenna connector to the quarter glass.

(3) Connect the antenna lead and electrical connector to the antenna module.

(4) Raise and install headliner.

(5) Connect the battery negative cable.

CD CHANGER

DESCRIPTION

The 4 Disc In-Dash CD Changer (if equipped) is located in the instrument panel below the radio. The remote changer does not use a cartridge or magazine for the CD's. Up to 4 CD's can be directly loaded into this unit.

OPERATION

Due to its compact design, the CD changer can carry out only one operation at a time. For example, you can not load a new disc while playing another at the same time. Each operation happens sequentially.

The radio unit provides control over all features of the CD changer with the exception of the CD load and eject functions, which are controlled by buttons located on the front of the CD changer. All features you would expect, such as Disc Up/Down, Track Up/Down, Random and Scan are controlled by the radio, which also displays all relevant CD changer information on the radio display.

The CD changer contains a Load/Eject button and an indicator LED for each of the four disc positions as well as an illuminated disc opening. The individual LED indicates whether a CD is currently loaded in that particular chamber of the CD changer. Pressing the individual Load/Eject button for a particular chamber will eject a disc currently present in that chamber. If the chamber is currently empty, actuating the Load/Eject button will position that chamber to receive and load a new disc in that chamber.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove screws holding CD changer.

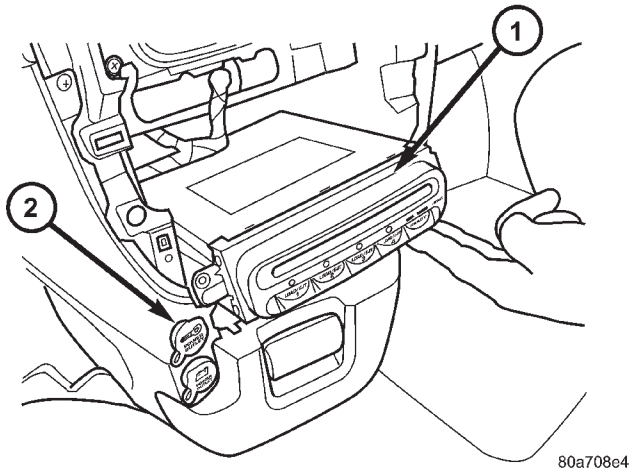

Fig. 6 CD - CHANGER

1 - CD-CHANGER
2 - POWER OUTLET

(3) Disconnect the wire connector from the back of the CD changer.

(4) Remove the CD changer from the vehicle (Fig. 6).

INSTALLATION

(1) Reconnect the wire connector to the CD changer.

(2) Insert the CD changer into the instrument panel.

CD CHANGER (Continued)

NOTE: Use care when inserting CD changer so that cable is not pinched or trapped against instrument panel.

(3) Install screws holding CD changer.
(4) Reconnect the battery negative cable.

INSTRUMENT PANEL ANTENNA CABLE

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.
(2) Remove glove box (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
(3) Disconnect extension cable end from antenna cable end.
(4) Disconnect cable hanger clip from HVAC unit.
(5) Remove radio as necessary to gain access to extension cable (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
(6) Disconnect extension cable from back of radio.
(7) Remove extension cable from vehicle.

INSTALLATION

(1) Install extension cable to vehicle.
(2) Connect extension cable to back of radio.
(3) Install radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
(4) Connect cable hanger clip to HVAC unit.
(5) Connect extension cable end to antenna cable end.
(6) Install glove box (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
(7) Connect the battery negative cable.

QUARTER GLASS INTEGRAL ANTENNA - EXPORT

DESCRIPTION

The quarter glass integral antenna element is bonded to the right rear quarter glass and is replaced with the glass assembly only (Fig. 7).

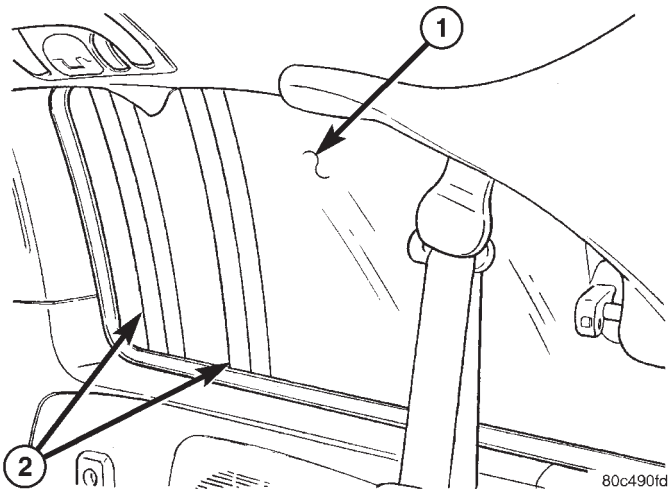

Fig. 7 QUARTER GLASS INTEGRAL ANTENNA

1 - REAR QUARTER GLASS
2 - ANTENNA

OPERATION

The integral antenna receives RF (Radio Frequencies) and sends them to the antenna module for amplification.

DIAGNOSIS AND TESTING - QUARTER GLASS INTEGRAL ANTENNA - EXPORT

The antenna grid pattern is divided into two separate patterns. Each terminal connects to a separate grid pattern, one for AM and the other for FM.

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. To detect breaks in the integral antenna elements, the following procedure is required:

(1) Disconnect the antenna module connector from the antenna terminals on the glass.

(2) Using an ohmmeter, place a lead on one of the terminals and check each end of the grid pattern connected to this terminal for continuity. If continuity is not present, move one lead through the grid in progression starting at the terminal with the other lead on the terminal until continuity is lost. Repeat procedure for the other terminal. A break in the antenna grid can be repaired using a Mopar Rear Window Defogger Repair Kit (Part Number 4267922) or equivalent. (Refer to 8 - ELECTRICAL/HEATED GLASS/WINDSHIELD GRID - STANDARD PROCEDURE).

RADIO

DIAGNOSIS AND TESTING - RADIO

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If the vehicle is equipped with remote radio switches located on the back of the steering wheel spokes, and the problem being diagnosed is related to one of the symptoms listed below, be certain to check the remote radio switches and circuits as described in this group, prior to attempting radio diagnosis or repair.

- Stations changing with no remote radio switch input
- Radio memory presets not working properly
- Volume changes with no remote radio switch input
- Remote radio switch buttons taking on other functions
- CD player skipping tracks
- Remote radio switch inoperative.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

(1) Check the fuse(s) in the junction block and the Integrated Power Module (IPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse(s).

(2) Check for battery voltage at the fuse in the (IPM). If OK, go to Step 3. If not OK, repair the open circuit to the battery as required.

(3) Turn the ignition switch to the ON position. Check for battery voltage at the fuse in the junction block. If OK, go to Step 4. If not OK, repair the open circuit to the ignition switch as required.

(4) Turn the ignition switch to the OFF position. Remove the radio, but do not unplug the wire harness connectors. Check for continuity between the radio chassis and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open radio chassis ground circuit as required.

(5) Connect the battery negative cable. Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output circuit cavity of the radio wire harness connector. If OK, go to Step 6. If not OK, repair the open circuit as required.

(6) Turn the ignition switch to the OFF position. Check for battery voltage at the fused B(+) circuit cavity of the radio wire harness connector. If OK, replace the faulty radio. If not OK, repair the open circuit to the Ignition-Off Draw (IOD) fuse as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove cup holder.

(3) Remove trim panel above cupholder by pulling straight out.

(4) Remove center instrument panel trim panel.

(5) Remove screws holding radio to instrument panel.

(6) Pull radio rearward to gain access to the back of radio (Fig. 8).

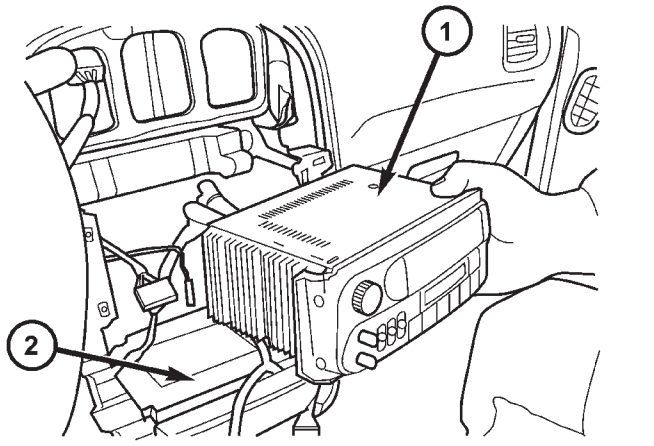

Fig. 8 RADIO

1 - RADIO
2 - CD-PLAYER

(7) Disconnect the antenna cable by pulling the locking antenna connector away from the radio (Fig. 9).

(8) Disconnect bolt holding ground strap to the radio (if equipped).

RADIO (Continued)

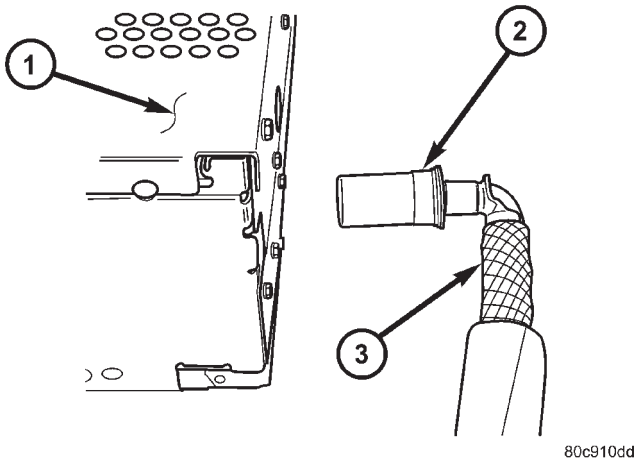

Fig. 9 ANTENNA TO RADIO

1 - RADIO
2 - LOCKING ANTENNA CONNECTOR
3 - INSTRUMENT PANEL ANTENNA CABLE

(9) Disconnect the wire connectors from the back of the radio.

INSTALLATION

(1) Connect wire harness to back of radio.
(2) Install bolt holding ground strap to the radio (if equipped).
(3) Connect antenna cable to back of radio.
(4) Position radio into instrument panel.
(5) Install screws holding radio to instrument panel.
(6) Install center instrument panel trim.
(7) Install trim panel above cupholder.
(8) Install cupholder.
(9) Connect battery negative cable.

RADIO NOISE SUPPRESSION COMPONENTS

DESCRIPTION

Radio noise suppression devices are factory-installed standard equipment on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of “buzzing,” “hissing,” “popping,” “clicking,” “crackling,” and/or “whirring” sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with factory-installed radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Factory-installed radio noise suppression is accomplished primarily through circuitry or devices that are integral to the factory-installed radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI.

OPERATION

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

REMOTE SWITCHES

DESCRIPTION

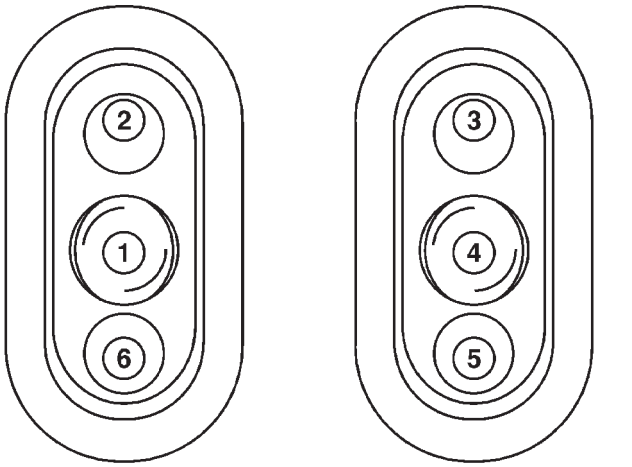

Fig. 10 Remote Radio Switch Operational View

1 - PRESET SEEK
2 - SEEK UP
3 - VOLUME UP
4 - MODE
5 - VOLUME DOWN
6 - SEEK DOWN

A remote radio control switch option is available on some models. Two rocker-type switches are mounted on the back (instrument panel side) of the steering wheel spokes (Fig. 10). The switch on the left spoke is the seek switch and has seek up, seek down, and preset station advance functions. The switch on the right spoke is the volume control switch and has volume up, and volume down functions. The switch on the right spoke also includes a “mode” control that allows the driver to sequentially select AM radio, FM radio, cassette player, CD player or CD changer (if equipped).

OPERATION

These switches are resistor multiplexed units that are hard-wired to the Body Control Module (BCM) through the clockspring. The BCM sends the proper messages on the Programmable Communications Interface (PCI) data bus network to the radio receiver. For diagnosis of the BCM or the PCI data bus, the use of a DRB III® scan tool and the proper Diagnostic Procedures manual are recommended. For more information on the operation of the remote radio switch controls, refer to the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING - REMOTE SWITCHES

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Disconnect and isolate the battery negative cable. Wait two minutes for the airbag system capacitor to discharge before further service.

(2) Remove the remote radio switch(es) from the steering wheel. (Refer to 8 - ELECTRICAL/AUDIO/ REMOTE SWITCHES - REMOVAL).

(3) Use an ohmmeter to check the switch resistance as shown in the Remote Radio Switch Test table (Fig. 11).

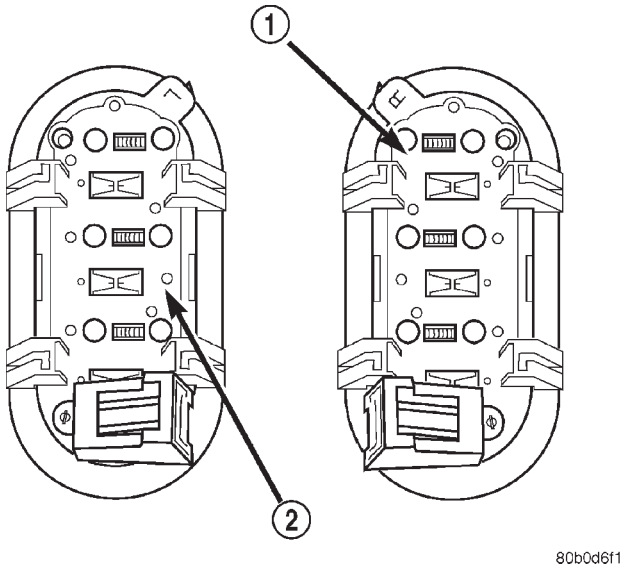

Fig. 11 Remote Radio Switches

1 - WHITE REAR SWITCH
2 - BLACK REAR SWITCH

REMOTE SWITCHES (Continued)

REMOTE RADIO SWITCH TEST

SWITCH POSITION	RESISTANCE
VOLUME UP	7320 OHMS
VOLUME DOWN	1210 OHMS
SEEK UP	4530 OHMS
SEEK DOWN	2050 OHMS
PRE-SET STATION ADVANCE	10 OHMS

NOTE: The right remote radio switch back is white in color. The left switch back is black in color. The right/left remote radio switch orientation is with the steering wheel installed, and driver in drivers seat.

(4) If the switch resistance checks OK, go to Step 5. If not OK, replace the faulty switch.

(5) Check for continuity between the ground circuit cavity of the switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open circuit as required.

(6) Unplug the 24-way white wire harness connector from the Body Control Module (BCM). Check for continuity between the radio control circuit cavity of the remote radio switch wire harness connector and a good ground. There should be no continuity. If OK, go to Step 7. If not OK, repair the short circuit as required.

(7) Check for continuity between the radio control circuit cavities of the remote radio switch wire harness connector and the BCM wire harness connector. There should be continuity. If OK, refer to the proper Diagnostic Procedures manual to test the BCM and the PCI data bus. If not OK, repair the open circuit as required.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable. Wait two minutes for the airbag system capacitor to discharge before further service.

(2) Remove the driver side airbag module from the vehicle. Refer to ELECTRICAL/RESTRAINTS/DRIVER AIR BAG.

(3) Remove the steering wheel from the steering column. Refer to STEERING/COLUMN/STEERING WHEEL.

(4) Unplug the wire harness connector from the remote radio switch (s).

(5) Remove three screws securing steering wheel rear cover.

(6) Remove the remote radio switch from the steering wheel by depressing tabs on each side of each switch.

NOTE: The right remote radio switch back is white in color. The left switch back is black in color. The right/left remote radio switch orientation is with the steering wheel installed, and driver in drivers seat.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Install remote radio switch to the steering wheel.

(2) Install three screws securing steering wheel rear cover.

(3) Connect the wire harness to the remote radio switch.

(4) Install the steering wheel. Refer to STEERING/COLUMN/STEERING WHEEL.

(5) Install the driver side airbag module. Refer to ELECTRICAL/RESTRAINTS/DRIVER AIRBAG.

(6) Connect the battery negative cable.

SPEAKER

DIAGNOSIS AND TESTING - SPEAKER

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

SPEAKER (Continued)

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

(1) If all speakers are inoperative, check the radio fuses in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 3.

(3) Turn the radio receiver OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. Remove the radio receiver.

(4) Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the radio receiver wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted speaker feed (+) and/or return (-) circuits(s) to the speaker as required.

(5) Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuits(s) as required.

REMOVAL

D-PILLAR SPEAKER

(1) Disconnect and isolate the battery negative cable.
(2) Remove rear header trim (right side speaker).
(3) Remove jack cover (left side speaker).
(4) Remove liftgate scuff plate.
(5) Remove upper seat belt bolt. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT OUTBOARD FRONT - REMOVAL).
(6) Partially remove quarter trim panel to access the D-pillar speaker.
(7) Slide the speaker from the retainer (Fig. 12).

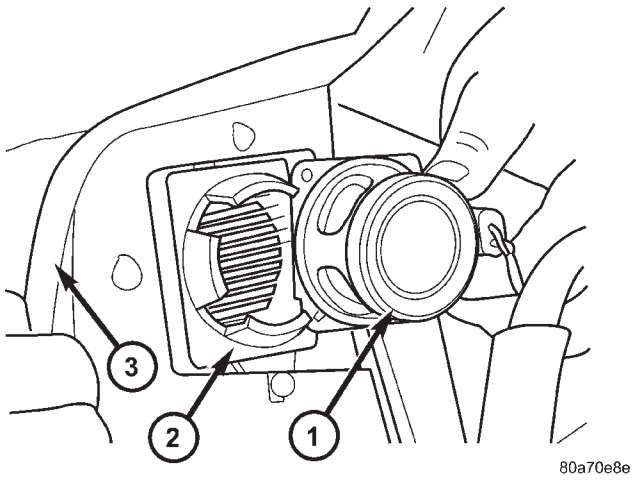

Fig. 12 D-PILLAR SPEAKER

1 - SPEAKER
2 - RETAINER
3 - TRIM PANEL

(8) Disconnect the wire harness connector from the speaker.

FRONT DOOR SPEAKER

(1) Disconnect and isolate the battery negative cable.
(2) Remove the front door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
(3) Remove the speaker mounting screws (Fig. 13).

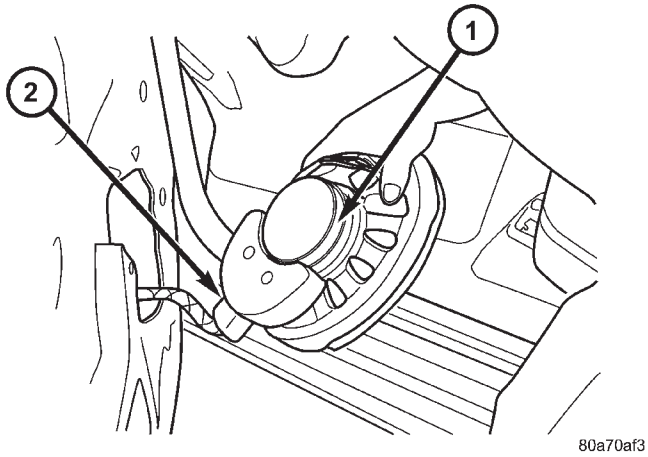

Fig. 13 DOOR SPEAKER

1 - SPEAKER
2 - WIRE HARNESS CONNECTOR

(4) Disconnect wire harness connector and remove speaker from door.

SPEAKER (Continued)

INSTRUMENT PANEL SPEAKER

(1) Disconnect and isolate the battery negative cable.
(2) Remove the A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
(3) Remove instrument panel top pad (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - REMOVAL).
(4) Remove speaker screws (Fig. 14).

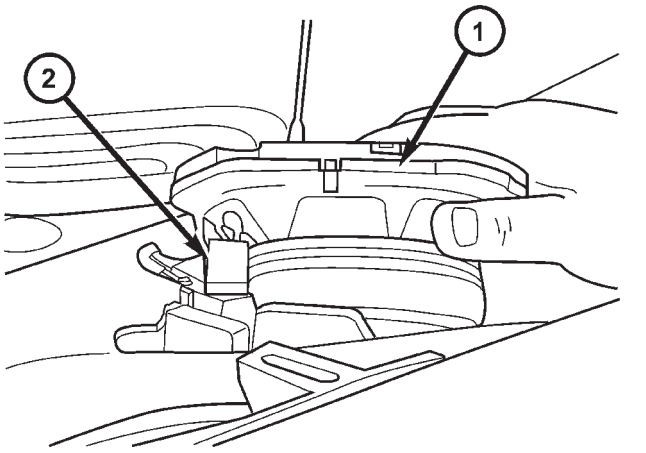

Fig. 14 INSTRUMENT PANEL SPEAKER

1 - SPEAKER
2 - WIRE HARNESS CONNECTOR

(5) Disconnect wire harness connector and remove speaker.

QUARTER PANEL SPEAKER

(1) Disconnect and isolate the battery negative cable.
(2) Using a trim stick, gently pry speaker grill from trim panel.
(3) Remove speaker retaining screws (Fig. 15).
(4) Disconnect wire harness connector and remove speaker.

INSTALLATION

D-PILLAR SPEAKER

(1) Connect the wire harness connector to the speaker.
(2) Slide the speaker into the retainer.
(3) Install quarter panel trim.
(4) Install upper seat belt bolt (right side).
(5) Install liftgate scuff plate.
(6) Install rear header trim (right side).

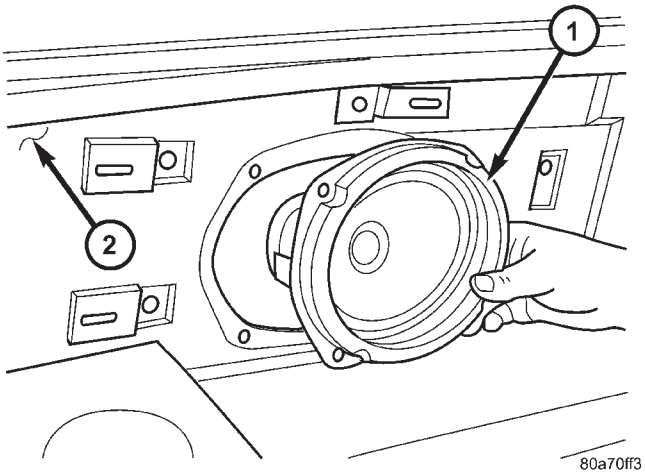

Fig. 15 QUARTER PANEL SPEAKER

1 - SPEAKER
2 - TRIM PANEL

(7) Install jack cover (left side).
(8) Connect battery negative cable.

FRONT DOOR SPEAKER

(1) Connect the wire harness connector and install speaker to door.
(2) Install the speaker mounting screws.
(3) Install the front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
(4) Connect battery negative cable.

INSTRUMENT PANEL SPEAKER

(1) Connect the wire harness connector and install speaker to instrument panel.
(2) Install the speaker mounting screws.
(3) Install instrument panel top pad (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - INSTALLATION).
(4) Install A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).
(5) Connect battery negative cable.

QUARTER PANEL SPEAKER

(1) Connect the wire harness connector and install speaker to trim panel.
(2) Install the speaker mounting screws.
(3) Install speaker grill by pressing into the trim panel.
(4) Connect battery negative cable.

CHIME/BUZZER

DESCRIPTION

The chime/buzzer system provides the driver with warning chimes for:

- Seat Belt
- Exterior Lamps ON
- Key-In Ignition
- Engine Temperature Critical
- Turn Signals ON
- Dome Lamp ON
- Low Oil Pressure
- High Speed Warning
- Warning Lamp Announcement
- Key-In Accessory
- Low/High Tire Pressure
- Service Tire Pressure Monitor (TPM)

HIGH SPEED WARNING - EXPORT

The chime will sound, acting as a warning to the driver that the vehicle speed has exceeded 120 ± 3 kph (75 ± 2 mph).

OPERATION

The Chime/Buzzer Warning System is diagnosed using a DRB lll® scan tool. Refer to the proper Body Diagnostic Procedures Manual.

HIGH SPEED WARNING - EXPORT

When the vehicle speed sensor sees 120 ± 3 kph (75 ± 2 mph), it sends a PCI data bus message to the Body Control Module (BCM). The BCM then turns on the chime to let the driver know that the vehicle has reached a speed greater than 120 ± 3 kph (75 ± 2 mph). This audible message will continue until the vehicle is slowed below the predetermined speed.

WARNING

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CHIME SYSTEM

NO TONE WHEN IGNITION SWITCH IS TURNED ON AND DRIVER'S SEAT BELT IS NOT BUCKLED.

(1) Using a DRB lll® scan tool, actuate chime (BCM actuates).

(2) Using a voltmeter, check for voltage:

(a) BCM has two battery feeds at pin 1 and pin 5 of the 6–way connector.

(b) Pin 5 of the (BX2) 32 way connector of the BCM for ignition feed.

(c) Check voltage (PX2) connector, pin 34 for 12v.

(d) If voltage OK, go to step Step 3

(e) If NO voltage repair as necessary. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

(3) Check driver's seat belt buckle switch input (form ORC) for a closed circuit when not buckled. If input not seen, look for open in wiring or switch. The switch is grounded when belt is not buckled.

(4) Verify PCI data bus communication between ORC and BCM.

NO FASTEN SEAT BELT LAMP WHEN IGNITION SWITCH IS TURNED ON.

(1) Check for burned out lamp.

(2) Using a voltmeter check for voltage at the cluster connccctor:

(a) Pin 2 of the mechanical instrument cluster for battery feed.

(b) Pin 11 of the mechanical instrument cluster for ignition voltage.

(3) Repair as necessary.

FASTEN SEAT BELT LAMP OR TONE CONTINUES FOR MORE THAN 10 SECONDS AFTER SEAT BELTS ARE FASTENED AND DRIVER'S DOOR IS CLOSED.

Refer to the proper Body Diagnostic Procedures manual.

NO TONE WHEN PARK OR HEADLAMPS ARE ON AND DRIVER'S DOOR IS OPEN.

Make sure ignition is in lock position with the key removed.

(1) Check the BCM DTC's and BCM sensors to verify the door is open. Repair as necessary.

(2) Actuate Chime (BCM actuates).

(3) Inspect BCM connectors and wires for proper connection.

(4) Measure with a voltmeter the voltage (12v) on BCM connector (PX2) pin 34 with harness connected.

DIAGNOSIS AND TESTING - DOME LAMP ON CHIME

The dome lamp on chime will warn the driver that the dome lamps have been left on.

When the ignition is OFF and the key is out of the ignition:

- Driver's door OPEN (door ajar switch is closed to ground) and
- Dome lamps are ON (dome lamp switch is closed to ground),

The chime will sound continuously until the drivers door is closed, dome lamps turned OFF or until the battery protection time out of 15 minutes has expired. Chime rate: 168 to 192 chimes per minute.

DIAGNOSIS AND TESTING - ENGINE TEMPERATURE CRITICAL CHIME

The engine temperature critical chime will warn the driver that the vehicle's engine is overheating. While monitoring the coolant temperature, the Powertrain Control Module (PCM) will send on the PCI data bus as engine temperature every 1.376 seconds to the cluster. The MIC calculates engine temperature and determines if a warning should occur. This feature is functional only with the Ignition Switch in the Run/Start position.

When the engine temperature reaches 122°C (252°F) the MIC requests a chime from the BCM and the engine temperature lamp comes ON. The MIC turns OFF the lamp when the engine temperature reaches 117°C (242°F). The MIC will chime continuously (request from the BCM). The chime will turn OFF after four minutes or when the temperature reaches 117°C (242°F), which ever occurs first.

DIAGNOSIS AND TESTING - EXTERIOR LAMPS ON CHIME

The exterior lamp on chime will warn the driver that the exterior lights have been left on.

With the ignition switch OFF/key out of ignition:

- Driver's door is open (door ajar switch is closed to ground)
- Parking lamps or headlamps ON (parking lamp switch is closed to ground)

The chime will sound until lights are turned OFF, driver's door closed or until the battery protection time out of 3 minutes has expired.

Chime rate: 168 to 192 chimes per minute.

To test the exterior lamps left on function:

- Turn ignition off
- Remove ignition key
- Turn exterior lamps on with driver's door open. Chime should sound until lamps are turned off or driver's door is closed.

DIAGNOSIS AND TESTING - KEY-IN IGNITION CHIME

The key-in ignition chime will act as a warning to the driver that the ignition key has been left in the

ignition switch. This chime will operate for all ignition positions except ON and START.

With the ignition switch in the OFF position ONLY:

- Driver's door is open/ajar (door ajar switch is closed to ground)
- Key is in the ignition switch (ignition is in the LOCK position)

The chime will sound until one of the above conditions is removed or until battery protection time out (15 min.) has expired. Chime rate: 168 to 192 chimes per minute.

To test the key-in ignition function, insert key into the ignition and open drivers door. Do not turn ignition ON. Chime should sound until key is removed from ignition or drivers door is closed.

For diagnosis and testing of the Key-In chime for other ignition positions, use the same testing procedure as above but with the key in the accessory or unlock position.

DIAGNOSIS AND TESTING - LOW OIL PRESSURE CHIME

The low oil pressure chime will warn the driver that the engine oil pressure is low. The oil pressure switch will close to ground during a low oil pressure condition. The oil pressure lamp will illuminate in the message center. The PCM will monitor the oil pressure switch and signal a low oil pressure condition. A continuous four minute warning chime will sound and the oil pressure lamp will come ON when the following conditions are met:

- Ignition on and engine not cranking
- Engine running at 420 to 480 rpm for 10 seconds
- Oil pressure switch closed to ground for (1 second minimum, 2 seconds maximum)

Chime rate: 168 to 192 chimes per minute.

DIAGNOSIS AND TESTING - SEAT BELT CHIME

The seat belt chime will sound for 4 to 8 seconds, when the ignition is turned on and the driver's seat belt is not buckled (seat belt switch is closed to ground). This is a reminder to the driver to buckle the seat belt. The seat belt lamp is controlled by the ORC. The cluster will also bulb check the seat belt warning lamp for 6 seconds. Buckling the driver's seat belt before the time out has expired will cause the chime to stop immediately. Chime rate: 38 to 62 chimes per minute but the lamp will remain on until 6 seconds have expired.

To test the seat belt warning system, the ignition switch must be in the OFF position for 1 minute before starting the test. Turn the ignition switch to the on position with the driver's seat belt not buckled. The seat belt warning lamp should light and the chime should sound 4 to 8 seconds.

DIAGNOSIS AND TESTING - SEAT BELT LAMP

The seat belt lamp in the instrument cluster signals the vehicle passengers to fasten their seat belts. The seat belt lamp is illuminated directly by the instrument cluster for 6 seconds after the instrument cluster receives the message from the ORC. The seat belt lamp is therefore illuminated for 6 seconds whenever the ignition switch is moved to run/start position.

(1) While ignition is off, the seat belt lamp will not be illuminated.

(2) The ignition power feed status will be updated every 250 milliseconds or on change.

(3) This lamp will be checked by the instrument cluster for 6 seconds with every run/start cycle of the ignition switch.

DIAGNOSIS AND TESTING - TIRE PRESSURE MONITOR

The Tire Pressure Warning chime, as well as the information being displayed in the EVIC, will act as a warning to the driver that a tire has either Low or High pressure, or if there is a need to service the Tire Pressure Monitor System. With the ignition switch in the ON position and the “Low Pressure/ High Pressure” or “Service the TPM System” displayed on the EVIC display, a single chime will sound.

DIAGNOSIS AND TESTING - TURN SIGNAL ON CHIME

The turn signal on chime will warn the driver that the turn signals have been left on. When the body control module receives a turn signal input for 1.0 mile, vehicle speed is greater than 24 km/h (15 mph), the chime will sound continuously until the turn signal is turned OFF. If vehicle speed drops below 24 km/h (15 mph) prior to the warning being activated, the accumulated distance traveled will be reset. The turn signal chime is not activated when the emergency flashers are turned on. Chime rate: 50 ± 12 chimes per minute.

For the turn signal warning system to operate:

- Must have input from either the right or left turn signal lamps. Creates a voltage change between 0 and battery voltage.
- The vehicle speed sensor sends a message to the Powertrain Control Module that vehicle has exceeded 24 km/h (15 mph) for 1.0 mile).
- When the above two conditions are met, the chime will sound. The chime will stop when no further voltage change is detected.

- If hazard warning signals are pulsing, no chime will sound.
- If speed drops below 24 km/h (15 mph) before the warning is issued, the warning will not be issued and the distance counter will be reset.
- If turn signal lamps are not working properly, the chime will not sound.
- When using the scan tool, refer to the proper Body Diagnostic Manual for the procedure.

DIAGNOSIS AND TESTING - WARNING LAMP ANNOUNCEMENT CHIME

The warning lamp announcement chime will warn the driver to scan the instrument cluster to observe which warning lamp is illuminated. Whenever the volts, low fuel, airbag, door ajar or gate ajar lamps are first illuminated, the chime will sound one tone. The door/liftgate ajar warning lamp announcement chime sounds only if the vehicle speed is above 4 m.p.h.

Two seconds after ignition switch is turned ON or until the seat belt warning chime ends, all warning announcement chimes will be consolidated into one warning announcement. This will occur 2 seconds after the seat belt warning chime ends. If a warning announcement should occur while another warning chime in progress (turn signal, low oil pressure or high speed warnings), no additional chimes will sound after the chime in progress ends. All associated lamps will be illuminated, and the active chime will be the warning announcement.

ELECTRONIC CONTROL MODULES

STANDARD PROCEDURE - PCM/SKIM PROGRAMMING

NOTE: Before replacing the PCM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM driver/control circuit failures are caused by internal component failures (i.e. relay and solenoids) and shorted circuits (i.e. pull-ups, drivers and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

When a PCM (SBEC) and the SKIM are replaced at the same time perform the following steps in order:

(1) Program the new PCM (SBEC)
(2) Program the new SKIM
(3) Replace all ignition keys and program them to the new SKIM.

PROGRAMMING THE PCM (SBEC)

The SKIS Secret Key is an ID code that is unique to each SKIM. This code is programmed and stored in the SKIM, PCM and transponder chip (ignition keys). When replacing the PCM it is necessary to program the secret key into the new PCM using the DRB III. Perform the following steps to program the secret key into the PCM.

(1) Turn the ignition switch on (transmission in park/neutral).
(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.
(3) Select PCM REPLACED (GAS ENGINE).
(4) Enter secured access mode by entering the vehicle four-digit PIN.
(5) Select ENTER to update PCM VIN.

NOTE: If three attempts are made to enter secure access mode using an incorrect PIN, secured access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. (Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary).

(6) Press ENTER to transfer the secret key (the SKIM will send the secret key to the PCM).
(7) Press Page Back to get to the Select System menu and select ENGINE, MISCELLANEOUS, and SRI MEMORY CHECK.
(8) The DRB III will ask, Is odometer reading between XX and XX? Select the YES or NO button on the DRB III. If NO is selected, the DRB III will read, Enter odometer Reading<From I.P. odometer>. Enter the odometer reading from the Instrument Panel and press ENTER.

PROGRAMMING THE SKIM

(1) Turn the ignition switch on (transmission in park/neutral).
(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.
(3) Select PCM REPLACED (GAS ENGINE).
(4) Program the vehicle four-digit PIN into SKIM.
(5) Select COUNTRY CODE and enter the correct country.

NOTE: Be sure to enter the correct country code. If the incorrect country code is programmed into SKIM, the SKIM must be replaced.

(6) Select YES to update VIN (the SKIM will learn the VIN from the PCM).
(7) Press ENTER to transfer the secret key (the PCM will send the secret key to the SKIM).
(8) Program ignition keys to SKIM.

NOTE: If the PCM and the SKIM are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new SKIM.

PROGRAMMING IGNITION KEYS TO THE SKIM

(1) Turn the ignition switch on (transmission in park/neutral).
(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.
(3) Select PROGRAM IGNITION KEY'S.
(4) Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: A maximum of eight keys can be learned to each SKIM. Once a key is learned to a SKIM it (the key) cannot be transferred to another vehicle.

If ignition key programming is unsuccessful, the DRB III will display one of the following messages:

Programming Not Attempted - The DRB III attempts to read the programmed key status and there are no keys programmed into SKIM memory.

Programming Key Failed (Possible Used Key From Wrong Vehicle) - SKIM is unable to program key due to one of the following:

- faulty ignition key transponder
- ignition key is programmed to another vehicle.

8 Keys Already Learned, Programming Not Done - SKIM transponder ID memory is full.

ELECTRONIC CONTROL MODULES (Continued)

(5) Obtain ignition keys to be programmed from customer (8 keys maximum).

(6) Using the DRB III, erase all ignition keys by selecting MISCELLANEOUS and ERASE ALL CURRENT IGN. KEYS.

(7) Program all ignition keys.

Learned Key In Ignition - Ignition key transponder ID is currently programmed in SKIM memory.

ADJUSTABLE PEDAL MODULE

DIAGNOSIS AND TESTING - ADJUSTABLE PEDAL MODULE

Refer to Appropriate Diagnostic Information.

REMOVAL

(1) Remove adjustable pedal assembly from vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PEDAL - REMOVAL)

(2) Disconnect 2 wiring connectors from module (Fig. 1).

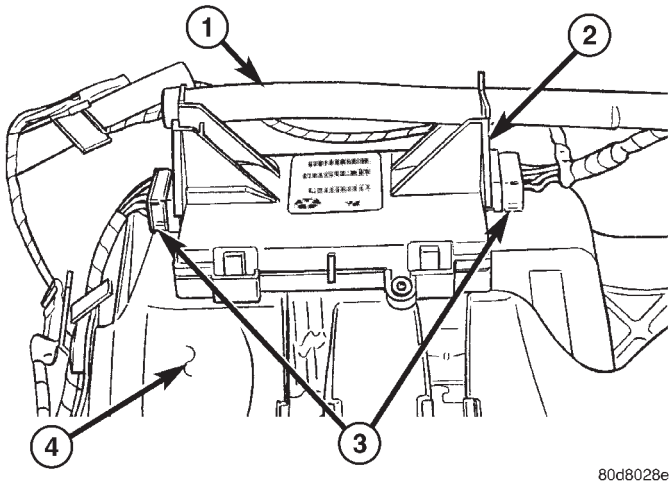

Fig. 1 Adjustable Pedal Module

1 - CABLE
2 - ADJUSTABLE PEDAL MODULE
3 - WIRING CONNECTORS
4 - ADJUSTABLE PEDAL ASSEMBLY

(3) Remove cable from routing clips on module (Fig. 1).

(4) Remove module mounting screws.

(5) Remove module.

INSTALLATION

(1) Install module on pedal assembly and install mounting screws.

(2) Place cable in routing clips on module (Fig. 1).

(3) Connect 2 wiring connectors to module (Fig. 1).

(4) Install adjustable pedal assembly. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PEDAL - INSTALLATION)

BODY CONTROL MODULE

DESCRIPTION

The Body Control Module (BCM) is located in the passenger compartment, attached to the bulkhead underneath the left side of the instrument panel.

The BCM utilizes integrated circuitry and information carried on the Programmable Communications Interface (PCI) data bus network along with many hard wired inputs to monitor many sensor and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the BCM allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the PCI data bus.

OPERATION

The Body Control Module (BCM) supplies vehicle occupants with visual and audible information and controls various vehicle functions. To provide and receive information, the BCM is interfaced to the vehicle's serial bus communications network, referred to as the Programmable Communications Interface (PCI) bus.

This network consists of the;

- Powertrain Control Module (PCM)
- Transmission Control Module (TCM)
- Mechanical Instrument Cluster (MIC)
- Occupant Restraint Controller (ORC)
- Compass/Mini-Trip Computer (CMTC)
- Electronic Vehicle Information Center (EVIC)
- Controller Antilock Brake (CAB)
- HVAC Control Module
- Sliding Door Control Modules (driver and passenger side doors)
- Power Liftgate Module (PLG)
- Audio system equipped with RAZ, RBU, RBK, and RBB radios.
- Side Impact Airbag Control Module (SIACM)
- Memory Seat Module (MSM)
- Sentry Key Immobilizer Module (SKIM)

The BCM is operational when battery power is supplied to the module.

The BCM provides the following features:

- Power Door Locks
- Automatic Door Locks
- Battery Protection - The BCM will automatically turn off all exterior lamps after 3 minutes, and all

BODY CONTROL MODULE (Continued)

interior lamps after 15 minutes after the ignition is turned off, if they are not turned off by the driver.

- Chime Driver
- Compass/Mini-Trip support.
- Interior Lighting (Courtesy/Reading Lamps)
- BCM Diagnostic Reporting
- Electronic Liftgate Release (with Power Door Locks)
- Exterior Lighting
- Headlamp Time Delay (with/without Automatic Headlamps)
- Illuminated Entry
- Fade to Off Interior Lamps - This feature dims the interior lighting (courtesy lamps) gradually if the BCM does not receive any new inputs that would cause the interior lamps to remain on.
- Pulse Width Modulated Instrument Panel Dimming
- Door Lock Inhibit - This feature disables the door lock functions if the key is in the ignition and either front door is ajar. Pressing the Remote Keyless Entry (RKE) lock/unlock button under these conditions result in normal lock/unlock activation.

The BCM has the ability to LEARN additional features in the vehicle, provided the appropriate switch input and PCI data bus messages are received. Refer to the LEARNED FEATURES table.

LEARNED FEATURES

FEATURE	LEARNING KEY
CENTRAL LOCKING (WITH VTSS ONLY)	DRIVER/PASSENGER KEY CYLINDER SWITCH PRESENT
AUTOMATIC HEADLAMPS	PCI MESSAGE FROM OVERHEAD OR HEADLAMP SWITCH POSITION (AUTO)
REMOTE KEYLESS ENTRY	RKE MESSAGE RECEIVED FROM MODULE
FRONT FOG LAMPS	HEADLAMP SWITCH POSITION (PARK W/FRONT FOG LAMPS)
POWER SLIDING DOOR	PCI IFR RECEIVED FROM MODULE
THE BCM HAS FOUR SWITCH INPUTS FOR THE POWER SLIDING DOOR FEATURE; LOCATED IN THE OVERHEAD CONSOLE ARE THE LEFT AND RIGHT SIDE SLIDING DOOR SWITCHES TO ACTIVATE EITHER OR BOTH SLIDING DOORS UNDER THE PROPER CONDITIONS. ALSO ARE B-PILLAR SWITCHES LOCATED ON THE LEFT AND RIGHT B-PILLAR POSTS.	
POWER LIFTGATE	PCI IFR RECEIVED FROM MODULE
THE BCM HAS ONE LIFTGATE INPUT LOCATED IN THE OVERHEAD CONSOLE.	
POWER LOCKOUT SWITCH INPUT	
THE BCM HAS ONE LOCKOUT SWITCH INPUT THAT WHEN ENABLED WILL DISABLE THE B-PILLAR SLIDING DOOR SWITCHES FROM ACTIVATING EITHER SLIDING DOOR WHEN DEPRESSED.	
PCI AUDIO SYSTEM	PCI MESSAGE RECEIVED FROM MODULE
NOTE: SWAPPING OUT A HIGHLINE RADIO FOR A NON-PCI BUS RADIO (RAS) WILL RESULT IN IMPROPER HARDWIRE COMMUNICATION BETWEEN THE BCM AND THE NEW RAS RADIO. THE LCD DISPLAY WILL NOT ILLUMINATE PROPERLY DUE TO THE BCM LEARNING THAT A PCI RADIO EXISTS. HOWEVER, THE BCM CAN RE-INITIALIZE LEARNED FEATURES VIA THE USE OF THE DRB III® SCAN TOOL.	
REMOTE RADIO CONTROLS	REMOTE RADIO SWITCHES PRESENT
VEHICLE THEFT SECURITY	DRIVER/PASSENGER DOOR CYLINDER LOCK SWITCH
MEMORY SEAT AND MIRRORS	MEMORY SEAT SWITCH PRESENT AND OR PCI MESSAGE RECEIVED FROM MEMORY MODULE
ABS W/TRACTION CONTROL	PCI MESSAGE RECEIVED FROM CAB
SENTRY KEY IMMOBILIZER SYSTEM	PCI MESSAGE RECEIVED FROM SKIM OR VTSS PRESENT
ADJUSTABLE PEDAL MODULE	PCI MESSAGE RECEIVED FROM ADJUSTABLE PEDAL MODULE (APM)

BODY CONTROL MODULE (Continued)

When replacing a BCM there are three modules available:

- Base
- Midline
- Highline

The Midline controller is used on vehicles that have Power Door Locks and the Highline controller is used for vehicles equipped with a Power Liftgate. If a vehicle is equipped with the Vehicle Theft Security System, the Midline/Highline controller becomes a Premium when the theft feature is enabled.

CAUTION: Do not swap Body Control Modules between vehicles or body controller's off the shelf.

The BCM has internal diagnostic capability that assists in diagnosing the system error. When an OPEN or a SHORT circuit exists, the diagnostic tool can be used to read the BCM faults. The faults are very descriptive in identifying the appropriate feature that has faulted.

The only two faults that the BCM logs that conclude the replacement of a BCM are faults;

- # 01 - Internal BCM failure (replace BCM)
- # 1F - J1850 Internal Hardware Failure (replace BCM)

Otherwise the appropriate diagnostic procedures for each of the features should be taken when the BCM logs a fault.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the lower instrument panel silencer.

(3) Remove the knee blocker and reinforcement (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER REINFORCEMENT - REMOVAL).

(4) Disconnect the five wire connectors from the bottom of the Body Control Module (BCM).

(5) Move bulkhead wiring aside.

(6) Remove the screws holding the BCM to the bulkhead.

(7) Remove the BCM from the mounting bracket.

INSTALLATION

(1) Install the BCM to the mounting bracket.

(2) Install the screws holding the BCM to the bulkhead.

(3) Connect the five wire connectors to the bottom of the Body Control Module (BCM).

(4) Install the knee blocker and reinforcement (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER REINFORCEMENT - INSTALLATION).

(5) Install the lower instrument panel silencer.

(6) Connect the battery negative cable.

(7) Verify proper operation of BCM and its functions.

CONTROLLER ANTILOCK BRAKE

DESCRIPTION

The controller antilock brake (CAB) is a microprocessor-based device which monitors the antilock brake system (ABS) during normal braking and controls it when the vehicle is in an ABS stop. The CAB is mounted to the HCU as part of the integrated control unit (ICU) (Fig. 2). The CAB uses a 24-way electrical connector on the vehicle wiring harness. The power source for the CAB is through the ignition switch in the RUN or ON position. The CAB is on the PCI bus.

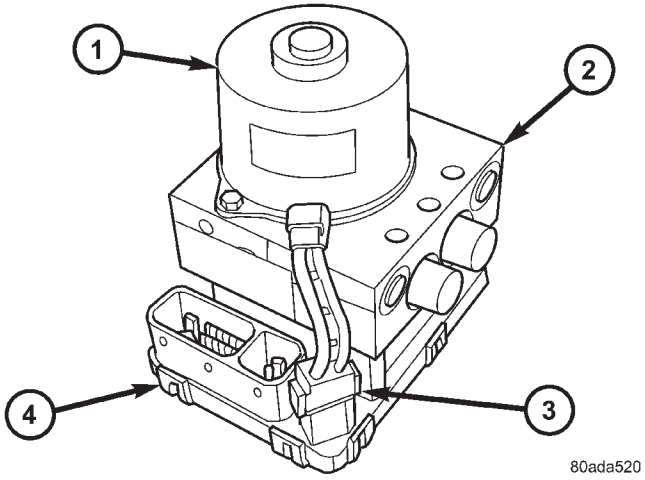

Fig. 2 Integrated Control Unit (ICU)

1 - PUMP/MOTOR
2 - HCU
3 - PUMP/MOTOR CONNECTOR
4 - CAB

OPERATION

The primary functions of the controller antilock brake (CAB) are to:

- Monitor the antilock brake system for proper operation.
- Detect wheel locking or wheel slipping tendencies by monitoring the speed of all four wheels of the vehicle.
- Control fluid modulation to the wheel brakes while the system is in an ABS mode.
- Store diagnostic information.
- Provide communication to the DRBIII® scan tool while in diagnostic mode.
- Illuminate the amber ABS warning indicator lamp.
- (With traction control only) Illuminate the TRAC ON lamp in the message center on the instrument panel when a traction control event occurs.

CONTROLLER ANTILOCK BRAKE (Continued)

- (with traction control only) Illuminate the TRAC OFF lamp when the amber ABS warning indicator lamp illuminates.

The CAB constantly monitors the antilock brake system for proper operation. If the CAB detects a fault, it will turn on the amber ABS warning indicator lamp and disable the antilock braking system. The normal base braking system will remain operational.

NOTE: If the vehicle is equipped with traction control, the TRAC OFF lamp will illuminate anytime the amber ABS warning indicator lamp illuminates.

The CAB continuously monitors the speed of each wheel through the signals generated by the wheel speed sensors to determine if any wheel is beginning to lock. When a wheel locking tendency is detected, the CAB commands the CAB command coils to actuate. The coils then open and close the valves in the HCU that modulate brake fluid pressure in some or all of the hydraulic circuits. The CAB continues to control pressure in individual hydraulic circuits until a locking tendency is no longer present.

The CAB contains a self-diagnostic program that monitors the antilock brake system for system faults. When a fault is detected, the amber ABS warning indicator lamp is turned on and the fault diagnostic trouble code (DTC) is then stored in a diagnostic program memory. These DTC's will remain in the CAB memory even after the ignition has been turned off. The DTC's can be read and cleared from the CAB memory by a technician using the DRBIII® scan tool. If not cleared with a DRBIII® scan tool, the fault occurrence and DTC will be automatically cleared from the CAB memory after the identical fault has not been seen during the next 3,500 miles.

CAB INPUTS

- Wheel speed sensors (four)
- Brake lamp switch
- Ignition switch
- System and pump voltage
- Ground
- Traction control switch (if equipped)
- Diagnostic communication (PCI)

CAB OUTPUTS

- Amber ABS warning indicator lamp actuation (via BUS)
- Instrument cluster (MIC) communication (PCI)
- Traction control lamps (if equipped)
- Diagnostic communication (PCI, via BUS)

REMOVAL

(1) Disconnect the battery cables.

(2) Remove the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(3) Disconnect the vacuum hose connector at the tank built into the battery tray.

(4) Remove the screw securing the coolant filler neck to the battery tray.

(5) Remove the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

(6) Pull up on the CAB connector lock and disconnect the 24–way electrical connector (Fig. 3).

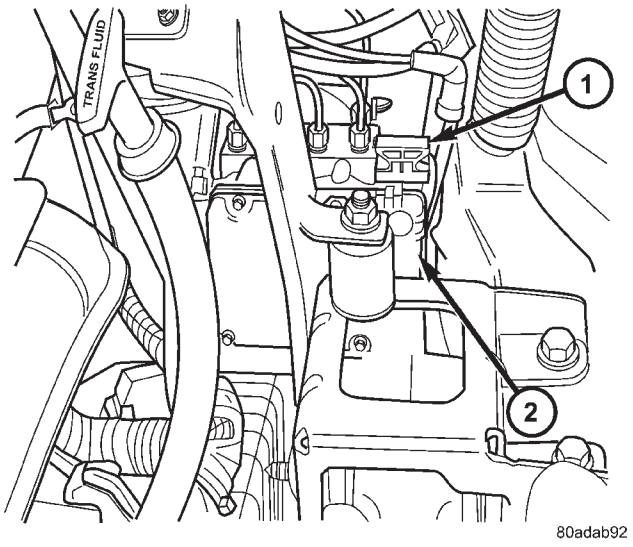

Fig. 3 CAB Connector Lock

1 - CONNECTOR LOCK
2 - CAB

(7) Disconnect the pump/motor connector from the CAB.

(8) Remove the screws securing the CAB to the HCU (Fig. 4)

(9) Pull CAB straight forward off HCU.

INSTALLATION

(1) Slide the CAB onto the HCU (Fig. 4).

(2) Install screws securing the CAB to the HCU (Fig. 4) Tighten the mounting screws to 2 N·m (17 in lbs).

(3) Reconnect the 24–way wiring connector and the pump/motor wiring connector. (Fig. 3)

(4) Install the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).

(5) Install the screw securing the coolant filler neck to the battery tray.

(6) Reconnect the vacuum hose to the coolant tank built into the battery tray.

(7) Install the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

(8) Reconnect the battery cables.

(9) Connect a DRBIII® to the vehicle and initialize the system.

DATA LINK CONNECTOR

DESCRIPTION

The data link connector is located inside the vehicle, below instrument panel next to the center column (Fig. 5).

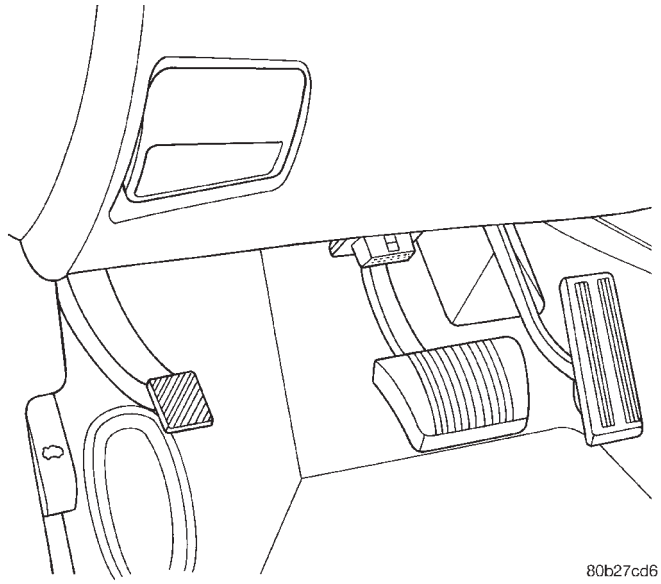

Fig. 5 DATA LINK CONNECTOR

OPERATION

The data link connector (diagnostic connector) links the DRB scan tool with the Powertrain Control Module (PCM). Refer to On-Board Diagnostics in the General Diagnosis section of this group.

FRONT CONTROL MODULE

DESCRIPTION

The Front Control Module (FCM) is a micro controller based module located in the engine compartment. This FCM mates to the power distribution center to form the Integrated Power Module (IPM). The IPM connects directly to the battery and provides the primary means of circuit protection and power distribution for all vehicle electrical systems. The FCM controls power to some of these vehicle systems electrical and electromechanical loads based on inputs received from hard wired switch inputs and data received on the Programmable Communications Interface (PCI) data bus.

For information on the IPM, (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - DESCRIPTION)

OPERATION

As messages are sent over the Programmable Communications Interface (PCI) data bus, the Front Control Module (FCM) reads these messages and controls power to some of the vehicles electrical systems by completing the circuit to ground (low side driver) or completing the circuit to 12 volt power (high side driver).

The following functions are **controlled** by the Front Control Module:

- Accessory Relay Actuation
- Brake Transmission Shift Interlock Functions (BTSI)
- Diesel Cabin Heater (Diesel Engine Vehicles)
- Electronic Back Light (EBL) Rear Defogger
- Electronic Transaxle (Gasoline engine Vehicles)
- Front and Rear Blower Motor Relay Actuation
- Front Fog Lamp Relay Actuation
- Front Washer Motor
- Front Windshield Wiper “HI” & “LO” Relay Actuation
- Front Windshield Wiper “ON” Relay Actuation
- Headlamp Power with Voltage Regulation
- Horn Relay Actuation
- Headlamp Washer Relay Actuation
- Name Brand Speaker (NBS) Relay Actuation
- Occupant Restraint Controller Voltage
- Park Lamp Relay Actuation
- Rear Washer Motor
- Side Airbag Voltage

The following inputs are **Received/Monitored** by the Front Control Module:

- Ambient Temperature Sensing

FRONT CONTROL MODULE (Continued)

- Back-Up switch
- Brake Fluid Level
- B+ Connection Detection
- Engine Crank Signal (Diesel Engine Vehicles)
- Horn Input
- Ignition Switch Start Only
- Ignition Switch Run and Start Only
- Stop Lamp Sense
- Washer Fluid Level
- Windshield Wiper Park

DIAGNOSIS AND TESTING - FRONT CONTROL MODULE

The Front Control Module (FCM) is a printed circuit board based module with a on-board micro-processor. The FCM interfaces with other electronic modules in the vehicle via the Programmable Communications Interface (PCI) data bus. In order to obtain conclusive testing the PCI data bus and all of the electronic modules that provide inputs to, or receive outputs from the FCM must be checked. All PCI communication faults must be resolved prior to further diagnosing any front control module related issues.

The FCM was designed to be diagnosed with an appropriate diagnostic scan tool, such as the DRB III®. The most reliable, efficient, and accurate means to diagnose the front control module requires the use of a DRB III® scan tool and the proper Body Diagnostic Procedures manual.

Before any testing of the FCM is attempted, the battery should be fully charged and all wire harness and ground connections inspected around the affected areas on the vehicle.

REMOVAL

(1) Disconnect the positive and negative battery cables from the battery.

(2) Remove the battery from the vehicle. Refer to the procedure in Battery Systems.

(3) Using a long flat-bladed screwdriver, gently twist the Integrated Power Module (IPM) retaining clip outboard to free the IPM from its mounting bracket (Fig. 6). Rotate IPM upward to access the Front Control Module (FCM) retaining screws.

(4) Remove the front control module retaining screws.

(5) Using both hands, pull the FCM straight from the IPM assembly to disconnect the 49-way electrical connector (Fig. 7) and remove the front control module from the vehicle.

INSTALLATION

NOTE: Front Control Module must be programmed to the correct radio EQ curve using the DRB III®. This will ensure that the audio system is operating correctly.

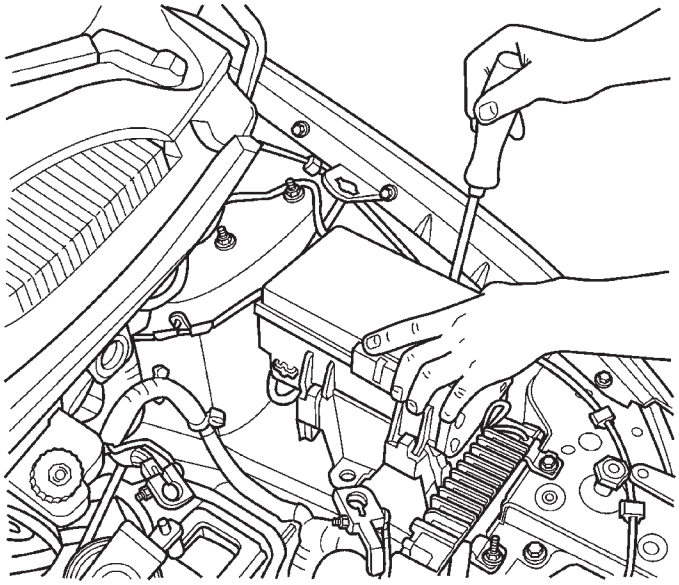

Fig. 6 REMOVING INTELLIGENT POWER MODULE

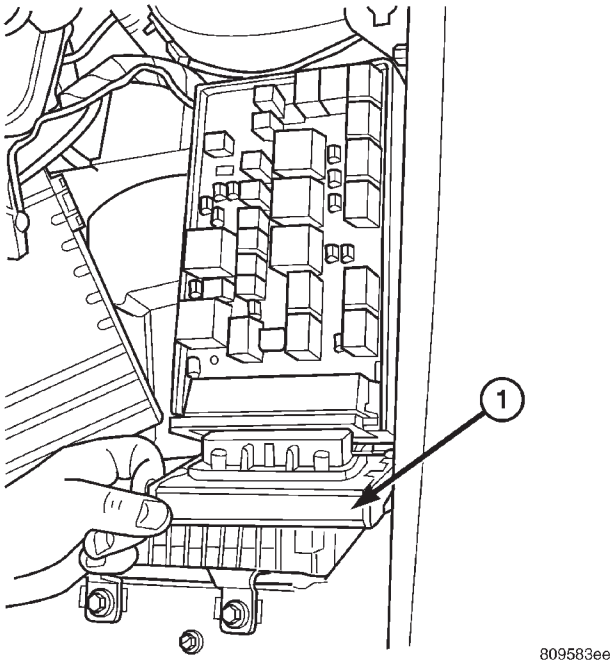

Fig. 7 FRONT CONTROL MODULE

1 - FRONT CONTROL MODULE

(1) Install the Front Control Module (FCM) in the Integrated Power Module (IPM) assembly by pushing the 49-way electrical connector straight in.

(2) Install the FCM retaining screws. Torque the screws to 1 N·m (7 in. lbs).

(3) Rotate the IPM assembly downward to secure in mounting bracket.

FRONT CONTROL MODULE (Continued)

(4) Install the battery in the vehicle. Refer to the procedure in Battery Systems.

(5) Connect the positive and negative battery cables.

(6) Using the DRB III ®, under “FRONT CONTROL MODULE” then “MISC” program the EQ curve of the radio into the Front Control Module. Refer to the appropriate diagnostic manual.

NOTE: If the vehicle is not equipped with Name Brand Speakers (Infinity, etc.) or Headlamp Washers the DRB III® must be used to Disable the appropriate relays in the Intelligent Power Module Assembly.

HEATED SEAT MODULE

DESCRIPTION

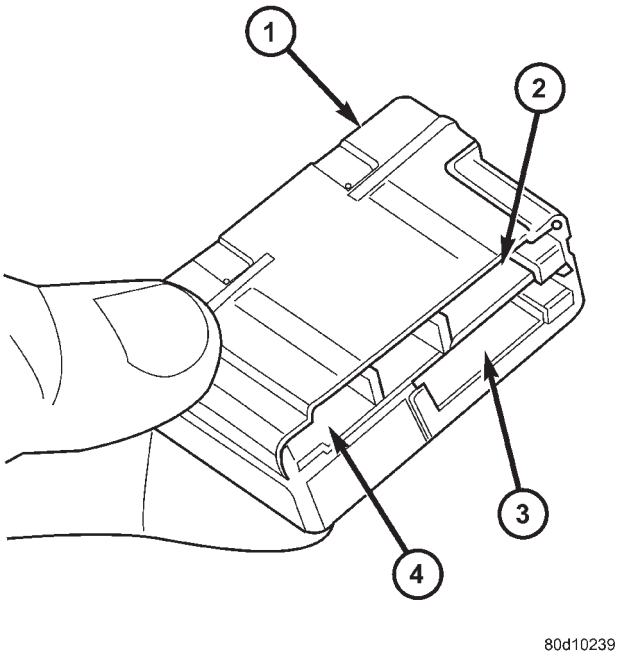

Fig. 8 RS/RG Heated Seat Modules

1 - HEATED SEAT MODULE
2 - C1 CONNECTOR
3 - C3 CONNECTOR
4 - C1 CONNECTOR

Vehicles equipped with heated seats utilize two heated seat modules. The heated seat modules (Fig. 8) are located under the front seats, where they are secured to the seat cushion pans. The left heated seat module controls the left heated seat, and the right controls the right. Each heated seat module has three connector receptacles that allows the module to be connected to all of the required inputs and outputs through the seat wire harness.

The heated seat module is an electronic microprocessor controlled device designed and programmed to use inputs from the ignition switch, heated seat switch and the heated seat sensor to operate and control the heated seat elements in the front seat and the two heated seat indicator lamp Light-Emitting Diodes (LEDs) in the heated seat switch.

The heated seat module cannot be repaired. If the heated seat module is damaged or faulty, the entire module must be replaced.

OPERATION

The heated seat module operates on fused battery current received from the ignition switch and integrated power module. The module is grounded at all times through the seat wire harness. Inputs to the module include a resistor multiplexed heated seat switch request circuit for the heated seat switch and the heated seat sensor inputs from the seat cushions of each front seat. In response to those inputs the heated seat module controls battery current feeds to the heated seat elements, and controls the ground for the heated seat switch indicator lamps.

When a heated seat switch request signal is received by the heated seat module, the module energizes the proper indicator lamp (Low or High) in the switch by grounding the indicator lamp circuit to indicate that the heated seat system is operating. At the same time, the heated seat module energizes the selected heated seat sensor circuit and the sensor provides the module with an input indicating the surface temperature of the selected seat cushion.

The Low heat set point is about 38° C (100.4° F), and the High heat set point is about 42° C (107.6° F). If the seat cushion surface temperature input is below the temperature set point for the selected temperature setting, the heated seat module energizes an N-channel Field Effect Transistor (N-FET) within the module which energizes the heated seat elements in the selected seat cushion and back. When the sensor input to the module indicates the correct temperature set point has been achieved, the module de-energizes the N-FET which de-energizes the heated seat elements. The heated seat module will continue to cycle the N-FET as needed to maintain the selected temperature set point.

DIAGNOSIS AND TESTING - HEATED SEAT MODULE

If a heated seat fails to heat and one or both of the indicator lamps on a heated seat switch flash, refer to **Diagnosis and Testing Heated Seat System** in Heated Seats for the location of flashing LED heated seat system diagnosis and testing procedures. If a heated seat heats but one or both indicator lamps on the heated seat switch fail to operate, test the heated

HEATED SEAT MODULE (Continued)

seat switch. Refer to **Diagnosis and Testing Heated Seat Switch** in Heated Seats for heated seat switch diagnosis and testing procedures. If the heated seat switch checks OK, proceed as follows.

(1) Check the heated seat element (Refer to 8 - ELECTRICAL/HEATED SEATS/HEATED SEAT ELEMENT - DIAGNOSIS AND TESTING).

(2) Check the heated seat sensor (Refer to 8 - ELECTRICAL/HEATED SEATS/HEATED SEAT SENSOR - DIAGNOSIS AND TESTING).

(3) Check the heated seat switch (Refer to 8 - ELECTRICAL/HEATED SEATS/DRIVER HEATED SEAT SWITCH - DIAGNOSIS AND TESTING).

NOTE: Refer to Wiring for the location of complete heated seat system wiring diagrams and connector pin-out information.

(4) Using a voltmeter, backprobe the appropriate heated seat module connector, do not disconnect. Check for voltage at the appropriate pin cavities. 12v should be present. If OK go to Step 5, if Not, Repair the open or shorted voltage supply circuit as required.

(5) Using a ohmmeter, backprobe the appropriate heated seat module connector, do not disconnect. Check for proper continuity to ground on the ground pin cavities. Continuity should be present. If OK replace the heated seat module with a known good unit and retest system, if Not OK, Repair the open or shorted ground circuit as required.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the appropriate front seat from the vehicle (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(3) Unsnap the module from the seat cushion pan.

(4) Disconnect the module wire harness connectors.

INSTALLATION

(1) Connect the module wire harness connectors.

(2) Snap the module on the seat cushion pan.

(3) Install the appropriate front seat in the vehicle (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

(4) Connect and isolate the negative battery cable.

POWER LIFTGATE MODULE

DESCRIPTION

Vehicles equipped with a power liftgate (PLG) utilize a PLG control module. This module is located on the vehicles left side D-pillar just below the motor

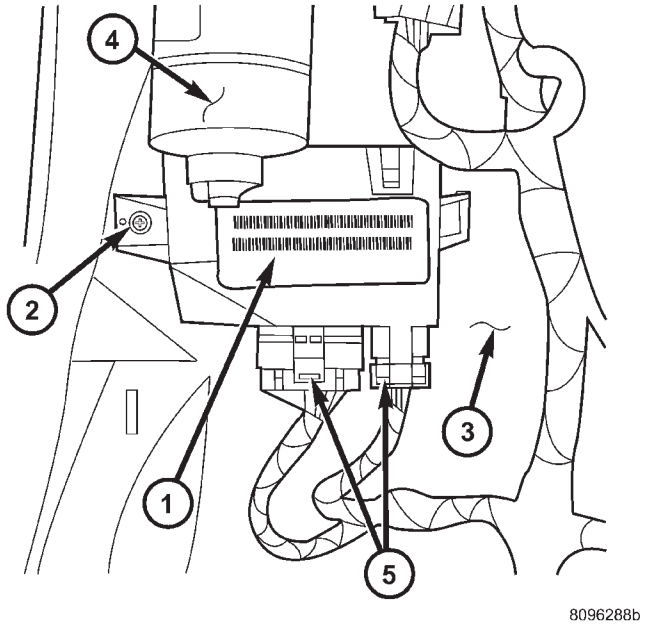

Fig. 9 LIFTGATE CONTROL MODULE

1 - POWER LIFTGATE CONTROL MODULE
2 - MODULE RETAINING SCREWS
3 - D-PILLAR
4 - POWER LIFTGATE MOTOR
5 - MODULE ELECTRICAL CONNECTORS

assembly (Fig. 9) and contains a microprocessor, which is used to communicate to the vehicles body control module. The PLG control module receives and monitors logic inputs from all the PLG system switches except for the outside handle switch. This module also contains the software technology to detect liftgate obstructions and stop and / or reverse the door accordingly.

OPERATION

The PLG control module contains the electronic circuitry and software used to control the sequence of events for the PLG system. This module comunicates on the PCI bus circuit with the vehicles body control module to monitor many different inputs and outputs such as door lock status, transmission gear selector position and vehicle speed. Refer to PLG system operation for more information.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove left D-pillar trim panel from the vehicle. Refer to Body for the procedure.

(3) Disconnect the wire harness connections from the PLG motor assembly (Fig. 10).

POWER LIFTGATE MODULE (Continued)

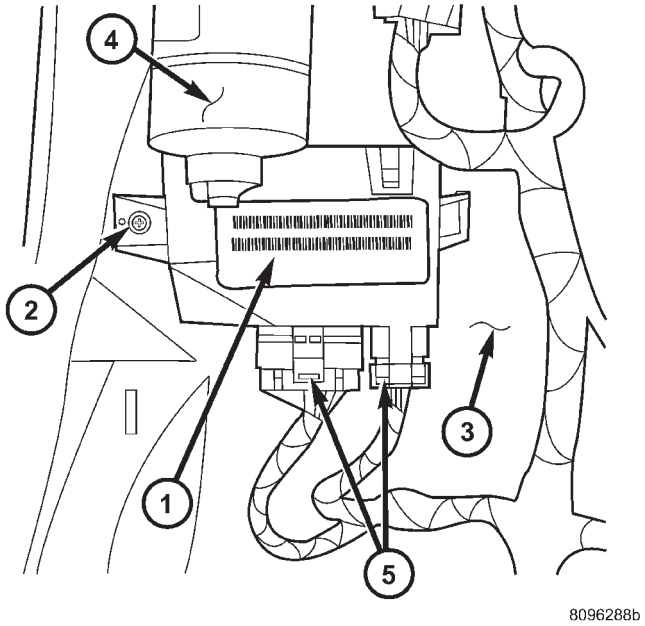

Fig. 10 LIFTGATE CONTROL MODULE

1 - POWER LIFTGATE CONTROL MODULE
2 - MODULE RETAINING SCREWS
3 - D-PILLAR
4 - POWER LIFTGATE MOTOR
5 - MODULE ELECTRICAL CONNECTORS

(4) Remove the screw holding the PLG control module to the D-pillar (Fig. 10).

(5) Remove the PLG control module from the vehicle.

INSTALLATION

(1) Install the PLG control module on the D-pillar and install retaining screw. Torque the screw to 14.5 in. lbs.

(2) Connect the wire harness connections on the PLG control module. Be certain to slide connector locks to the locked position.

(3) Install the D-pillar trim panel on the vehicle. Refer to the Body section for the procedure.

(4) Connect the negative battery cable.

(5) Using an appropriate scan tool, check any erase any PLG control module diagnostic trouble codes.

(6) Verify PLG system operation. Cycle the PLG through one complete open and close cycle, this will allow the PLG control module to relearn its cycle with the new components.

POWERTRAIN CONTROL MODULE

DESCRIPTION

DESCRIPTION

The Powertrain Control Module (PCM) is a digital computer containing a microprocessor (Fig. 11). The PCM receives input signals from various switches and sensors referred to as Powertrain Control Module Inputs. Based on these inputs, the PCM adjusts various engine and vehicle operations through devices referred to as Powertrain Control Module Outputs.

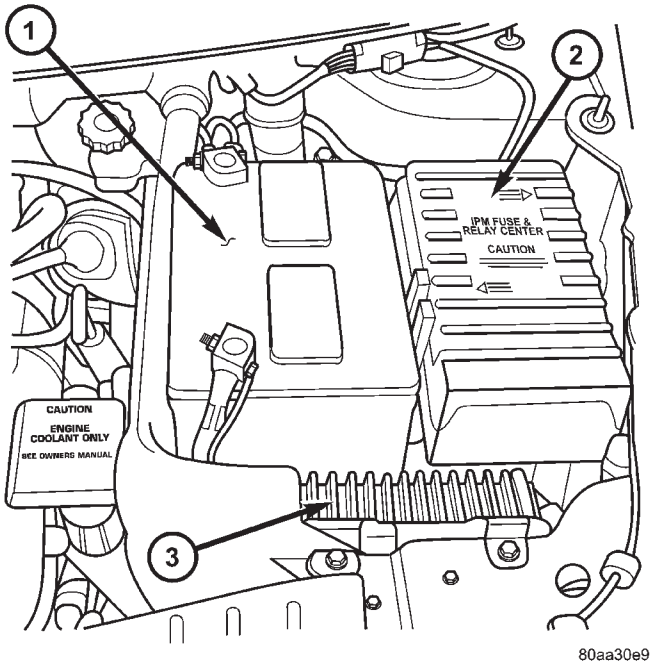

Fig. 11 Powertrain Control Module (PCM)

1 - Battery
2 - Power Distribution Center
3 - Powertrain Control Module

NOTE: PCM Inputs:

- Air Conditioning Pressure Transducer
- ASD Relay
- Battery Voltage
- Brake Switch
- Camshaft Position Sensor
- Crankshaft Position Sensor
- Distance Sensor (from transmission control module)
- EGR Position Feedback
- Engine Coolant Temperature Sensor
- Heated Oxygen Sensors

POWERTRAIN CONTROL MODULE (Continued)

- Ignition sense
- Intake Air Temperature Sensor
- Knock Sensor
- Leak Detection Pump Feedback
- Manifold Absolute Pressure (MAP) Sensor
- Park/Neutral (from transmission control module)
- PCI Bus
- Power Steering Pressure Switch
- Proportional Purge Sense
- SCI Receive
- Speed Control
- Throttle Position Sensor
- Torque Management Input (From TCM)
- Transaxle Control Module (TCM)
- Transaxle Gear Engagement (From TCM)
- Vehicle Speed (from transmission control module)

NOTE: PCM Outputs:

- Air Conditioning Clutch Relay
- Automatic Shut Down (ASD) and Fuel Pump Relays
- Data Link Connector (PCI and SCI Transmit)
- Double Start Override
- EGR Solenoid
- Fuel Injectors
- Generator Field
- High Speed Fan Relay
- Idle Air Control Motor
- Ignition Coils
- Leak Detection Pump
- Low Speed Fan Relay
- MTV Actuator
- Proportional Purge Solenoid
- SRV Valve
- Speed Control Relay
- Speed Control Vent Relay
- Speed Control Vacuum Relay
- 8 Volt Output
- 5 Volt Output

Based on inputs it receives, the powertrain control module (PCM) adjusts fuel injector pulse width, idle speed, ignition timing, and canister purge operation. The PCM regulates the cooling fans, air conditioning and speed control systems. The PCM changes generator charge rate by adjusting the generator field.

The PCM adjusts injector pulse width (air-fuel ratio) based on the following inputs.

- Battery Voltage
- Intake Air Temperature Sensor
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Exhaust Gas Oxygen Content (heated oxygen sensors)
- Manifold Absolute Pressure
- Throttle Position

The PCM adjusts engine idle speed through the idle air control motor based on the following inputs.

- Brake Switch
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Park/Neutral (transmission gear selection)
- Transaxle Gear Engagement
- Throttle Position
- Vehicle Speed (from Transmission Control Module)

The PCM adjusts ignition timing based on the following inputs.

- Intake Air Temperature
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Knock Sensor
- Manifold Absolute Pressure
- Park/Neutral (transmission gear selection)
- Transaxle Gear Engagement
- Throttle Position

The automatic shut down (ASD) and fuel pump relays are mounted externally, but turned on and off by the powertrain control module through the same circuit.

The camshaft and crankshaft signals are sent to the powertrain control module. If the PCM does not receive both signals within approximately one second of engine cranking, it deactivates the ASD and fuel pump relays. When these relays are deactivated, power is shut off to the fuel injectors, ignition coils, fuel pump and the heating element in each oxygen sensor.

The PCM contains a voltage converter that changes battery voltage to a regulated 8.0 volts. The 8.0 volts power the camshaft position sensor, crankshaft position sensor and vehicle speed sensor. The PCM also provides a 5.0 volts supply for the engine coolant temperature sensor, intake air temperature sensor, manifold absolute pressure sensor and throttle position sensor.

The PCM engine control strategy prevents reduced idle speeds until after the engine operates for 320 km (200 miles). If the PCM is replaced after 320 km (200 miles) of usage, update the mileage in new PCM. Use the DRB scan tool to change the mileage in the PCM. Refer to the appropriate Powertrain Diagnostic Manual and the DRB scan tool.

POWERTRAIN CONTROL MODULE (Continued)

DIAGNOSTIC TROUBLE CODE

DESCRIPTION

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

NOTE: For a list of DTC's, refer to the charts in this section.

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0016	Crankshaft/Camshaft Timing Misalignment	A rationality error has been detected for camshaft position out of phase with crankshaft
P0030	O2 sensor 1/1 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0031	O2 sensor 1/1 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0036	O2 sensor 1/2 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0037	O2 sensor 1/2 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0038	O2 sensor 1/2 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0043	O2 sensor 1/3 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0044	O2 sensor 1/3 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0050	O2 sensor 2/1 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0051	O2 sensor 2/1 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0052	O2 sensor 2/1 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0056	O2 sensor 2/1 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0057	O2 sensor 2/2 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0058	O2 sensor 2/2 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0068	Manifold Pressure/Throttle Position Correlation	MAP sensor signal does not correlate to throttle position sensor signal. Possible vacuum leak.
P0070	Ambient Temp Sensor Stuck	A rationality error has been detected in the ambient temp. sensor test.
P0071 (M)	Ambient Temp Sensor Performance	Ambient change less than 3° C in 200 Miles
P0072	Ambient Temp Sensor Low	Ambient temp. sensor input below the minimum acceptable voltage
P0073	Ambient Temp Sensor High	Ambient temp. sensor input above the maximum acceptable voltage

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0106 (M)	Barometric Pressure Out of Range	MAP sensor input voltage out of an acceptable range detected during reading of barometric pressure at key-on.
P0107 (M)	Map Sensor Voltage Too Low	MAP sensor input below minimum acceptable voltage.
P0108 (M)	Map Sensor Voltage Too High	MAP sensor input above maximum acceptable voltage.
P0110	Intake Air Temp Sensor Stuck	A rationality error has been detected for the intake air temp. sensor.
P0111 (M)	Intake Air Temp Sensor Performance	Intake Air change less than 3° C in 200 Miles
P0112 (M)	Intake Air Temp Sensor Voltage Low	Intake air (charge) temperature sensor input below the minimum acceptable voltage.
P0113 (M)	Intake Air Temp Sensor Voltage High	Intake air (charge) temperature sensor input above the maximum acceptable voltage.
P0116	Engine Coolant Temp Performance	A rationality error has been detected in the coolant temp sensor.
P0117 (M)	ECT Sensor Voltage Too Low	Engine coolant temperature sensor input below the minimum acceptable voltage.
P0118 (M)	ECT Sensor Voltage Too High	Engine coolant temperature sensor input above the maximum acceptable voltage.
P0121 (M)	TPS Voltage Does Not Agree With MAP	TPS signal does not correlate to MAP sensor signal.
P0122 (M)	Throttle Position Sensor Voltage Low	Throttle position sensor input below the acceptable voltage range.
P0123 (M)	Throttle Position Sensor Voltage High	Throttle position sensor input above the maximum acceptable voltage.
P0125 (M)	Engine Coolant Temp Not Reached	Time to enter Closed Loop Operation (Fuel Control) is excessive.
P0128	Thermostat Rationality	A rationality error has been detected for the thermostat
P0129	Barometic Pressure Out-of-Range low	MAP sensor input voltage out of an acceptable range detected during reading of barometric pressure.
P0130	1/1 O2 Sensor Heater Relay Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P0131 (M)	1/1 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0132 (M)	1/1 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0133 (M)	1/1 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0134 (M)	1/1 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor input.
P0135 (M)	1/1 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0136	1/2 O2 Sensor Heater Relay Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P0137 (M)	1/2 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0138 (M)	1/2 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0139 (M)	1/2 O2 Sensor Slow Response	Oxygen sensor response not as expected.
P0140 (M)	1/2 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0141 (M)	1/2 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0143	1/3 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0144	1/3 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0145	1/3 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0146	1/3 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0147	1/3 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0151 (M)	2/1 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0152 (M)	2/1 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage sustained above normal operating range.
P0153 (M)	2/1 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0154 (M)	2/1 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0155 (M)	2/1 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0157 (M)	2/2 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0158 (M)	2/2 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0159	2/2 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0160 (M)	2/2 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0161 (M)	2/2 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0165	Starter Relay Circuit	
P0171 (M)	1/1 Fuel System Lean	A lean air/fuel mixture has been indicated by an abnormally rich correction factor.
P0172 (M)	1/1 Fuel System Rich	A rich air/fuel mixture has been indicated by an abnormally lean correction factor.
P0174 (M)	2/1 Fuel System Lean	A lean air/fuel mixture has been indicated by an abnormally rich correction factor.
P0175 (M)	2/1 Fuel System Rich	A rich air/fuel mixture has been indicated by an abnormally lean correction factor.
P0176	Flex Fuel Calibration Signal	No calibration voltage present from flex fuel sensor.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0178	Flex Fuel Sensor Volts Too Low	Flex fuel sensor input below minimum acceptable voltage.
P0179	Flex Fuel Sensor Volts Too High	Flex fuel sensor input above maximum acceptable voltage.
P0201 (M)	Injector #1 Control Circuit	An open or shorted condition detected in control circuit for injector #1 or the INJ 1 injector bank.
P0202 (M)	Injector #2 Control Circuit	An open or shorted condition detected in control circuit for injector #2 or the INJ 2 injector bank.
P0203 (M)	Injector #3 Control Circuit	An open or shorted condition detected in control circuit for injector #3 or the INJ 3 injector bank.
P0204 (M)	Injector #4 Control Circuit	Injector #4 or INJ 4 injector bank output driver stage does not respond properly to the control signal.
P0205 (M)	Injector #5 Control Circuit	Injector #5 output driver stage does not respond properly to the control signal.
P0206 (M)	Injector #6 Control Circuit	Injector #6 output driver stage does not respond properly to the control signal.
P0207	Injector #7 Control Circuit	Injector #7 output driver stage does not respond properly to the control signal.
P0208	Injector #8 Control Circuit	Injector #8 output driver stage does not respond properly to the control signal.
P0209	Injector #9 Control Circuit	Injector #9 output driver stage does not respond properly to the control signal.
P0210	Injector #10 Control Circuit	Injector #10 output driver stage does not respond properly to the control signal.
P0234	Boost Limit Exceeded	
P0243	Wastegate Solenoid Circuit	
P0300 (M)	Multiple Cylinder Mis-fire	Misfire detected in multiple cylinders.
P0301 (M)	CYLINDER #1 MISFIRE	Misfire detected in cylinder #1.
P0302 (M)	CYLINDER #2 MISFIRE	Misfire detected in cylinder #2.
P0303 (M)	CYLINDER #3 MISFIRE	Misfire detected in cylinder #3.
P0304 (M)	CYLINDER #4 MISFIRE	Misfire detected in cylinder #4.
P0305 (M)	CYLINDER #5 MISFIRE	Misfire detected in cylinder #5.
P0306 (M)	CYLINDER #6 MISFIRE	Misfire detected in cylinder #6.
P0307 (M)	CYLINDER #7 MISFIRE	Misfire detected in cylinder #7
P0308 (M)	CYLINDER #8 MISFIRE	Misfire detected in cylinder #8.
P0309 (M)	CYLINDER #9 MISFIRE	Misfire detected in cylinder #9.
P0310 (M)	CYLINDER #10 MISFIRE	Misfire detected in cylinder #10.
P0315	No Crank Sensor Learned	Unable to learn the crank senor's signal in preparation for misfire diagnostics.
P0320	No Crank Reference Signal at PCM	No reference signal (crankshaft position sensor) detected during engine cranking.
P0325	Knock Sensor #1 Circuit	Knock sensor (#1) signal above or below minimum acceptable threshold voltage at particular engine speeds.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0330	Knock Sensor #2 Circuit	Knock sensor (#2) signal above or below minimum acceptable threshold voltage at particular engine speeds.
P0335	Crankshaft Position Sensor Circuit	A rationality error has been detected for loss of crankshaft position sensor.
P0339	Crankshaft Position Sensor Circuit Intermittent	A rationality error has been detected for intermittent loss of crankshaft position sensor.
P0340 (M)	Camshaft Position Sensor Circuit	A rationality error has been detected for loss of camshaft position sensor.
P0344	Camshaft Position Sensor Circuit Intermittent	A rationality error has been detected for intermittent loss of camshaft position sensor.
P0350	Ignition Coil Draws Too Much Current	A coil (1-5) is drawing too much current.
P0351 (M)	Ignition Coil Primary # 1 Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0352 (M)	Ignition Coil Primary # 2 Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0353 (M)	Ignition Coil Primary # 3 Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0354 (M)	Ignition Coil Primary# 4 Circuit	Peak primary circuit current not achieved with maximum dwell time (High Impedance).
P0355 (M)	Ignition Coil Primary # 5 Circuit	Peak primary circuit current not achieved with maximum dwell time (High Impedance).
P0356 (M)	Ignition Coil Primary # 6 Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0357	Ignition Coil Primary # 7 Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0358	Ignition Coil Primary # 8 Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0400	Diesel EGR System Failure	
P0401 (M)	EGR System Failure	Required change in air/fuel ration not detected during diagnostic test.
P0403 (M)	EGR Solenoid Circuit	An open or shorted condition detected in the EGR solenoid control circuit.
P0404 (M)	EGR Position Sensor Rationality	EGR position sensor signal does not correlate to EGR duty cycle.
P0405 (M)	EGR Position Sensor Volts Too Low	EGR position sensor input below the acceptable voltage range.
P0406 (M)	EGR Position Sensor Volts Too High	EGR position sensor input above the acceptable voltage range.
P0412	Secondary Air Solenoid Circuit	An open or shorted condition detected in the secondary air (air switching/aspirator) solenoid control circuit.
P0420 (M)	1/1 Catalytic Converter Efficiency	Catalyst 1/1 efficiency below required level.
P0432 (M)	1/2 Catalytic Converter Efficiency	Catalyst 2/1 efficiency below required level.
P0440	General EVAP System Failure	General system failure.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0441 (M)	Evap Purge Flow Monitor	Insufficient or excessive vapor flow detected during evaporative emission system operation.
P0442 (M)	Evap Leak Monitor 0.040 Leak Detected	A 0.040 leak has been detected in the evaporative system.
P0443 (M)	Evap Purge Solenoid Circuit	An open or shorted condition detected in the EVAP purge solenoid control circuit.
P0452	NVLD Pressure Switch Stuck Closed	NVLD pressure switch stuck closed.
P0453	NVLD Pressure Switch Stuck Open	NVLD pressure switch stuck open.
P0455 (M)	Evap Leak Monitor Large Leak Detected	A large leak has been detected in the evaporative system.
P0456 (M)	Evap Leak Monitor 0.020 Leak Detected	A 0.020 leak has been detected in the evaporative system.
P0460	Fuel Level Unit No Change Over Miles	No movement of fuel level sender detected.
P0461	Fuel Level Unit No Changeover Time	No level of fuel level sender detected.
P0462	Fuel Level Sending Unit Volts Too Low	Fuel level sensor input below acceptable voltage.
P0463	Fuel Level Sending Unit Volts Too High	Fuel level sensor input above acceptable voltage.
P0480	Low Speed Fan Relay Control Circuit	An open or shorted condition detected in the low speed rad. fan relay control circuit.
P0481	High Speed Fan Relay Control Circuit	An open or shorted condition detected in the high speed rad. fan relay control circuit.
P0498	NVLD Canister Vent Valve Solenoid Circuit Low	A shorted low condition detected in NVLD solenoid circuit.
P0499	NVLD Canister Vent Valve Solenoid Circuit High	A shorted high condition detected in NVLD solenoid circuit.
P0500 (M)	No Vehicle Speed Sensor Signal	No vehicle speed sensor signal detected during road load conditions.
P0501	Vehicle Speed Sensor #1 Performance	A rationality error has been detected for no vehicle speed sensor signal detected during road load conditions.
P0505 (M)	Idle Air Control Motor Circuits	Replace idle air control motor.
P0508 (M)	Idle Air Control Motor Circuit Low	Idle Air Control Motor Circuit input below acceptable current
P0509 (M)	Idle Air Control Motor Circuit High	Idle Air Control Motor Circuit input above acceptable current
P0511	Idle Air Control Valve Solenoid Circuit	An open or shorted condition detected in the IAC control circuit.
P0513	Invalid SKIM Key	The engine controller has received an invalid key from the Smart Key Immobilizer Module.
P0516	Battery Temperature Sensor Low	Battery Temp. sensor input below minimum acceptable voltage.
P0517	Battery Temperature Sensor High	Battery Temp. sensor input above maximum acceptable voltage.
P0519	Idle Speed Performance	A rationality error has been detected for target RPM not met during drive idle condition. Possible Vacuum leak or IAC lost steps.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0522	Oil Pressure Sens Low	Oil pressure sensor input below acceptable voltage.
P0523	Oil Pressure Sens High	Oil pressure sensor input above acceptable voltage.
P0532	A/C Pressure Sensor Low	A/C pressure sensor input below the minimum acceptable voltage.
P0533	A/C Pressure Sensor High	A/C pressure sensor input above the maximum acceptable voltage.
P0551 (M)	Power Steering Switch Failure	Incorrect input state detected for the power steering switch circuit. PL: High pressure seen at high speed.
P0562	Battery Voltage Low	Battery voltage sense input below the minimum acceptable voltage.
P0563	Battery Voltage High	Battery voltage sense input above the maximum acceptable voltage.
P0579	Speed Control Switch #1 Performance	Cruise switch stuck in a valid voltage range.
P0580	Speed Control Switch #1 Low	Speed control switch input below minimum acceptable voltage.
P0581	Speed Control Switch #1 High	Speed control switch input above maximum acceptable voltage.
P0582	Speed Control Vacuum Solenoid Circuit	An open or shorted condition detected in speed control Vacuum solenoid control circuit.
P0586	Speed Control Vent Solenoid Circuit	An open or shorted condition detected in speed control vent solenoid control circuit.
P0594	Speed Control Servo Power Circuit	An open or shorted condition open/short condition detected in the speed control servo power control circuit.
P0600 (M)	PCM Failure SPI Communications	No communication detected between co-processors in the control module.
P0601 (M)	Internal Controller Failure	Internal control module fault condition (check sum) detected.
P0604	Internal Trans Controller	Transmission control module RAM self test fault detected. -Aisin transmission.
P0605	Internal Trans Controller	Transmission control module ROM self test fault detected -Asian transmission.
P0615	Starter Relay Circuit	Open or shorted condition detected in the starter relay control circuit.
P0622 (G)	Generator Field Not Switching Properly	An open or shorted condition detected in the generator field control circuit.
P0627	Fuel Pump Relay Circuit	An open or shorted condition detected in the fuel pump relay control circuit.
P0630	VIN Not Programmed In PCM	VIN is not programmed in the control module EEPROM.
P0632	Odometer Not Programmed In PCM	Odometer is not programmed in the control module EEPROM.
P0633	SKIM Key Not Programmed In PCM	SKIM secert key is not programmed in the control module EEPROM.
P0645	A/C Clutch Relay Circuit	An open or shorted condition detected in the A/C clutch relay control circuit.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0660	Manifold Tune Valve Solenoid Circuit	An open or shorted condition detected in the manifold tuning valve solenoid control circuit.
P0685	ASD Relay Control Circuit	An open or shorted condition detected in the ASD relay control circuit.
P0688	ASD Relay Sense Circuit Low	ASD voltage sensed when ASD relay is energized or ASD voltage not sensed when ASD relay is not energized.
P0700 (M)	Check Transmission DTC's	This SBEC III or JTEC DTC indicates that the EATX has an active fault and has requested illuminated the MIL via a BUS message. The specific fault must be acquired from the EATX.
P0703 (M)	Brake Switch Stuck Pressed or Released	Incorrect input state detected in the brake switch circuit. (Changed from P1595).
P0711	Trans Temp Sensor, No Temp Rise After Start	Relationship between the transmission temperature and overdrive operation and/or TCC operation indicates a failure of the Transmission Temperature Sensor. OBD II Rationality.
P0712	Trans Temp Sensor Voltage Too Low	Transmission fluid temperature sensor input below acceptable voltage.
P0713	Trans Temp Sensor Voltage Too High	Transmission fluid temperature sensor input above acceptable voltage.
P0720	Low Output SPD Sensor RPM, Above 15 MPH	The relationship between the Output Shaft Speed Sensor and vehicle speed is not within acceptable limits.
P0740 (M)	Torque Con Clu, No RPM Drop at Lockup	Relationship between engine and vehicle speeds indicated failure of torque convertor clutch lock-up system (TCC/PTU sol).
P0743	Torque Converter Clutch Solenoid/ Trans Relay Circuits	An open or shorted condition detected in the torque converter clutch (part throttle unlock) solenoid control circuit. Shift solenoid C electrical fault - Asian transmission
P0748	Governor Pressure Sol Control/Trans Relay Circuits	An open or shorted condition detected in the Governor Pressure Solenoid circuit or Trans Relay Circuit in JTEC RE transmissions.
P0751	O/D Switch Pressed (Lo) More Than 5 Minutes	Overdrive override switch input is in a prolonged depressed state.
P0753	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the overdrive solenoid control circuit or Trans Relay Circuit in JTEC RE transmissions.
P0756	AW4 Shift Sol B (2-3) Functional Failure	Shift solenoid B (2-3) functional fault - Asian transmission
P0783	3-4 Shift Sol, No RPM Drop at Lockup	The overdrive solenoid is unable to engage the gear change from 3rd gear to the overdrive gear.
P0801	Reverse Gear Lockout Circuit Open or Short	An open or shorted condition detected in the transmission reverse gear lock-out solenoid control circuit.
P0833	Clutch Upstop Switch Performance	Rationality error detected for clutch upstop switch performance

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0850	Park/Natural Switch Performance	A rationality error has been detected for park/neutral switch performance.
P1105	Baro Read Solenoid Circuit	Open or shorted condition detected in the baro read solenoid control circuit.
P1115	General Temperature Rationality	General temperature sensor rationality error.
P1192 (M)	Inlet Air Temp. Circuit Low	Inlet Air Temp. sensor input below acceptable voltage
P1193 (M)	Inlet Air Temp. Circuit High	Inlet Air Temp. sensor input above acceptable voltage.
P1194	PWM O2 Heater Performance	Incorrect or irrational performance has been detected for the PWM O2 heater circuit.
P1195 (M)	1/1 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/1 during catalyst monitor test. (was P0133)
P1196 (M)	2/1 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 2/1 during catalyst monitor test. (was P0153)
P1197	1/2 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/2 during catalyst monitor test. (was P0139)
P1198	Radiator Temperature Sensor Volts Too High	Radiator coolant temperature sensor input above the maximum acceptable voltage.
P1199	Radiator Temperature Sensor Volts Too Low	Radiator coolant temperature sensor input below the minimum acceptable voltage.
P1281	Engine is Cold Too Long	Engine coolant temperature remains below normal operating temperatures during vehicle travel (Thermostat).
P1282	Fuel Pump Relay Control Circuit	An open or shorted condition detected in the fuel pump relay control circuit.
P1288	Intake Manifold Short Runner Solenoid Circuit	An open or shorted condition detected in the short runner tuning valve circuit.
P1289	Manifold Tune Valve Solenoid Circuit	An open or shorted condition detected in the manifold tuning valve solenoid control circuit.
P1290	CNG Fuel System Pressure Too High	Compressed natural gas system pressure above normal operating range.
P1291	No Temp Rise Seen From Intake Heaters	Energizing Heated Air Intake does not change intake air temperature sensor an acceptable amount.
P1292	CNG Pressure Sensor Voltage Too High	Compressed natural gas pressure sensor reading above acceptable voltage.
P1293	CNG Pressure Sensor Voltage Too Low	Compressed natural gas pressure sensor reading below acceptable voltage.
P1294 (M)	Target Idle Not Reached	Target RPM not achieved during drive idle condition. Possible vacuum leak or IAC (AIS) lost steps.
P1295	No 5 Volts to TP Sensor	Loss of a 5 volt feed to the Throttle Position Sensor has been detected.
P1296	No 5 Volts to MAP Sensor	Loss of a 5 volt feed to the MAP Sensor has been detected.
P1297 (M)	No Change in MAP From Start To Run	No difference is recognized between the MAP reading at engine idle and the stored barometric pressure reading.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P1298	Lean Operation at Wide Open Throttle	A prolonged lean condition is detected during Wide Open Throttle.
P1299 (M)	Vacuum Leak Found (IAC Fully Seated)	MAP Sensor signal does not correlate to Throttle Position Sensor signal. Possible vacuum leak.
P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P1389	No ASD Relay Output Voltage At PCM	No Z1 or Z2 voltage sensed when the auto shutdown relay is energized.
P1390 (M)	Timing Belt Skipped 1 Tooth or More	Relationship between Cam and Crank signals not correct.
P1391 (M)	Intermittent Loss of CMP or CKP	Loss of the Cam Position Sensor or Crank Position sensor has occurred. For PL 2.0L
P1398 (M)	Mis-Fire Adaptive Numerator at Limit	PCM is unable to learn the Crank Sensor's signal in preparation for Misfire Diagnostics. Probable defective Crank Sensor.
P1399	Wait To Start Lamp Circuit	An open or shorted condition detected in the Wait to Start Lamp circuit.
P1403	No 5 Volts to EGR Sensor	Loss of 5v feed to the EGR position sensor.
P1476	Too Little Secondary Air	Insufficient flow of secondary air injection detected during aspirator test.(was P0411)
P1477	Too Much Secondary Air	Excessive flow of secondary air injection detected during aspirator test (was P0411).
P1478 (M)	Battery Temp Sensor Volts Out of Limit	Internal temperature sensor input voltage out of an acceptable range.
P1479	Transmission Fan Relay Circuit	An open or shorted condition detected in the transmission fan relay circuit.
P1480	PCV Solenoid Circuit	An open or shorted condition detected in the PCV solenoid circuit.
P1481	EATX RPM Pulse Performance	ETAX RPM pulse generator signal for misfire detection does not correlate with expected value.
P1482	Catalyst Temperature Sensor Circuit Shorted Low	Catalyst temperature sensor circuit shorted low.
P1483	Catalyst Temperature Sensor Circuit Shorted High.	Catalyst temperature sensor circuit shorted high.
P1484	Catalytic Converter Overheat Detected	A catalyst overheat condition has been detected by the catalyst temperature sensor.
P1485	Air Injection Solenoid Circuit	An open or shorted condition detected in the air assist solenoid circuit.
P1486 (M)	Evap Leak Monitor Pinched Hose Found	LDP has detected a pinched hose in the evaporative hose system.
P1487	Hi Speed Rad Fan CTRL Relay Circuit	An open or shorted condition detected in the control circuit of the #2 high speed radiator fan control relay.
P1488	Auxiliary 5 Volt Supply Output Too Low	Auxiliary 5 volt sensor feed is sensed to be below an acceptable limit.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P1489 (M)	High Speed Fan CTRL Relay Circuit	An open or shorted condition detected in the control circuit of the high speed radiator fan control relay.
P1490 (M)	Low Speed Fan CTRL Relay Circuit	An open or shorted condition detected in control circuit of the low speed radiator fan control relay.
P1491	Rad Fan Control Relay Circuit	An open or shorted condition detected in the radiator fan control relay control circuit. This includes PWM solid state relays.
P1492 (M,G)	Ambient/Batt Temp Sen Volts Too High	External temperature sensor input above acceptable voltage.
P1493 (M,G)	Ambient/Batt Temp Sen Volts Too Low	External temperature sensor input below acceptable voltage.
P1494 (M)	Leak Detection Pump Sw or Mechanical Fault	Incorrect input state detected for the Leak Detection Pump (LDP) pressure switch.
P1495 (M)	Leak Detection Pump Solenoid Circuit	An open or shorted condition detected in the Leak Detection Pump (LDP) solenoid circuit.
P1496 (M)	5 Volt Supply, Output Too Low	5 volt sensor feed is sensed to be below an acceptable limit. (< 4v for 4 sec).
P1498	High Speed Rad Fan Ground CTRL Rly Circuit	An open or shorted condition detected in the control circuit of the #3 high speed radiator fan control relay.
P1594 (G)	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.
P1595	Speed Control Solenoid Circuits	An open or shorted condition detected in either of the speed control vacuum or vent solenoid control circuits.
P1596	Speed Control Switch Always High	Speed control switch input above maximum acceptable voltage.
P1597	Speed Control Switch Always Low	Speed control switch input below minimum acceptable voltage.
P1598	A/C Pressure Sensor Volts Too High	A/C pressure sensor input above maximum acceptable voltage.
P1599	A/C Pressure Sensor Volts Too Low	A/C pressure sensor input below minimum acceptable voltage.
P1602 (M)	PCM not Programmed	PCM not programmed (generic controller fault).
P1603	PCM Internal Dual Port Ram Communication	Dual port RAM communication link error.
P1604	PCM Internal Dual Port Ram Read/Write Integrity Failure	Dual port RAM read/write error.
P1607	PCM internal Shutdown Timer Rationality	A rationality error has been detected for the shutdown timer.
P1680	Clutch Released Switch Circuit	
P1681	No I/P Cluster CCD/J1850 Messages Received	No CCD/J1850 messages received from the cluster control module.
P1682 (G)	Charging System Voltage Too Low	Battery voltage sense input below target charging voltage during engine operation and no significant change in voltage detected during active test of generator output circuit.

POWERTRAIN CONTROL MODULE (Continued)

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.		
(G) Generator Lamp Illuminated		
GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P1683	SPD CTRL PWR Relay; or S/C 12v Driver CKT	An open or shorted condition detected in the speed control servo power control circuit. (SBECII: ext relay).
P1684	Battery Loss In The Last 50 Starts	The battery has been disconnected within the last 50 starts.
P1685	Skim Invalid Key	The engine controller has received an invalid key from the SKIM.
P1686	No SKIM BUS Messages Received	No CCD/J1850 messages received from the Smart Key Immobilizer Module (SKIM).
P1687	No MIC BUS Message	No CCD/J1850 messages received from the Mechanical Instrument Cluster (MIC) module.
P1693	DTC Detected in Companion Module	A fault has been generated in the companion engine control module.
P1694	Fault In Companion Module	No CCD/J1850 messages received from the powertrain control module-Aisin transmission.
P1695	No CCD/J1850 Message From Body Control Module	No CCD/J1850 messages received from the body control module.
P1696 (M)	PCM Failure EEPROM Write Denied	Unsuccessful attempt to write to an EEPROM location by the control module.
P1697 (M)	PCM Failure SRI Mile Not Stored	Unsuccessful attempt to update Service Reminder Indicator (SRI or EMR) mileage in the control module EEPROM.
P1698 (M)	No CCD/J1850 Message From TCM	No CCD/J1850 messages received from the electronic transmission control module (EATX) or the Aisin transmission controller.
P1719	Skip Shift Solenoid Circuit	An open or shorted condition detected in the transmission 2-3 gear lock-out solenoid control circuit.
P1740	TCC or O/D Solenoid Performance	Rationality error detected in either the torque convertor clutch or solenoid or overdrive solenoid system.
P1756	GOV Press Not Equal to Target @ 15-20 PSI	The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear. (Mid Pressure Malfunction)
P1757	GOV Press Not Equal to Target @ 15-20 PSI	The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear (Zero Pressure Malfunction)
P1762	Gov Press Sen Offset Volts Too Low or High	The Governor Pressure Sensor input is greater than a calibration limit or is less than a calibration limit for 3 consecutive park/neutral calibrations.
P1763	Governor Pressure Sensor Volts Too Hi	The Governor Pressure Sensor input is above an acceptable voltage level.
P1764	Governor Pressure Sensor Volts Too Low	The Governor Pressure Sensor input is below an acceptable voltage level.
P1765	Trans 12 Volt Supply Relay CTRL Circuit	An open or shorted condition is detected in the Transmission Relay control circuit. This relay supplies power to the TCC
P1899 (M)	P/N Switch Stuck in Park or in Gear	Incorrect input state detected for the Park/Neutral switch.

P2503	Charging System Voltage Low	Charging system voltage below minimum acceptable voltage.

OPERATION - SENSOR RETURN - PCM INPUT

The sensor return circuit provides a low electrical noise ground reference for all of the systems sensors. The sensor return circuit connects to internal ground circuits within the Powertrain Control Module (PCM).

OPERATION - SCI RECEIVE - PCM INPUT

SCI Receive is the serial data communication receive circuit for the DRB scan tool. The Powertrain Control Module (PCM) receives data from the DRB through the SCI Receive circuit.

OPERATION - IGNITION SENSE - PCM INPUT

The ignition sense input informs the Powertrain Control Module (PCM) that the ignition switch is in the crank or run position.

OPERATION - PCM GROUND

Ground is provided through multiple pins of the PCM connector. Depending on the vehicle there may be as many as three different ground pins. There are power grounds and sensor grounds.

The power grounds are used to control the ground side of any relay, solenoid, ignition coil or injector. The signal ground is used for any input that uses sensor return for ground, and the ground side of any internal processing component.

The SBEC III case is shielded to prevent RFI and EMI. The PCM case is grounded and must be firmly attached to a good, clean body ground.

Internally all grounds are connected together, however there is noise suppression on the sensor ground. For EMI and RFI protection the case is also grounded separately from the ground pins.

OPERATION

OPERATION - 8-VOLT SUPPLY - PCM OUTPUT

The PCM supplies 8 volts to the crankshaft position sensor, camshaft position sensor.

OPERATION - 5 VOLT SUPPLY - PCM OUTPUT

The PCM supplies 5 volts to the following sensors:

- A/C pressure transducer
- Engine coolant temperature sensor
- Manifold absolute pressure sensor
- Throttle position sensor
- Linear EGR solenoid
- Battery temperature
- Knock sensor

STANDARD PROCEDURE - OBTAINING DIAGNOSTIC TROUBLE CODES

BULB CHECK

Key on: Bulb illuminated until vehicle starts, as long as all once per trip (readiness) monitors completed. If monitors have **not** been completed, then: Key on: bulb check for about 8 seconds, lamp then flashes if once per trip (readiness) monitors have **not** been completed until vehicle is started, then MIL is extinguished.

OBTAINING DTC'S USING DRB SCAN TOOL

(1) Connect the DRB scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.

POWERTRAIN CONTROL MODULE (Continued)

(2) Turn the ignition switch on and access the "Read Fault" screen.

(3) Record all the DTC's and "freeze frame" information shown on the DRB scan tool.

(4) To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

OBTAINING DTC'S USING IGNITION KEY

(1) Cycle the ignition key On - Off - On - Off - On within 5 seconds.

(2) The Odometer will show the P-code for the DTC code number. Refer to the Emission section for the DTC chart for a detailed explanation of the DTC codes.

(3) If no DTC's are present, the cluster will display one of two texts: "P1684" and "done" or only "done".

- P1684 is only a status and indicates that the PCM memory has been cleared within the last 50 ignition cycles and does not indicate a problem.
- done indicates that NO DTCs are present and the procedure is complete.

REMOVAL

(1) Disconnect the negative battery cable.

(2) Remove the battery shield, refer to the Battery section for more information.

(3) Remove the 2 upper PCM bracket bolts (Fig. 12).

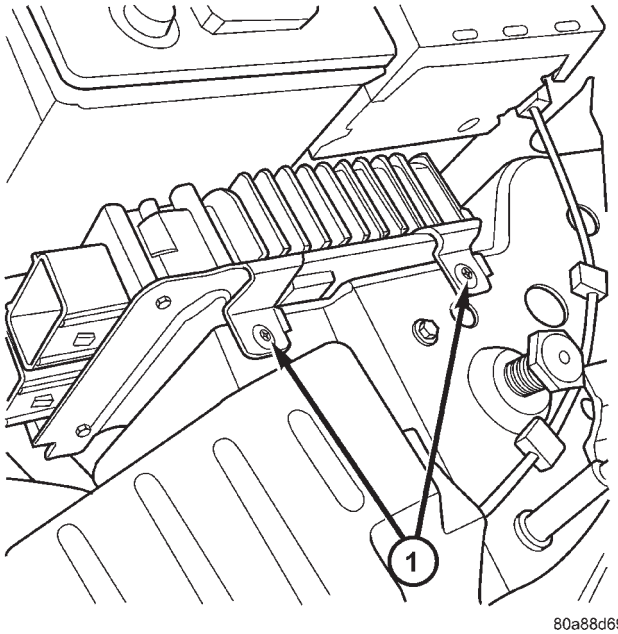

Fig. 12 PCM

1 - Attaching Bolts

(4) Remove the 2 PCM connectors.

(5) Remove the headlamp, refer to the Lamps section for more information.

(6) Remove the lower PCM mounting bolt (Fig. 13).

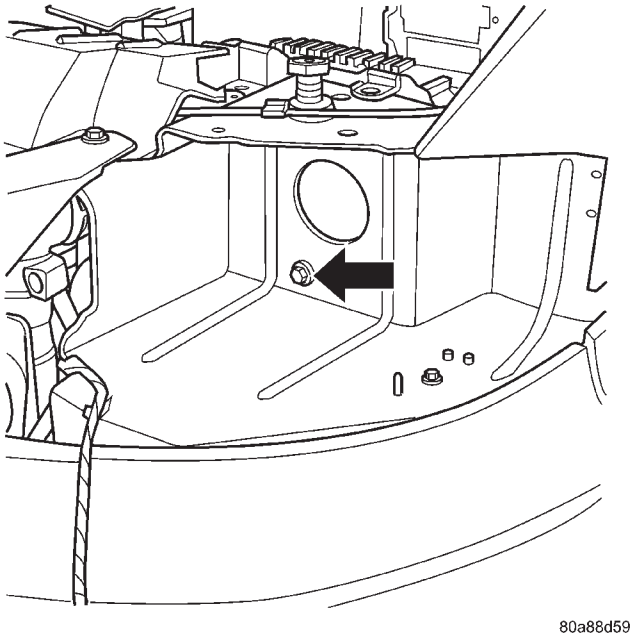

Fig. 13 PCM LOWER BOLT

(7) Remove PCM.

INSTALLATION

(1) Install the PCM.

(2) Install the lower PCM mounting bolt. Tighten bolt.

(3) Install the 2 upper PCM bracket bolts. Tighten bolt.

(4) Install the headlamp, refer to the Lamps section for more information.

(5) Install the 2 PCM connectors.

(6) Install the battery shield, refer to the Battery section for more information.

(7) Connect the negative battery cable.

SENTRY KEY IMMOBILIZER MODULE

DESCRIPTION

The Sentry Key Immobilizer Module (SKIM) contains a Radio Frequency (RF) transceiver and a microprocessor. The SKIM retains in memory the ID numbers of any Sentry Key that is programmed to it. The maximum number of keys that may be programmed to each module is eight (8). The SKIM also communicates over the PCI bus with the Powertrain Control Module (PCM), the Body Control Module

SENTRY KEY IMMOBILIZER MODULE (Continued)

(BCM), and the DRB III® scan tool. The SKIM transmits and receives RF signals through a tuned antenna enclosed within a molded plastic ring formation that is integral to the SKIM housing. When the SKIM is properly installed on the steering column, the antenna ring fits snugly around the circumference of the ignition lock cylinder housing. If this ring is not mounted properly, communication problems may arise in the form of transponder-related faults.

For added system security, each SKIM is programmed with a unique ″Secret Key″ code. This code is stored in memory and is sent over the PCI bus to the PCM and to each key that is programmed to work with the vehicle. The ″Secret Key″ code is therefore a common element found in all components of the Sentry Key Immobilizer System (SKIS). In the event that a SKIM replacement is required, the ″Secret Key″ code can be restored from the PCM by following the SKIM replacement procedure found in the DRB III® scan tool. Proper completion of this task will allow the existing ignition keys to be reprogrammed. Therefore, new keys will NOT be needed. In the event that the original ″Secret Key″ code can not be recovered, new ignition keys will be required. The DRB III® scan tool will alert the technician if key replacement is necessary. Another security code, called a PIN, is used to gain secured access to the SKIM for service. The SKIM also stores in its memory the Vehicle Identification Number (VIN), which it learns through a bus message from the assembly plant tester. The SKIS scrambles the information that is communicated between its components in order to reduce the possibility of unauthorized SKIM access and/or disabling.

OPERATION

When the ignition switch is moved to the RUN position, the SKIM transmits an RF signal to the transponder in the ignition key. The SKIM then waits for a response RF signal from the transponder in the key. If the response received identifies the key as valid, the SKIM sends a ″valid key″ message to the PCM over the PCI bus. If the response received identifies the key as invalid or no response is received from the transponder in the ignition key, the SKIM sends an ″invalid key″ message to the PCM. The PCM will enable or disable engine operation based upon the status of the SKIM messages. It is important to note that the default condition in the PCM is ″invalid key.″ Therefore, if no response is received by the PCM, the engine will be immobilized after two (2) seconds of running.

The SKIM also sends indicator light status messages to the BCM to operate the light. This is the method used to turn the light ON solid or to flash it after the indicator light test is complete to signify a fault in the SKIS. If the light comes ON and stays ON solid after the indicator light test, this signifies that the SKIM has detected a system malfunction and/or that the SKIS has become inoperative. If the SKIM detects an invalid key **OR** a key-related fault exists, the indicator light will flash following the indicator light test. The SKIM may also request an audible chime if the customer key programming feature is available and the procedure is being utilized (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/TRANSPONDER KEY - STANDARD PROCEDURE).

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove Lower Instrument Panel Cover. Refer to Body, Instrument Panel, Lower Instrument Panel Cover, Removal.

(3) Remove the steering column upper and lower shrouds. Refer to Steering, Column, Column Shroud, Removal.

(4) Disengage the steering column wire harness from the Sentry Key Immobilizer Module (SKIM).

(5) Remove the one screws securing the SKIM to the steering column.

(6) Rotate the SKIM upwards and then to the side away from the steering column to slide the SKIM antenna ring from around the ignition switch lock cylinder housing.

(7) Remove the SKIM from the vehicle.

INSTALLATION

(1) Slip the SKIM antenna ring around the ignition switch lock cylinder housing. Rotate the SKIM downwards and then towards the steering column.

(2) Install the one screws securing the SKIM to the steering column.

(3) Engage the steering column wire harness from the Sentry Key Immobilizer Module (SKIM).

(4) Install the steering column upper and lower shrouds. Refer to Steering, Column, Column Shroud, Installation.

(5) Install the Lower Instrument Panel Cover. Refer to Body, Instrument Panel, Lower Instrument Panel Cover, Installation.

(6) Connect the battery negative cable.

TRANSMISSION CONTROL MODULE

DESCRIPTION

The Transmission Control Module (TCM) is located behind the left fender and is fastened with three screws to three clips in the left frame rail forward of the suspension (Fig. 14).

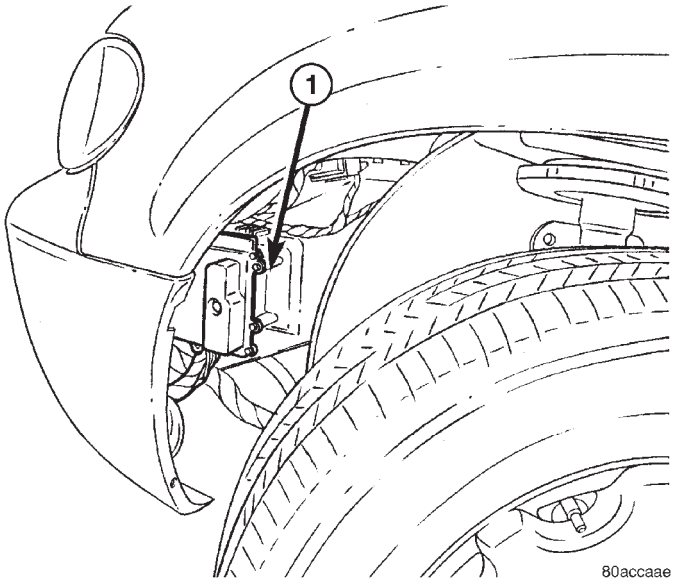

Fig. 14 Transmission Control Module (TCM) Location

1 - TRANSMISSION CONTROL MODULE (TCM)

OPERATION

The TCM is the controlling unit for all electronic operations of the transaxle. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transaxle. Direct inputs are hardwired to, and used specifically by the TCM. Indirect inputs originate from other components/modules, and are shared with the TCM via the J1850 communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition "ON" voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor
- Crankshaft Position Sensor (CKP)
- Transmission Range Sensor (TRS)
- Pressure Switches (L/R, 2/4, OD)
- Transmission Temperature Sensor (Integral to TRS)
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Speed Control ON/OFF Switch
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Brake Switch Status
- DRB Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids (LR/CC, 2/4, OD and UD)
- Vehicle Speed (to PCM)
- Torque Reduction Request (to PCM)

An example of a TCM **indirect output** is:

- Transmission Temperature (to PCM)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indices (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with DRB scan tool)

TRANSMISSION CONTROL MODULE (Continued)

CLUTCH VOLUME INDEX (CVI)

An important function of the TCM is to monitor Clutch Volume Index (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transaxle gear ratio. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur (Fig. 15).

Gear ratios can be determined by using the DRB Scan Tool and reading the Input/Output Speed Sensor values in the “Monitors” display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the clutch assemblies (broken return springs, out of position snap rings, excessive clutch pack clearance, improper assembly, etc.) can cause inadequate or out-of-range clutch volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

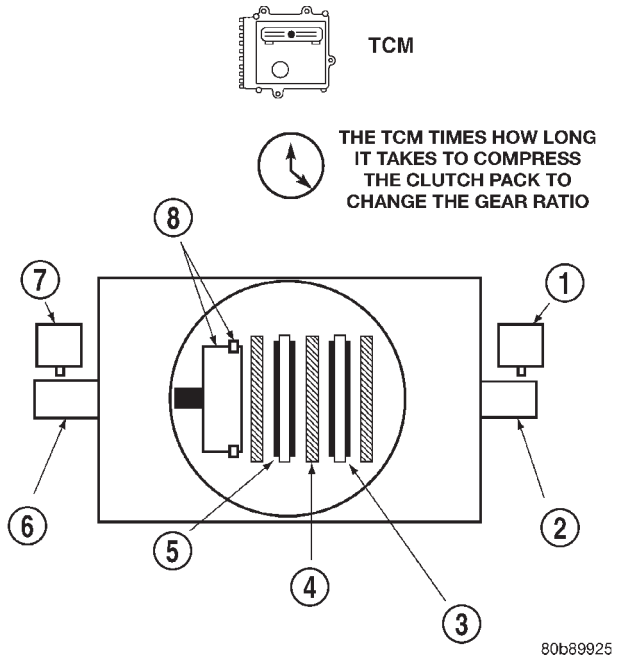

Fig. 15 Example of CVI Calculation

1 - OUTPUT SPEED SENSOR
2 - OUTPUT SHAFT
3 - CLUTCH PACK
4 - SEPARATOR PLATE
5 - FRICTION DISCS
6 - INPUT SHAFT
7 - INPUT SPEED SENSOR
8 - PISTON AND SEAL

CLUTCH VOLUMES				
Clutch	When Updated			Proper Clutch Volume
	Shift Sequence	Oil Temperature	Throttle Angle	
L/R	2-1 or 3-1 coast downshift	> 70°	< 5°	35 to 83
2/4	1-2 shift	> 110°	5 - 54°	20 to 77
OD	2-3 shift			48 to 150
UD	4-3 or 4-2 shift		> 5°	24 to 70

TRANSMISSION CONTROL MODULE (Continued)

SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following chart to determine the appropriate operation expected, depending on driving conditions.

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature at start-up below -16° F	Park, Reverse, Neutral and 2nd gear only (prevents shifting which may fail a clutch with frequent shifts)
Cold	Oil temperature at start-up above -12° F and below 36° F	– Delayed 2-3 upshift (approximately 22-31 mph) – Delayed 3-4 upshift (45-53 mph) – Early 4-3 costdown shift (approximately 30 mph) – Early 3-2 coastdown shift (approximately 17 mph) – High speed 4-2, 3-2, 2-1 kickdown shifts are prevented – No EMCC
Warm	Oil temperature at start-up above 36° F and below 80 degree F	– Normal operation (upshift, kickdowns, and coastdowns) – No EMCC
Hot	Oil temperature at start-up above 80° F	– Normal operation (upshift, kickdowns, and coastdowns) – Full EMCC, no PEMCC except to engage FEMCC (except at closed throttle at speeds above 70-83 mph)
Overheat	Oil temperature above 240° F or engine coolant temperature above 244° F	– Delayed 2-3 upshift (25-32 mph) – Delayed 3-4 upshift (41-48 mph) – 3rd gear FEMCC from 30-48 mph – 3rd gear PEMCC from 27-31 mph
Super Overheat	Oil temperature above 260° F	– All ″Overheat″ shift schedule features apply – 2nd gear PEMCC above 22 mph – Above 22 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

STANDARD PROCEDURE

STANDARD PROCEDURE - PINION FACTOR SETTING

NOTE: This procedure must be performed if the Transmission Control Module (TCM) has been replaced with a NEW or replacement unit. Failure to perform this procedure will result in an inoperative or improperly calibrated speedometer.

The vehicle speed readings for the speedometer are taken from the output speed sensor. The TCM must be calibrated to the different combinations of equipment (final drive and tires) available. Pinion Factor allows the technician to set the Transmission Control Module initial setting so that the speedometer readings will be correct. To properly read and/or reset the Pinion Factor, it is necessary to use a DRBIII® scan tool.

(1) Plug the DRBIII® scan tool into the diagnostic connector located under the instrument panel.
(2) Select the Transmission menu.
(3) Select the Miscellaneous menu.
(4) Select Pinion Factor. Then follow the instructions on the DRBIII® scan tool screen.

STANDARD PROCEDURE - QUICK LEARN PROCEDURE

The quick learn procedure requires the use of the DRBIII® scan tool. This program allows the electronic transaxle system to recalibrate itself. This will provide the best possible transaxle operation.

NOTE: The quick learn procedure should be performed if any of the following procedures are performed:

- Transaxle Assembly Replacement
- Transmission Control Module Replacement
- Solenoid/Pressure Switch Assembly Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 rpm
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the DRBIII® indicates the procedure is complete
- The calculated oil temperature must be above 60° and below 200°

(1) Plug the DRBIII® scan tool into the diagnostic connector. The connector is located under the instrument panel.
(2) Go to the Transmission screen.
(3) Go to the Miscellaneous screen.
(4) Select Quick Learn Procedure. Follow the instructions of the DRBIII® to perform the Quick Learn Procedure.

REMOVAL

NOTE: If transmission control module is being replaced with a new or replacement unit, the Pinion Factor and Quick Learn procedures must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect battery negative cable.
(2) Raise vehicle on hoist.
(3) Remove left front tire/wheel assembly.
(4) Pull back splash shield to gain access to TCM location.
(5) Disconnect TCM 60-way connector (Fig. 16).

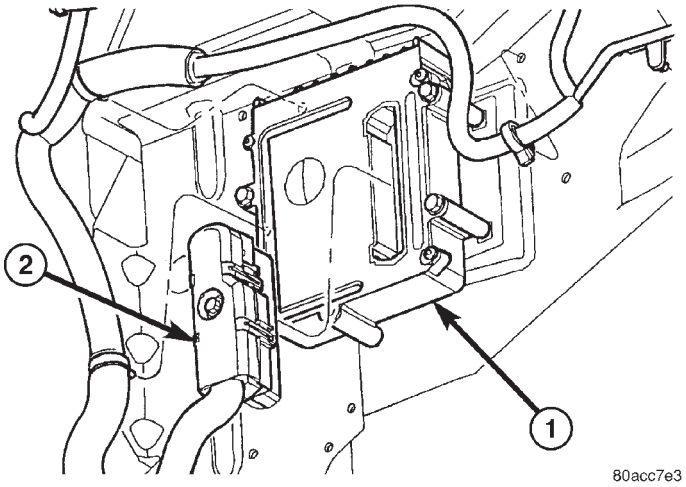

Fig. 16 Transmission Control Module 60-way Connector

1 - TRANSMISSION CONTROL MODULE (TCM)
2 - 60-WAY CONNECTOR

TRANSMISSION CONTROL MODULE (Continued)

(6) Remove three (3) TCM-to-rail screws and remove TCM from vehicle (Fig. 17).

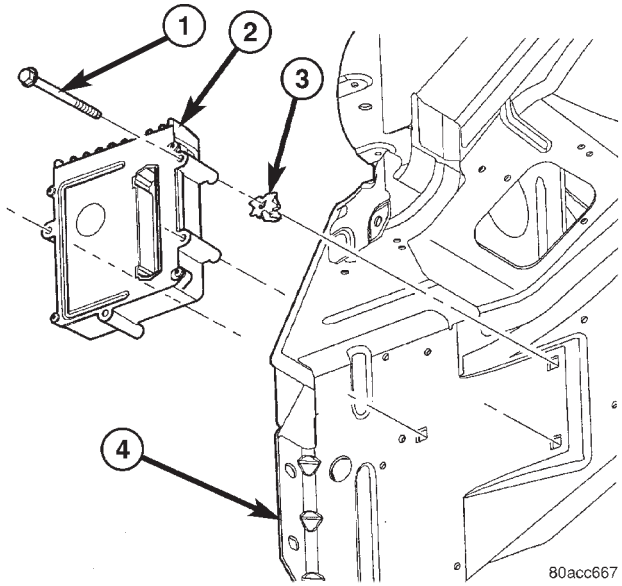

Fig. 17 Transmission Control Module Removal/ Installation

1 - SCREW
2 - TRANSMISSION CONTROL MODULE (TCM)
3 - CLIP
4 - LEFT RAIL

INSTALLATION

NOTE: If transmission control module is being replaced with a new or replacement unit, the Pinion Factor and Quick Learn procedures must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Install TCM into position (Fig. 18). Install three (3) screws and torque to 3 N·m (30 in. lbs.).

(2) Install TCM harness 60–way connector (Fig. 19) and torque to 4 N·m (35 in. lbs.).

(3) Install splash shield into position with fasteners.

(4) Install left front wheel/tire assembly.

(5) Lower vehicle.

(6) Connect battery negative cable.

(7) If TCM was replaced, reset Pinion Factor and Quick Learn. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

MEMORY SEAT/MIRROR MODULE

DESCRIPTION

Vehicles equipped with the memory seat/mirror option, utilize a memory module located under the drivers front seat. This module is basically wired in-line between the power seat switch and the power seat track/adjuster motors, or in-line between the power mirror switch and the power side view mirror(s) motor(s). The MSMM contains a central processing unit that communicates with other modules on the Programmable Communications Interface (PCI) data bus network.

The Memory Seat/Mirror Module (MSMM) receives hard wired inputs from the driver power seat switch and the potentiometers on each of the driver side power seat track motors, or from the power mirror switch and the potentiometers on the side view mirror. The MSMM receives messages over the PCI data bus from the Body Control Module (BCM) (memory switch status), the Powertrain Control Module (PCM) (vehicle speed status). The MSMM will prevent the seat memory recall function from being initiated if the driver side seat belt is buckled, if the transmission gear selector lever is not in the Park or Neutral positions, or if the vehicle is moving.

For diagnosis of the MSMM or the PCI data bus, a DRB III® scan tool and the proper Diagnostic Procedures manual are recommended. The MSMM cannot be repaired and, if faulty or damaged, it must be replaced. Refer to **Memory System** in the Power Seat or Power Mirror section of this manual for more information on the memory system option.

OPERATION

When memory system operation is requested (depressing of the memory switch), a resistor multiplexed signal is sent from the memory switch to the body control module (BCM). The body control module will then send the appropriate signals out to the memory/mirror seat module, the memory/mirror seat module then applies the voltage supply to the power seat track or side-view mirror if the proper requirements are met. The vehicle speed must equal zero and the transmission must be in park or neutral in order for the memory system to function.

DIAGNOSIS AND TESTING - MEMORY SEAT/MIRROR MODULE

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. If any of the above conditions are present, repair as necessary. If not, use a DRB III® scan tool and the proper Diagnostic Procedures Manual to test the memory/mirror seat module. For complete circuit diagrams, refer to **Wiring Diagrams**.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the driver side front bucket seat retaining nuts from under the vehicle (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(3) Lift the drivers seat up and out of the mounting holes in the floor pan and lay the seat rearward to access the module located under the seat. It is not necessary to disconnect the seat electrical, just use care not to damage the wiring by over-extending.

(4) Disconnect the memory/mirror seat module electrical connectors. Depress the retaining tab and pull straight apart.

(5) Remove the module retaining bolts and remove the module from the bracket.

INSTALLATION

(1) Position and install the module retaining bolts.

(2) Connect the memory/mirror seat module electrical connectors.

(3) Position the drivers seat in the mounting holes in the floor pan.

(4) Install the driver side front bucket seat retaining nuts from under the vehicle (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

(5) Connect the battery negative cable.

SLIDING DOOR CONTROL MODULE

DESCRIPTION

Vehicles equipped with a power sliding door utilize a sliding door control module. The sliding door control module is located behind the sliding door trim panel in the center of the door, just above the sliding door motor (Fig. 20). This module controls the operation of the door through the Programmable Communication Interface (PCI) J1850 data bus circuit and the Body Control Module. The sliding door control module contains software technology which enables it to detect resistance to door travel and to reverse door travel in order to avoid damage to the door or to avoid possible personal injury if the obstruction is a person. This feature functions in both the opening and closing cycles. If the power sliding door system develops any problems the control module will store and recall Diagnostic Trouble Codes (DTC). The use of a diagnostic scan tool, such as the DRB III® is required to read and troubleshoot these trouble codes. The sliding door control module can be

SLIDING DOOR CONTROL MODULE (Continued)

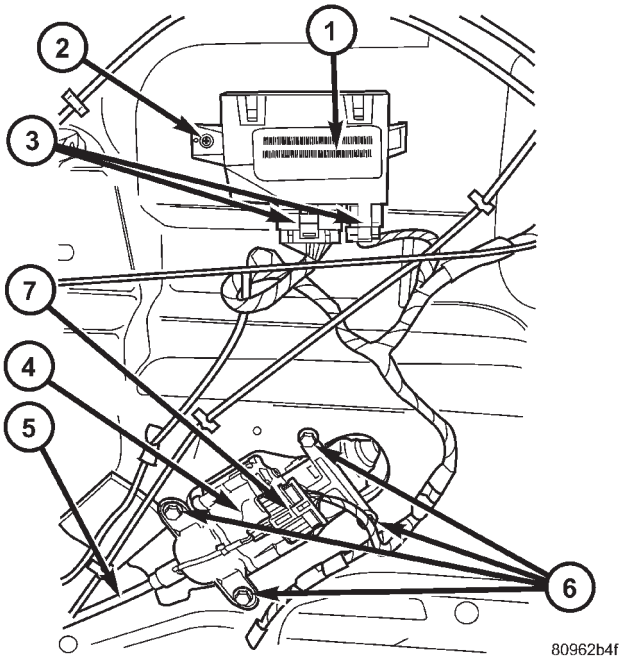

Fig. 20 Power Side Door Components

1 - SLIDING DOOR CONTROL MODULE

4 - DOOR MOTOR ASSEMBLY
5 - FLEX DRIVE ASSEMBLY
6 - DOOR MOTOR RETAINING FASTENERS
7 - DOOR MOTOR ELECTRICAL CONNECTOR

reflashed if necessary. Refer to the latest Technical Service Bulletin (TSB) Information for any updates.

The power door control module is a replaceable component and cannot be repaired, if found to be faulty it must be replaced. Consult your Mopar™ parts catalog for a specific part number.

OPERATION

The power sliding door control module serves as the main computer for the power sliding side door system. All power door functions are processed through the power door control module and/or the vehicles body control module (BCM). At the start of a power open command, a signal is sent to the BCM and then to the power door control module via the J1850 data bus circuit. This signal, generated by any of the power door command switches, tells the power door control module to activate a power latch release, engage the clutch assembly and drive the door into the full open position. If an obstacle is felt during this power open cycle, the module will reverse direction and close the door. This process is also enabled during a power close cycle. This process will repeat three times, and if a fourth obstacle is detected, the door will go into full manual mode. Once the full open position is obtained, a hold open latch assembly mounted full open switch tells the control module that the door has reached the full open position. If the power sliding door system develops any problems the control module will store and recall Diagnostic Trouble Codes (DTC). The use of a diagnostic scan tool, such as the DRB III® is required to read and troubleshoot these trouble codes.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the appropriate door trim panel from the vehicle. Refer to Body for the procedure.

(3) Remove the weather shield. Refer to Body for the procedure.

(4) Disconnect the power door control module electrical connectors. Slide the red locking tab out (away from module) and depress connector retaining tab, while pulling straight apart.

(5) Remove the control module retaining screw (Fig. 20).

(6) Remove the module from the vehicle.

INSTALLATION

(1) Position the control module and install the retaining screw.

(2) Connect the control module electrical connectors. Slide the locking tab into the locked position.

(3) Install the appropriate door trim panel on the vehicle. Refer to Body for the procedure.

(4) Install the weather shield. Refer to Body for the procedure.

(5) Connect the negative battery cable.

(6) Using an appropriate scan tool, check and erase any power door control module diagnostic trouble codes.

(7) Verify power door system operation. Cycle the power door through one complete open and close cycle.

REMOVAL 4
INSTALLATION 4

ENGINE CONTROL MODULE

DESCRIPTION

The ECM is located in the left front corner of the engine compartment attached to the radiator support (Fig. 1).

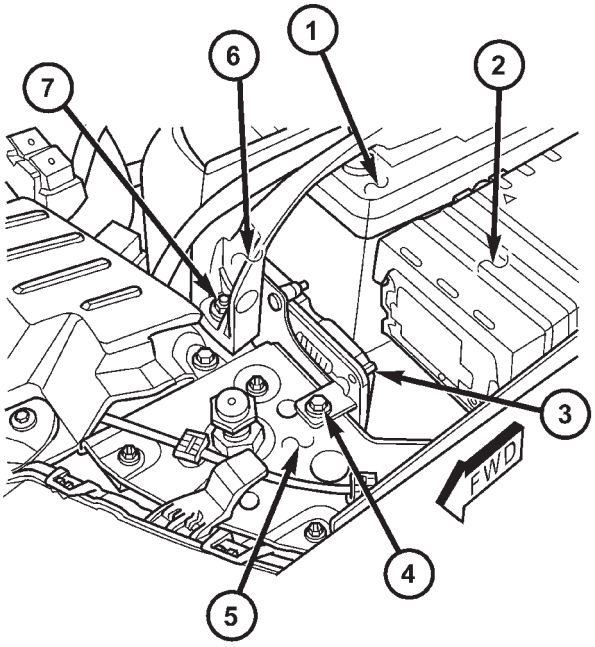

Fig. 1 ENGINE CONTROL MODULE LOCATION-TYPICAL

1 - BATTERY
2 - IPM (INTEGRATED POWER MODULE)
3 - ECM (ENGINE CONTROL MODULE)
4 - RETAINING BOLT
5 - RADIATOR SUPPORT
6 - CLUTCH CABLE BRACKET (LHD)
7 - CLUTCH CABLE BRACKET RETAINING BOLT (LHD)

OPERATION

The ECM has been programmed to monitor different circuits of the diesel fuel injection system. This monitoring is called on-board diagnostics. Certain criteria must be met for a diagnostic trouble code to be entered into the ECM memory. The criteria may be a range of: engine rpm, engine temperature, time or other input signals to the ECM. If all of the criteria for monitoring a system or circuit are met, and a problem is sensed, then a DTC will be stored in the ECM memory. It is possible that a DTC for a monitored circuit may not be entered into the ECM memory, even though a malfunction has occurred. This may happen when the monitoring criteria have not been met. The ECM compares input signal voltages from each input device with specifications (the established high and low limits of the input range) that are programmed into it for that device. If the input voltage is not within the specifications and other trouble code criteria are met, a DTC will be stored in the ECM memory.

ECM OPERATING MODES

As input signals to the ECM change, the ECM adjusts its response to the output devices. For example, the ECM must calculate a different fuel quantity and fuel timing for engine idle condition than it would for a wide open throttle condition. There are several different modes of operation that determine how the ECM responds to the various input signals.

Ignition Switch On (Engine Off)

When the ignition is turned on, the ECM activates the glow plug relay for a time period that is determined by engine coolant temperature, atmospheric temperature and battery voltage.

Engine Start-Up Mode

The ECM uses the engine temperature sensor and the crankshaft position sensor (engine speed) inputs to determine fuel injection quantity.

Normal Driving Modes

Engine idle, warm-up, acceleration, deceleration and wide open throttle modes are controlled based on all of the sensor inputs to the ECM. The ECM uses

these sensor inputs to adjust fuel quantity and fuel injector timing.

Limp-In Mode

If there is a fault detected with the accelerator pedal position sensor, the ECM will set the engine speed at 1100 RPM.

Overspeed Detection Mode

If the ECM detects engine RPM that exceeds 5200 RPM, the ECM will set a DTC in memory and illuminate the MIL until the DTC is cleared.

After-Run Mode

The ECM transfers RAM information to ROM and performs an Input/Output state check.

MONITORED CIRCUITS

The ECM is able to monitor and identify most driveability related trouble conditions. Some circuits are directly monitored through ECM feedback circuitry. In addition, the ECM monitors the voltage state of some circuits and compares those states with expected values. Other systems are monitored indirectly when the ECM conducts a rationality test to identify problems. Although most subsytems of the engine control module are either directly or indirectly monitored, there may be occasions when diagnostic trouble codes are not immediately identified. For a trouble code to set, a specific set of conditions must occur and unless these conditions occur, a DTC will not set.

DIAGNOSTIC TROUBLE CODES

Each diagnostic trouble code (DTC) is diagnosed by following a specific procedure. The diagnostic test procedure contains step-by-step instruction for determining the cause of the DTC as well as no trouble code problems. Refer to the appropriate Diesel Powertrain Diagnostic Manual for more information.

HARD CODE

A DTC that comes back within one cycle of the ignition key is a hard code. This means that the problem is current every time the ECM/SKIM checks that circuit or function. Procedures in this manual verify if the DTC is a hard code at the beginning of each test. When the fault is not a hard code, an intermittent test must be performed. NOTE: If the DRBIII® displays faults for multiple components (i.e. ECT, VSS, IAT sensors) identify and check the shared circuits for possible problems before continuing (i.e. sensor grounds or 5-volt supply circuits). Refer to the appropriate schematic to identify shared circuits. Refer to the appropriate Diesel Powertrain Diagnostic Manual for more information.

INTERMITTENT CODE

A DTC that is not current every time the ECM/SKIM checks the circuit or function is an intermittent code. Most intermittent DTCs are caused by wiring or connector problems. Problems that come and go like this are the most difficult to diagnose; they must be looked for under specific conditions that cause them. **NOTE: Electromagnetic (radio) interference can cause an intermittent system malfunction.** This interference can interrupt communication between the ignition key transponder and the SKIM. The following checks may assist you in identifying a possible intermittent problem:

- Visually inspect the related wire harness connectors. Look for broken, bent, pushed out or corroded terminals.
- Visually inspect the related wire harness. Look for chafed, pierced or partially broken wire.
- Refer to hotlines or technical service bulletins that may apply. Refer to the appropriate Diesel Powertrain Diagnostic Manual for more information.

ECM DIAGNOSTIC TROUBLE CODES

IMPORTANT NOTE: Before replacing the ECM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most ECM driver/control circuit failures are caused by internal failures to components (i.e. relays and solenoids) and shorted circuits (i.e. sensor pull-ups, drivers and ground circuits). These faults are difficult to detect when a double fault has occurred and only one DTC has set. If the DRBIII® displays faults for multiple components (i.e.VSS, ECT, Batt Temp, etc.) identify and check the shared circuits for possible problems before continuing (i.e. sensor grounds or 5-volt supply circuits). Refer to the appropriate wiring diagrams to identify shared circuits. Refer to the appropriate Diesel Powertrain Diagnostic Manual for more information.

STANDARD PROCEDURE - PCM/ECM/SKIM PROGRAMMING - DIESEL

NOTE: Before replacing the PCM/ECM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM/ECM driver/control circuit failures are caused by internal component failures (i.e. relay and solenoids) and shorted circuits (i.e. pull-ups, drivers and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

ENGINE CONTROL MODULE (Continued)

PCM/SKIM PROGRAMMING

When a PCM (JTEC) and the SKIM are replaced at the same time perform the following steps in order:

(1) Program the new PCM (JTEC)
(2) Program the new SKIM
(3) Replace all ignition keys and program them to the new SKIM.

ECM/SKIM PROGRAMMING

When an ECM (Bosch) and the SKIM are replaced at the same time perform the following steps in order:

(1) Program the new SKIM
(2) Program the new ECM (Bosch)

PROGRAMMING THE ECM (Bosch)

(1) To program the VIN, connect the DRB III and turn the ignition on.
(2) Select Engine from the main menu. The DRB III will require the VIN to be entered before continuing.
(3) Select ENTER to update the VIN. The DRB III will display the updated VIN.
(4) If the engine is equipped with air conditioning, the ECM A/C function must be enabled. Enable the ECM A/C function as follows:

- Using the DRB III select ENGINE, MISCELLANEOUS, then ENABLE/DISABLE A/C
- Push 1 to enable A/C. DRB III screen should display A/C Activated.

PROGRAMMING THE PCM (JTEC)

The SKIS Secret Key is an ID code that is unique to each SKIM. This code is programmed and stored in the SKIM, PCM and transponder chip (ignition keys). When replacing the PCM it is necessary to program the secret key into the new PCM using the DRB III. Perform the following steps to program the secret key into the PCM.

(1) Turn the ignition switch on (transmission in park/neutral).
(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.
(3) Select PCM REPLACED (GAS ENGINE).
(4) Enter secured access mode by entering the vehicle four-digit PIN.
(5) Select ENTER to update PCM VIN.

NOTE: If three attempts are made to enter secure access mode using an incorrect PIN, secured access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. (Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary).

(6) Press ENTER to transfer the secret key (the SKIM will send the secret key to the PCM).
(7) Press Page Back to get to the Select System menu and select ENGINE, JTEC (diesel only), MISCELLANEOUS, and SRI MEMORY CHECK.
(8) The DRB III will ask, Is odometer reading between XX and XX? Select the YES or NO button on the DRB III. If NO is selected, the DRB III will read, Enter odometer Reading<From I.P. odometer>. Enter the odometer reading from the Instrument Panel and press ENTER.

PROGRAMMING THE SKIM

(1) Turn the ignition switch on (transmission in park/neutral).
(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.
(3) Select PCM REPLACED (GAS ENGINE).
(4) Program the vehicle four-digit PIN into SKIM.
(5) Select COUNTRY CODE and enter the correct country.

NOTE: Be sure to enter the correct country code. If the incorrect country code is programmed into SKIM, the SKIM must be replaced.

(6) Select YES to update VIN (the SKIM will learn the VIN from the PCM).
(7) Press ENTER to transfer the secret key (the PCM will send the secret key to the SKIM).
(8) Program ignition keys to SKIM.

NOTE: If the PCM and the SKIM are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new SKIM.

PROGRAMMING IGNITION KEYS TO THE SKIM

(1) Turn the ignition switch on (transmission in park/neutral).
(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.
(3) Select PROGRAM IGNITION KEY'S.
(4) Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: A maximum of eight keys can be learned to each SKIM. Once a key is learned to a SKIM it (the key) cannot be transferred to another vehicle.

If ignition key programming is unsuccessful, the DRB III will display one of the following messages:

Programming Not Attempted - The DRB III attempts to read the programmed key status and there are no keys programmed into SKIM memory.

ENGINE CONTROL MODULE (Continued)

Programming Key Failed (Possible Used Key From Wrong Vehicle) - SKIM is unable to program key due to one of the following:

- faulty ignition key transponder
- ignition key is programmed to another vehicle.

8 Keys Already Learned, Programming Not Done - SKIM transponder ID memory is full.

(5) Obtain ignition keys to be programmed from customer (8 keys maximum).

(6) Using the DRB III, erase all ignition keys by selecting MISCELLANEOUS and ERASE ALL CURRENT IGN. KEYS.

(7) Program all ignition keys.

Learned Key In Ignition - Ignition key transponder ID is currently programmed in SKIM memory.

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove left front headlamp module (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(3) Remove lower headlamp assembly mounting bolt (Fig. 2).

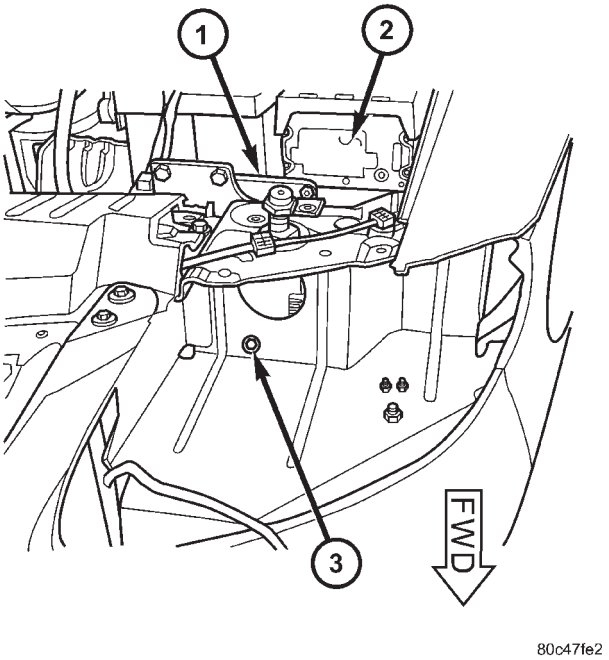

Fig. 2 ENGINE CONTROL MODULE-LOWER MOUNTING BOLT

1 - ENGINE CONTROL MODULE (ECM)
2 - INTEGRATED POWER MODULE
3 - ECM LOWER MOUNTING BOLT

(4) Remove ECM upper mounting bolts (Fig. 3).

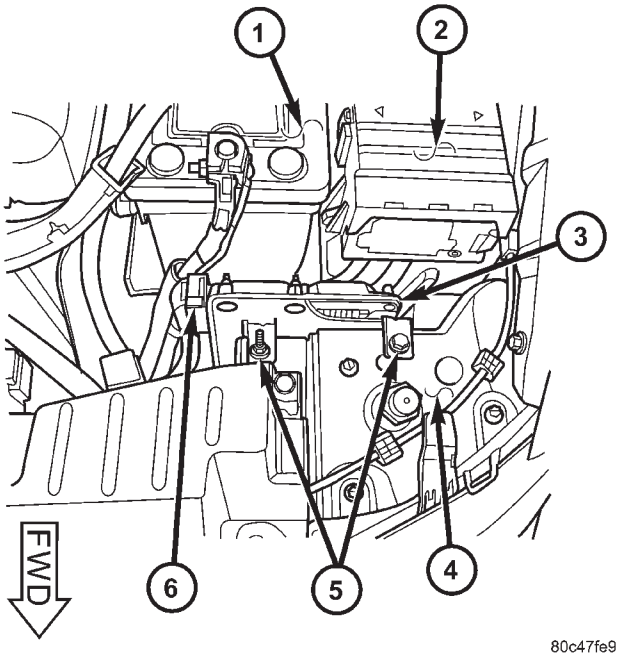

Fig. 3 ENGINE CONTROL MODULE-UPPER MOUNTING BOLTS

1 - BATTERY
2 - INTEGRATED POWER MODULE
3 - ENGINE CONTROL MODULE
4 - RADIATOR SUPPORT
5 - ECM UPPER MOUNTING BOLTS
6 - ECM ELECTRICAL CONNECTORS

(5) Lift ECM from radiator support.

(6) Disconnect ECM electrical connectors.

(7) Separate ECM from mounting bracket.

INSTALLATION

(1) Install ECM on mounting bracket.

(2) Connect ECM electrical connectors.

(3) Place ECM and bracket assembly in position on radiator support.

(4) Install upper and lower mounting bolts.

(5) Install left headlamp module (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

(6) Connect negative battery cable.

(7) Program ECM as necessary (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ENGINE CONTROL MODULE - STANDARD PROCEDURE).

BATTERY SYSTEM

DESCRIPTION

A single 12-volt battery system is standard factory-installed equipment on this model. All of the components of the battery system are located within the engine compartment of the vehicle. The service information for the battery system in this vehicle covers the following related components, which are covered in further detail elsewhere in this service manual:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cable** - The battery cables connect the battery terminal posts to the vehicle electrical system.

BATTERY SYSTEM (Continued)

- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray in the engine compartment.
- **Battery Thermowrap** - The battery thermowarp insulates the battery to protect it from engine compartment temperature extremes.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules and jump starting procedures, see the owner's manual in the vehicle glove box. Optionally, refer to Lubrication and Maintenance for the recommended battery maintenance schedules and for the proper battery jump starting procedures. While battery charging can be considered a maintenance procedure, the battery charging procedures and related information are located in the standard procedures section of this service manual. This was done because the battery must be fully-charged before any battery system diagnosis or testing procedures can be performed. Refer to Standard procedures for the proper battery charging procedures.

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING - BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. Refer to Charging System for the proper charging system onboard diagnostic test procedures.

MICRO 420 ELECTRICAL SYSTEM TESTER

The Micro 420 automotive battery system tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro 420 electrical system tester.

BATTERY SYSTEM (Continued)

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is faulty.	2. Determine if the charging system is performing to specifications. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Charge the faulty battery, as required.
	4. The battery terminal connections are loose or corroded.	4. Refer to Battery Cables for the proper battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. Refer to Battery System Specifications for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is faulty.	6. Test the battery using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Replace the faulty battery, as required.
	7. The starting system is faulty.	7. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

BATTERY SYSTEM (Continued)

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle.	1. Refer to Battery System Specifications for the proper specifications. Replace an incorrect battery, as required.
	2. The battery terminal connections are loose or corroded.	2. Refer to Battery Cable for the proper cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	3. The electrical system ignition-off draw is excessive.	3. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the faulty electrical system, as required.
	4. The battery is faulty.	4. Test the battery using the Micro 420 battery tester. Refer to Standard Procedures for additional test procedures. Replace the faulty battery, as required.
	5. The starting system is faulty.	5. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	6. The charging system is faulty.	6. Determine if the charging system is performing to specifications. Refer to Charging System for charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	7. Electrical loads exceed the output of the charging system.	7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.
	8. Slow driving or prolonged idling with high-amperage draw loads in use.	8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is faulty.	1. Test the battery using the Micro 420 battery tester.. Charge or replace the faulty battery, as required.

ABNORMAL BATTERY DISCHARGING

Any of the following conditions can result in abnormal battery discharging:

1. A faulty or incorrect charging system component. Refer to Charging System for additional charging system diagnosis and testing procedures.
2. A faulty or incorrect battery. Use Micro 420 tester and refer to Battery System for additional battery diagnosis and testing procedures.
3. A faulty circuit or component causing excessive ignition-off draw.
4. Electrical loads that exceed the output of the charging system. This can be due to equipment installed after manufacture, or repeated short trip use.
5. A faulty or incorrect starting system component. Refer to Starting System for the proper starting system diagnosis and testing procedures.
6. Corroded or loose battery posts and/or terminal clamps.
7. Slow driving speeds (heavy traffic conditions) or prolonged idling, with high-amperage draw loads in use.

BATTERY SYSTEM (Continued)

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Clean the battery cable terminal clamps of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution (Fig. 1).

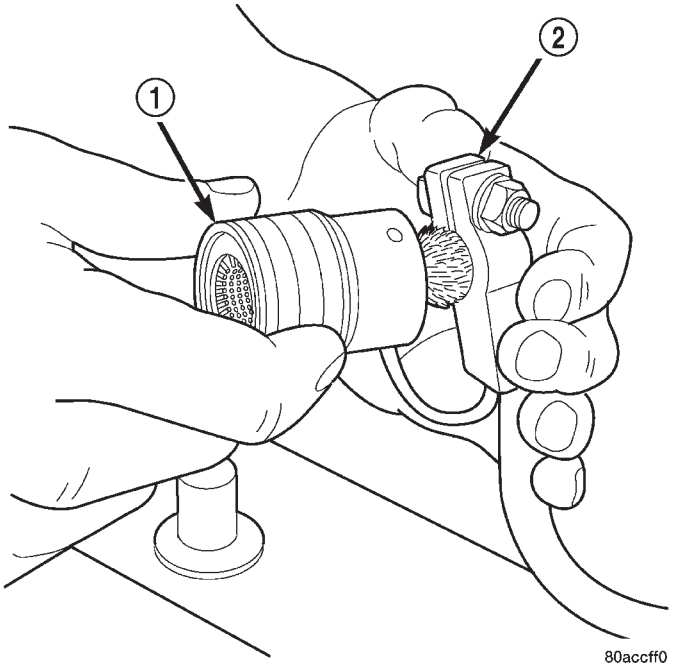

Fig. 1 Clean Battery Cable Terminal Clamp - Typical

1 - TERMINAL BRUSH
2 - BATTERY CABLE

(2) Clean the battery tray and battery holddown hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

(3) If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film (Fig. 2). Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, refer to Battery System Specifications for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

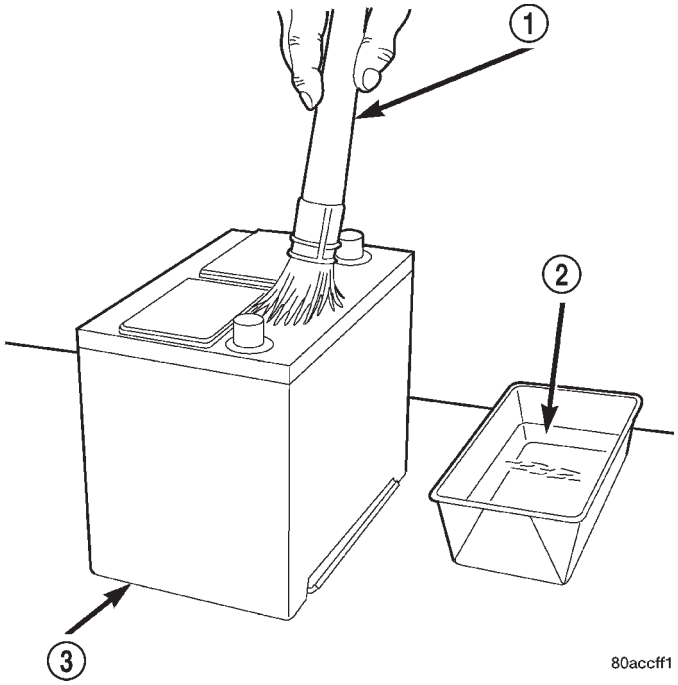

Fig. 2 Clean Battery - Typical

1 - CLEANING BRUSH
2 - WARM WATER AND BAKING SODA SOLUTION
3 - BATTERY

(4) Clean the battery thermowrap with a sodium bicarbonate (baking soda) and warm water cleaning solution using a soft bristle parts cleaning brush to remove any acid film.

(5) Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner, and a sodium bicarbonate (baking soda) and warm water cleaning solution (Fig. 3).

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.

(2) Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.

(3) Slide the thermowrap off of the battery case. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.

BATTERY SYSTEM (Continued)

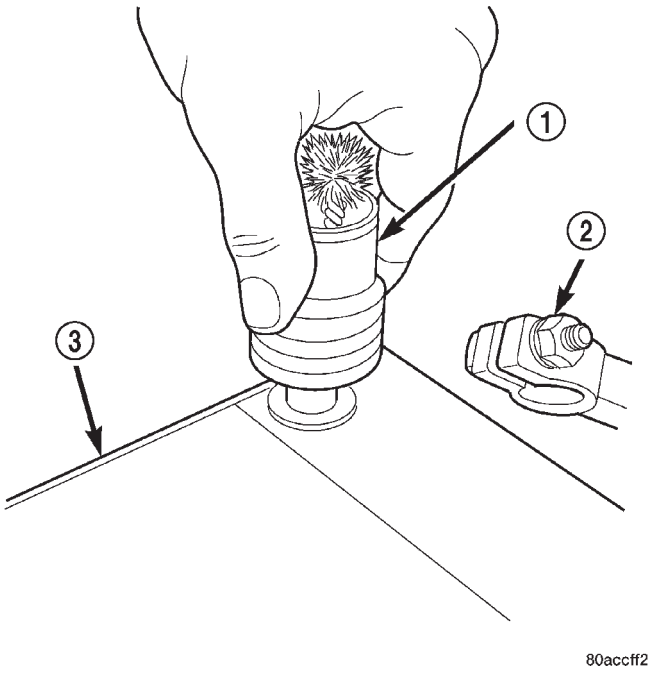

Fig. 3 Clean Battery Terminal Post - Typical

1 - TERMINAL BRUSH
2 - BATTERY CABLE
3 - BATTERY

(4) Inspect the battery thermowrap for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.

(5) Inspect the battery built-in test indicator sight glass(if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to Standard Procedures for the proper battery built-in indicator test procedures. Also refer to Standard Procedures for the proper battery charging procedures.

SPECIFICATIONS

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.

BATTERY CLASSIFICATIONS & RATINGS					
Part Number	BCI Group Size Classification	Cold Cranking Amperage	Reserve Capacity	Ampere - Hours	Load Test Amperage

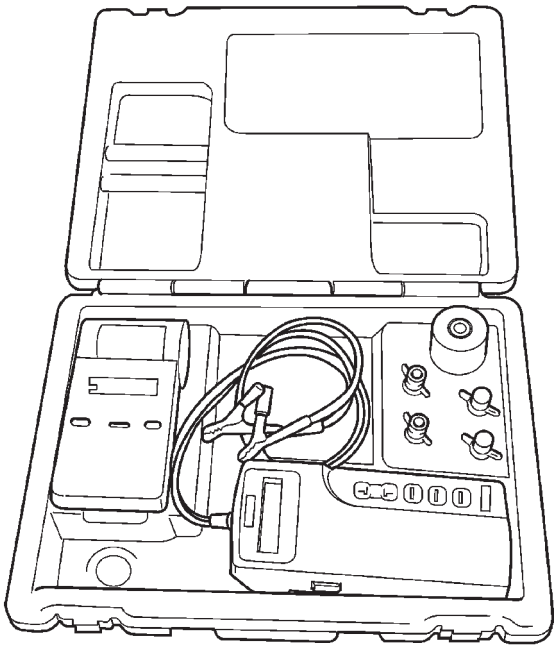
BATTERY SYSTEM (Continued)

SPECIAL TOOLS

BATTERY SYSTEM SPECIAL TOOLS



MICRO 420 BATTERY TESTER

BATTERY

DESCRIPTION

There are three different batteries available on this model. Vehicles equipped with a diesel engine utilize a spiral wound plate designed battery with recombination technology. This is a maintenance-free battery that is capable of delivering more power than a conventional battery. This additional power is required by a diesel engine during cold cranking. Vehicles equipped with a gasoline engine utilize a conventional battery. Refer to the following information for detailed differences and descriptions of these batteries.

SPIRAL PLATE BATTERY - DIESEL ENGINE

Spiral plate technology takes the elements of traditional batteries - lead and sulfuric acid - to the next level. By tightly winding layers of spiral grids and acid-permeated vitreous separators into cells, the manufacturer has developed a battery with more power and service life than conventional batteries the same size. The spiral plate battery is completely, permanently sealed. Through gas recombination, hydrogen and oxygen within the battery are captured during normal charging and reunited to form the water within the electrolyte, eliminating the need to add distilled water. Therefore, these batteries have non-removable battery vent caps (Fig. 4). Water **cannot** be added to this battery.

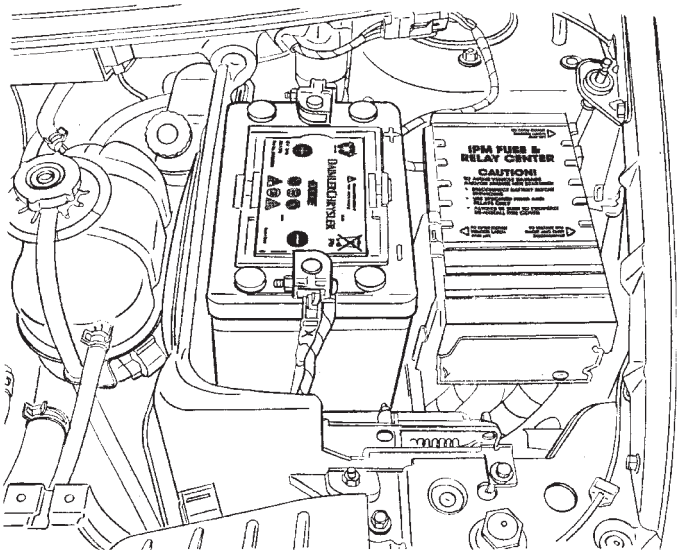


Fig. 4 MAINTENANCE-FREE DIESEL ENGINE BATTERY

The acid inside an spiral plate battery is bound within the vitreous separators, ending the threat of acid leaks. This feature allows the battery to be installed in any position anywhere in the vehicle.

Spiral plate technology is the process by which the plates holding the active material in the battery are wound tightly in coils instead of hanging flat, like conventional batteries. This design has a lower internal resistance and also increases the active material surface area.

WARNING: NEVER EXCEED 14.4 VOLTS WHEN CHARGING A SPIRAL PLATE BATTERY. PERSONAL INJURY AND/OR BATTERY DAMAGE MAY RESULT.

Due to the maintanance-free design, distilled water cannot be added to this battery. Therefore, if more than 14.4 volts are used during the spiral plate battery charging process, water vapor can be exhausted through the pressure-sensitive battery vents and lost for good. This can permanently damage the spiral plate battery. Never exceed 14.4 volts when charging a spiral plate battery. Personal injury and/or battery damage may result.

BATTERY (Continued)

CONVENTIONAL BATTERY - GASOLINE ENGINE

1 - POSITIVE POST
2 - VENT
3 - CELL CAP
4 - VENT
5 - CELL CAP
6 - VENT
7 - NEGATIVE POST
8 - INDICATOR EYE (if equipped)
9 - ELECTROLYTE LEVEL
10 - PLATE GROUPS
11 - MAINTENANCE-FREE BATTERY

Low-maintenance batteries are used on vehicles equipped with a gasoline engine, these batteries have removable battery cell caps (Fig. 5). Water **can** be added to this battery. Under normal service, the composition of this battery reduces gassing and water loss at normal charge rates. However these batteries may require additional distilled water after years of service.

Maintenance-free batteries are standard factory-installed equipment on this model. Male post type terminals made of a soft lead material protrude from the top of the molded plastic battery case (Fig. 6)to provide the means for connecting the battery to the vehicle electrical system. The battery positive terminal post is visibly larger in diameter than the negative terminal post, for easy identification. The letters **POS** and **NEG** are also molded into the top of the battery case adjacent to their respective positive and negative terminal posts for additional identification confirmation.

This battery is designed to provide a safe, efficient and reliable means of storing electrical energy in a chemical form. This means of energy storage allows the battery to produce the electrical energy required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery is made up of six individual cells that are connected in series. Each cell contains positively charged plate groups that are connected with lead straps to the positive terminal post, and negatively charged plate groups that are connected with lead straps to the negative terminal post. Each plate consists of a stiff mesh framework or grid coated with lead dioxide (positive plate) or sponge lead (negative plate). Insulators or plate separators made of a non-conductive material are inserted between the positive and negative plates to prevent them from contacting or shorting against one another. These dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

Some factory-installed batteries have a built-in test indicator (hydrometer). The color visible in the sight glass of the indicator will reveal the battery condition. For more information on the use of the built-in test indicator, refer to **Standard Procedures** The chemical composition of the metal coated plates within the low-maintenance battery reduces battery gassing and water loss, at normal charge and discharge rates. Therefore, the battery should not require additional water in normal service. If the electrolyte level in this battery does become low, distilled water must be added. However, rapid loss of

BATTERY (Continued)

electrolyte can be caused by an overcharging condition. Be certain to diagnose the charging system after replenishing the water in the battery for a low electrolyte condition and before returning the vehicle to service. Refer to **Charging System** for additional information.

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Refer to **Battery Specifications** in this group for the location of the proper factory-installed battery specifications.

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING - BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. Refer to Battery System Cleaning for the proper cleaning procedures, and Battery System Inspection for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

MICRO 420 ELECTRICAL SYSTEM TESTER

The Micro420 automotive battery tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro420 electrical system tester.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is faulty and must be replaced.

BATTERY (Continued)

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

STANDARD PROCEDURE

STANDARD PROCEDURE - SPIRAL PLATE BATTERY CHARGING

Vehicles equipped with a diesel engine utilize a unique spiral plate battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the following spiral plate battery charging procedure could result in damage to the battery or personal injury.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.65 volts or above.
- Battery passes Load Test multiple times.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS OR LOW ELECTROLYTE LEVEL, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed 14.4 volts while charging a battery.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.6 volts or greater, perform a load test to determine the battery cranking capacity. Refer to Standard Procedures for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY – SPIRAL PLATE BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

(1) Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt (Fig. 7). If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.

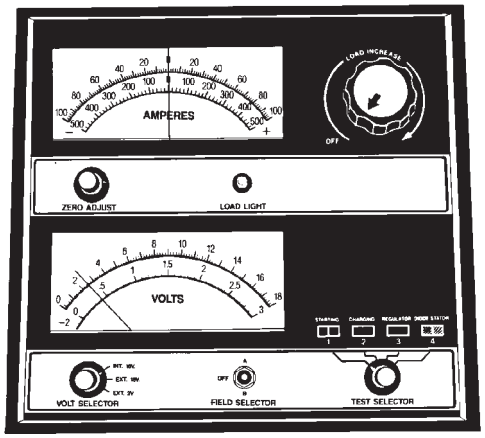

Fig. 7 Voltmeter - Typical

(2) Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

(3) Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

BATTERY (Continued)

CHARGE RATE TABLE	
Voltage	Hours
14.4 volts maximum	up to 4 hours
13.0 to 14 volts	up to 8 hours
12.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies eight amperes will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE		
Charging Amperage	5 Amps	8 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)	
12.25 to 12.49	6 hours	3 hours
12.00 to 12.24	10 hours	5 hours
10.00 to 11.99	14 hours	7 hours
Below 10.00	18 hours	9 hours

STANDARD PROCEDURE - CONVENTIONAL BATTERY CHARGING

Vehicles equipped with a diesel engine utilize a unique spiral plate battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the spiral plate battery charging procedure could result in damage to the battery or personal injury.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- Three hydrometer tests, taken at one-hour intervals, indicate no increase in the temperature-corrected specific gravity of the battery electrolyte.
- Open-circuit voltage of the battery is 12.64 volts or above.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS IS IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

BATTERY (Continued)

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.4 volts or greater, retest the battery with the micro 420 tester or perform a load test to determine the battery cranking capacity. Refer to Standard Procedures for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

(1) Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt (Fig. 8). If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.

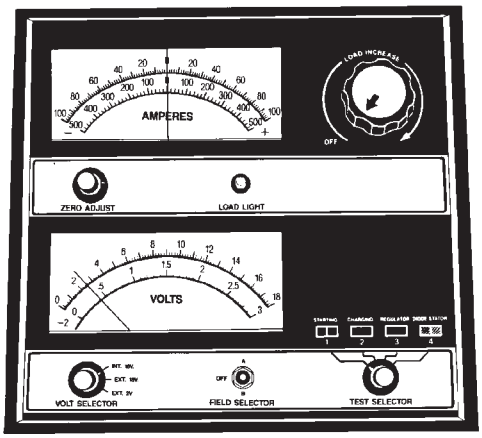

Fig. 8 Voltmeter - Typical

(2) Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

(3) Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	Hours
16.0 volts maximum	up to 10 min.
14.0 to 15.9 volts	up to 20 min.
13.9 volts or less	up to 30 min.

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Conventional Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY (Continued)

CONVENTIONAL BATTERY CHARGING TIME TABLE			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

STANDARD PROCEDURE - OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used if no other battery tester is available.

Before proceeding with this test, completely charge the battery. Refer to Standard Procedures for the proper battery charging procedures.

(1) Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.

(2) Disconnect and isolate both battery cables, negative cable first.

(3) Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage (Fig. 9).

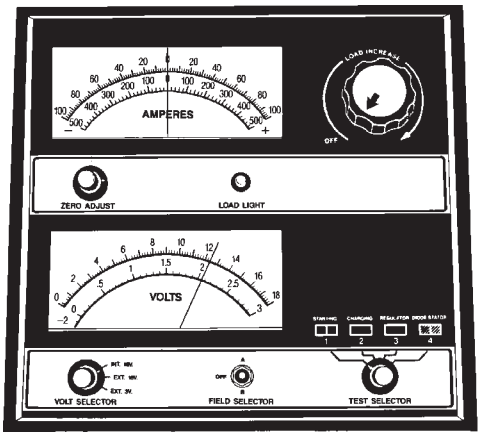

Fig. 9 Testing Open-Circuit Voltage - Typical

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity. Refer to Standard Procedures for the proper battery load test procedures.

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.45 volts	75%
12.65 volts or more	100%

STANDARD PROCEDURE - IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.015 to 0.025 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to twenty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty-one days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty-one days or more (stored), remove the IOD fuse from the Integrated Power Module (IPM). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over twenty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

(1) Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes.

(2) Disconnect the battery negative cable.

(3) Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter

BATTERY (Continued)

between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

(4) After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Integrated Power Module (IPM), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information in this service manual for complete Integrated Power Module fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, refer to Charging System for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

(5) Allow twenty minutes for the IOD to stabilize and observe the multi-meter reading. The low-amperage IOD should not exceed twenty-five milliamperes (0.025 ampere). If the current draw exceeds twenty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 4. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

STANDARD PROCEDURE - CHECKING BATTERY ELECTROLYTE LEVEL

The following procedure can be used to check the electrolyte level in a low-maintenance lead-acid battery.

(1) Unscrew and remove the battery cell caps with a flat-bladed screw driver (Fig. 10).

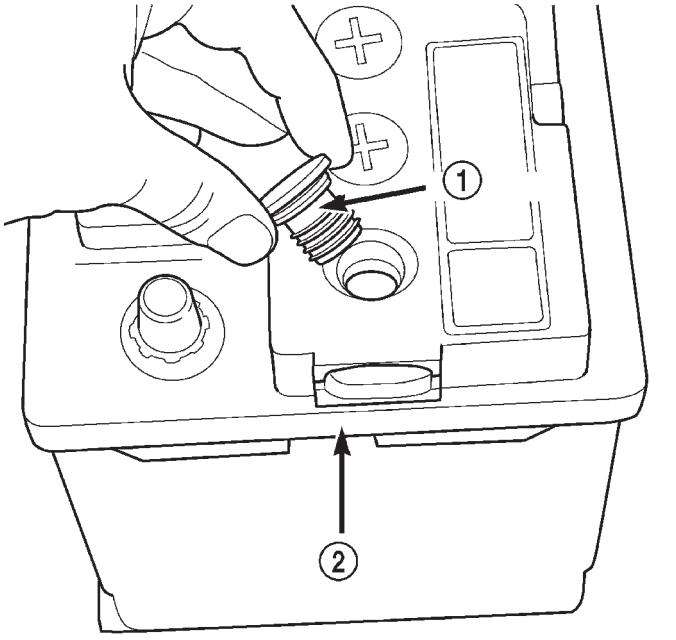

Fig. 10 BATTERY CELL CAP REMOVAL/ INSTALLATION - LOW-MAINTENANCE BATTERY ONLY

1 - BATTERY CELL CAP
2 - BATTERY CASE

WARNING: NEVER PUT YOUR FACE NEAR A GASSING, HOT OR SWELLED BATTERY. SERIOUS PERSONAL INJURY MAY RESULT.

(2) Wearing safety glasses, look through the battery cell cap holes to determine the level of the electrolyte in the battery. The electrolyte should be above the hooks inside the battery cells (Fig. 11).

(3) **Add only distilled water** until the electrolyte is above the hooks inside the battery cells (Fig. 11).

REMOVAL - BATTERY

WARNING: A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.

BATTERY (Continued)

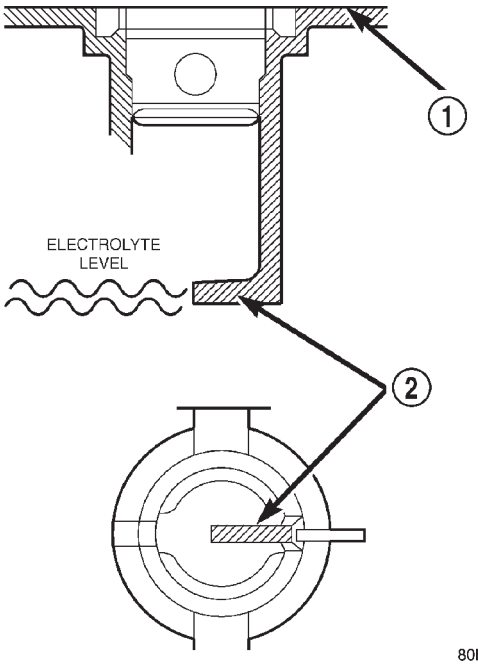

Fig. 11 HOOK INSIDE BATTERY CELLS - LOW-MAINTENANCE BATTERY ONLY

1 - TOP OF BATTERY
2 - HOOK INSIDE BATTERY CELLS

WARNING: REMOVE METALLIC JEWELRY TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.

(1) Verify that the ignition switch and all accessories are OFF.
(2) Disconnect the battery cables from the battery posts, negative first (Fig. 12).
(3) Remove the battery hold down retaining nut.
(4) Remove the battery hold down bracket.
(5) Remove the battery from the vehicle.

INSTALLATION

(1) Position the battery in the battery tray.
(2) Install the battery hold down bracket and retaining nut. Torque the nut to 20 N·m (180 in. lbs.).
(3) Connect the battery cables to the battery posts, positive cable first. Torque terminal fasteners to 8.5 N·m (75 in. lbs.).

BATTERY HOLDDOWN

DESCRIPTION

The battery hold down hardware consists of a molded plastic lip that is integral to the outboard edge of the battery tray and support unit, a molded steel hold down bracket and a single hex nut with a coned washer.

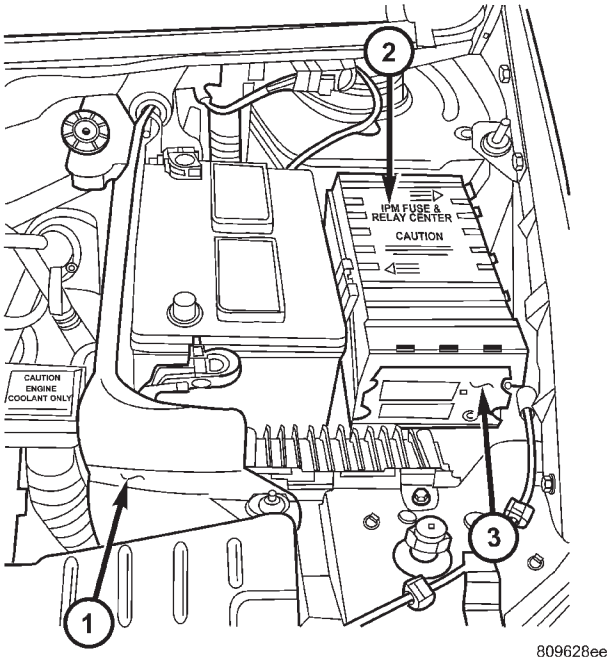

Fig. 12 BATTERY POSITION & ORIENTATION

1 - BATTERY THERMOWRAP (IF EQUIPPED)
2 - INTEGRATED POWER MODULE
3 - FRONT CONTROL MODULE

When installing a battery into the battery tray, be certain that the hold down hardware is properly installed and that the fasteners are tightened to the proper specifications. Improper hold down fastener tightness, whether too loose or too tight, can result in damage to the battery, the vehicle or both. Refer to **Battery Hold Downs** in this section of this service manual for the location of the proper battery hold down installation procedures, including the proper hold down fastener tightness specifications.

OPERATION

The battery holddown secures the battery in the battery tray. This holddown is designed to prevent battery movement during the most extreme vehicle operation conditions. Periodic removal and lubrication of the battery holddown hardware is recommended to prevent hardware seizure at a later date.

NOTE: Never operate a vehicle without a battery holddown device properly installed. Damage to the vehicle, components and battery could result.

REMOVAL

All of the battery hold down hardware can be serviced without removal of the battery or the battery tray and support unit.

BATTERY HOLDDOWN (Continued)

(1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.

(2) Remove the nut with washer that secures the battery hold down bracket to the battery tray and support unit.

(3) Remove the battery hold down bracket from the battery tray and support unit.

INSTALLATION

(1) Install the battery hold down bracket in the battery tray and support unit.

(2) Install the nut with washer that secures the battery hold down bracket to the battery tray and support unit. Torque to 20 N·m (180 in. lbs.).

BATTERY CABLES

DESCRIPTION

The battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. Refer to **Wiring Diagrams** in the index of this service manual for the location of the proper battery cable wire gauge information.

A clamping type female battery terminal made of stamped metal is attached to one end of the battery cable wire. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a black insulating jacket and a smaller female battery terminal clamp.

The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some models. Refer to **Wiring Diagrams** in the index of this service manual for the location of more information on the various wiring circuits included in the battery wire harness for the vehicle being serviced.

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

The battery positive cable terminal clamp is attached to the ends of two wires. One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Integrated Power Module (IPM), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp is also attached to the ends of two wires. One wire has an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a stud on the left side of the engine cylinder block. The other wire has an eyelet terminal that connects the battery negative cable to the vehicle body through a ground screw on the left front fender inner shield, near the battery.

DIAGNOSIS AND TESTING - BATTERY CABLE

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

BATTERY CABLES (Continued)

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and load tested. Refer to Standard Procedures for the proper battery charging and load test procedures.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay is located in the Intelligent Power Module (IPM), in the engine compartment. See the fuse and relay layout label affixed to the underside of the IPM cover for ASD relay identification and location.

(1) Connect the positive lead of the voltmeter to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp (Fig. 13). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

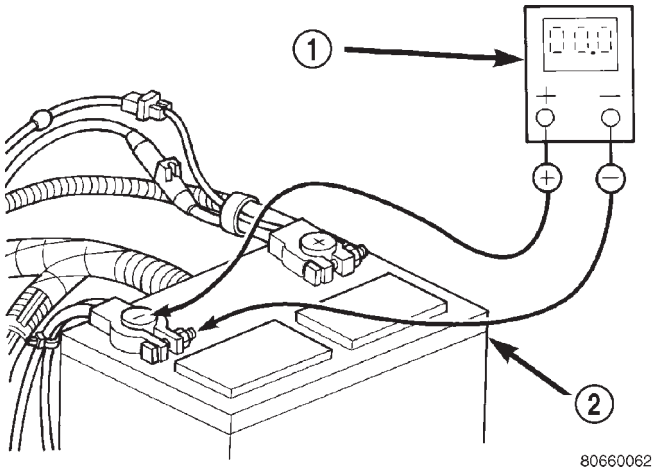

Fig. 13 TEST BATTERY NEGATIVE CONNECTION RESISTANCE - TYPICAL

1 - VOLTMETER
2 - BATTERY

(2) Connect the positive lead of the voltmeter to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp (Fig. 14). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

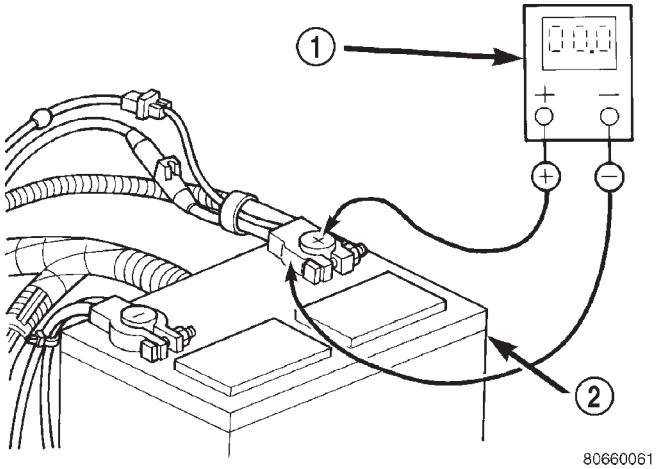

Fig. 14 TEST BATTERY POSITIVE CONNECTION RESISTANCE - TYPICAL

1 - VOLTMETER
2 - BATTERY

(3) Connect the voltmeter to measure between the battery positive cable terminal clamp and the starter solenoid B(+) terminal stud (Fig. 15). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

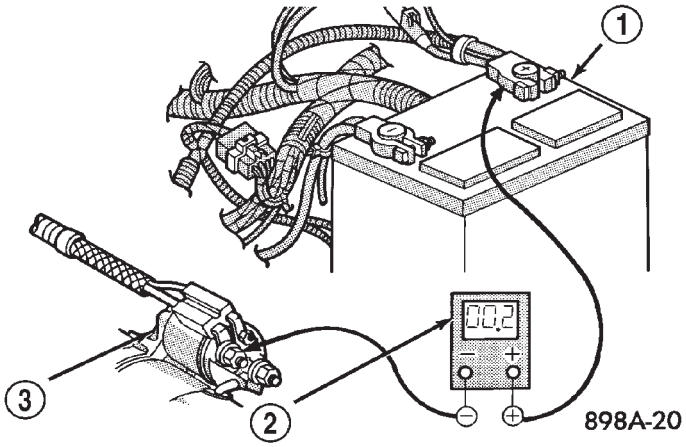

Fig. 15 TEST BATTERY POSITIVE CABLE RESISTANCE - TYPICAL

1 - BATTERY
2 - VOLTMETER
3 - STARTER MOTOR

BATTERY CABLES (Continued)

(4) Connect the voltmeter to measure between the battery negative cable terminal clamp and a good clean ground on the engine block (Fig. 16). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.

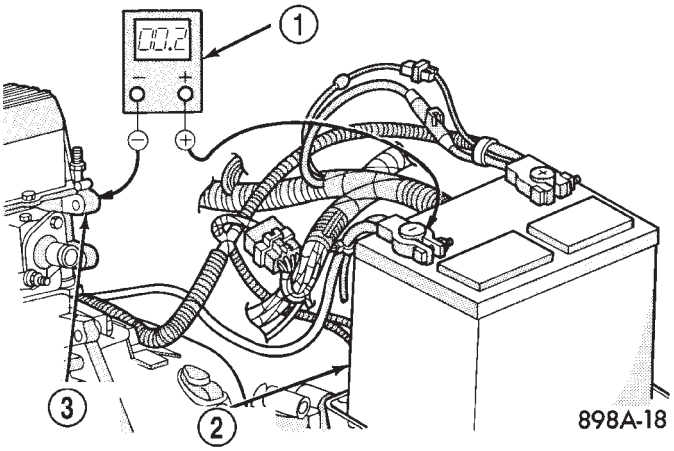

Fig. 16 TEST GROUND CIRCUIT RESISTANCE - TYPICAL

1 - VOLTMETER
2 - BATTERY
3 - ENGINE GROUND

REMOVAL

The battery cables on this model may include portions of wiring circuits for the generator and other components on the vehicle. If battery cable replacement is required, it will be necessary to extract the cables out of the engine wire harness assembly. Use care not to damage the other wires and circuits which are also packaged into the engine wire harness assembly.

(1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.

(2) Disconnect and isolate the negative battery cable terminal.

(3) Remove the battery thermowrap (if equipped) from the battery tray.

(4) Remove the tape from the engine wire harness assembly, to access the desired battery cable.

(5) One at a time, trace and disconnect the battery cable retaining fasteners and routing clips until the desired cable is free from the vehicle.

(6) Feed the battery cable out of the vehicle.

INSTALLATION

(1) Position the battery cable in the vehicle.

(2) One at a time, trace and install the battery cable retaining fasteners and routing clips until the desired cable is properly installed in the engine wire harness assembly.

(3) Install the tape on the engine wire harness assembly.

(4) Install the battery thermowrap (if equipped) on the battery tray.

(5) Connect the negative battery cable terminal.

BATTERY TRAY

DESCRIPTION

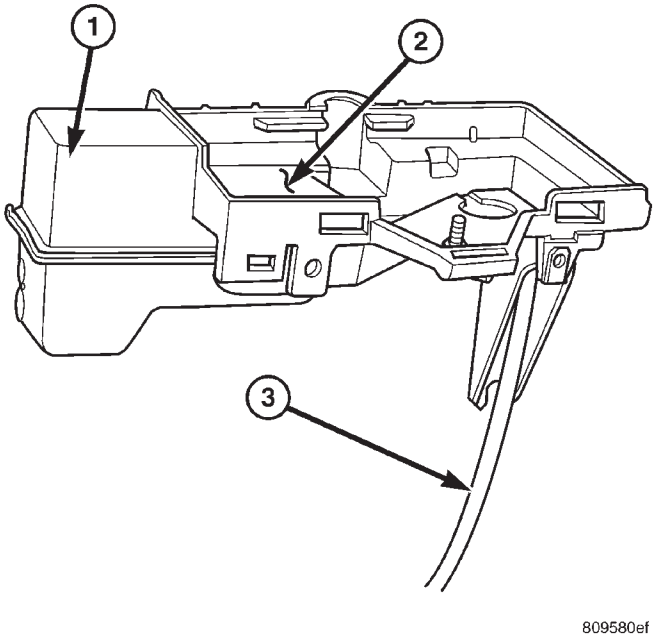

Fig. 17 RS BATTERY TRAY

1 - ENGINE VACUUM RESERVOIR
2 - BATTERY TRAY ASSEMBLY
3 - DRAINAGE HOSE

The battery is mounted in a molded plastic battery tray and support unit located in the left front corner of the engine compartment. The battery tray and support unit is secured with two nuts, one is located directly under the battery and the other is located on the right side of the tray which also serves as a coolant bottle neck retaining bolt. An additional bolt is located directly under the battery.

The battery tray and support unit also includes a engine vacuum reservoir, located in the rear of the unit (Fig. 17). And a drainage hose, located in the front of the unit (Fig. 17).

BATTERY TRAY (Continued)

OPERATION

The battery tray provides a secure mounting location and supports the battery. The battery tray also provides the anchor point for the battery holddown hardware. The battery tray and the battery holddown hardware combine to secure and stabilize the battery in the engine compartment, which prevents battery movement during vehicle operation. Unrestrained battery movement during vehicle operation could result in damage to the vehicle, the battery, or both.

The battery tray used on this model also includes a engine vacuum reservoir and drainage hose. The vacuum reservoir provides a storage container for engine vacuum. Refer to the engine section of the service manual for more engine vacuum information. The drainage hose provides means for any liquid that might collect in the bottom of the battery tray to drain under the vehicle.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the battery from the vehicle. Refer to the procedure in this section.

(3) Remove the battery tray retaining fasteners (Fig. 18).

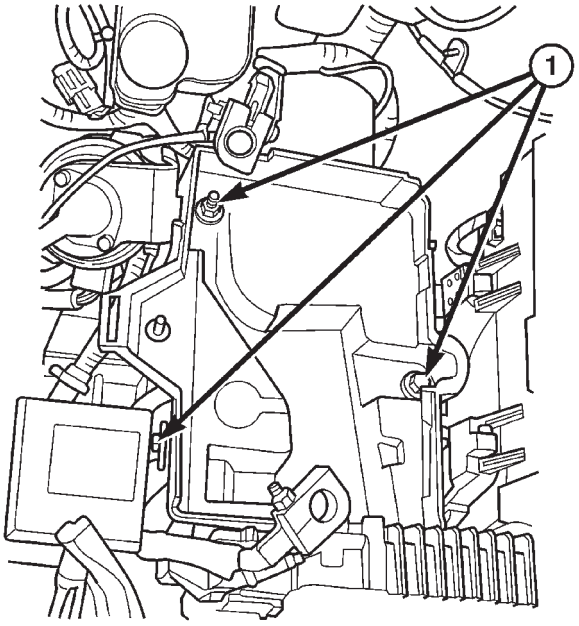

Fig. 18 BATTERY TRAY POSITION & ORIENTATION

1 - BATTERY TRAY RETAINING FASTENERS

(4) Pull battery tray up far enough to disconnect the engine vacuum harness hose from the battery tray mounted, vacuum reservoir.

(5) Remove the battery tray from the vehicle.

INSTALLATION

(1) Position the battery tray in the vehicle.

(2) Connect the engine vacuum harness hose on the battery tray mounted vacuum reservoir.

(3) Position drainage hose and install the battery tray retaining fasteners (Fig. 18).

(4) Install the battery in the vehicle. Refer to the procedure in this section.

(5) Connect the negative battery cable.

THERMOWRAP

DESCRIPTION

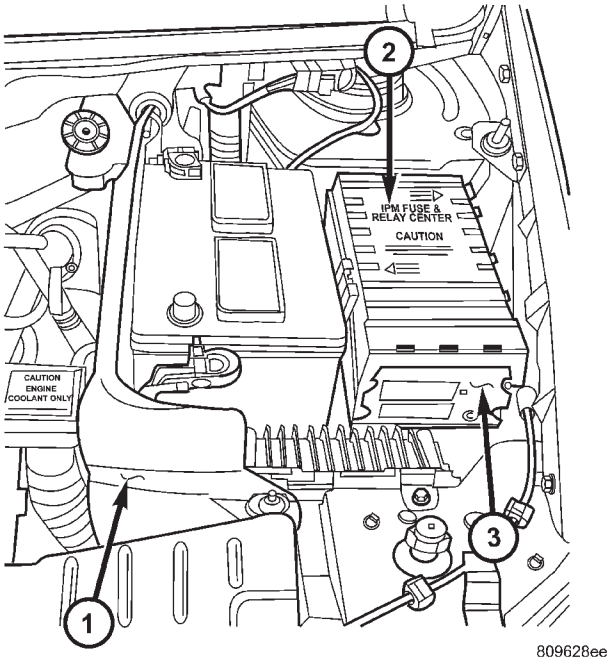

Fig. 19 BATTERY POSITION & ORIENTATION

1 - BATTERY THERMOWRAP (IF EQUIPPED)
2 - INTEGRATED POWER MODULE
3 - FRONT CONTROL MODULE

A one-piece slip-on thermowrap unit shields the battery case from engine compartment heat (Fig. 19).

THERMOWRAP (Continued)

OPERATION

The thermowrap protects the battery from engine compartment temperature extremes. The temperature of the battery can affect battery life. The air trapped in the padded material of the thermowrap creates a dead air space, which helps to insulate the sides of the battery case from the air temperature found in the surrounding engine compartment.

REMOVAL

(1) Disconnect and isolate the negative battery cable.
(2) Disconnect the positive battery cable.
(3) Lift the battery thermowrap straight up to remove from the battery.

INSTALLATION

(1) Position the thermowrap on the battery.
(2) Connect the negative and positive battery cables.

CHARGING

DESCRIPTION - CHARGING SYSTEM

The charging system consists of:

- Generator
- Decoupler Pulley (If equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch (refer to the Ignition System section for information)
- Battery (refer to the Battery section for information)
- Inlet Air Temperature (calculated battery temperature)
- Voltmeter (refer to the Instrument Cluster section for information if equipped)
- Wiring harness and connections (refer to the Wiring section for information)
- Accessory drive belt (refer to the Cooling section for more information)

OPERATION - CHARGING SYSTEM

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. The ASD relay is energized when the PCM grounds the ASD control circuit. This voltage is connected through the PCM or IPM (intelligent power module) (if equipped) and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The generator is driven by the engine through a serpentine belt and pulley or decoupler pulley arrangement.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

An Inlet air temperature sensor is used to calculate the temperature near the battery. This temperature data, along with data from monitored line voltage (battery voltage sense circuit), is used by the PCM to vary the battery charging rate. This is done by cycling the ground path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly to maintain system voltage at the targeted system voltage based on battery temperature.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects and illuminate the (MIL) lamp. Refer to On-Board Diagnostics in the Electronic Control Modules(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) section for more DTC information.

CHARGING (Continued)

The Check Gauges Lamp (if equipped) or Battery Lamp monitors: **charging system voltage,** engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. The signal to activate the lamp is sent via the PCI bus circuits. The lamp is located on the instrument panel. Refer to the Instrument Cluster section for additional information.

The PCM uses the inlet air temperature sensor to control the charge system voltage. This temperature, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. The system voltage is higher at cold temperatures and is gradually reduced as the calculated battery temperature increases.

The ambient temperature sensor is used to control the battery voltage based upon ambient temperature (approximation of battery temperature). The PCM maintains the optimal output of the generator by monitoring battery voltage and controlling it to a range of 13.5 - 14.7 volts based on battery temperature.

DIAGNOSIS AND TESTING - ON-BOARD DIAGNOSTIC SYSTEM

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 50 engine starts if the problem does not occur again.

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the DRBIII® scan tool. Refer to the appropriate Powertrain Diagnostic Procedures manual for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The DRBIII® Scan Tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/ BATTERY - STANDARD PROCEDURE)

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the DRBIII® scan tool. Perform the following inspections before attaching the scan tool.

(1) Inspect the battery condition. Refer to the Battery section (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING) for procedures.

(2) Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.

(3) Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.

(4) Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications (Refer to 8 - ELECTRICAL/ CHARGING - SPECIFICATIONS).

(5) Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications(Refer to 7 - COOLING/ ACCESSORY DRIVE - SPECIFICATIONS).

CHARGING (Continued)

(6) Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.

(7) Inspect automatic belt tensioner (if equipped). Refer to the Cooling System for more information.

(8) Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

BATTERY TEMPERATURE SENSOR

DESCRIPTION

The PCM incorporates a Battery Temperature Sensor (BTS) on its circuit board.

OPERATION

The PCM uses the temperature of the battery area to control the charge system voltage. This temperature, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. The system voltage is higher at cold temperatures and is gradually reduced as temperature around the battery increases.

The ambient temperature sensor is used to control the battery voltage based upon ambient temperature (approximation of battery temperature). The PCM maintains the optimal output of the generator by monitoring battery voltage and controlling it to a range of 13.5 - 14.7 volts based on battery temperature.

The battery temperature sensor is also used for OBD II diagnostics. Certain faults and OBD II monitors are either enabled or disabled depending upon the battery temperature sensor input (example: disable purge and EGR, enable LDP). Most OBD II monitors are disabled below 20°F.

REMOVAL

The battery temperature sensor is not serviced separately. If replacement is necessary, the PCM must be replaced.

GENERATOR

DESCRIPTION

The generator is belt-driven by the engine. It is serviced only as a complete assembly. The generator produces DC voltage at the B+ terminal. If the generator is failed, the generator assembly subcomponents (generator and decoupler pulley) must be inspected for individual failure and replaced accordingly.

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The Y type stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicles electrical system through the generator, battery, and ground terminals.

Excessive or abnormal noise emitting from the generator may be caused by:

- Worn, loose or defective bearings
- Loose or defective drive pulley (2.4L) or decoupler (3.3/3.8L)
- Incorrect, worn, damaged or misadjusted drive belt
- Loose mounting bolts
- Misaligned drive pulley
- Defective stator or diode
- Damaged internal fins

REMOVAL

REMOVAL - 2.4L

(1) Release hood latch and open hood.
(2) Disconnect battery negative cable.
(3) Disconnect the Inlet Air Temperature sensor.
(4) Remove the Air Box, refer to the Engine/Air Cleaner for more information.
(5) Remove the EVAP Purge solenoid from its bracket and reposition.
(6) Disconnect the push-in field wire connector from back of generator.
(7) Remove nut holding B+ wire terminal to back of generator.
(8) Separate B+ terminal from generator.
(9) Remove accessory drive belt, refer to the Cooling System section for proper procedures.
(10) Remove the generator.

REMOVAL - 3.3/3.8L

(1) Release hood latch and open hood.
(2) Disconnect battery negative cable.
(3) Disconnect the push-in field wire connector from back of generator.
(4) Remove nut holding B+ wire terminal to back of generator.
(5) Separate B+ terminal from generator.
(6) Raise vehicle and support.
(7) Remove the right front lower splash shield.
(8) Remove accessory drive belt, refer to the Cooling System section for proper procedures.
(9) Remove the lower oil dip stick tube bolt (Fig. 2).
(10) Remove wiring harness from the oil dip stick tube
(11) Remove the 3 mounting bolts.
(12) Lower vehicle.
(13) Remove oil dip stick tube from vehicle.
(14) Roll and remove the generator from vehicle (Fig. 3).

GENERATOR (Continued)

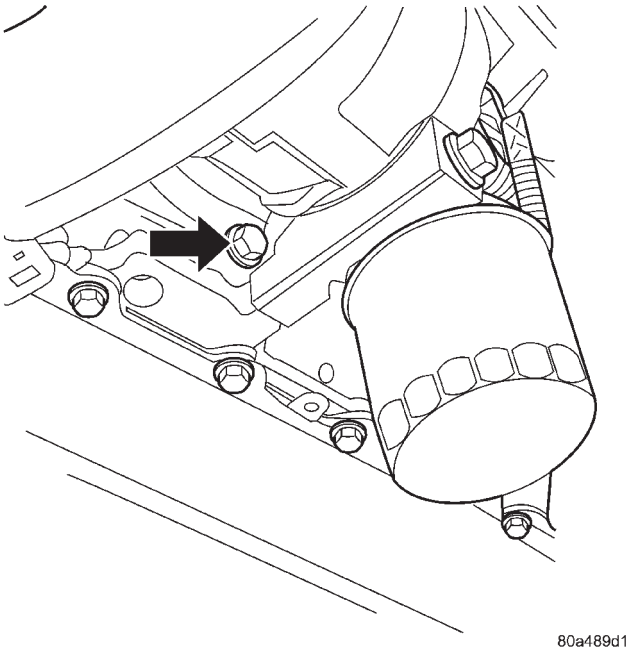

Fig. 2 DIP STICK LOWER BOLT

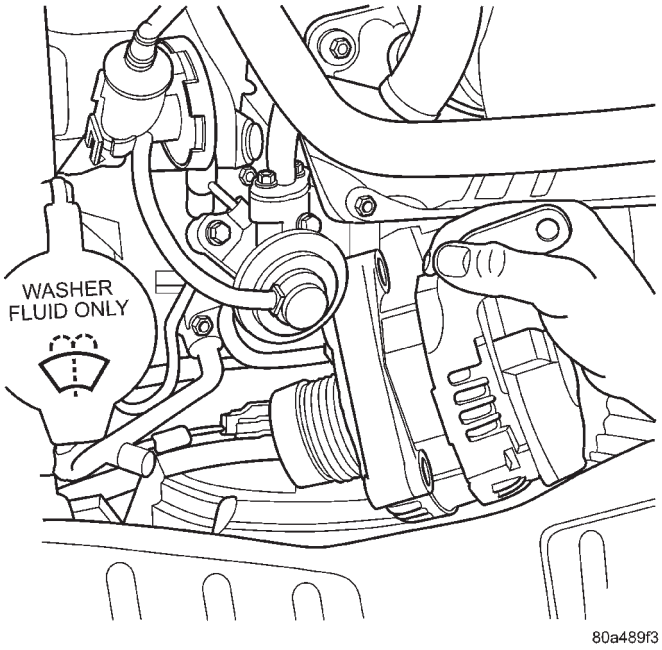

Fig. 3 GENERATOR 3.3/3.8L

INSTALLATION

INSTALLATION - 2.4L

(1) Install the generator.
(2) Install the accessory drive belt, refer to the Cooling System section for proper procedures.
(3) Connect B+ terminal to generator.
(4) Install nut holding B+ wire terminal to back of generator.
(5) Connect the push-in field wire connector to back of generator.
(6) Install the EVAP Purge solenoid to its bracket.
(7) Install the Air Box, refer to the Engine/Air Cleaner for more information.
(8) Connect the Inlet Air Temperature sensor.
(9) Connect battery negative cable.

INSTALLATION - 3.3/3.8L

(1) Roll and place generator in position on vehicle (Fig. 3).
(2) Install upper bolts to hold generator in place.
(3) Lubricate the o-ring. Install oil dip stick tube.
(4) Install the upper oil dip stick tube bolt.
(5) Place B+ terminal in position on generator.
(6) Install nut to hold B+ wire terminal to back of generator.
(7) Connect the push-in field wire connector into back of generator.
(8) Raise vehicle and support.
(9) Install the lower mounting bolt and tighten.
(10) Install the lower oil dip stick tube bolt and tighten (Fig. 2).
(11) Install accessory drive belt, refer to the Cooling System section for proper procedures.
(12) Install the right front lower splash shield.
(13) Lower vehicle.
(14) Install wiring harness to the oil dip stick tube
(15) Connect battery negative cable.
(16) Verify generator output rate.

GENERATOR DECOUPLER PULLEY

DESCRIPTION

The Generator Decoupler is a one way clutch (Fig. 4). It is attached to the generator and replaces the standard pulley. It is a non-serviceable item and is to be replaced as an assembly. It is a dry operation (no grease or lubricants). The operation of it is not temperature sensitive and has a low sensitivity to electrical load.

GENERATOR DECOUPLER PULLEY (Continued)

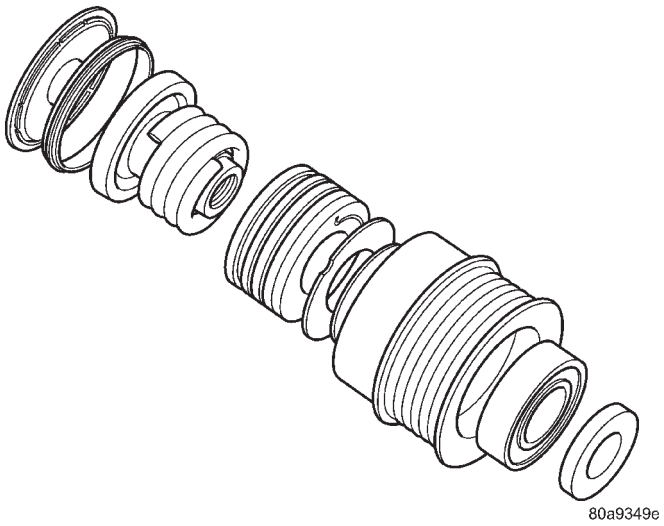

Fig. 4 GENERATOR DECOUPLER 3.3/3.8L

OPERATION

The generator decoupler is a one way clutch and should be replaced as an assembly. It is designed to help reduce belt tension fluctuation, reduce fatigue loads, improve belt life, reduce hubloads on components, and reduce noise.

DIAGNOSIS AND TESTING - GENERATOR DECOUPLER PULLEY

CONDITION	POSSIBLE CAUSES	CORRECTION
Does not drive generator (Generator not Charging)	Clutch failure	Replace Decoupler

REMOVAL

(1) Release hood latch and open hood.
(2) Disconnect battery negative cable.
(3) Raise vehicle and support.
(4) Remove the right front lower splash shield.
(5) Remove accessory drive belt, refer to the Cooling System section for proper procedures (Fig. 5).
(6) Lower vehicle.
(7) Remove the Air Box, refer to the Engine section for more information.
(8) Use Special Tool #8433 (Fig. 7) to loosen the Generator Decoupler (Fig. 6).
(9) Remove the tool.
(10) Remove the Generator Decoupler.

INSTALLATION

(1) Install the Generator Decoupler to the generator shaft.
(2) Use Special Tool #8433 (Fig. 7) to tighten the Generator Decoupler (Fig. 8). Refer to the torque chart for the proper torque.

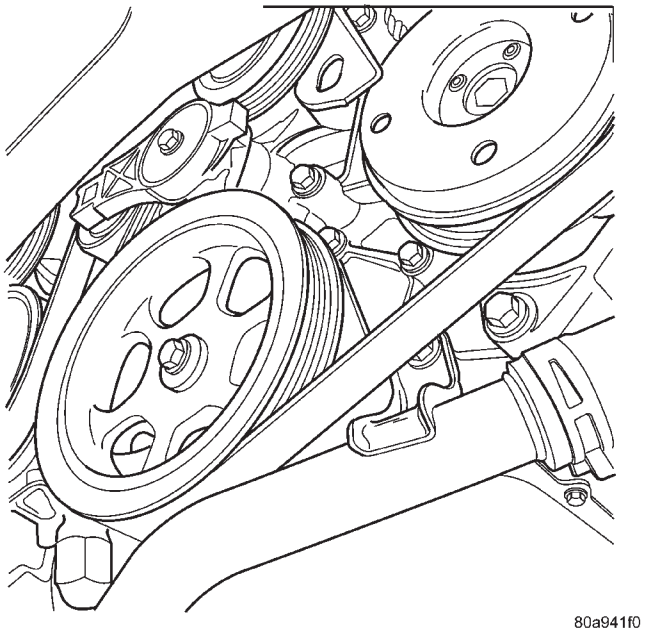

Fig. 5 DRIVE BELT 3.3/3.8L

GENERATOR DECOUPLER PULLEY (Continued)

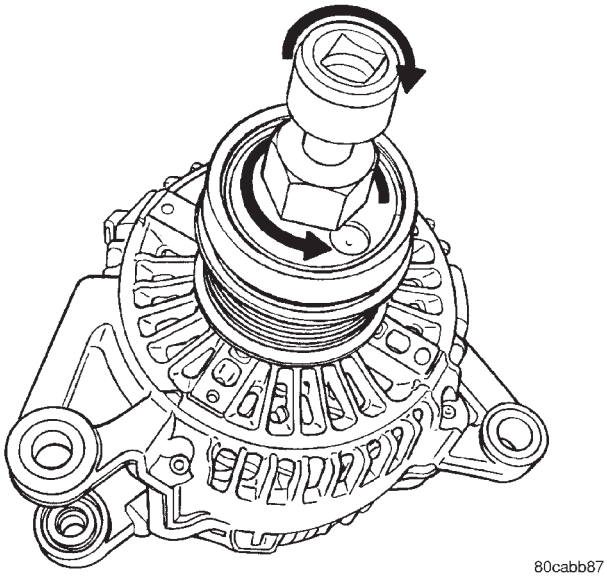

Fig. 6 DECOUPLER REMOVAL (LITENS)

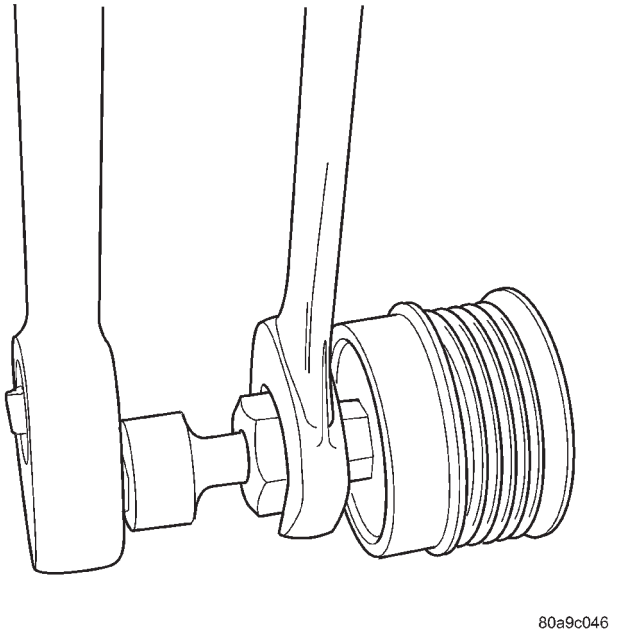

Fig. 7 SPECIAL TOOL 8433 AND DECOUPLER

(3) Install the Air Box, refer to the Engine section for more information.

(4) Raise vehicle and support.

(5) Install accessory drive belt, refer to the Cooling System section for proper procedures (Fig. 5).

(6) Install the right front lower splash shield.

(7) Lower vehicle.

(8) Connect battery negative cable.

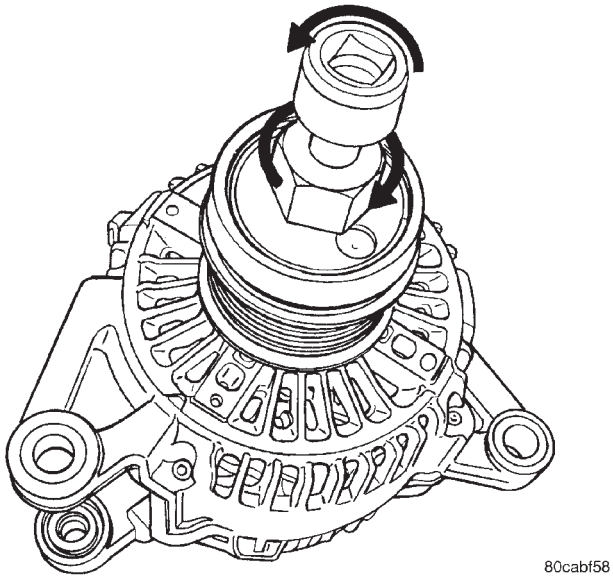

Fig. 8 DECOUPLER INSTALLATION (Litens)

VOLTAGE REGULATOR

DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and calculated battery temperature or inlet air temperature sensor (refer to Inlet Air Temperature Sensor, if equipped, for more information). It then determines a target charging voltage. If sensed battery voltage is lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is at the target voltage. A circuit in the PCM cycles the ground side of the generator field at 250 times per second (250Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output. Also refer to Charging System Operation for additional information.

STARTING

DESCRIPTION

The starting system has (Fig. 1):

- Ignition switch
- Starter relay
- Transmission Range Sensor or Park/Neutral Switch
- Wiring harness
- Battery
- Starter motor with an integral solenoid
- Powertrain Control Module (PCM)

OPERATION

These components form two separate circuits. A high amperage circuit that feeds the starter motor up to 300+ amps, and a control circuit that operates on less than 20 amps.

The PCM controls a double start over-ride safety that does not allow the starter to be engaged if the engine is already running.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STARTING SYSTEM TEST

For circuit descriptions and diagrams, refer to the Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO THE PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

INSPECTION

Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

- **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine the state-of-charge and cranking capacity of the battery. Charge or replace the battery, if required. Refer to the Battery section for more information.
- **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections.
- **Transmission Range Sensor** - Visually inspect the transmission range sensor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Relay** - Visually inspect the starter relay for indications of physical damage and loose or corroded wire harness connections.

- **Starter** - Visually inspect the starter for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect the starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect the wire harness for damage. Repair or replace any faulty wiring, as required. Check for loose or corroded wire harness connections at main engine ground and remote jump post.
- **Power Distribution Center (PDC)** - Visually inspect the B+ connections at the PDC for physical damage and loose or corroded harness connections.

STARTING (Continued)

STARTING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO ENGAGE.	1. BATTERY DISCHARGED OR FAULTY.	1. REFER TO THE BATTERY SECTION FOR MORE INFORMATION. CHARGE OR REPLACE BATTERY, IF REQUIRED.
	2. STARTING CIRCUIT WIRING FAULTY.	2. REFER TO FEED CIRCUIT RESISTANCE TEST AND FEED CIRCUIT TEST IN THIS SECTION.
	3. STARTER RELAY FAULTY.	3. REFER TO RELAY TEST, IN THIS SECTION. REPLACE RELAY, IF NECESSARY.
	4. IGNITION SWITCH FAULTY.	4. REFER TO IGNITION SWITCH TEST, IN THE STEERING SECTION OR 8 WIRING DIAGRAMS. REPLACE SWITCH, IF NECESSARY.
	5. PARK/NEUTRAL POSITION SWITCH (AUTO TRANS) FAULTY OR MIS-ADJUSTED.	5. REFER PARK/NEUTRAL POSITION SWITCH TEST, IN THE TRANSAXLE. SECTION FOR MORE INFORMATION. REPLACE SWITCH, IF NECESSARY.
	6. CLUTCH PEDAL POSITION SWITCH (MAN TRANS) FAULTY.	6. REFER TO CLUTCH PEDAL POSITION SWITCH TEST, IN THE CLUTCH. SECTION. REPLACE SWITCH, IF NECESSARY.
	7. STARTER SOLENOID FAULTY.	7. REFER TO SOLENOID TEST, IN THIS SECTION. REPLACE STARTER ASSEMBLY, IF NECESSARY.
	8. STARTER ASSEMBLY FAULTY.	8. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
	9. FAULTY TEETH ON RING GEAR.	9. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.
	10. PCM DOUBLE START OVERRIDE OUTPUT FAILURE.	10. REFER TO PCM DIAGNOSTIC. CHECK FOR CONTINUITY BETWEEN PCM AND TERMINAL 85. REPAIR OPEN CIRCUIT AS REQUIRED. IF OK, PCM MAY BE DEFECTIVE.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. BATTERY DISCHARGED OR FAULTY.	1. REFER TO THE BATTERY SECTION FOR MORE INFORMATION. CHARGE OR REPLACE BATTERY AS NECESSARY.
	2. STARTING CIRCUIT WIRING FAULTY.	2. REFER TO THE FEED CIRCUIT RESISTANCE TEST AND THE FEED CIRCUIT TEST IN THIS SECTION. REPAIR AS NECESSARY.
	3. STARTER ASSEMBLY FAULTY.	3. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
	4. ENGINE SEIZED.	4. REFER TO THE ENGINE SECTION, FOR DIAGNOSTIC AND SERVICE PROCEDURES.
	5. LOOSE CONNECTION AT BATTERY, PDC, STARTER, OR ENGINE GROUND.	5. INSPECT FOR LOOSE CONNECTIONS.
	6. FAULTY TEETH ON RING GEAR.	6. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.

STARTING (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. BROKEN TEETH ON STARTER RING GEAR.	1. REMOVE STARTER. INSPECT RING GEAR AND REPLACE IF NECESSARY.
	2. STARTER ASSEMBLY FAULTY.	2. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
STARTER DOES NOT DISENGAGE.	1. STARTER IMPROPERLY INSTALLED.	1. INSTALL STARTER. TIGHTEN STARTER MOUNTING HARDWARE TO CORRECT TORQUE SPECIFICATIONS.
	2. STARTER RELAY FAULTY.	2. REFER TO RELAY TEST, IN THIS SECTION. REPLACE RELAY, IF NECESSARY.
	3. IGNITION SWITCH FAULTY.	3. REFER TO IGNITION SWITCH TEST, IN THE STEERING SECTION. REPLACE SWITCH, IF NECESSARY.
	4. STARTER ASSEMBLY FAULTY.	4. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
	5. FAULTY TEETH ON RING GEAR.	5. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.

DIAGNOSIS AND TESTING - CONTROL CIRCUIT TEST

The starter control circuit has:

- Starter motor with integral solenoid
- Starter relay
- Transmission range sensor, or Park/Neutral Position switch with automatic transmissions
- Ignition switch
- Battery
- All related wiring and connections
- Powertrain Control Module (PCM)

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

- To disable ignition and fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for the proper relay location.

STARTER SOLENOID

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK POSITION WITH THE PARKING BRAKE APPLIED.

(1) Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests.

(2) Perform Starter Solenoid test BEFORE performing the starter relay test.

(3) Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.

(4) Locate and remove the starter relay from the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location.

(5) Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.

(a) If engine cranks, starter/starter solenoid is good. Go to the Starter Relay Test.

(b) If engine does not crank or solenoid chatters, check wiring and connectors from starter relay to starter solenoid for loose or corroded connections. Particularly at starter terminals.

(c) Repeat test. If engine still fails to crank properly, trouble is within starter or starter mounted solenoid, and replace starter. Inspect the ring gear teeth.

STARTER RELAY

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK/NEUTRAL POSITION WITH THE PARKING BRAKE APPLIED.

RELAY TEST

The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

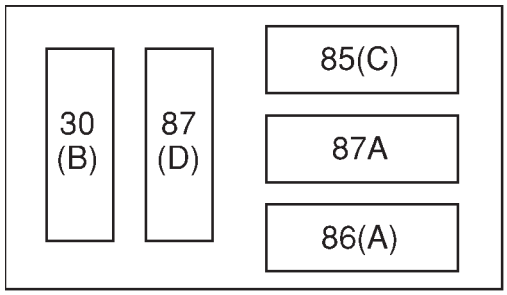
STARTING (Continued)

Remove the starter relay from the PDC as described in this group to perform the following tests:

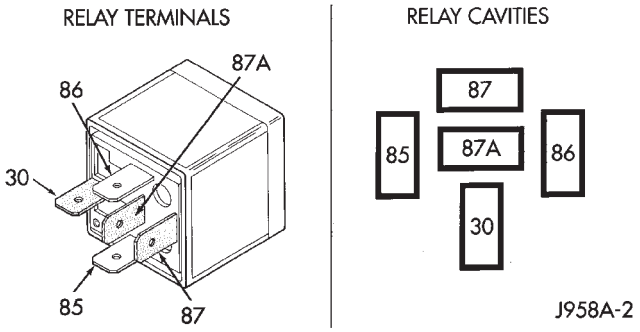
(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

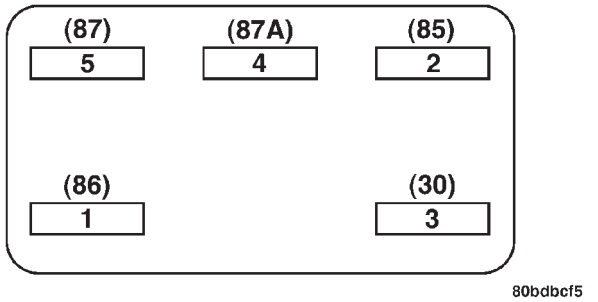
(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ±5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery B+ lead to terminals 86 and a ground lead to terminal 85 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, refer to Relay Circuit Test procedure. If not OK, replace the faulty relay.



Starter Relay Pinout





Starter Relay Pinout

CAV	FUNCTION
30	B (+)
85	P/N POSITION SW.SENSE
86	IGNITION SWITCH OUTPUT
87	STARTER RELAY OUTPUT
87A	NO CONNECT

RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to Step 4. If not OK, repair the open circuit to the starter solenoid as required.

(4) The coil battery terminal (86) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position and the clutch pedal is depressed (manual trans). Check for battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position and the clutch pedal is depressed (manual trans), and no voltage when the ignition switch is released to the On position. If OK, go to Step 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, see the Ignition Switch Test procedure in this group.

(5) The coil ground terminal (85) is connected to the electromagnet in the relay. It is grounded through the transmission range sensor only when the gearshift selector lever is in the Park or Neutral positions. Check for continuity to ground at the cavity for relay terminal 85. If not OK with an automatic transmission, check for an open or short circuit to the transmission range sensor and repair. It is grounded by the PCM if the conditions are right to start the car. For automatic trans. cars the PCM must see Park Neutral switch and near zero engine rpm. For manual trans. cars the PCM only needs to see near zero engine rpm. To diagnose the Park Neutral switch of the trans range sensor refer to the transaxle section for more information. Check for continuity to ground while the ignition switch is in the start position. If not OK and the vehicle has an automatic trans. verify Park Neutral switch opera-

STARTING (Continued)

tion. If that checks OK check for continuity between PCM and the terminal 85. Repair open circuit as required. If OK, the PCM may be defective.

SAFETY SWITCHES

For diagnostics of the Transmission Range Sensor, refer to the Transaxle section for more information.

If equipped with Clutch Interlock/Upstop Switch, refer to Diagnosis and Testing in the Clutch section.

IGNITION SWITCH

After testing starter solenoid and relay, test ignition switch and wiring. Refer to the Ignition Section or Wiring Diagrams for more information. Check all wiring for opens or shorts, and all connectors for being loose or corroded.

BATTERY

For battery diagnosis and testing, refer to the Battery section for procedures.

ALL RELATED WIRING AND CONNECTORS

Refer to Wiring Diagrams for more information.

DIAGNOSIS AND TESTING - FEED CIRCUIT RESISTANCE TEST

Before proceeding with this operation, review Diagnostic Preparation and Starter Feed Circuit Tests. The following operation will require a voltmeter, accurate to 1/10 of a volt.

CAUTION: Ignition and Fuel systems must be disabled to prevent engine start while performing the following tests.

(1) To disable the Ignition and Fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for proper relay location.

(2) Gain access to battery terminals.

(3) With all wiring harnesses and components properly connected, perform the following:

(a) Connect the negative lead of the voltmeter to the battery negative post, and positive lead to the battery negative cable clamp. Rotate and hold the ignition switch in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between cable clamp and post.

(b) Connect positive lead of the voltmeter to the battery positive post, and negative lead to the battery positive cable clamp. Rotate and hold the ignition switch key in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between the cable clamp and post.

(c) Connect negative lead of voltmeter to battery negative terminal, and positive lead to engine block near the battery cable attaching point. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at ground cable attaching point. If voltage reading is still above 0.2 volt after correcting poor contacts, replace ground cable.

(4) Connect positive voltmeter lead to the starter motor housing and the negative lead to the battery negative terminal. Hold the ignition switch key in the START position. If voltage reads above 0.2 volt, correct poor starter to engine ground.

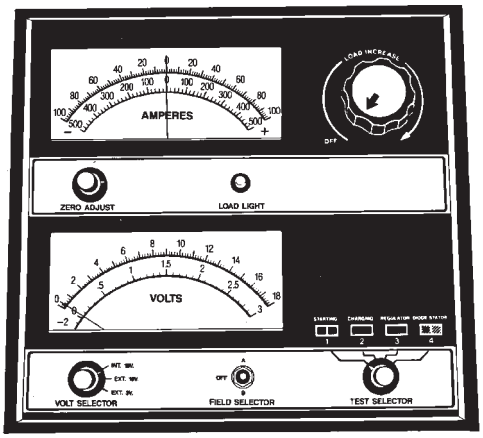
(a) Connect the positive voltmeter lead to the battery positive terminal, and negative lead to battery cable terminal on starter solenoid. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at battery cable to solenoid connection. If reading is still above 0.2 volt after correcting poor contacts, replace battery positive cable.

(b) If resistance tests do not detect feed circuit failures, replace the starter motor.

DIAGNOSIS AND TESTING - FEED CIRCUIT TEST

NOTE: The following results are based upon the vehicle being at room temperature.

The following procedure will require a suitable volt-ampere tester (Fig. 3).



898A-8

Fig. 3 Volt Ampere Tester

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

(1) Check battery before performing this test. Battery must be fully charged.

(2) Connect a volt-ampere tester to the battery terminals. Refer to the operating instructions provided with the tester being used.

STARTING (Continued)

(3) To disable the ignition and fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for proper relay location.

(4) Verify that all lights and accessories are OFF, and the transmission shift selector is in the PARK and SET parking brake.

CAUTION: Do not overheat the starter motor or draw the battery voltage below 9.6 volts during cranking operations.

(5) Rotate and hold the ignition switch in the START position. Observe the volt-ampere tester (Fig. 3).

- If voltage reads above 9.6 volts, and amperage draw reads above 280 amps, check for engine seizing or faulty starter.
- If voltage reads 12.4 volts or greater and amperage reads 0 to 10 amps, check for corroded cables and/or bad connections.
- Voltage below 9.6 volts and amperage draw above 300 amps, the problem is the starter. Replace the starter refer to starter removal.

(6) After the starting system problems have been corrected, verify the battery state-of-charge and charge battery if necessary. Disconnect all testing equipment and connect ASD relay. Start the vehicle several times to assure the problem has been corrected.

INSTALLATION

INSTALLATION - 2.4L

(1) Place starter in position on vehicle.
(2) Install the lower bolts to hold starter to transaxle bellhousing.
(3) Install the upper bolt and ground wire (Fig. 6).
(4) Place solenoid and B+ wires in position on starter terminals (Fig. 5).
(5) Install nut to hold B+ wire to terminal.
(6) Connect solenoid wire connector onto terminal.
(7) Connect battery negative cable.
(8) Verify starter operation.

INSTALLATION - 3.3/3.8L

(1) Place starter spacer in position on transaxle bellhousing, flange toward flywheel.
(2) Place starter in position on bellhousing.
(3) Install bolts and ground wire (Fig. 6) to hold starter to transaxle bellhousing.
(4) Connect solenoid connector into starter.
(5) Install nut to hold B+ terminal to starter solenoid.
(6) Lower vehicle.
(7) Connect battery negative cable.
(8) Verify starter operation.

BATTERY SYSTEM

DESCRIPTION

A single 12-volt battery system is standard factory-installed equipment on this model. All of the components of the battery system are located within the engine compartment of the vehicle. The service information for the battery system in this vehicle covers the following related components, which are covered in further detail elsewhere in this service manual:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cable** - The battery cables connect the battery terminal posts to the vehicle electrical system.

- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray in the engine compartment.
- **Battery Thermowrap** - The battery thermowarp insulates the battery to protect it from engine compartment temperature extremes.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules and jump starting procedures, see the owner's manual in the vehicle glove box. Optionally, refer to Lubrication and Maintenance for the recommended battery maintenance schedules and for the proper battery jump starting procedures. While battery charging can be considered a maintenance procedure, the battery charging procedures and related information are located in the standard procedures section of this service manual. This was done because the battery must be fully-charged before any battery system diagnosis or testing procedures can be performed. Refer to Standard procedures for the proper battery charging procedures.

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING - BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. Refer to Charging System for the proper charging system onboard diagnostic test procedures.

MICRO 420 ELECTRICAL SYSTEM TESTER

The Micro 420 automotive battery system tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro 420 electrical system tester.

BATTERY SYSTEM (Continued)

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is faulty.	2. Determine if the charging system is performing to specifications. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Charge the faulty battery, as required.
	4. The battery terminal connections are loose or corroded.	4. Refer to Battery Cables for the proper battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. Refer to Battery System Specifications for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is faulty.	6. Test the battery using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Replace the faulty battery, as required.
	7. The starting system is faulty.	7. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

BATTERY SYSTEM (Continued)

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle.	1. Refer to Battery System Specifications for the proper specifications. Replace an incorrect battery, as required.
	2. The battery terminal connections are loose or corroded.	2. Refer to Battery Cable for the proper cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	3. The electrical system ignition-off draw is excessive.	3. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the faulty electrical system, as required.
	4. The battery is faulty.	4. Test the battery using the Micro 420 battery tester. Refer to Standard Procedures for additional test procedures. Replace the faulty battery, as required.
	5. The starting system is faulty.	5. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	6. The charging system is faulty.	6. Determine if the charging system is performing to specifications. Refer to Charging System for charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	7. Electrical loads exceed the output of the charging system.	7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.
	8. Slow driving or prolonged idling with high-amperage draw loads in use.	8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is faulty.	1. Test the battery using the Micro 420 battery tester.. Charge or replace the faulty battery, as required.

BATTERY SYSTEM (Continued)

ABNORMAL BATTERY DISCHARGING

Any of the following conditions can result in abnormal battery discharging:

1. A faulty or incorrect charging system component. Refer to Charging System for additional charging system diagnosis and testing procedures.
2. A faulty or incorrect battery. Use Micro 420 tester and refer to Battery System for additional battery diagnosis and testing procedures.
3. A faulty circuit or component causing excessive ignition-off draw.
4. Electrical loads that exceed the output of the charging system. This can be due to equipment installed after manufacture, or repeated short trip use.
5. A faulty or incorrect starting system component. Refer to Starting System for the proper starting system diagnosis and testing procedures.
6. Corroded or loose battery posts and/or terminal clamps.
7. Slow driving speeds (heavy traffic conditions) or prolonged idling, with high-amperage draw loads in use.

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Clean the battery cable terminal clamps of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution (Fig. 1).

(2) Clean the battery tray and battery holddown hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

(3) If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film (Fig. 2). Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, refer to Battery System Specifications for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.

(2) Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.

(3) Slide the thermowrap off of the battery case. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.

(4) Inspect the battery thermowrap for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.

(5) Inspect the battery built-in test indicator sight glass(if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to Standard Procedures for the proper battery built-in indicator test procedures. Also refer to Standard Procedures for the proper battery charging procedures.

SPECIFICATIONS

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.

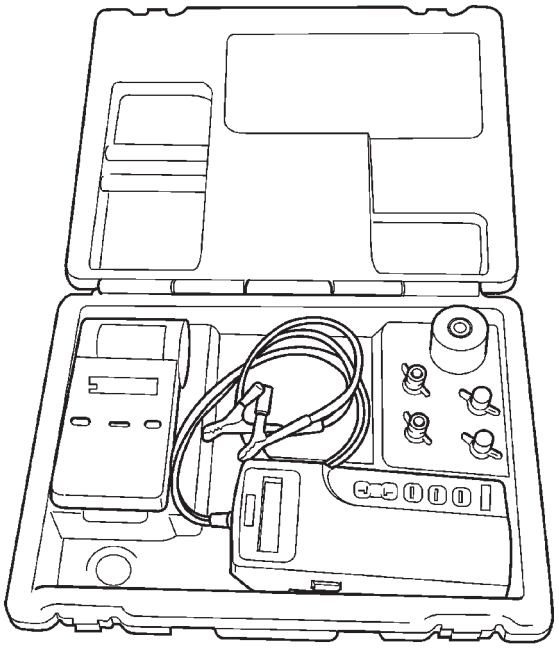
SPECIAL TOOLS

BATTERY SYSTEM SPECIAL TOOLS



MICRO 420 BATTERY TESTER

BATTERY

DESCRIPTION

There are three different batteries available on this model. Vehicles equipped with a diesel engine utilize a spiral wound plate designed battery with recombination technology. This is a maintenance-free battery that is capable of delivering more power than a conventional battery. This additional power is required by a diesel engine during cold cranking. Vehicles equipped with a gasoline engine utilize a conventional battery. Refer to the following information for detailed differences and descriptions of these batteries.

SPIRAL PLATE BATTERY - DIESEL ENGINE

Spiral plate technology takes the elements of traditional batteries - lead and sulfuric acid - to the next level. By tightly winding layers of spiral grids and acid-permeated vitreous separators into cells, the manufacturer has developed a battery with more power and service life than conventional batteries the same size. The spiral plate battery is completely, permanently sealed. Through gas recombination, hydrogen and oxygen within the battery are captured during normal charging and reunited to form the water within the electrolyte, eliminating the need to add distilled water. Therefore, these batteries have non-removable battery vent caps (Fig. 4). Water **cannot** be added to this battery.

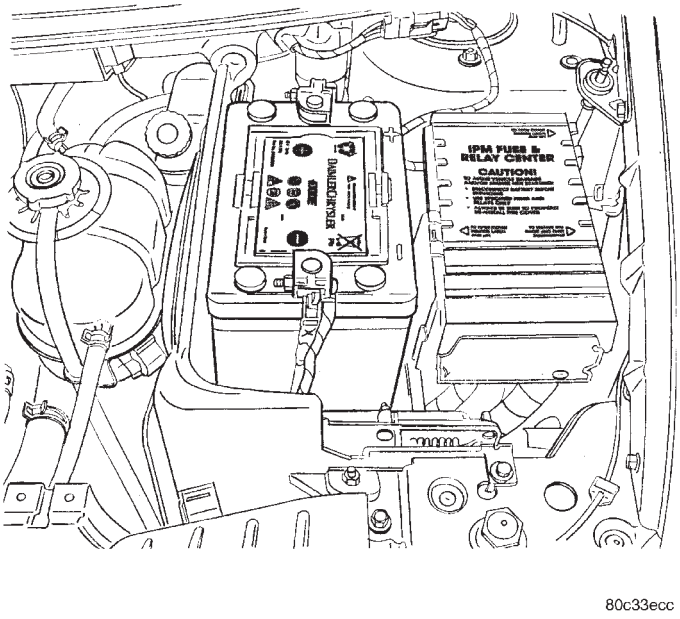


Fig. 4 MAINTENANCE-FREE DIESEL ENGINE BATTERY

The acid inside an spiral plate battery is bound within the vitreous separators, ending the threat of acid leaks. This feature allows the battery to be installed in any position anywhere in the vehicle.

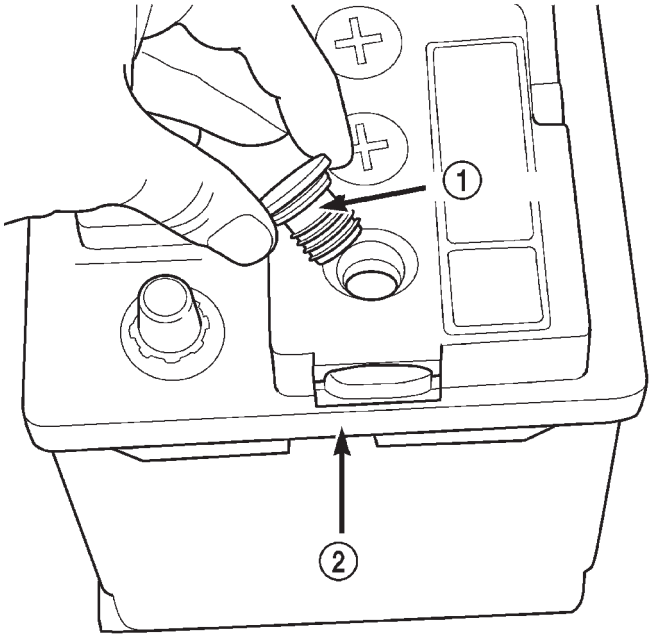
Spiral plate technology is the process by which the plates holding the active material in the battery are wound tightly in coils instead of hanging flat, like conventional batteries. This design has a lower inter-

nal resistance and also increases the active material surface area.

WARNING: NEVER EXCEED 14.4 VOLTS WHEN CHARGING A SPIRAL PLATE BATTERY. PERSONAL INJURY AND/OR BATTERY DAMAGE MAY RESULT.

Due to the maintanance-free design, distilled water cannot be added to this battery. Therefore, if more than 14.4 volts are used during the spiral plate battery charging process, water vapor can be exhausted through the pressure-sensitive battery vents and lost for good. This can permanently damage the spiral plate battery. Never exceed 14.4 volts when charging a spiral plate battery. Personal injury and/or battery damage may result.

CONVENTIONAL BATTERY - GASOLINE ENGINE



80b76fd0

Fig. 5 BATTERY CELL CAP REMOVAL/ INSTALLATION - LOW-MAINTANANCE GASOLINE ENGINE BATTERY

1 - BATTERY CELL CAP
2 - BATTERY CASE

Low-maintenance batteries are used on vehicles equipped with a gasoline engine, these batteries have removable battery cell caps (Fig. 5). Water **can** be added to this battery. Under normal service, the composition of this battery reduces gassing and water loss at normal charge rates. However these batteries may require additional distilled water after years of service.

Maintenance-free batteries are standard factory-installed equipment on this model. Male post type terminals made of a soft lead material protrude from the top of the molded plastic battery case (Fig. 6)to provide the means for connecting the battery to the vehicle electrical system. The battery positive terminal post is visibly larger in diameter than the negative terminal post, for easy identification. The letters **POS** and **NEG** are also molded into the top of the battery case adjacent to their respective positive and negative terminal posts for additional identification confirmation.

2 - VENT
3 - CELL CAP
4 - VENT
5 - CELL CAP
6 - VENT
7 - NEGATIVE POST
8 - INDICATOR EYE (if equipped)
9 - ELECTROLYTE LEVEL
10 - PLATE GROUPS
11 - MAINTENANCE-FREE BATTERY

This battery is designed to provide a safe, efficient and reliable means of storing electrical energy in a chemical form. This means of energy storage allows the battery to produce the electrical energy required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery is made up of six individual cells that are connected in series. Each cell contains positively charged plate groups that are connected with lead straps to the positive terminal post, and negatively charged plate groups that are connected with lead straps to the negative terminal post. Each plate consists of a stiff mesh framework or grid coated with lead dioxide (positive plate) or sponge lead (negative plate). Insulators or plate separators made of a non-conductive material are inserted between the positive and nega-

BATTERY (Continued)

tive plates to prevent them from contacting or shorting against one another. These dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

Some factory-installed batteries have a built-in test indicator (hydrometer). The color visible in the sight glass of the indicator will reveal the battery condition. For more information on the use of the built-in test indicator, refer to **Standard Procedures** The chemical composition of the metal coated plates within the low-maintenance battery reduces battery gassing and water loss, at normal charge and discharge rates. Therefore, the battery should not require additional water in normal service. If the electrolyte level in this battery does become low, distilled water must be added. However, rapid loss of electrolyte can be caused by an overcharging condition. Be certain to diagnose the charging system after replenishing the water in the battery for a low electrolyte condition and before returning the vehicle to service. Refer to **Charging System** for additional information.

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Refer to **Battery Specifications** in this group for the location of the proper factory-installed battery specifications.

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING - BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. Refer to Battery System Cleaning for the proper cleaning procedures, and Battery System Inspection for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

MICRO 420 ELECTRICAL SYSTEM TESTER

The Micro420 automotive battery tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro420 electrical system tester.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

BATTERY (Continued)

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is faulty and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

STANDARD PROCEDURE

STANDARD PROCEDURE - SPIRAL PLATE BATTERY CHARGING

Vehicles equipped with a diesel engine utilize a unique spiral plate battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the following spiral plate battery charging procedure could result in damage to the battery or personal injury.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.65 volts or above.
- Battery passes Load Test multiple times.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS OR LOW ELECTROLYTE LEVEL, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed 14.4 volts while charging a battery.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

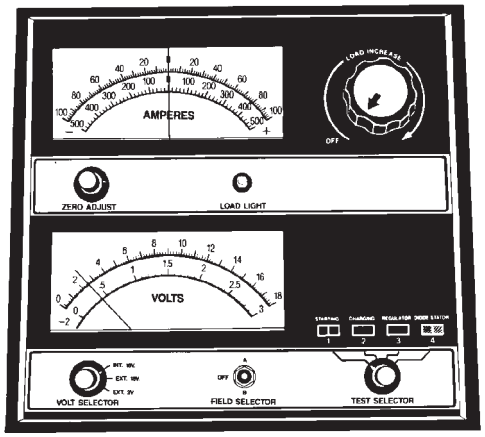
After the battery has been charged to 12.6 volts or greater, perform a load test to determine the battery cranking capacity. Refer to Standard Procedures for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY – SPIRAL PLATE BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

(1) Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt (Fig. 7). If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.



898A-12

Fig. 7 Voltmeter - Typical

(2) Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufac-

BATTERY (Continued)

turer of the battery charger for details on how to bypass the polarity-sensing circuitry.

(3) Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	Hours
14.4 volts maximum	up to 4 hours
13.0 to 14 volts	up to 8 hours
12.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies eight amperes will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE		
Charging Amperage	5 Amps	8 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)	
12.25 to 12.49	6 hours	3 hours
12.00 to 12.24	10 hours	5 hours
10.00 to 11.99	14 hours	7 hours
Below 10.00	18 hours	9 hours

STANDARD PROCEDURE - CONVENTIONAL BATTERY CHARGING

Vehicles equipped with a diesel engine utilize a unique spiral plate battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the spiral plate battery charging procedure could result in damage to the battery or personal injury.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- Three hydrometer tests, taken at one-hour intervals, indicate no increase in the temperature-corrected specific gravity of the battery electrolyte.
- Open-circuit voltage of the battery is 12.64 volts or above.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

BATTERY (Continued)

WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS IS IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.4 volts or greater, retest the battery with the micro 420 tester or perform a load test to determine the battery cranking capacity. Refer to Standard Procedures for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

(1) Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt (Fig. 8). If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.

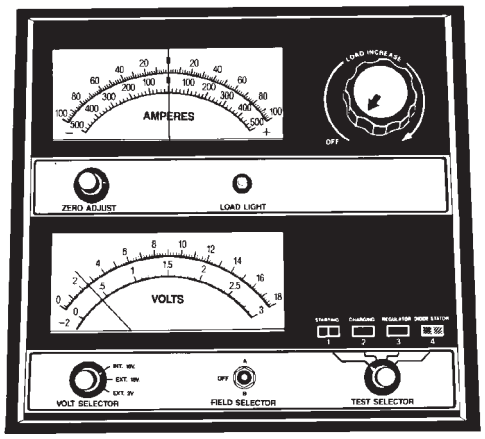


Fig. 8 Voltmeter - Typical

(2) Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

(3) Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	Hours
16.0 volts maximum	up to 10 min.
14.0 to 15.9 volts	up to 20 min.
13.9 volts or less	up to 30 min.

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80°

BATTERY (Continued)

F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).

- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Conventional Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

CONVENTIONAL BATTERY CHARGING TIME TABLE			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

STANDARD PROCEDURE - OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used if no other battery tester is available.

Before proceeding with this test, completely charge the battery. Refer to Standard Procedures for the proper battery charging procedures.

(1) Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.

(2) Disconnect and isolate both battery cables, negative cable first.

(3) Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage (Fig. 9).

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity. Refer to Standard Procedures for the proper battery load test procedures.

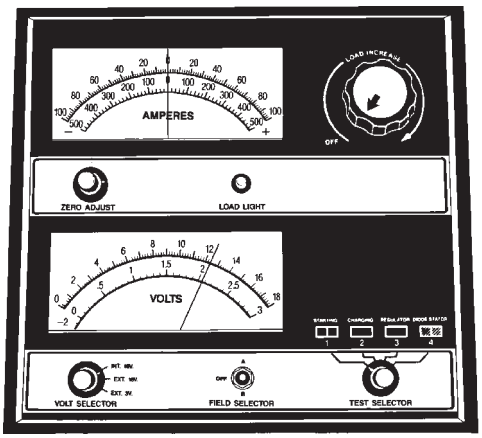

Fig. 9 Testing Open-Circuit Voltage - Typical

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.45 volts	75%
12.65 volts or more	100%

STANDARD PROCEDURE - IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.015 to 0.025 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to twenty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty-one days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty-one days or more (stored), remove the IOD fuse from the Integrated Power Module (IPM). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.

BATTERY (Continued)

- Intermittent shorts in the wiring.

If the IOD is over twenty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

(1) Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes.

(2) Disconnect the battery negative cable.

(3) Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

(4) After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Integrated Power Module (IPM), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information in this service manual for complete Integrated Power Module fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, refer to Charging System for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

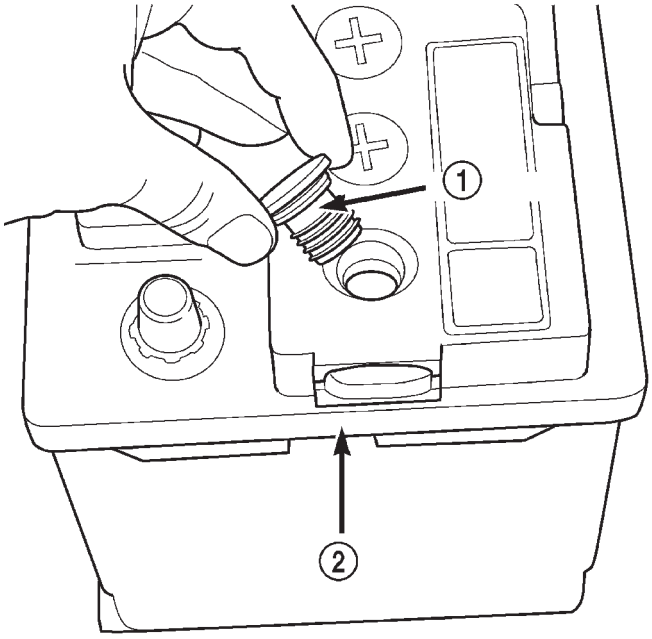
CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

(5) Allow twenty minutes for the IOD to stabilize and observe the multi-meter reading. The low-amperage IOD should not exceed twenty-five milliamperes (0.025 ampere). If the current draw exceeds twenty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 4. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

STANDARD PROCEDURE - CHECKING BATTERY ELECTROLYTE LEVEL

The following procedure can be used to check the electrolyte level in a low-maintenance lead-acid battery.

(1) Unscrew and remove the battery cell caps with a flat-bladed screw driver (Fig. 10).



80b76fd0

Fig. 10 BATTERY CELL CAP REMOVAL/ INSTALLATION - LOW-MAINTENANCE BATTERY ONLY

1 - BATTERY CELL CAP
2 - BATTERY CASE

WARNING: NEVER PUT YOUR FACE NEAR A GASSING, HOT OR SWELLED BATTERY. SERIOUS PERSONAL INJURY MAY RESULT.

BATTERY (Continued)

(2) Wearing safety glasses, look through the battery cell cap holes to determine the level of the electrolyte in the battery. The electrolyte should be above the hooks inside the battery cells (Fig. 11).

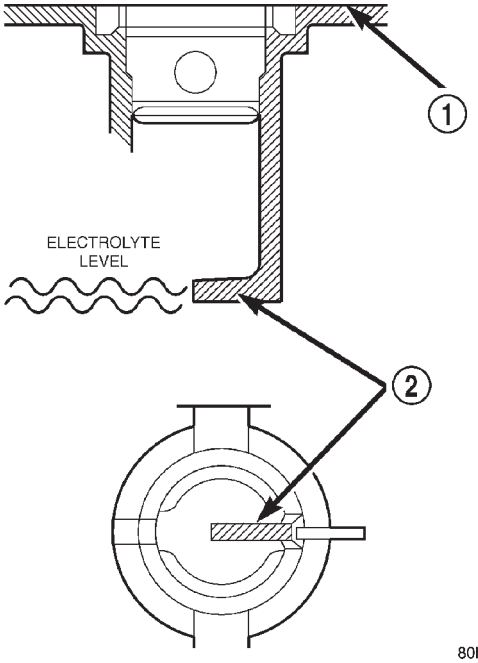


Fig. 11 HOOK INSIDE BATTERY CELLS - LOW-MAINTENANCE BATTERY ONLY

1 - TOP OF BATTERY
2 - HOOK INSIDE BATTERY CELLS

(3) **Add only distilled water** until the electrolyte is above the hooks inside the battery cells (Fig. 11).

REMOVAL - BATTERY

WARNING: A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.

WARNING: REMOVE METALLIC JEWELRY TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.

(1) Verify that the ignition switch and all accessories are OFF.
(2) Disconnect the battery cables from the battery posts, negative first (Fig. 12).
(3) Remove the battery hold down retaining nut.
(4) Remove the battery hold down bracket.
(5) Remove the battery from the vehicle.

INSTALLATION

(1) Position the battery in the battery tray.

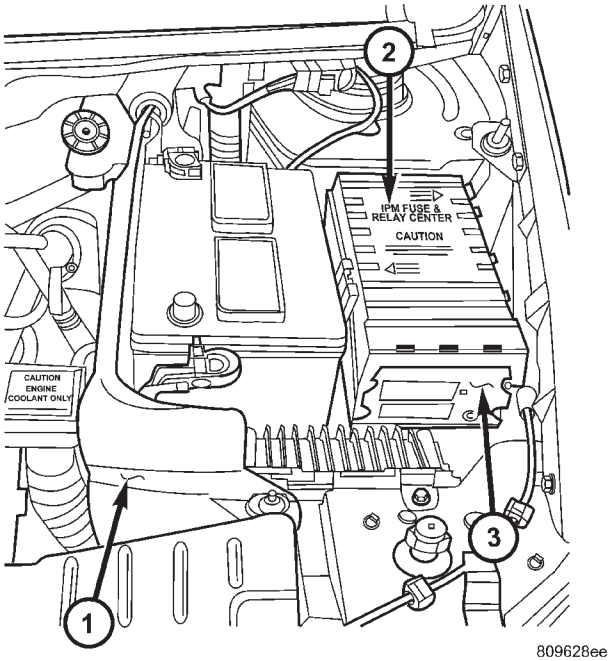

Fig. 12 BATTERY POSITION & ORIENTATION

1 - BATTERY THERMOWRAP (IF EQUIPPED)
2 - INTEGRATED POWER MODULE
3 - FRONT CONTROL MODULE

(2) Install the battery hold down bracket and retaining nut. Torque the nut to 20 N·m (180 in. lbs.).
(3) Connect the battery cables to the battery posts, positive cable first. Torque terminal fasteners to 8.5 N·m (75 in. lbs.).

BATTERY HOLDDOWN

DESCRIPTION

The battery hold down hardware consists of a molded plastic lip that is integral to the outboard edge of the battery tray and support unit, a molded steel hold down bracket and a single hex nut with a coned washer.

When installing a battery into the battery tray, be certain that the hold down hardware is properly installed and that the fasteners are tightened to the proper specifications. Improper hold down fastener tightness, whether too loose or too tight, can result in damage to the battery, the vehicle or both. Refer to **Battery Hold Downs** in this section of this service manual for the location of the proper battery hold down installation procedures, including the proper hold down fastener tightness specifications.

OPERATION

The battery holddown secures the battery in the battery tray. This holddown is designed to prevent

BATTERY HOLDDOWN (Continued)

battery movement during the most extreme vehicle operation conditions. Periodic removal and lubrication of the battery holddown hardware is recommended to prevent hardware seizure at a later date.

NOTE: Never operate a vehicle without a battery holddown device properly installed. Damage to the vehicle, components and battery could result.

REMOVAL

All of the battery hold down hardware can be serviced without removal of the battery or the battery tray and support unit.

(1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.

(2) Remove the nut with washer that secures the battery hold down bracket to the battery tray and support unit.

(3) Remove the battery hold down bracket from the battery tray and support unit.

INSTALLATION

(1) Install the battery hold down bracket in the battery tray and support unit.

(2) Install the nut with washer that secures the battery hold down bracket to the battery tray and support unit. Torque to 20 N·m (180 in. lbs.).

BATTERY CABLES

DESCRIPTION

The battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. Refer to **Wiring Diagrams** in the index of this service manual for the location of the proper battery cable wire gauge information.

A clamping type female battery terminal made of stamped metal is attached to one end of the battery cable wire. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a black insulating jacket and a smaller female battery terminal clamp.

The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some models. Refer to **Wiring Diagrams** in the index of this service manual for the location of more information on the various wiring circuits included in the battery wire harness for the vehicle being serviced.

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

The battery positive cable terminal clamp is attached to the ends of two wires. One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Integrated Power Module (IPM), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp is also attached to the ends of two wires. One wire has an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a stud on the left side of the engine cylinder block. The other wire has an eyelet terminal that connects the battery negative cable to the vehicle body through a ground screw on the left front fender inner shield, near the battery.

DIAGNOSIS AND TESTING - BATTERY CABLE

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAM-**

BATTERY CABLES (Continued)

PLE: When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and load tested. Refer to Standard Procedures for the proper battery charging and load test procedures.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay is located in the Intelligent Power Module (IPM), in the engine compartment. See the fuse and relay layout label affixed to the underside of the IPM cover for ASD relay identification and location.

(1) Connect the positive lead of the voltmeter to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp (Fig. 13). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

(2) Connect the positive lead of the voltmeter to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp (Fig. 14). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

(3) Connect the voltmeter to measure between the battery positive cable terminal clamp and the starter solenoid B(+) terminal stud (Fig. 15). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

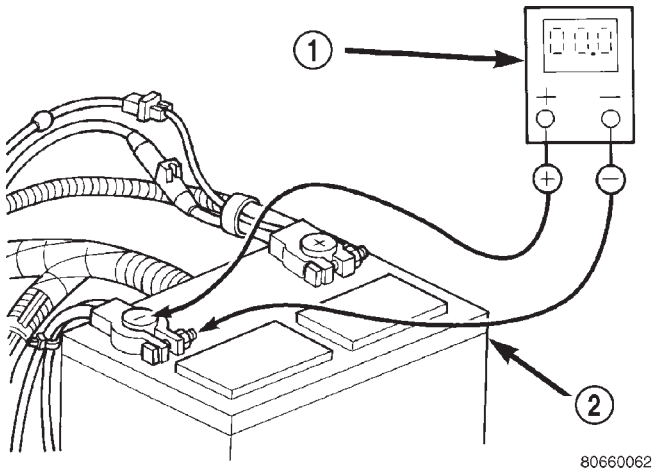

Fig. 13 TEST BATTERY NEGATIVE CONNECTION RESISTANCE - TYPICAL

1 - VOLTMETER
2 - BATTERY

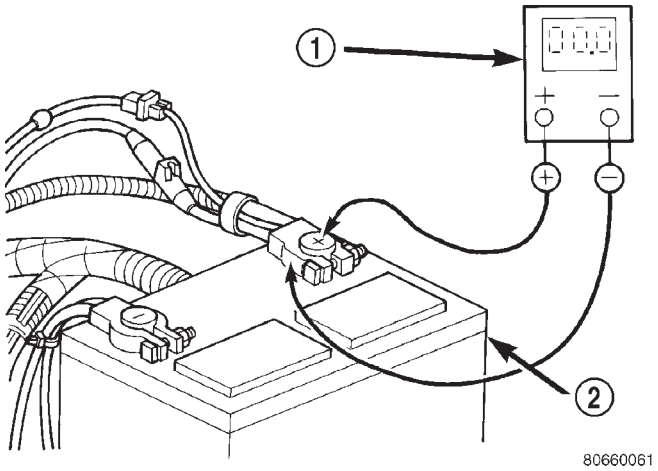

Fig. 14 TEST BATTERY POSITIVE CONNECTION RESISTANCE - TYPICAL

1 - VOLTMETER
2 - BATTERY

(4) Connect the voltmeter to measure between the battery negative cable terminal clamp and a good clean ground on the engine block (Fig. 16). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.

REMOVAL

The battery cables on this model may include portions of wiring circuits for the generator and other components on the vehicle. If battery cable replacement is required, it will be necessary to extract the cables out of the engine wire harness assembly. Use care not to damage the other wires and circuits which are also packaged into the engine wire harness assembly.

(1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.

(2) Disconnect and isolate the negative battery cable terminal.

(3) Remove the battery thermowrap (if equipped) from the battery tray.

(4) Remove the tape from the engine wire harness assembly, to access the desired battery cable.

(5) One at a time, trace and disconnect the battery cable retaining fasteners and routing clips until the desired cable is free from the vehicle.

(6) Feed the battery cable out of the vehicle.

INSTALLATION

(1) Position the battery cable in the vehicle.

(2) One at a time, trace and install the battery cable retaining fasteners and routing clips until the desired cable is properly installed in the engine wire harness assembly.

(3) Install the tape on the engine wire harness assembly.

(4) Install the battery thermowrap (if equipped) on the battery tray.

(5) Connect the negative battery cable terminal.

BATTERY TRAY

DESCRIPTION

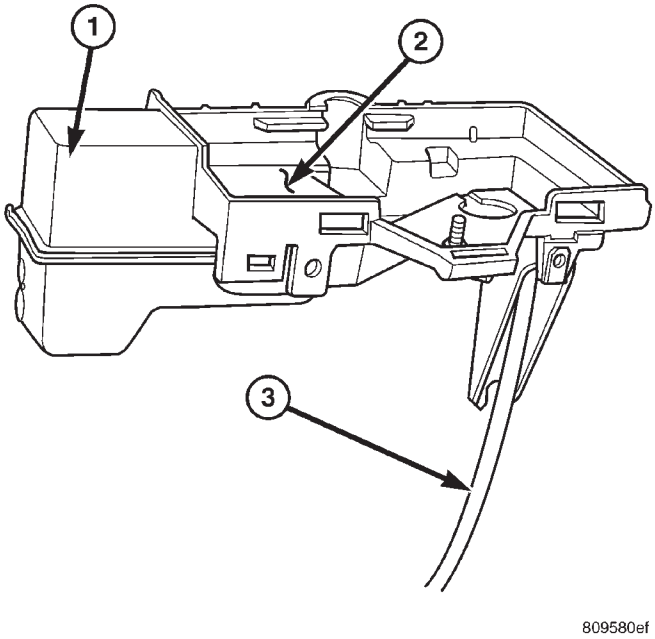

Fig. 17 RS BATTERY TRAY

1 - ENGINE VACUUM RESERVOIR
2 - BATTERY TRAY ASSEMBLY
3 - DRAINAGE HOSE

The battery is mounted in a molded plastic battery tray and support unit located in the left front corner of the engine compartment. The battery tray and support unit is secured with two nuts, one is located

BATTERY TRAY (Continued)

directly under the battery and the other is located on the right side of the tray which also serves as a coolant bottle neck retaining bolt. An additional bolt is located directly under the battery.

The battery tray and support unit also includes a engine vacuum reservoir, located in the rear of the unit (Fig. 17). And a drainage hose, located in the front of the unit (Fig. 17).

OPERATION

The battery tray provides a secure mounting location and supports the battery. The battery tray also provides the anchor point for the battery holddown hardware. The battery tray and the battery holddown hardware combine to secure and stabilize the battery in the engine compartment, which prevents battery movement during vehicle operation. Unrestrained battery movement during vehicle operation could result in damage to the vehicle, the battery, or both.

The battery tray used on this model also includes a engine vacuum reservoir and drainage hose. The vacuum reservoir provides a storage container for engine vacuum. Refer to the engine section of the service manual for more engine vacuum information. The drainage hose provides means for any liquid that might collect in the bottom of the battery tray to drain under the vehicle.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the battery from the vehicle. Refer to the procedure in this section.

(3) Remove the battery tray retaining fasteners (Fig. 18).

(4) Pull battery tray up far enough to disconnect the engine vacuum harness hose from the battery tray mounted, vacuum reservoir.

(5) Remove the battery tray from the vehicle.

INSTALLATION

(1) Position the battery tray in the vehicle.

(2) Connect the engine vacuum harness hose on the battery tray mounted vacuum reservoir.

(3) Position drainage hose and install the battery tray retaining fasteners (Fig. 18).

(4) Install the battery in the vehicle. Refer to the procedure in this section.

(5) Connect the negative battery cable.

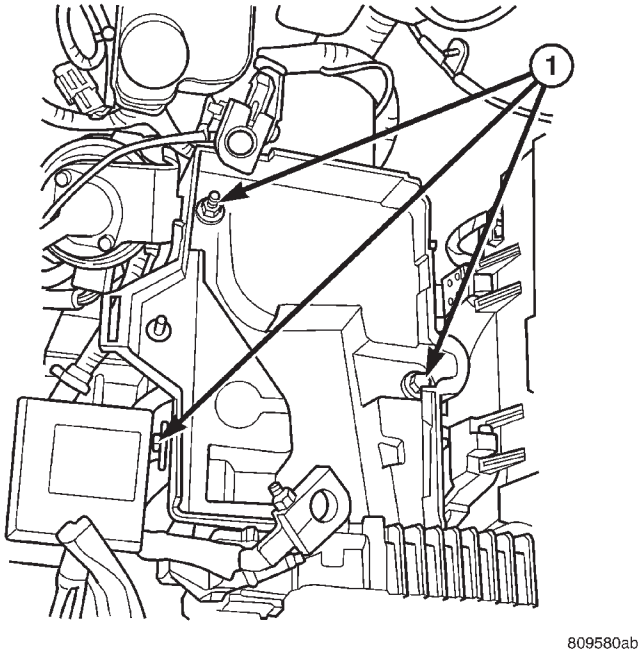

Fig. 18 BATTERY TRAY POSITION & ORIENTATION

1 - BATTERY TRAY RETAINING FASTENERS

THERMOWRAP

DESCRIPTION

A one-piece slip-on thermowrap unit shields the battery case from engine compartment heat. The thermowrap slips over the battery case and due to its one piece design, the battery cables must be removed in order to install or remove the thermowrap.

OPERATION

The thermowrap protects the battery from engine compartment temperature extremes. The temperature of the battery can affect battery life. The air trapped in the padded material of the thermowrap creates a dead air space, which helps to insulate the sides of the battery case from the air temperature found in the surrounding engine compartment.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Disconnect the positive battery cable.

(3) Lift the battery thermowrap straight up to remove from the battery.

INSTALLATION

(1) Position the thermowrap on the battery.

(2) Connect the negative and positive battery cables.

CHARGING

DESCRIPTION - CHARGING SYSTEM

The charging system consists of:

- Generator
- Decoupler Pulley (If equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch (refer to the Ignition System section for information)
- Battery (refer to the Battery section for information)
- Inlet Air Temperature (calculated battery temperature)
- Voltmeter (refer to the Instrument Cluster section for information if equipped)
- Wiring harness and connections (refer to the Wiring section for information)
- Accessory drive belt (refer to the Cooling section for more information)

OPERATION - CHARGING SYSTEM

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. The ASD relay is energized when the PCM grounds the ASD control circuit. This voltage is connected through the PCM or IPM (intelligent power module) (if equipped) and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The generator is driven by the engine through a serpentine belt and pulley or decoupler pulley arrangement.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

An Inlet air temperature sensor is used to calculate the temperature near the battery. This temperature data, along with data from monitored line voltage (battery voltage sense circuit), is used by the PCM to vary the battery charging rate. This is done by cycling the ground path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly to maintain system voltage at the targeted system voltage based on battery temperature.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects and illuminate the (MIL) lamp. Refer to On-Board Diagnostics in the Electronic Control Modules(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MOD-

CHARGING (Continued)

ULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) section for more DTC information.

The Check Gauges Lamp (if equipped) or Battery Lamp monitors: **charging system voltage,** engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. The signal to activate the lamp is sent via the PCI bus circuits. The lamp is located on the instrument panel. Refer to the Instrument Cluster section for additional information.

The PCM uses the inlet air temperature sensor to control the charge system voltage. This temperature, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. The system voltage is higher at cold temperatures and is gradually reduced as the calculated battery temperature increases.

The ambient temperature sensor is used to control the battery voltage based upon ambient temperature (approximation of battery temperature). The PCM maintains the optimal output of the generator by monitoring battery voltage and controlling it to a range of 13.5 - 14.7 volts based on battery temperature.

DIAGNOSIS AND TESTING - ON-BOARD DIAGNOSTIC SYSTEM

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 50 engine starts if the problem does not occur again.

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the DRBIII® scan tool. Refer to the appropriate Powertrain Diagnostic Procedures manual for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The DRBIII® Scan Tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/ BATTERY - STANDARD PROCEDURE)

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the DRBIII® scan tool. Perform the following inspections before attaching the scan tool.

(1) Inspect the battery condition. Refer to the Battery section (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING) for procedures.

(2) Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.

(3) Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.

(4) Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications (Refer to 8 - ELECTRICAL/ CHARGING - SPECIFICATIONS).

CHARGING (Continued)

(5) Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications(Refer to 7 - COOLING/ ACCESSORY DRIVE - SPECIFICATIONS).

(6) Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.

(7) Inspect automatic belt tensioner (if equipped). Refer to the Cooling System for more information.

(8) Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

BATTERY TEMPERATURE SENSOR

DESCRIPTION

The PCM incorporates a Battery Temperature Sensor (BTS) on its circuit board.

OPERATION

The PCM uses the temperature of the battery area to control the charge system voltage. This temperature, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. The system voltage is higher at cold temperatures and is gradually reduced as temperature around the battery increases.

The ambient temperature sensor is used to control the battery voltage based upon ambient temperature (approximation of battery temperature). The PCM maintains the optimal output of the generator by monitoring battery voltage and controlling it to a range of 13.5 - 14.7 volts based on battery temperature.

The battery temperature sensor is also used for OBD II diagnostics. Certain faults and OBD II monitors are either enabled or disabled depending upon the battery temperature sensor input (example: disable purge and EGR, enable LDP). Most OBD II monitors are disabled below 20°F.

REMOVAL

The battery temperature sensor is not serviced separately. If replacement is necessary, the PCM must be replaced.

GENERATOR

DESCRIPTION

The generator is belt-driven by the engine. It is serviced only as a complete assembly. The generator produces DC voltage at the B+ terminal. If the generator is failed, the generator assembly subcomponents (generator and decoupler pulley) must be inspected for individual failure and replaced accordingly.

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The Y type stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicles electrical system through the generator, battery, and ground terminals.

Excessive or abnormal noise emitting from the generator may be caused by:

- Worn, loose or defective bearings
- Loose or defective drive pulley (2.4L) or decoupler (3.3/3.8L)
- Incorrect, worn, damaged or misadjusted drive belt
- Loose mounting bolts
- Misaligned drive pulley
- Defective stator or diode
- Damaged internal fins

REMOVAL

REMOVAL - 2.4L

(1) Release hood latch and open hood.
(2) Disconnect battery negative cable.
(3) Disconnect the Inlet Air Temperature sensor.
(4) Remove the Air Box, refer to the Engine/Air Cleaner for more information.
(5) Remove the EVAP Purge solenoid from its bracket and reposition.
(6) Disconnect the push-in field wire connector from back of generator.
(7) Remove nut holding B+ wire terminal to back of generator.
(8) Separate B+ terminal from generator.
(9) Remove accessory drive belt, refer to the Cooling System section for proper procedures.
(10) Remove the generator.

GENERATOR (Continued)

REMOVAL - 2.5L

(1) Disconnect the negative battery cable (Fig. 1).

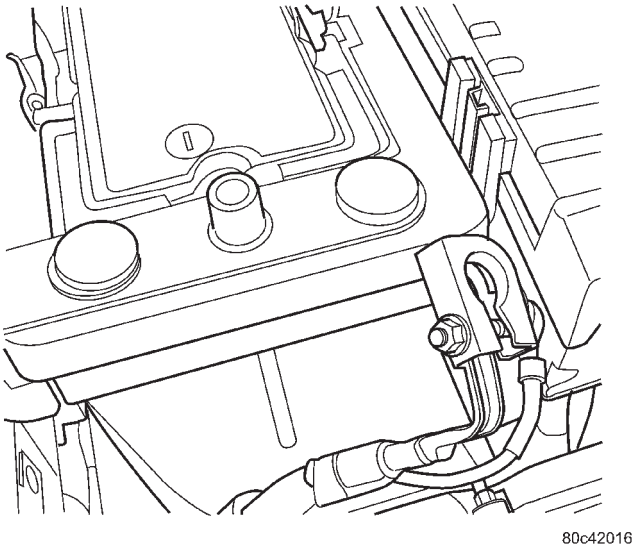

Fig. 1 BATTERY CONNECTION

(2) Remove the engine cover (Fig. 2).

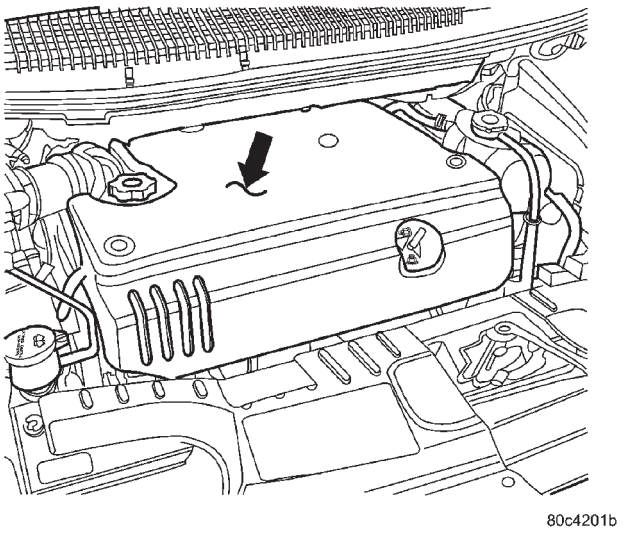

Fig. 2 ENGINE COVER

(3) Raise vehicle and support.

(4) Turn wheels to the right. Remove the right front splash shield (Fig. 3).

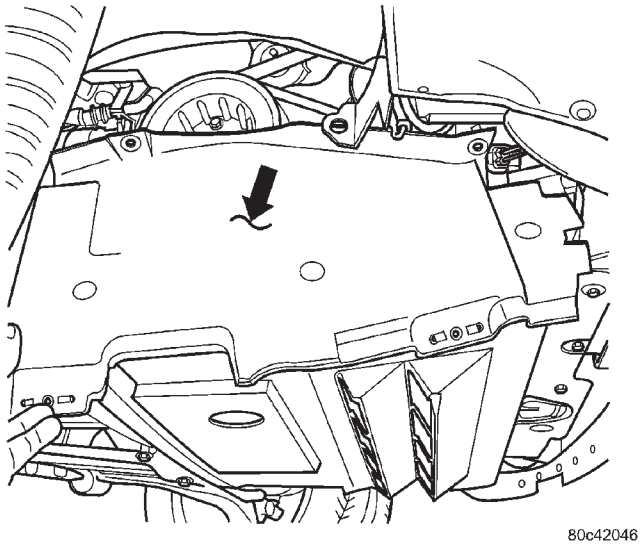

Fig. 3 SPLASH SHIELD

(5) Remove the generator drive belt (Fig. 4).

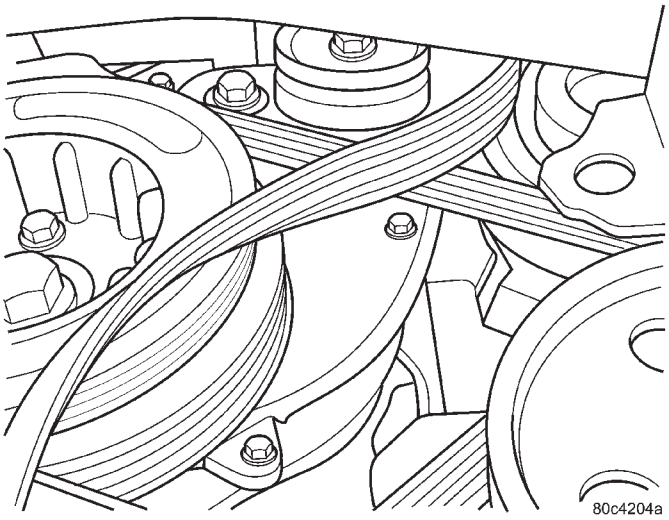

Fig. 4 GENERATOR BELT

GENERATOR (Continued)

(6) Lower vehicle.
(7) Disconnect the generator battery connection (Fig. 5).

(8) Disconnect the field connection (Fig. 5).
(9) Relocate the wiring harness on upper generator bracket (Fig. 6).

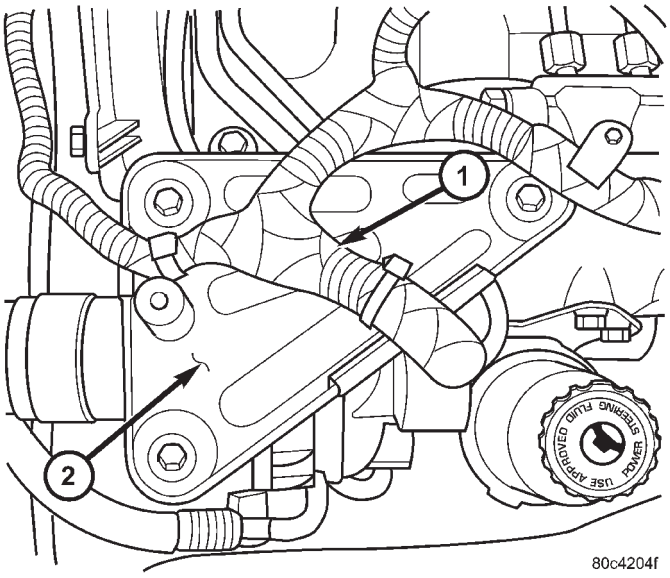

Fig. 6 UPPER SUPPORT BRACKET

1 - Wiring Harness
2 - Upper Bracket

(10) Remove the Air Cleaner Box (Fig. 7).
(11) Remove the 2 lower mounting Bolts (Fig. 8).
(12) Remove generator.

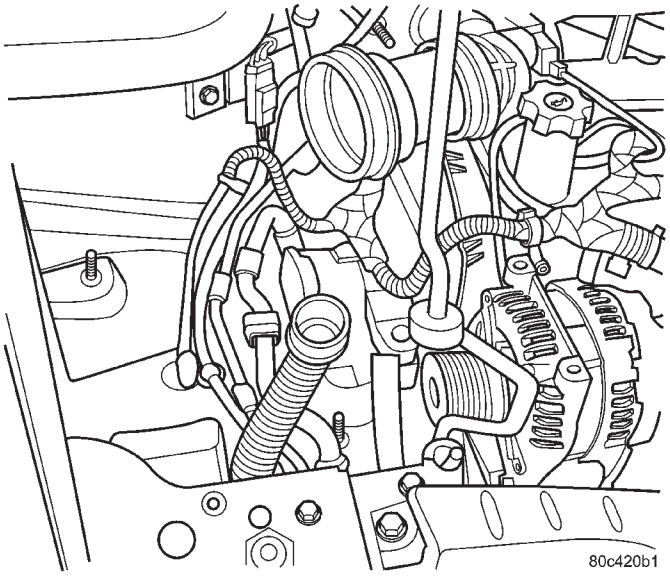

Fig. 7 AIR BOX REMOVED

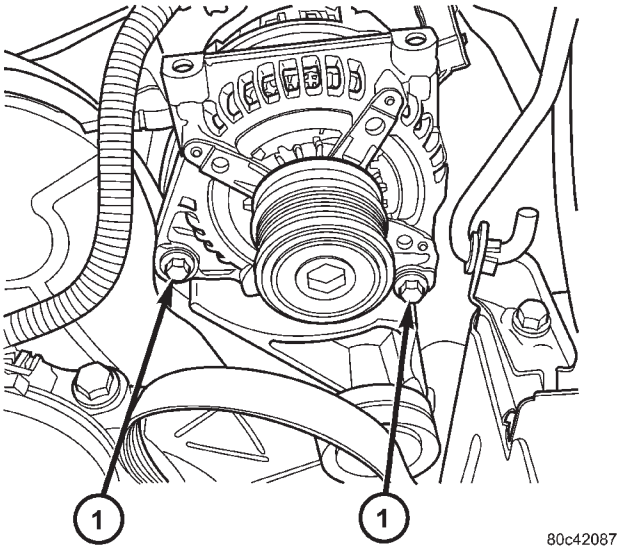

Fig. 8 GENERATOR LOWER BOLTS

1 - Lower Mounting Bolts

REMOVAL - 3.3/3.8L

(1) Release hood latch and open hood.
(2) Disconnect battery negative cable.
(3) Disconnect the push-in field wire connector from back of generator.
(4) Remove nut holding B+ wire terminal to back of generator.
(5) Separate B+ terminal from generator.
(6) Raise vehicle and support.
(7) Remove the right front lower splash shield.
(8) Remove accessory drive belt, refer to the Cooling System section for proper procedures.

GENERATOR (Continued)

(9) Remove the lower oil dip stick tube bolt (Fig. 9).

(10) Remove wiring harness from the oil dip stick tube

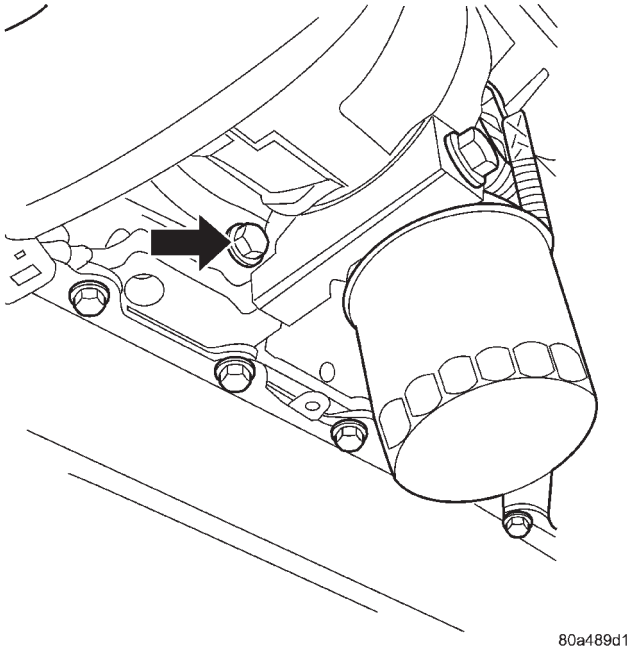

Fig. 9 DIP STICK LOWER BOLT

(11) Remove the 3 mounting bolts.

(12) Lower vehicle.

(13) Remove oil dip stick tube from vehicle.

(14) Roll and remove the generator from vehicle (Fig. 10).

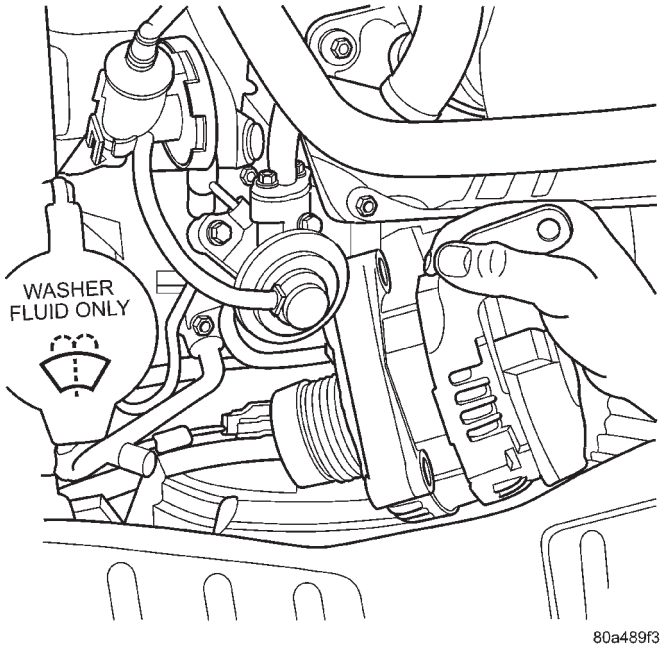

Fig. 10 GENERATOR 3.3/3.8L

REMOVAL - 3.5L

(1) Disconnect the negative battery cable.

(2) Turn wheels to the right.

(3) Raise and support the vehicle.

(4) Remove the right front tire.

(5) Remove the front axle nut.

(6) Relocate the ABS sensor (Fig. 11) wiring from bracket (Fig. 12).

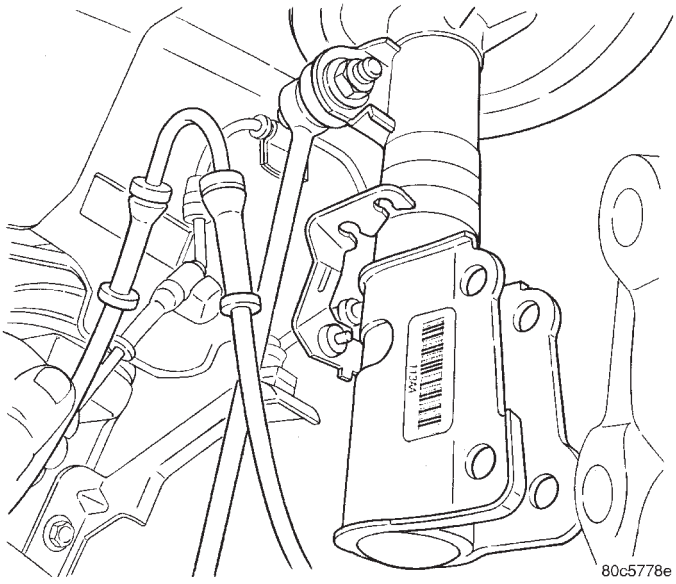

Fig. 11 ABS WIRING AND STRUT

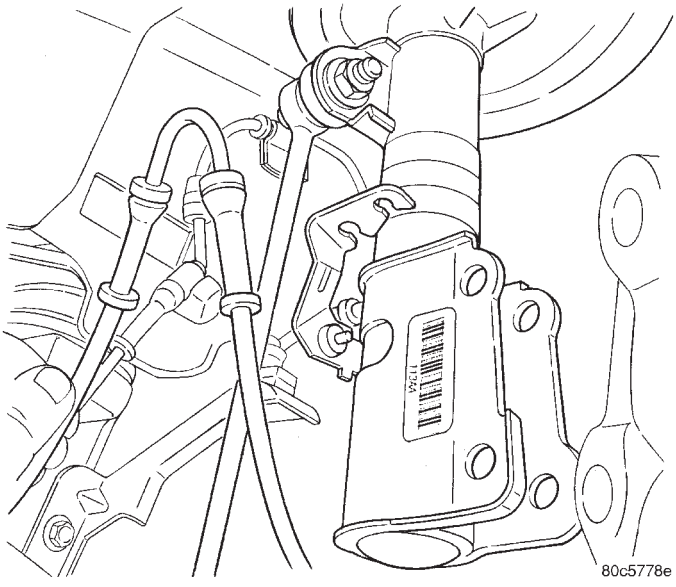

Fig. 12 ABS WIRING AND STRUT

GENERATOR (Continued)

(7) Remove the 2 upper clevies bolts.
(8) Remove axle from knuckle (Fig. 13).

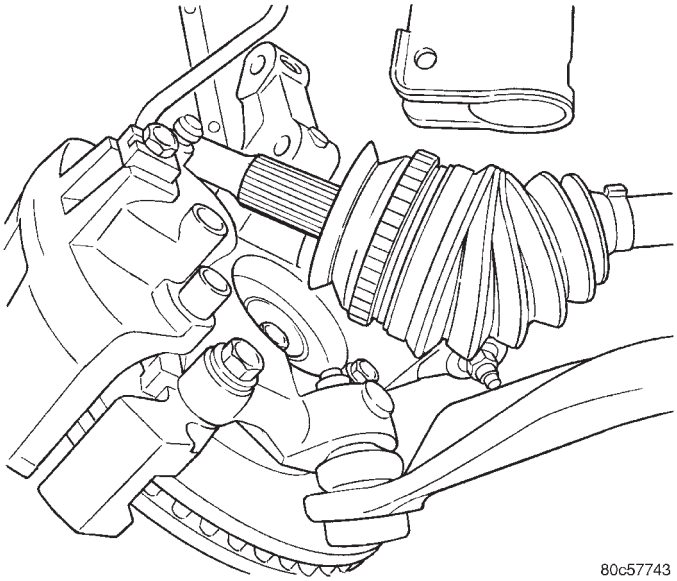

Fig. 13 AXLE AND KNUCKLE

(9) Remove the right front splash shield.
(10) Remove the accessory drive belt (Fig. 14), refer to the cooling section.

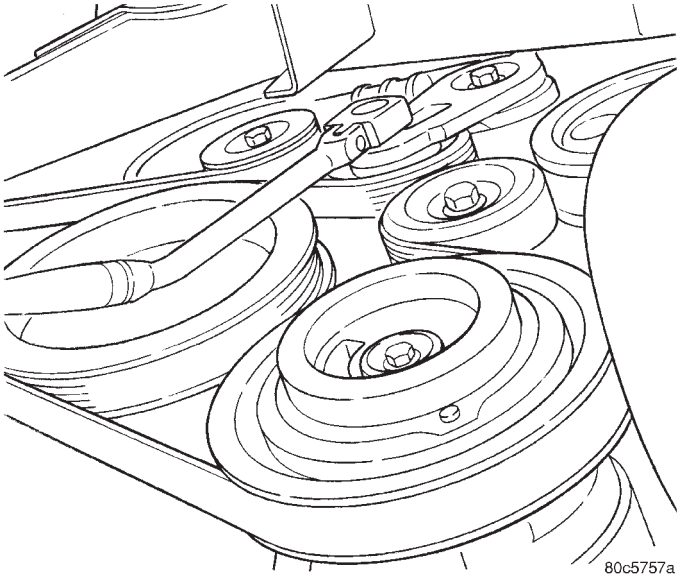

Fig. 14 ACCESSORY DRIVE BELT

(11) Disconnect the generator positive battery cable.
(12) Unlock the electrical connector for the field connector (Fig. 15).

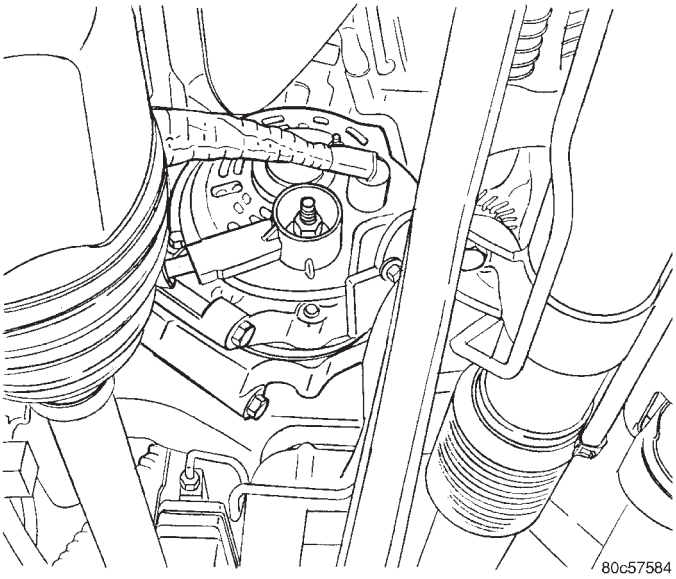

Fig. 15 GENERATOR CONNECTORS

(13) Disconnect the field connector.
(14) Remove the axle from vehicle, oil will leak from transmission.
(15) Remove the 3 mounting bolts for generator.
(16) Remove generator from vehicle (Fig. 16).

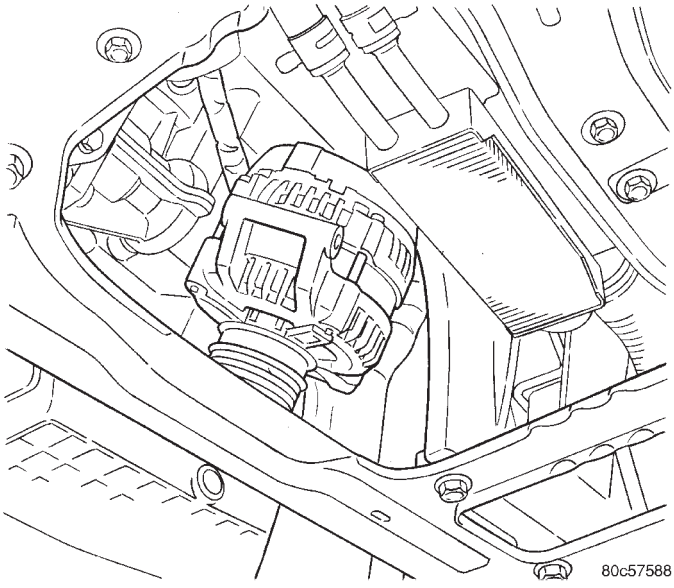

Fig. 16 GENERATOR REMOVEL/INSTALLATION

INSTALLATION

INSTALLATION - 2.4L

(1) Install the generator.
(2) Install the accessory drive belt, refer to the Cooling System section for proper procedures.
(3) Connect B+ terminal to generator.
(4) Install nut holding B+ wire terminal to back of generator.

GENERATOR (Continued)

(5) Connect the push-in field wire connector to back of generator.
(6) Install the EVAP Purge solenoid to its bracket.
(7) Install the Air Box, refer to the Engine/Air Cleaner for more information.
(8) Connect the Inlet Air Temperature sensor.
(9) Connect battery negative cable.

INSTALLATION - 2.5L

(1) Install generator.
(2) Install the 2 lower mounting Bolts (Fig. 8).
(3) Install the Air Cleaner Box (Fig. 7).
(4) Install the upper support bracket (Fig. 6).
(5) Install the wiring harness on upper generator bracket (Fig. 6).
(6) Connect the field connection (Fig. 5).
(7) Connect the generator battery connection (Fig. 5).
(8) Raise vehicle and support.
(9) Install the generator drive belt (Fig. 4).
(10) Install the right front splash shield (Fig. 3).
(11) Lower vehicle.
(12) Install the engine cover (Fig. 2).
(13) Connect the negative battery cable (Fig. 1).

INSTALLATION - 3.3/3.8L

(1) Roll and place generator in position on vehicle (Fig. 10).
(2) Install upper bolts to hold generator in place.
(3) Lubricate the o-ring. Install oil dip stick tube.
(4) Install the upper oil dip stick tube bolt.
(5) Place B+ terminal in position on generator.
(6) Install nut to hold B+ wire terminal to back of generator.
(7) Connect the push-in field wire connector into back of generator.
(8) Raise vehicle and support.
(9) Install the lower mounting bolt and tighten.
(10) Install the lower oil dip stick tube bolt and tighten (Fig. 9).
(11) Install accessory drive belt, refer to the Cooling System section for proper procedures.
(12) Install the right front lower splash shield.
(13) Lower vehicle.
(14) Install wiring harness to the oil dip stick tube
(15) Connect battery negative cable.
(16) Verify generator output rate.

INSTALLATION - 3.5L

(1) Install generator (Fig. 16) and the 3 mounting bolts and tighten.
(2) Connect the generator positive battery cable (Fig. 15).
(3) Connect the field connector and lock the connector (Fig. 15).
(4) Install the axle shaft to the transmission.
(5) Install axle to steering knuckle (Fig. 13).
(6) Install the 2 upper clevies bolts and tighten, refer to the Suspension section.
(7) Install axle nut and tighten, refer to the Differential and Driveline section.
(8) Relocate the ABS sensor wiring to bracket (Fig. 12).
(9) Install the accessory drive belt (Fig. 14), refer to the Cooling section.
(10) Install the right front splash shield.
(11) Install the right front tire, refer to the Wheels and Tires section.
(12) Lower vehicle.
(13) Connect the negative battery cable.

GENERATOR DECOUPLER PULLEY

DESCRIPTION

The Generator Decoupler is a one way clutch (Fig. 17). It is attached to the generator and replaces the standard pulley. It is a non-serviceable item and is to be replaced as an assembly. It is a dry operation (no grease or lubricants). The operation of it is not temperature sensitive and has a low sensitivity to electrical load.

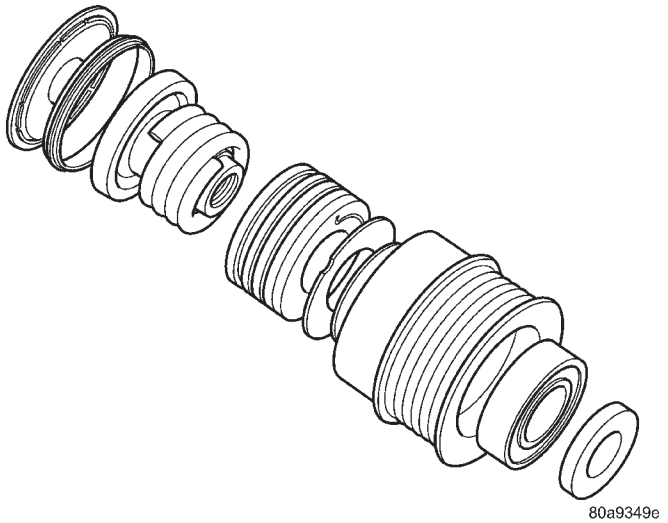

Fig. 17 GENERATOR DECOUPLER 3.3/3.8L

OPERATION

The generator decoupler is a one way clutch and should be replaced as an assembly. It is designed to help reduce belt tension fluctuation, reduce fatigue loads, improve belt life, reduce hubloads on components, and reduce noise.

GENERATOR DECOUPLER PULLEY (Continued)

DIAGNOSIS AND TESTING - GENERATOR DECOUPLER PULLEY

CONDITION	POSSIBLE CAUSES	CORRECTION
Does not drive generator (Generator not Charging)	Clutch failure	Replace Decoupler

REMOVAL

(1) Release hood latch and open hood.
(2) Disconnect battery negative cable.
(3) Raise vehicle and support.
(4) Remove the right front lower splash shield.
(5) Remove accessory drive belt, refer to the Cooling System section for proper procedures (Fig. 18).

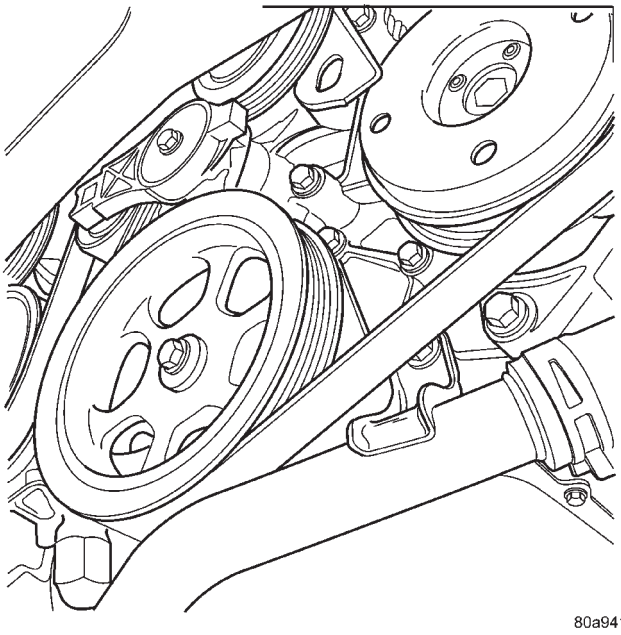

Fig. 18 DRIVE BELT 3.3/3.8L

(6) Lower vehicle.
(7) Remove the Air Box, refer to the Engine section for more information.
(8) Use Special Tool #8433 (Fig. 20) to loosen the Generator Decoupler (Fig. 19).
(9) Remove the tool.
(10) Remove the Generator Decoupler.

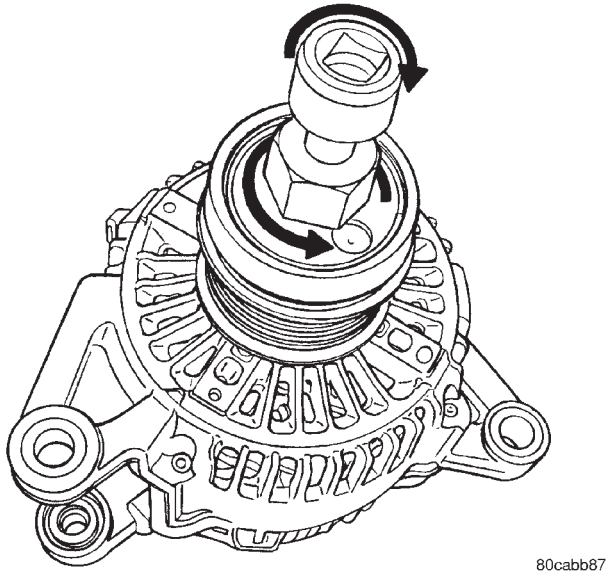

Fig. 19 DECOUPLER REMOVAL (LITENS)

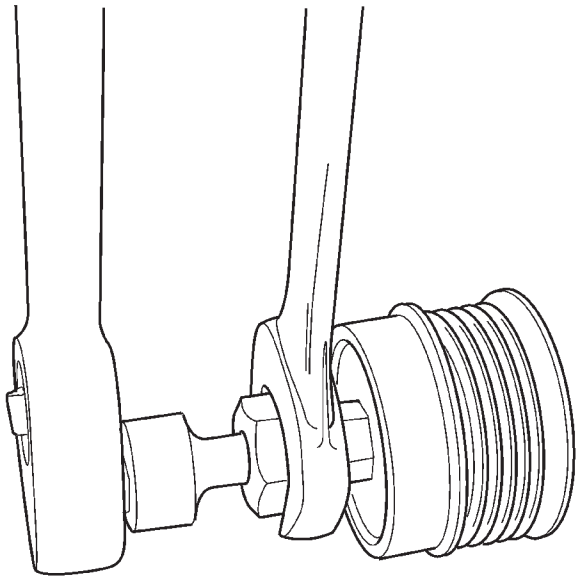

Fig. 20 SPECIAL TOOL 8433 AND DECOUPLER

GENERATOR DECOUPLER PULLEY (Continued)

INSTALLATION

(1) Install the Generator Decoupler to the generator shaft.

(2) Use Special Tool #8433 (Fig. 20) to tighten the Generator Decoupler (Fig. 21). Refer to the torque chart for the proper torque.

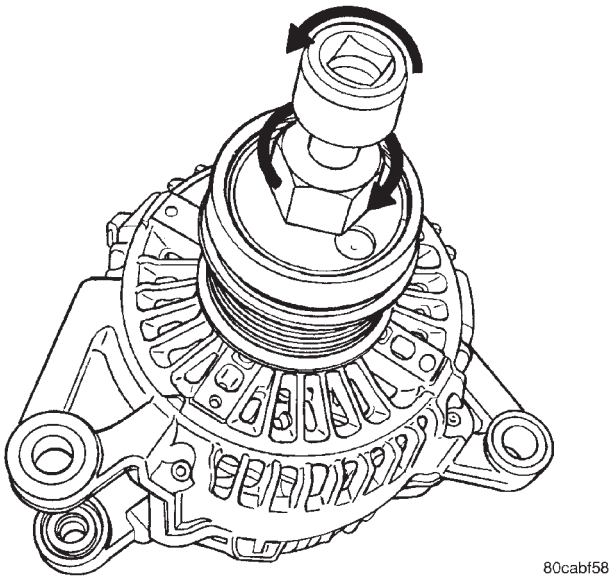

Fig. 21 DECOUPLER INSTALLATION (Litens)

(3) Install the Air Box, refer to the Engine section for more information.

(4) Raise vehicle and support.

(5) Install accessory drive belt, refer to the Cooling System section for proper procedures (Fig. 18).

(6) Install the right front lower splash shield.

(7) Lower vehicle.

(8) Connect battery negative cable.

VOLTAGE REGULATOR

DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and calculated battery temperature or inlet air temperature sensor (refer to Inlet Air Temperature Sensor, if equipped, for more information). It then determines a target charging voltage. If sensed battery voltage is lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is at the target voltage. A circuit in the PCM cycles the ground side of the generator field at 250 times per second (250Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output. Also refer to Charging System Operation for additional information.

STARTING

DESCRIPTION

The starting system has (Fig. 1):

- Ignition switch
- Starter relay
- Transmission Range Sensor or Park/Neutral Switch
- Wiring harness
- Battery
- Starter motor with an integral solenoid
- Powertrain Control Module (PCM)

OPERATION

These components form two separate circuits. A high amperage circuit that feeds the starter motor up to 300+ amps, and a control circuit that operates on less than 20 amps.

The PCM controls a double start over-ride safety that does not allow the starter to be engaged if the engine is already running.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STARTING SYSTEM TEST

For circuit descriptions and diagrams, refer to the Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO THE PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

INSPECTION

Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

- **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine the state-of-charge and cranking capacity of the battery. Charge or replace the battery, if required. Refer to the Battery section for more information.
- **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections.
- **Transmission Range Sensor** - Visually inspect the transmission range sensor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Relay** - Visually inspect the starter relay for indications of physical damage and loose or corroded wire harness connections.
- **Starter** - Visually inspect the starter for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect the starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect the wire harness for damage. Repair or replace any faulty wiring, as required. Check for loose or corroded wire harness connections at main engine ground and remote jump post.
- **Power Distribution Center (PDC)** - Visually inspect the B+ connections at the PDC for physical damage and loose or corroded harness connections.

STARTING (Continued)

STARTING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO ENGAGE.	1. BATTERY DISCHARGED OR FAULTY.	1. REFER TO THE BATTERY SECTION FOR MORE INFORMATION. CHARGE OR REPLACE BATTERY, IF REQUIRED.
	2. STARTING CIRCUIT WIRING FAULTY.	2. REFER TO FEED CIRCUIT RESISTANCE TEST AND FEED CIRCUIT TEST IN THIS SECTION.
	3. STARTER RELAY FAULTY.	3. REFER TO RELAY TEST, IN THIS SECTION. REPLACE RELAY, IF NECESSARY.
	4. IGNITION SWITCH FAULTY.	4. REFER TO IGNITION SWITCH TEST, IN THE STEERING SECTION OR 8 WIRING DIAGRAMS. REPLACE SWITCH, IF NECESSARY.
	5. PARK/NEUTRAL POSITION SWITCH (AUTO TRANS) FAULTY OR MIS-ADJUSTED.	5. REFER PARK/NEUTRAL POSITION SWITCH TEST, IN THE TRANSAXLE. SECTION FOR MORE INFORMATION. REPLACE SWITCH, IF NECESSARY.
	6. CLUTCH PEDAL POSITION SWITCH (MAN TRANS) FAULTY.	6. REFER TO CLUTCH PEDAL POSITION SWITCH TEST, IN THE CLUTCH. SECTION. REPLACE SWITCH, IF NECESSARY.
	7. STARTER SOLENOID FAULTY.	7. REFER TO SOLENOID TEST, IN THIS SECTION. REPLACE STARTER ASSEMBLY, IF NECESSARY.
	8. STARTER ASSEMBLY FAULTY.	8. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
	9. FAULTY TEETH ON RING GEAR.	9. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.
	10. PCM DOUBLE START OVERRIDE OUTPUT FAILURE.	10. REFER TO PCM DIAGNOSTIC. CHECK FOR CONTINUITY BETWEEN PCM AND TERMINAL 85. REPAIR OPEN CIRCUIT AS REQUIRED. IF OK, PCM MAY BE DEFECTIVE.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. BATTERY DISCHARGED OR FAULTY.	1. REFER TO THE BATTERY SECTION FOR MORE INFORMATION. CHARGE OR REPLACE BATTERY AS NECESSARY.
	2. STARTING CIRCUIT WIRING FAULTY.	2. REFER TO THE FEED CIRCUIT RESISTANCE TEST AND THE FEED CIRCUIT TEST IN THIS SECTION. REPAIR AS NECESSARY.
	3. STARTER ASSEMBLY FAULTY.	3. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
	4. ENGINE SEIZED.	4. REFER TO THE ENGINE SECTION, FOR DIAGNOSTIC AND SERVICE PROCEDURES.
	5. LOOSE CONNECTION AT BATTERY, PDC, STARTER, OR ENGINE GROUND.	5. INSPECT FOR LOOSE CONNECTIONS.
	6. FAULTY TEETH ON RING GEAR.	6. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.

STARTING (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. BROKEN TEETH ON STARTER RING GEAR.	1. REMOVE STARTER. INSPECT RING GEAR AND REPLACE IF NECESSARY.
	2. STARTER ASSEMBLY FAULTY.	2. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
STARTER DOES NOT DISENGAGE.	1. STARTER IMPROPERLY INSTALLED.	1. INSTALL STARTER. TIGHTEN STARTER MOUNTING HARDWARE TO CORRECT TORQUE SPECIFICATIONS.
	2. STARTER RELAY FAULTY.	2. REFER TO RELAY TEST, IN THIS SECTION. REPLACE RELAY, IF NECESSARY.
	3. IGNITION SWITCH FAULTY.	3. REFER TO IGNITION SWITCH TEST, IN THE STEERING SECTION. REPLACE SWITCH, IF NECESSARY.
	4. STARTER ASSEMBLY FAULTY.	4. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
	5. FAULTY TEETH ON RING GEAR.	5. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.

DIAGNOSIS AND TESTING - CONTROL CIRCUIT TEST

The starter control circuit has:

- Starter motor with integral solenoid
- Starter relay
- Transmission range sensor, or Park/Neutral Position switch with automatic transmissions
- Ignition switch
- Battery
- All related wiring and connections
- Powertrain Control Module (PCM)

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

- To disable ignition and fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for the proper relay location.

STARTER SOLENOID

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK POSITION WITH THE PARKING BRAKE APPLIED.

(1) Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests.

(2) Perform Starter Solenoid test BEFORE performing the starter relay test.

(3) Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.

(4) Locate and remove the starter relay from the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location.

(5) Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.

(a) If engine cranks, starter/starter solenoid is good. Go to the Starter Relay Test.

(b) If engine does not crank or solenoid chatters, check wiring and connectors from starter relay to starter solenoid for loose or corroded connections. Particularly at starter terminals.

(c) Repeat test. If engine still fails to crank properly, trouble is within starter or starter mounted solenoid, and replace starter. Inspect the ring gear teeth.

STARTER RELAY

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK/NEUTRAL POSITION WITH THE PARKING BRAKE APPLIED.

RELAY TEST

The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

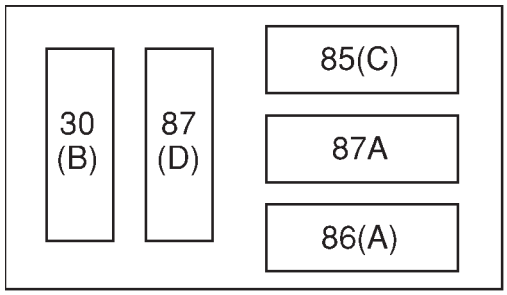
STARTING (Continued)

Remove the starter relay from the PDC as described in this group to perform the following tests:

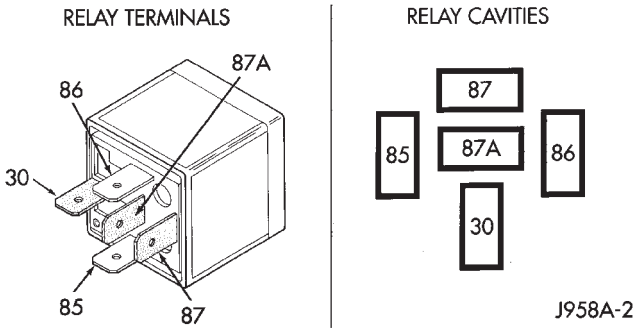
(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

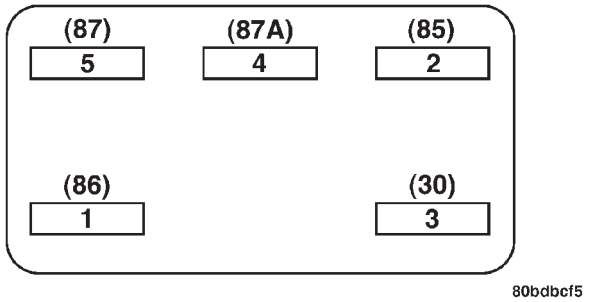
(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ±5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery B+ lead to terminals 86 and a ground lead to terminal 85 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, refer to Relay Circuit Test procedure. If not OK, replace the faulty relay.



Starter Relay Pinout





Starter Relay Pinout

CAV	FUNCTION
30	B (+)
85	P/N POSITION SW.SENSE
86	IGNITION SWITCH OUTPUT
87	STARTER RELAY OUTPUT
87A	NO CONNECT

RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to Step 4. If not OK, repair the open circuit to the starter solenoid as required.

(4) The coil battery terminal (86) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position and the clutch pedal is depressed (manual trans). Check for battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position and the clutch pedal is depressed (manual trans), and no voltage when the ignition switch is released to the On position. If OK, go to Step 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, see the Ignition Switch Test procedure in this group.

(5) The coil ground terminal (85) is connected to the electromagnet in the relay. It is grounded through the transmission range sensor only when the gearshift selector lever is in the Park or Neutral positions. Check for continuity to ground at the cavity for relay terminal 85. If not OK with an automatic transmission, check for an open or short circuit to the transmission range sensor and repair. It is grounded by the PCM if the conditions are right to start the car. For automatic trans. cars the PCM must see Park Neutral switch and near zero engine rpm. For manual trans. cars the PCM only needs to see near zero engine rpm. To diagnose the Park Neutral switch of the trans range sensor refer to the transaxle section for more information. Check for continuity to ground while the ignition switch is in the start position. If not OK and the vehicle has an automatic trans. verify Park Neutral switch opera-

STARTING (Continued)

tion. If that checks OK check for continuity between PCM and the terminal 85. Repair open circuit as required. If OK, the PCM may be defective.

SAFETY SWITCHES

For diagnostics of the Transmission Range Sensor, refer to the Transaxle section for more information.

If equipped with Clutch Interlock/Upstop Switch, refer to Diagnosis and Testing in the Clutch section.

IGNITION SWITCH

After testing starter solenoid and relay, test ignition switch and wiring. Refer to the Ignition Section or Wiring Diagrams for more information. Check all wiring for opens or shorts, and all connectors for being loose or corroded.

BATTERY

For battery diagnosis and testing, refer to the Battery section for procedures.

ALL RELATED WIRING AND CONNECTORS

Refer to Wiring Diagrams for more information.

DIAGNOSIS AND TESTING - FEED CIRCUIT RESISTANCE TEST

Before proceeding with this operation, review Diagnostic Preparation and Starter Feed Circuit Tests. The following operation will require a voltmeter, accurate to 1/10 of a volt.

CAUTION: Ignition and Fuel systems must be disabled to prevent engine start while performing the following tests.

(1) To disable the Ignition and Fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for proper relay location.

(2) Gain access to battery terminals.

(3) With all wiring harnesses and components properly connected, perform the following:

(a) Connect the negative lead of the voltmeter to the battery negative post, and positive lead to the battery negative cable clamp. Rotate and hold the ignition switch in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between cable clamp and post.

(b) Connect positive lead of the voltmeter to the battery positive post, and negative lead to the battery positive cable clamp. Rotate and hold the ignition switch key in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between the cable clamp and post.

(c) Connect negative lead of voltmeter to battery negative terminal, and positive lead to engine block near the battery cable attaching point. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at ground cable attaching point. If voltage reading is still above 0.2 volt after correcting poor contacts, replace ground cable.

(4) Connect positive voltmeter lead to the starter motor housing and the negative lead to the battery negative terminal. Hold the ignition switch key in the START position. If voltage reads above 0.2 volt, correct poor starter to engine ground.

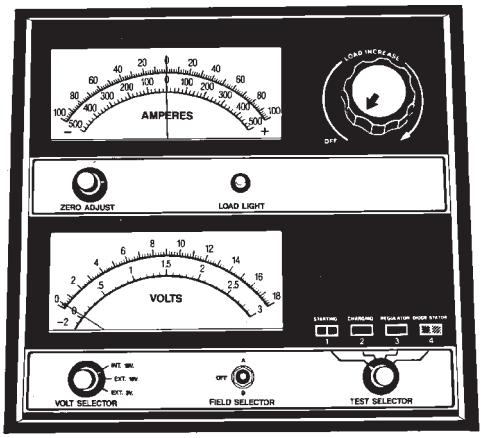
(a) Connect the positive voltmeter lead to the battery positive terminal, and negative lead to battery cable terminal on starter solenoid. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at battery cable to solenoid connection. If reading is still above 0.2 volt after correcting poor contacts, replace battery positive cable.

(b) If resistance tests do not detect feed circuit failures, replace the starter motor.

DIAGNOSIS AND TESTING - FEED CIRCUIT TEST

NOTE: The following results are based upon the vehicle being at room temperature.

The following procedure will require a suitable volt-ampere tester (Fig. 3).



898A-8

Fig. 3 Volt Ampere Tester

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

(1) Check battery before performing this test. Battery must be fully charged.

(2) Connect a volt-ampere tester to the battery terminals. Refer to the operating instructions provided with the tester being used.

STARTING (Continued)

(3) To disable the ignition and fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for proper relay location.

(4) Verify that all lights and accessories are OFF, and the transmission shift selector is in the PARK and SET parking brake.

CAUTION: Do not overheat the starter motor or draw the battery voltage below 9.6 volts during cranking operations.

(5) Rotate and hold the ignition switch in the START position. Observe the volt-ampere tester (Fig. 3).

- If voltage reads above 9.6 volts, and amperage draw reads above 280 amps, check for engine seizing or faulty starter.
- If voltage reads 12.4 volts or greater and amperage reads 0 to 10 amps, check for corroded cables and/or bad connections.
- Voltage below 9.6 volts and amperage draw above 300 amps, the problem is the starter. Replace the starter refer to starter removal.

(6) After the starting system problems have been corrected, verify the battery state-of-charge and charge battery if necessary. Disconnect all testing equipment and connect ASD relay. Start the vehicle several times to assure the problem has been corrected.

SPECIFICATIONS

STARTER

MANUFACTURER	NIPPONDENSO
Engine Application	2.4L /3.3/3.8L
Power rating	1.2 Kw
Voltage	12 VOLTS

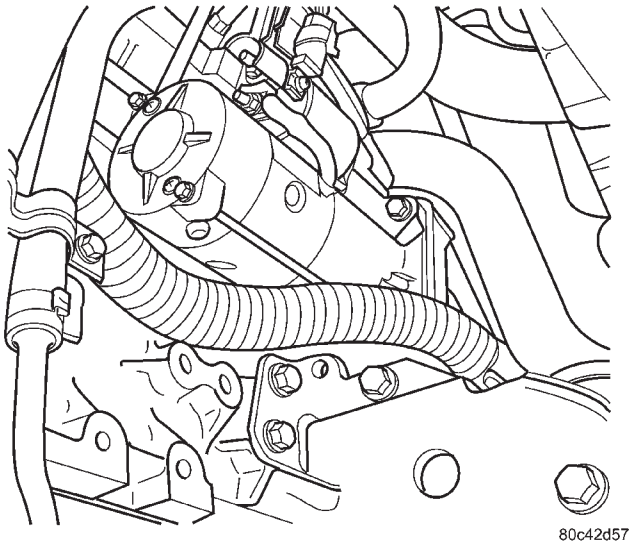

Fig. 14 STARTER LOCATION

STARTER MOTOR (Continued)

(5) Remove the starter mounting bolts (Fig. 15).

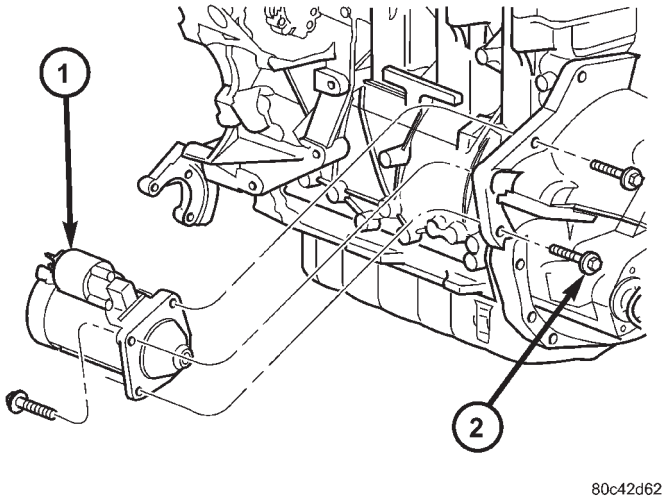

Fig. 15 STARTER MOUNTING BOLTS

1 - Starter
2 - Mounting Bolts

(6) Remove the starter.

INSTALLATION

INSTALLATION - 2.4L

(1) Place starter in position on vehicle.
(2) Install the lower bolts to hold starter to transaxle bellhousing.
(3) Install the upper bolt and ground wire (Fig. 6).
(4) Place solenoid and B+ wires in position on starter terminals (Fig. 5).
(5) Install nut to hold B+ wire to terminal.
(6) Connect solenoid wire connector onto terminal.
(7) Connect battery negative cable.
(8) Verify starter operation.

INSTALLATION - 3.3/3.8L

(1) Place starter spacer in position on transaxle bellhousing, flange toward flywheel.
(2) Place starter in position on bellhousing.
(3) Install bolts and ground wire (Fig. 6) to hold starter to transaxle bellhousing.
(4) Connect solenoid connector into starter.
(5) Install nut to hold B+ terminal to starter solenoid.
(6) Lower vehicle.
(7) Connect battery negative cable.
(8) Verify starter operation.

INSTALLATION - 3.5L

(1) Install starter.
(2) Install the middle (Fig. 12) and lower (Fig. 13) mounting bolts.

Turn front wheels to the left and use long extension to reach the upper mounting bolt (Fig. 11).

(3) Install the upper mounting bolt.
(4) Install the ground wires to the upper mounting bolt.
(5) Connect the solenoid connector (Fig. 10).
(6) Connect the battery positive cable at starter (Fig. 10).
(7) Lower vehicle.
(8) Connect the negative battery cable.

INSTALLATION - 2.5L

(1) Raise vehicle and support.
(2) Install the starter.
(3) Install the starter mounting bolts (Fig. 15).
(4) Install the electrical connectors to the starter (Fig. 14).
(5) Install the lower engine splash shield.
(6) Connect the negative battery cable.
(7) Lower vehicle.

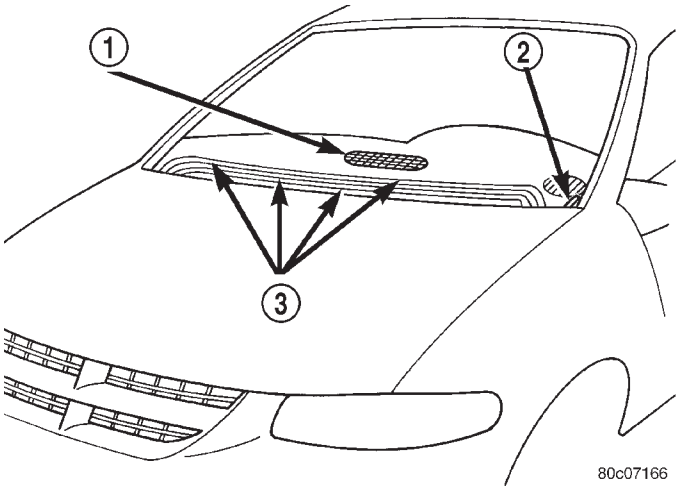

Fig. 2 (TYPICAL) Heated Windshield Wiper De-icer

1 - DEFROSTER OUTLET
2 - VIN #
3 - HEATED WINDSHIELD GRID

HEATED GLASS (Continued)

The electrically heated Rear Window Defogger (Fig. 1), Heated Power Side View Mirrors, and Heated Windshield Wiper De-icer (Fig. 2)is available on select models.

OPERATION

The Rear Window Defogger(Refer to 8 - ELECTRICAL/HEATED GLASS - DESCRIPTION) system consists of two vertical bus bars linked by a series of grid lines on the inside surface of the rear window. The electrical circuit consists of the rear defogger switch in the HVAC control assembly and a relay with timer switch to turn OFF the system after ten minutes. The main feed circuit is protected by fuse 13 (40 amp) in the Power Distribution Center (PDC) which is connected directly to the front control module (FCM) to form an integrated unit called an Integrated Power Module (IPM). The rear defogger switch and relay also activates the heated power side view mirrors. The rear defogger switch also activates the heated windshield wiper de-icer which is powered by the RUN/ACC relay in the IPM and feed thru fuse #11 (20 amp) in the PDC. The heated mirror circuit is protected by a non-servicable Positive Temperature Coefficient (PTC) located inside the PDC. The heated windshield wiper de-icer circuit is protected by fuse 11 (20 amp) in the PDC.

The Heated Windshield Wiper Deicer is also activated when the DEFROST mode is selected on the HVAC. In the DEFROST mode the rear defogger timout is bypassed, the heated windshield wiper de-icer will stay ON until the another mode is selected. For circuit information and component location refer to appropriate section for Wiring Diagrams.

CAUTION:
Since grid lines can be damaged or scraped off with sharp instruments, care should be taken in cleaning the glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

DEFOGGER RELAY

DESCRIPTION

There is no heated windshield wiper de-icer relay. The grid is powered directly from fuse #11 in the PDC and is controlled directly from the HVAC control assembly.

REAR WINDOW DEFOGGER GRID

STANDARD PROCEDURE - GRID LINE REPAIR REAR

For Grid repair procedure for the rear window defogger (Refer to 8 - ELECTRICAL/HEATED GLASS/WINDSHIELD GRID - STANDARD PROCEDURE).

REAR WINDOW DEFOGGER SWITCH

DESCRIPTION

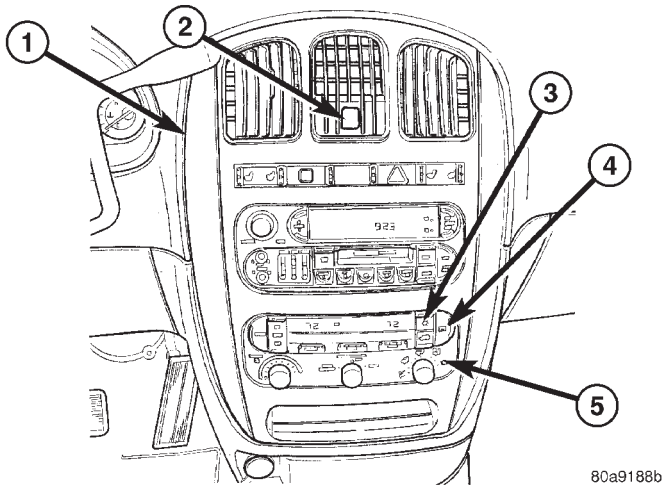

Fig. 3 HVAC CONTROL PANEL

1 - TRIM BEZEL
2 - ACT SENSOR
3 - A/C REQUEST SWITCH
4 - REAR WINDOW DEFOGGER/HEATED MIRRORS SWITCH COMBO
5 - FRONT WINDOW DEFROSTER MODE SELECTOR

The rear window defogger switch is integrated into the HVAC control panel assembly (Fig. 3)

OPERATION

A LED indicator will illuminate when the switch is activated. The switch energizes the HVAC control assembly when it requests the Front Control Module (FCM) to activate the rear window defogger relay. The relay controls the current to flow to the grids of the rear window defogger, heated power side view mirrors and the heated windshield wiper de-icer. The defogger relay will be on for approximately 10 minutes or until the control switch or ignition is turned off.

WINDSHIELD GRID

DIAGNOSIS AND TESTING - SYSTEM TEST

Electrically heated rear window defogger or the heated windshield wiper deicer operation can be checked on the vehicle in the following manner:

(1) Turn the ignition switch to the ON position.

(2) Using a ammeter on the battery, turn the rear defogger control switch to the ON position, a distinct increase in amperage draw should be noted.

(3) The rear window defogger or the heated windshield wiper deicer operation can be checked by feeling the glass. A distinct difference in temperature between the grid lines and adjacent clear glass can be detected in 3 to 4 minutes of operation.

(4) Using a DC voltmeter (Fig. 4) contact terminal B with the negative lead, and terminal A with the positive lead. The voltmeter should read 10-14 volts.

(5) Indicator light illumination means that there is power available at the switch only and does not necessarily verify system operation.

(6) If turning the defogger switch ON, no distinct current draw on the ammeter the problem should be isolated in the following manner:

- Confirm that ignition switch is ON.
- Ensure that the heated rear window or the heated windshield wiper deicer feed pigtail is connected to the wiring harness and that the ground pigtail is in fact grounded.
- Ensure that the proper fuse in the PDC is OK.

(7) When the above steps have been completed and the system is still inoperative it may be necessary to connect a DRBIII scan tool and refer to the Diagnostic Service Manual, you may also check for the following being defective:

- HVAC control assembly
- Rear window defogger relay in the PDC portion of the IPM.
- Rear window defogger relay control circuity in the FCM portion of the IPM.
- Check for loose connector or a wire pushed out of connector.
- Rear window or the windshield grid lines (all grid lines would have to be broken, or one of the feed pigtails not connected to the bus bar, for no ammeter deflection).

(8) If turning the switch ON produces severe voltmeter deflection, the circuit should be closely checked for a shorting condition.

(9) If the system operation has been verified but indicator LED does not light, replace the HVAC control assembly.

(10) For detailed wiring information, refer to the appropriate section for Wiring Diagrams.

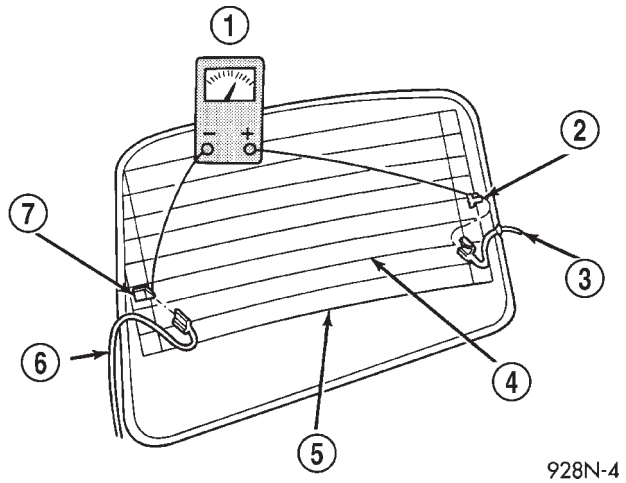

Fig. 4 Grid Line Test

STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR

WARNING:
REPAIR KIT MAY CAUSE SKIN OR EYE IRRITATION. CONTAINS EPOXY RESIN AND AMINE TYPE HARDENER, HARMFUL IF SWALLOWED. AVOID CONTACT WITH SKIN AND EYES. FOR SKIN, WASH AFFECTED AREAS WITH SOAP AND WATER. DO NOT TAKE INTERNALLY. IF TAKEN INTERNALLY, INDUCE VOMITING; CALL A PHYSICIAN IMMEDIATELY. IF IN CONTACT WITH EYES, FLUSH WITH PLENTY OF WATER. USE WITH ADEQUATE VENTILATION. DO NOT USE NEAR FIRE OR FLAME. CONTENTS CONTAINS 3% FLAMMABLE SOLVENTS. KEEP OUT OF REACH OF CHILDREN.

The repair for the front windshield or the rear window grids are the same.

The repair of grid lines and replacement of the terminal is possible using the Mopar® Repair Package or equivalent.

(1) Clean area surrounding grid line or terminal by gently rubbing area with steel wool.

(2) Wipe area with clean cloth soaked in alcohol or similar solvent. It is necessary that all contaminants be removed from repair area.

(3) Remove package separator clamp and mix plastic conductive epoxy thoroughly.

WINDSHIELD GRID (Continued)

(4) For grid line, mark off area to be repaired with masking tape (Fig. 5).

(5) Apply conductive epoxy through slit in masking tape. Overlap both ends of the break.

(6) For a terminal replacement, apply a thin layer of epoxy to area where terminal was fastened.

(7) Apply a thin layer of epoxy on terminal and place terminal on desired location. To prevent terminal from falling off use a wooden wedge to secure it.

(8) Carefully remove masking tape from grid line.

CAUTION:
Do not allow the laminated windshield glass surface to exceed 82° C (180° F) or the glass may fracture. The rear window glass surface should not exceed 204° C (400° F).

(9) Allow epoxy to cure 24 hours at room temperature.

(10) After epoxy is properly cured remove wedge from terminal and check the operation of the rear window defogger.

DESCRIPTION 6

HEATED MIRRORS

DESCRIPTION

Heated mirrors are available on models with Power Mirrors and Rear Window Defogger only.

OPERATION

The heated mirror is controlled by the rear window defogger switch. The heated mirror is ON when the rear window defogger is ON (Fig. 1).

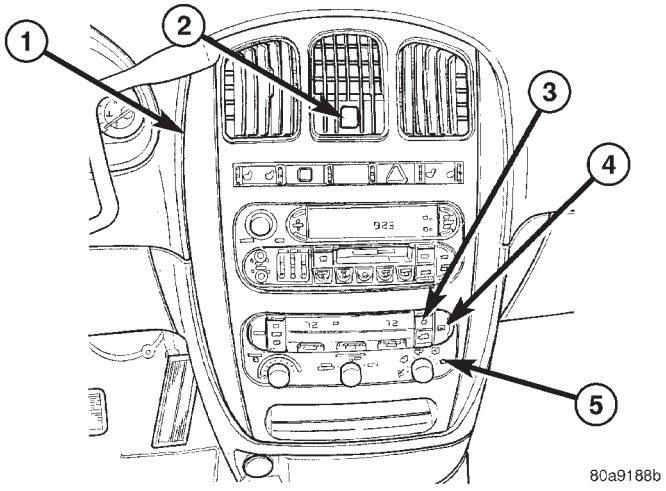

Fig. 1 HVAC CONTROL PANEL

1 - TRIM BEZEL
2 - ACT SENSOR
3 - A/C REQUEST SWITCH
4 - REAR WINDOW DEFOGGER/HEATED MIRRORS SWITCH COMBO
5 - FRONT WINDOW DEFROSTER MODE SELECTOR

DIAGNOSIS AND TESTING - HEATED MIRROR TEST

Heated mirrors are available on models with Power Mirrors and Rear Window Defogger only. The heated mirror is controlled by the rear window defogger switch. The heated mirror is ON when the rear window defogger is ON.

(1) The mirror glass should be warm to the touch.

(2) If not, check the 20 amp fuse (11) in the Power Distribution Center (PDC) part of the Integrated Power Module (IPM) in the engine compartment.

(3) Test voltage at rear window defogger switch.

- If no voltage repair wire.
- Remove mirror glass and test the wires for continuity. If no continuity repair wires.
- If wires are OK, replace mirror glass.
- To test defogger switch refer to the appropriate section in Electrical.

MIRROR SWITCH

DESCRIPTION

The heated mirror switch is integrated into the rear window defogger switch located in the HVAC control panel (Fig. 1).

MIRROR SWITCH (Continued)

OPERATION

A LED indicator will illuminate when the switch is activated. The switch energizes the HVAC control assembly when it requests the Front Control Module (FCM) to activate the rear window defogger relay. The relay controls the current to flow to the grids of the rear window defogger and the heated power side view mirrors. The defogger relay will be on for approximately 10 minutes or until the control switch or ignition is turned off.

HEATED MIRROR GRID

STANDARD PROCEDURE - HEATED MIRROR

Replacement of the mirror is necessary if the grid is damaged and diagnostics have been performed (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - REMOVAL).

RELAY

DESCRIPTION

There is no heated mirror relay it is integrated into the (E.B.L) relay that is located in the IPM in the engine compartment.

HEATED SEAT SYSTEM

DESCRIPTION

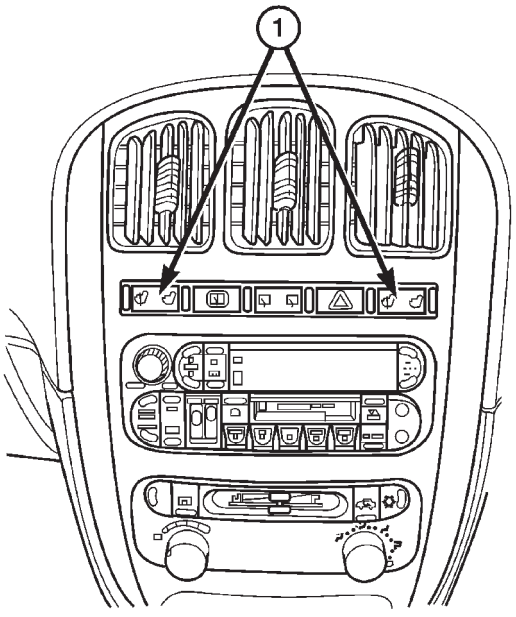

Fig. 1 HEATED SEAT SWITCH LOCATIONS

1 - HEATED SEAT SWITCHES

Vehicles with the heated seat option can be visually identified by the two separate heated seat switches located in the instrument panel center stack, just above the radio (Fig. 1). The heated seat system allows the front seat driver and passenger to select from two different levels of supplemental electrical seat heating (HI/LO), or no seat heating to suit their individual comfort requirements. The heated seat system for this vehicle includes the following major components, which are described in further detail later in this section:

- **Heated Seat Elements** - Four heated seat elements are used per vehicle, two for each front seat. One heated seat element is integral to each front seat trim cover, one in the seat back and one in the seat bottom (cushion). Service replacement heating elements are available, refer to heated seat elements later in this section for additional information.
- **Heated Seat Modules** - Two heated seat modules are used per vehicle. One module is mounted to each of the seat cushion pans, located under the forward edge of each front seat. Refer to heated seat module in the electronic control modules section of the service manual for additional information.
- **Heated Seat Sensors** - Two heated seat sensors are used per vehicle, one for each front seat. The heated seat sensors are integral to each of the heated seat bottoms (cushions).

HEATED SEAT SYSTEM (Continued)

• **Heated Seat Switch** - Two heated seat switches are used per vehicle, one for the driver and one for the passenger side front seats. The switches are mounted to in the instrument panel center stack. Refer to the description of the heated seat switch later in this section for additional information.

Hard wired circuitry connects the heated seat system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the heated seat system components through the use of a combination of soldered splices and splice block connectors. Refer to Wiring for complete system wiring schematics. The wiring information also includes the proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

The heated seat system components operate on battery current received through a fuse in the Integrated Power Module (IPM) on a fused ignition switch output (run-acc) circuit so that the system will only operate when the ignition switch is in the On or Accessory positions. The heated seat system will be turned Off automatically whenever the ignition switch is turned to any position except On or Accessory. Also, the heated seat system will not operate when the surface temperature of the seat cushion cover at either heated seat sensor is above the designed temperature set points of the system. The heated seat system has a self-diagnostic capability. When certain failures are detected within the heated seat system, the system will provide a visual indication of the failure by flashing the Light Emitting Diode (LED) indicator lamps located in the heated seat switches. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the heated seat system.

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

Refer to**Wiring Diagrams** for complete wiring schematics. The wiring information also includes the proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

HEATED SEAT SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
NO HEATED SEAT SWITCH ILLUMINATION WITH IGNITION ON (SYSTEM ON)	1. Faulty fuse	1. Check heated seat fuse in Integrated Power Module. Replace fuse, repair short if required.
	2. Faulty components	2. Refer to individual Heated Seat System components for the proper diagnosis and testing procedures.
	3. Ground faulty	3. Check for ground at heated seat switch and module. Repair, if required.
	4. Wiring faulty	4. Check fused ignition switch output (run-acc) circuits at switch and module. Repair, if required.

DRIVER HEATED SEAT SWITCH

DESCRIPTION

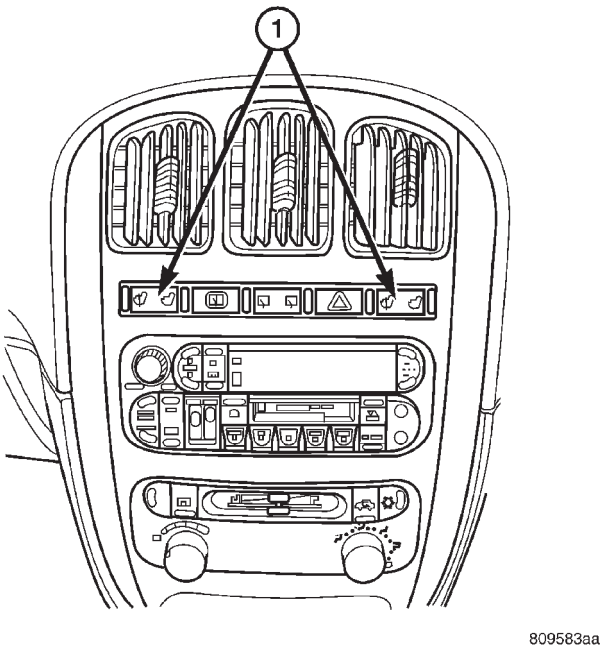

Fig. 2 HEATED SEAT SWITCH LOCATION

1 - HEATED SEAT SWITCHES

The heated seat switches are mounted in the instrument panel center bezel (Fig. 2). The two three-position rocker-type switches, one switch for each front seat, are incorporated into one large switch assembly that also includes the hazard, rear window wiper and washer switches. The heated seat switches provide a resistor multiplexed signal to the Heated Seat Module (HSM) through separate hard wired circuits. Each switch has an Off, Low, and High position so that both the driver and the front seat passenger can select a preferred seat heating mode. Each switch has two Light-Emitting Diodes (LED) which light to indicate that the heater for the seat is turned on.

The heated seat switches and their LEDs cannot be repaired. If either switch or LED is faulty or damaged, the entire switch assembly must be replaced.

OPERATION

There are three positions that can be selected with each of the heated seat switches: Off, Low, or High. When the left side of the switch rocker is fully depressed, the Low position is selected and the low position LED indicator illuminates. When the right side of the switch rocker is fully depressed, the High position is selected and the high position LED indicator illuminates. When the switch rocker is moved to its neutral position (middle), Off is selected and both LED indicators are extinguished.

Both switches provide separate resistor multiplexed hard wire inputs to the Heated Seat Module (HSM) to indicate the selected switch position. The heated seat module responds to the heated seat switch status messages by controlling the output to the seat heater elements of the selected seat. The Low heat position set point is about 36° C (97° F), and the High heat position set point is about 41° C (105° F).

DIAGNOSIS AND TESTING - DRIVER HEATED SEAT SWITCH

For complete circuit diagrams, refer to **Wiring Diagrams**.

WARNING: REFER TO THE RESTRAINTS SECTION OF THIS MANUAL BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CHECKING SWITCH SIGNAL AND WIRING AT THE MODULE

(1) Disconnect and isolate the battery negative cable.

(2) Access and disconnect the gray 4-way connector from the heated seat module. Visually inspect wiring terminals for damage that would prevent positive connection. If not OK, repair or replace the necessary components.

(3) Reconnect the negative battery cable and Turn heated seat ON in the LO position. Using an Ohmmeter, check the resistance between cavities 2 and 3 of the gray connector noted above. Resistance should be about 3.5 kiloohms (3500 ohms). If not OK, check resistance directly at switch, as noted below. If OK, proceed. If NOT OK replace the switch or faulty wiring.

(4) Turn heated seat ON in the HI position. Using an Ohmmeter, check the resistance between cavities 2 and 3 of the gray connector noted above. Resistance should be about 1.4 kiloohms (1400 ohms). If not OK, check resistance directly at switch, as noted below. If OK, proceed. If NOT OK replace the switch or faulty wiring.

(5) With the system ON in the HI position, Check for battery voltage and ground at cavities 4 and 1. If OK, proceed with testing remaining components. If NOT OK, repair open or wiring short.

DRIVER HEATED SEAT SWITCH (Continued)

CHECKING SWITCH ONLY

(1) Disconnect and isolate the battery negative cable. Remove the center bezel from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ INSTRUMENT PANEL CENTER BEZEL - REMOVAL). Check for continuity between the ground circuit cavity (#10) of the instrument panel switch bank electrical connector and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground as required.

(2) Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the instrument panel switch bank connector (#4). If OK, turn the ignition switch to the Off position, and go to Step 3. If not OK, repair the open fused ignition switch output (run) circuit as required.

(3) Test the heated seat switch as shown in the Heated Seat Switch Test chart and the connector pinout below (Fig. 3). If OK, go to Step 4. If not OK, replace the faulty switch bank assembly.

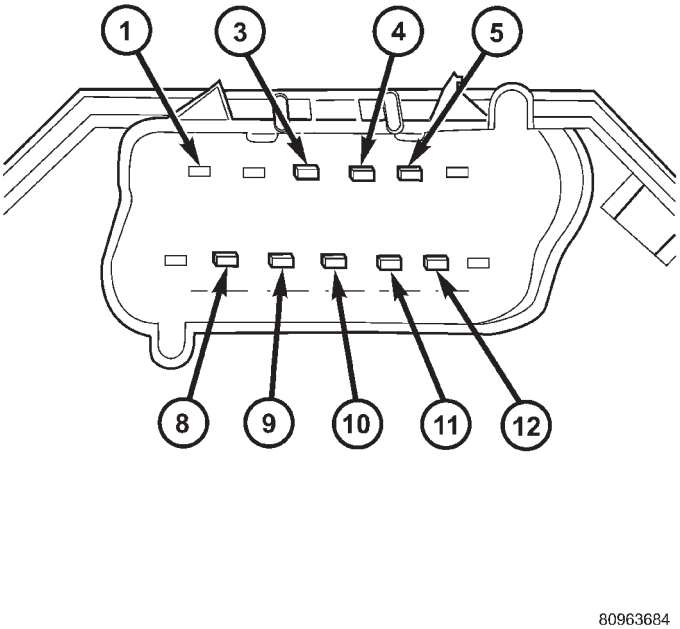

Fig. 3 Instrument Panel Switch Bank Connector

DRIVER HEATED SEAT SWITCH TEST		
SWITCH POSITION	RESISTANCE BETWEEN	RESISTANCE (OHMS)
Off	Pin 4 & 5	OPEN
Low	Pin 4 & 5	3570
High	Pin 4 & 5	1430
All resistance values are ±1%.		

(4) Reconnect the instrument panel switch bank and test the heated seat system for proper operation. If the system is still inoperative proceed with checking remaining components.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO THE RESTRAINTS SECTION OF THIS MANUAL BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel center bezel. Refer to **Instrument Panel Center Bezel** in the Body section for the procedure.

(3) Remove the three screws (Fig. 4) that secure the heated seat switch to the back of the instrument panel center bezel.

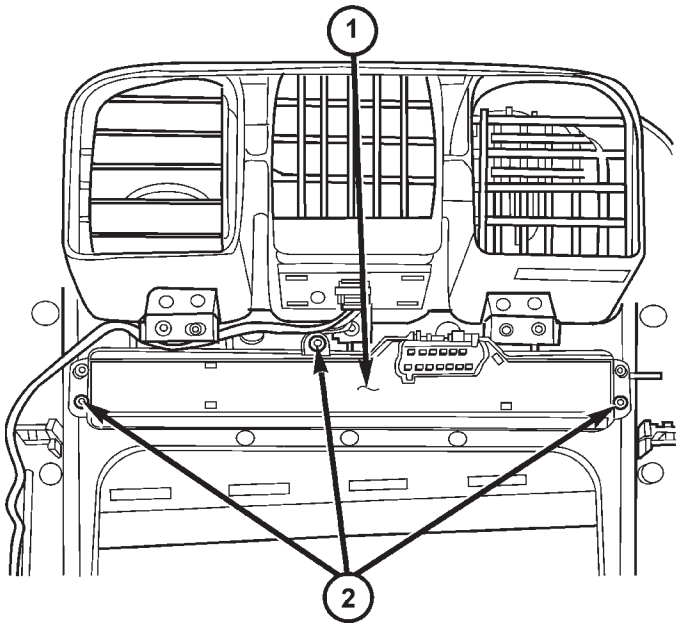

Fig. 4 SWITCH RETAINING SCREWS

1 - HEATED SEAT SWITCH ASSEMBLY
2 - RETAINING SCREWS

(4) Remove the heated seat switch from the back of the instrument panel center bezel.

INSTALLATION

(1) Position the heated seat switch onto the back of the instrument panel center bezel.

DRIVER HEATED SEAT SWITCH (Continued)

(2) Install and tighten the three screws that secure the heated seat switch to the back of the instrument panel center bezel. Tighten the screws to 1.5 N·m (13 in. lbs.) (Fig. 4).

(3) Install the center bezel onto the instrument panel. Refer to **Instrument Panel Center Bezel** in the Body section for the procedure.

(4) Reconnect the battery negative cable.

HEATED SEAT ELEMENT

DESCRIPTION

The heated seat system includes two seat heating elements in each front seat, one for the seat cushion and the other for the seat back. The two elements for each seat that are connected in series with the Heated Seat Module (HSM). The temperature sensor is a Negative Temperature Coefficient (NTC) thermistor. One temperature sensor is used for each seat, and it is located on the seat cushion heating element for all models.

The seat heating elements are sewn into the seat cushion cover trim and seat back cover trim units. The heated seat elements and the temperature sensor cannot be adjusted or repaired and, if faulty or damaged, the seat element assembly must be replaced. Refer to the procedure in this section.

OPERATION

The heated seat elements resist the flow of electrical current. When battery current is passed through the elements, the energy lost by the resistance of the elements to the current flow is released in the form of heat. The temperature sensor is a NTC thermistor. When the temperature of the seat cushion cover rises, the resistance of the sensor decreases. The heated seat module supplies a five-volt current to one side of each sensor, and monitors the voltage drop through the sensor on a return circuit. The heated seat module uses this temperature sensor input to monitor the temperature of the seat, and regulates the current flow to the seat heating elements accordingly.

DIAGNOSIS AND TESTING - HEATED SEAT ELEMENTS

The wire harness connectors for the seat cushion and seat back heating elements are located under the seat, at the heated seat module. For circuit descriptions and diagrams, refer to section 8W, Wiring Diagrams.

In order to access and test the heated seat elements it will be necessary to remove the appropriate front seat retaining bolts and lay the seat rearward, up against one of the rear seats. It is not necessary to disconnect the seat electrical connectors, just use care not to damage the attached wire harnesses while testing.

NOTE: WHEN CHECKING HEATED SEAT ELEMENTS FOR CONTINUITY, BE CERTAIN TO MOVE THE HEATING ELEMENT BEING CHECKED. MOVING THE ELEMENT, SUCH AS SITTING IN THE SEAT WILL ELIMINATE THE POSSIBILITY OF AN INTERMITTENT OPEN IN THE ELEMENT WHICH WOULD ONLY BE EVIDENT IF THE ELEMENT WAS MOVED IN A CERTAIN DIRECTION. FAILURE TO CHECK THE ELEMENT IN VARIOUS POSITIONS COULD RESULT IN AN INCOMPLETE TEST.

SEAT CUSHION ELEMENT

(1) From under the vehicle, remove the appropriate seats four retaining nuts.

(2) From inside the vehicle, pull the seat up, off the mounting studs and lay it back, up against one of the rear seats.

(3) Locate the heated seat module, attached to the bottom of the seat cushion pan. Remove the heated seat module from the seat cushion pan. Do not disconnect the electrical connectors at this time.

(4) Locate the green 4-way electrical connector, connected to the heated seat module. Disconnect the green 4-way connector from the heated seat module.

(5) Check for continuity between the two outboard circuit cavities of the wire harness connector (Pins 1&4). There should be continuity. If OK, refer to Heated Seat Module Diagnosis and Testing in the Electronic Control Modules section of the service manual for complete system testing procedures. If not OK, install a replacement heated seat cushion element. Refer to the procedure in this section.

SEAT BACK ELEMENT

(1) From under the vehicle, remove the appropriate seats four retaining nuts.

(2) From inside the vehicle, pull the seat up and off the mounting studs and lay it back, up against one of the rear seats.

(3) Locate the heated seat module, attached to the bottom of the seat cushion pan. Remove the heated seat module from the seat cushion pan. Do not disconnect the electrical connectors at this time.

(4) Locate the gray 2-way electrical connector, connected to the heated seat module. Disconnect the 2-way connector from the heated seat module.

(5) Check for continuity between the two circuit cavities of the 2-way wire harness connector. There should be continuity. If OK, refer to Heated Seat Module Diagnosis and Testing in the Electronic Control Modules section of the service manual for complete system testing procedures. If not OK, install a replacement heated seat back element. Refer to the procedure in this section.

HEATED SEAT ELEMENT (Continued)

REMOVAL

Do not remove the OEM heating element from the seat or seat back cushion/trim covers. The original element is permanently attached and cannot be removed without permanent damage. The service replacement heating element is designed to be applied directly on the seat cushion.

(1) Disconnect and isolate the negative battery cable.

(2) Remove the appropriate seat cushion or seat back trim cover. Refer to the Body section of the service manual for the procedures.

(3) Disconnect the inoperative heated seat cushion or seat back element electrical connectors.

(4) Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.

INSTALLATION

(1) Peel off the adhesive backing on the back of the replacement heating element and stick directly on the foam cushion.

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

(2) Connect the new heating element electrical connectors (Fig. 5).

(3) Connect the negative battery cable.

(4) Verify heated seat system operation.

(5) Install the appropriate seat cushion or seat back trim cover. Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover.

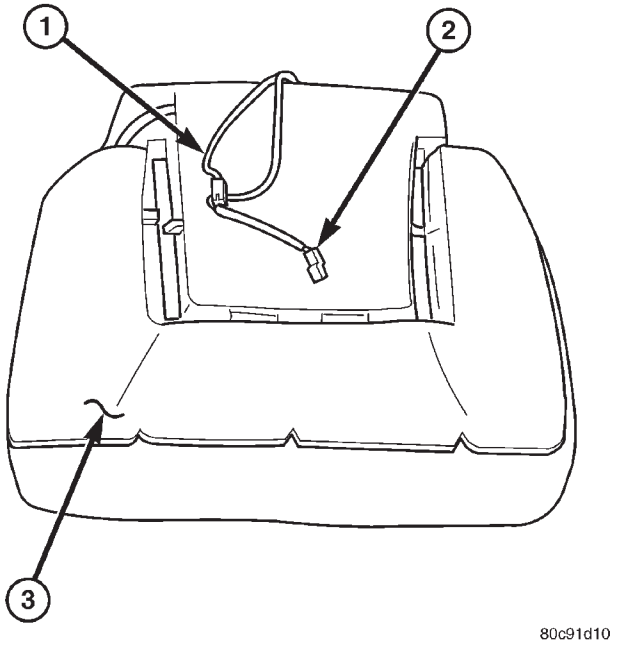

Fig. 5 HEATING ELEMENT INSTALLED - TYPICAL

1 - SEAT BACK WIRE HARNESS
2 - HEATED SEAT WIRE HARNESS CONNECTOR
3 - HEATED SEAT CUSHION ELEMENT

HEATED SEAT SENSOR

DESCRIPTION

Two heated seat sensors are used per vehicle, one in each front seat cushion heating element. The heated seat temperature sensor is a Negative Temperature Coefficient (NTC) thermistor.

The heated seat sensors cannot be repaired or adjusted and if found to be faulty, the complete heated seat cushion element must be replaced.

OPERATION

The temperature sensor is a NTC thermistor. When the temperature of the seat cushion cover rises, the resistance of the sensor decreases. The heated seat module supplies a five-volt current to one side of each sensor, and monitors the voltage drop through the sensor on a return circuit. The heated seat module uses this temperature sensor input to monitor the temperature of the seat, and regulates the current flow to the seat heating elements accordingly.

DIAGNOSIS AND TESTING - HEATED SEAT SENSOR

For complete circuit diagrams, refer to **Wiring Diagrams**.

(1) Disconnect and isolate the battery negative cable. Disconnect the green 4-way heated seat module wire harness connector.

(2) Using an ohmmeter, check the resistance between cavities 2 and 3. The sensor resistance should be between 2 kilohms at 15° C (60° F) and 50 kilohms at 30° C (85° F). If not OK, replace the faulty seat element and sensor assembly.

PASSENGER HEATED SEAT SWITCH

DESCRIPTION

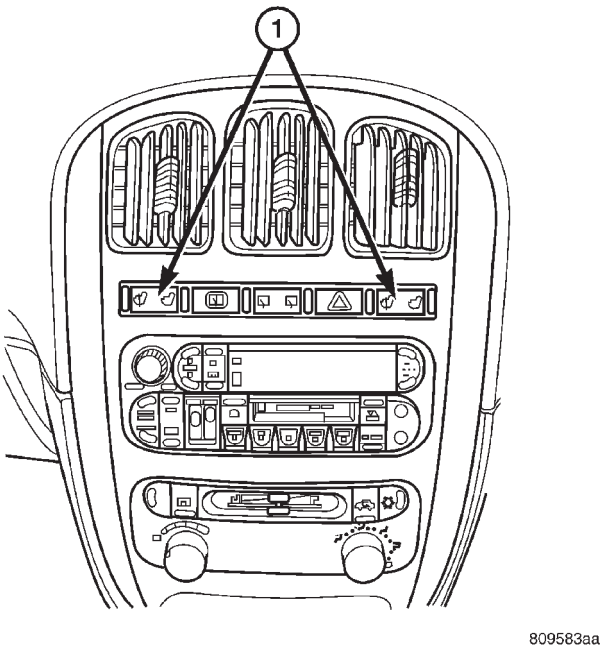

Fig. 6 HEATED SEAT SWITCH LOCATION

1 - HEATED SEAT SWITCHES

The heated seat switches are mounted in the instrument panel center bezel (Fig. 6). The two three-position rocker-type switches, one switch for each front seat, are incorporated into one large switch assembly that also includes the hazard, rear window wiper and washer switches. The heated seat switches provide a resistor multiplexed signal to the Heated Seat Module (HSM) through separate hard wired circuits. Each switch has an Off, Low, and High position so that both the driver and the front seat passenger can select a preferred seat heating mode. Each switch has two Light-Emitting Diodes (LED) which light to indicate that the heater for the seat is turned on.

The heated seat switches and their LEDs cannot be repaired. If either switch or LED is faulty or damaged, the entire switch assembly must be replaced.

OPERATION

There are three positions that can be selected with each of the heated seat switches: Off, Low, or High. When the left side of the switch rocker is fully depressed, the Low position is selected and the low position LED indicator illuminates. When the right side of the switch rocker is fully depressed, the High position is selected and the high position LED indicator illuminates. When the switch rocker is moved to its neutral position (middle), Off is selected and both LED indicators are extinguished.

Both switches provide separate resistor multiplexed hard wire inputs to the Heated Seat Module (HSM) to indicate the selected switch position. The heated seat module responds to the heated seat switch status messages by controlling the output to the seat heater elements of the selected seat. The Low heat position set point is about 36° C (97° F), and the High heat position set point is about 41° C (105° F).

DIAGNOSIS AND TESTING - PASSENGER HEATED SEAT SWITCH

For complete circuit diagrams, refer to **Wiring Diagrams**.

WARNING: REFER TO THE RESTRAINTS SECTION OF THIS MANUAL BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CHECKING SWITCH SIGNAL AND WIRING AT THE MODULE

(1) Disconnect and isolate the battery negative cable.

(2) Access and disconnect the gray 4-way connector from the heated seat module. Visually inspect wiring terminals for damage that would prevent positive connection. If not OK, repair or replace the necessary components.

(3) Reconnect the negative battery cable and Turn heated seat ON in the LO position. Using an Ohmmeter, check the resistance between cavities 2 and 3 of the gray connector noted above. Resistance should be about 3.5 kiloohms (3500 ohms). If not OK, check resistance directly at switch, as noted below. If OK, proceed. If NOT OK replace the switch or faulty wiring.

(4) Turn heated seat ON in the HI position. Using an Ohmmeter, check the resistance between cavities 2 and 3 of the gray connector noted above. Resistance should be about 1.4 kiloohms (1400 ohms). If not OK, check resistance directly at switch, as noted below. If OK, proceed. If NOT OK replace the switch or faulty wiring.

(5) With the system ON in the HI position, Check for battery voltage and ground at cavities 4 and 1. If OK, proceed with testing remaining components. If NOT OK, repair open or wiring short.

PASSENGER HEATED SEAT SWITCH (Continued)

CHECKING SWITCH ONLY

(1) Disconnect and isolate the battery negative cable. Remove the center bezel from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ INSTRUMENT PANEL CENTER BEZEL - REMOVAL). Check for continuity between the ground circuit cavity (#10) of the instrument panel switch bank electrical connector and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground as required.

(2) Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the instrument panel switch bank connector (#4). If OK, turn the ignition switch to the Off position, and go to Step 3. If not OK, repair the open fused ignition switch output (run) circuit as required.

(3) Test the heated seat switch as shown in the Heated Seat Switch Test chart and the connector pinout below (Fig. 7). If OK, go to Step 4. If not OK, replace the faulty switch bank assembly.

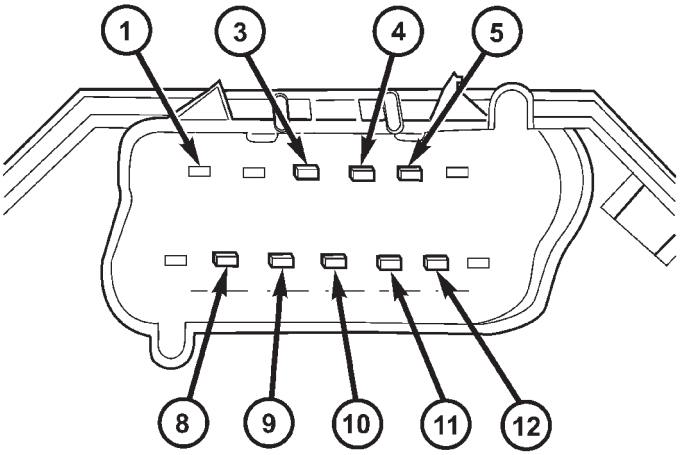

Fig. 7 Instrument Panel Switch Bank Connector

PASSENGER HEATED SEAT SWITCH TEST		
SWITCH POSITION	RESISTANCE BETWEEN	RESISTANCE (OHMS)
Off	Pin 3 & 4	OPEN
Low	Pin 3 & 4	3570
High	Pin 3 & 4	1430
All resistance values are ±1%.		

(4) Reconnect the instrument panel switch bank and test the heated seat system for proper operation. If the system is still inoperative proceed with checking remaining components.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO THE RESTRAINTS SECTION OF THIS MANUAL BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel center bezel. Refer to **Instrument Panel Center Bezel** in the Body section for the procedure.

(3) Remove the three screws (Fig. 8) that secure the heated seat switch to the back of the instrument panel center bezel.

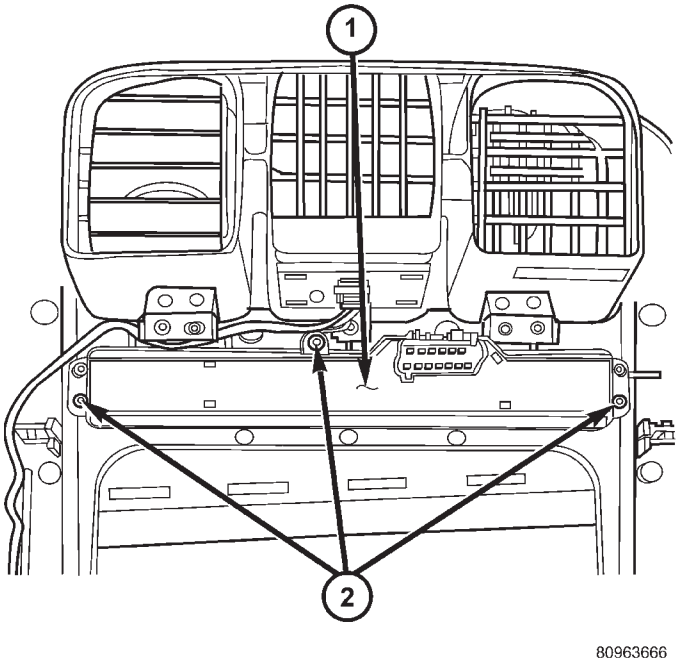

Fig. 8 SWITCH RETAINING SCREWS

1 - HEATED SEAT SWITCH ASSEMBLY
2 - RETAINING SCREWS

(4) Remove the heated seat switch from the back of the instrument panel center bezel.

PASSENGER HEATED SEAT SWITCH (Continued)

INSTALLATION

(1) Position the heated seat switch onto the back of the instrument panel center bezel.

(2) Install and tighten the three screws that secure the heated seat switch to the back of the instrument panel center bezel. Tighten the screws to 1.5 N·m (13 in. lbs.) (Fig. 8).

(3) Install the center bezel onto the instrument panel. Refer to **Instrument Panel Center Bezel** in the Body section for the procedure.

(4) Reconnect the battery negative cable.

HORN SYSTEM

DESCRIPTION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAG, REFER TO ELECTRICAL, RESTRAINTS FOR SAFETY PRECAUTIONS. DISCONNECT THE NEGATIVE CABLE FROM THE BATTERY BEFORE SERVICING COMPONENTS INVOLVING THE AIRBAG SYSTEM. ACCIDENTAL DEPLOYMENT OF AIRBAG AND PERSONAL INJURY CAN RESULT.

The horn circuit consists of a horn switch, clockspring, horn relay, horns and Integrated Power Module (IPM). The horn switch is a membrane switch located in the airbag trim cover. The horns are located forward of the left front wheel behind the bumper fascia.

OPERATION

The horn relay plugs into the Integrated Power Module (IPM) which is located in the engine compartment. For circuit information and component locations, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The horns will not function if the switch is “CLOSED” for more than 30 seconds. Once the switch is “OPEN”, a 20–30 second delay will occur before the horns are functional again.

DIAGNOSIS AND TESTING - HORN SYSTEM

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

Refer to Horn System Test below. If the horn does not sound, check horn fuse located in the Integrated Power Module (IPM). If the fuse is blown, replace with the correct fuse. If the horns fail to sound and the new fuse blows when depressing the horn switch, a short circuit in the horn or the horn wiring between the fuse terminal and the horn is responsible, or a defective horn switch allowed the horn to burn out is responsible.

If the fuse is OK, test horn relay (Refer to 8 - ELECTRICAL/HORN/HORN RELAY - DIAGNOSIS AND TESTING).

If the relay is OK, test horn. Refer to Horn System Test.

CAUTION: Continuous sounding of horn may cause horn failure.

Should the horn sound continuously:

- Unplug the horn relay from IPM.
- Refer to (Refer to 8 - ELECTRICAL/HORN/HORN RELAY - DIAGNOSIS AND TESTING).

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

HORN SYSTEM (Continued)

HORN SYSTEM TEST

CONDITION	POSSIBLE CAUSE	CORRECTION
HORN SOUNDS CONTINUOUSLY. NOTE: IMMEDIATELY UNPLUG HORN RELAY IN THE IPM.	(1) FAULTY HORN RELAY.	(1) REFER TO HORN RELAY TEST.
	(2) HORN CONTROL CIRCUIT TO RELAY SHORTED TO GROUND.	(2) CHECK TERMINAL 85 IN IPM FOR CONTINUITY TO GROUND. IF CONTINUITY TO GROUND INDICATES: (A) STEERING WHEEL HORN SWITCH/LEAD SHORTED TO GROUND. (B) WIRING HARNESS SHORTED TO GROUND. FIND THE SHORT AND REPAIR AS NECESSARY.
	(3) PINCHED HORN SWITCH WIRE UNDER DRIVER AIRBAG MODULE.	(3) REPLACE DRIVER AIRBAG MODULE TRIM COVER.
	(4) FAULTY HORN SWITCH.	(4) REPLACE DRIVER AIRBAG MODULE TRIM COVER.
	(5) FAULTY CLOCKSPRING.	(5) REPLACE CLOCKSPRING.
	(6) FAULTY FRONT CONTROL MODULE.	(6) REFER TO ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE.
HORN SOUND INTERMITTENTLY AS THE STEERING WHEEL IS TURNED.	(1) HORN RELAY CONTROL CIRCUIT X3 IS SHORTED TO GROUND INSIDE STEERING COLUMN OR WHEEL.	(1) REMOVE DRIVER AIRBAG MODULE AND/OR WHEEL. CHECK FOR RUBBING OR LOOSE WIRE/CONNECTOR, REPAIR AS NECESSARY.
	(2) PINCHED HORN SWITCH WIRE UNDER DRIVER AIRBAG MODULE.	(2) REPLACE DRIVER AIRBAG MODULE TRIM COVER.
	(3) FAULTY HORN SWITCH.	(3) REPLACE DRIVER AIRBAG MODULE TRIM COVER.
	(4) FAULTY CLOCKSPRING.	(4) REPLACE CLOCKSPRING.
HORN DOES NOT SOUND	(1) CHECK FUSE 8 IN INTELLIGENT POWER MODULE.	(1) REPLACE FUSE IF BLOWN REPAIR AS NECESSARY.
	(2) NO VOLTAGE AT HORN RELAY TERMINALS 30 & 86, AND FUSE IS OK.	(2) NO VOLTAGE, REPAIR THE CIRCUIT AS NECESSARY.
	(3) OPEN CIRCUIT FROM TERMINAL 85 OF THE HORN RELAY TO HORN SWITCH, X3 CIRCUIT.	(3) REPAIR CIRCUIT AS NECESSARY.
	(4) FAULTY OR DAMAGED HORN.	(4) VOLTAGE AT HORN WHEN HORN SWITCH IS PRESSED, REPLACE HORN.

HORN SYSTEM (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
	(5) FAULTY HORN SWITCH.	(5) REPLACE DRIVER AIRBAG MODULE TRIM COVER.
	(6) FAULTY CLOCKSPRING.	(6) REPLACE CLOCKSPRING.
	(7) FAULTY FRONT CONTROL MODULE.	(7) REFER TO ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE.
FUSE BLOWS WHEN HORN SOUNDS	(1) SHORT CIRCUIT IN HORN OR HORN WIRING.	(1) REMOVE HORN RELAY, CHECK FOR SHORTED HORN OR HORN WIRING. DISCONNECT HORN WIRE HARNESS TO ISOLATE SHORT AND REPAIR AS NECESSARY.
	(2) FAULTY CLOCKSPRING.	(2) REPLACE CLOCKSPRING.
FUSE BLOWS WITHOUT BLOWING HORN	(1) SHORT CIRCUIT.	(1) REMOVE RELAY, INSTALL NEW FUSE, IF FUSE DOES NOT BLOW REPLACE HORN RELAY. IF FUSE BLOWS WITH RELAY REMOVED, CHECK FOR SHORT TO GROUND WITH OHMMETER ON CIRCUIT BETWEEN TERMINALS 30 & 86 AND THE FUSE TERMINAL. REPAIR AS NECESSARY.
	(2) FAULTY CLOCKSPRING.	(2) REPLACE CLOCKSPRING.

HORN

DIAGNOSIS AND TESTING - HORN

HORN

(1) Disconnect wire connector at horn.

(2) Using a voltmeter, connect one lead to ground terminal and the other lead to the positive wire terminal (Fig. 1).

(3) Depress the horn switch, battery voltage should be present.

(4) If no voltage, refer to **HORNS WILL NOT SOUND**. If voltage is OK, go to step Step 5.

(5) Using ohmmeter, test ground wire for continuity to ground.

(6) If no ground repair as necessary.

(7) If wires test OK and horn does not sound, replace horn.

HORNS SOUND CONTINUOUSLY

CAUTION: Continuous sounding of horns may cause relay to fail.

The horn switch (membrane) sometimes can be the cause without the switch being depressed.

(1) Remove the horn relay from the intelligent power module.

(2) Using a continuity tester, test continuity from the X3 cavity of the horn relay to ground. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(a) If continuity is detected, proceed to step Step 3.

(b) If NO continuity, replace the horn relay.

(3) Remove the airbag trim cover from the steering wheel and disengage horn connector.

(4) Install horn relay into Integrated Power Module (IPM).

(a) If horn does not sound, replace airbag trim cover.

(b) If horn sounds, repair grounded X3 circuit from IPM to clockspring in the steering column.

HORNS WILL NOT SOUND

Check horn fuse # 8 in the IPM. If fuse is blown, check for a shorted switch in the airbag module. and refer to FUSE BLOWN section. If fuse is OK, refer to FUSE OK section.

HORN (Continued)

FUSE BLOWN

(1) Verify condition of battery terminals and voltage, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING). If battery connections and battery charge is OK proceed to Step 2.

(2) Using a voltmeter, test for battery voltage at both sides of horn fuse 7. If voltage is OK, on both sides of fuse, proceed to Fuse OK. If voltage is OK, on one side of fuse, the fuse is blown, proceed to Step 3.

(3) Using a suitable ammeter in place of the fuse, test amperage draw of the horn circuit. If amperage draw is greater than 20 amps without the horn switch depressed, a grounded circuit exists between the fuse and the horn relay. Proceed to Step 4. If amperage draw is greater than 20 amps with the horn switch depressed, a grounded circuit exists between the horn relay and the horn. Proceed to step Step 5.

(4) Remove the horn relay from the IPM. If the amperage draw drops to 0 amps, the horn switch or circuit is shorted. If the amperage draw does not drop to 0 amps, repair short at the IPM.

(5) Disengage a wire connector from one of the horns. If amperage drops and the connected horn sounds, replace the faulty horn. If amperage does not drop with both horns disconnected and the horn switch depressed, proceed to Step 6.

(6) Using a continuity tester, with the horns disconnected test continuity of the X2 cavity of the horn relay to ground. If continuity is detected, the circuit is grounded between the Junction Block and the horns. Locate and repair pinched harness.

FUSE OK

(1) Remove the horn relay from the intelligent power module.

(2) Using a continuity tester, Depress horn switch and test continuity from the X3 cavity of the horn relay to ground.

(a) If continuity is detected, proceed to Step 3.

(b) If NO continuity, proceed to Step 4.

(3) Using a suitable jumper wire, jump across the fuse F62 cavity and the X2 cavity of the horn relay in the Junction Block.

(a) If the horn sounds, replace the horn relay.

(b) If the horn does not sound, proceed to Step 4.

(4) Remove airbag trim cover from steering wheel. Refer to ELECTRICAL, RESTRAINTS.

(5) Test continuity across horn switch connectors with horn switch depressed.

(a) If continuity is detected, repair open circuit between the relay and the horn switch.

(b) If NO continuity, replace airbag trim cover.

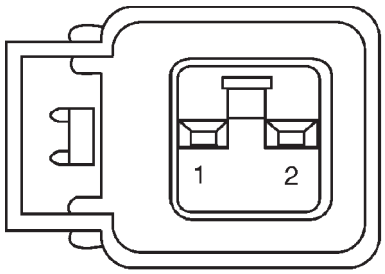
(6) Install horn relay into intelligent power module.

(7) Disengage wire connectors from horns.

(8) Using a voltmeter, with the horn switch depressed test voltage across horn connector terminals of the wire harness (Fig. 1).

(a) If voltage is detected, replace horns.

(b) If NO voltage, proceed to step Step 9.



80b6f054

Fig. 1 Horn Connector

(9) With the horn switch depressed, test for voltage between the X2 circuit and ground.

(a) If voltage OK, repair system ground at right cowl area.

(b) If NO voltage, repair open X2 circuit between the relay and the horns.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Hoist and support the front of the vehicle on safety stands.

(3) From behind the front fascia and forward of the left front wheel, disconnect the wire connectors from horn.

(4) Remove the mounting bracket attaching nut from the bottom of radiator closure panel. Do not remove the horn from mounting bracket.

(5) Separate the horn(s) from vehicle.

INSTALLATION

(1) Install the horns to the vehicle.

(2) Install the mounting bracket fastener.

(3) Reconnect the wire connectors to the horns.

(4) Lower the vehicle.

(5) Reconnect the battery negative cable.

HORN RELAY

DIAGNOSIS AND TESTING - HORN RELAY

(1) Remove horn relay.

(2) Using ohmmeter, test between relay connector terminals 85 to 86 for 70 to 75 ohms resistance. If resistance not OK, replace relay.

(3) Test for continuity between ground and terminal 85 of horn relay.

(a) When the horn switch is not depressed, no continuity should be present.

(b) Continuity to ground when horn switch is depressed.

(c) If continuity is not correct repair horn switch or wiring as necessary.

(4) Using voltmeter, test voltage at:

(a) Terminals 30 and 86 of the horn relay to body ground.

(b) If NO voltage check fuse 8 of the intelligent power module.

(c) If incorrect voltage, repair as necessary.

(5) Insert a jumper wire between terminal 30 and 87 of the intelligent power module.

(a) If horn sounds replace relay.

(b) If the horn does not sound, install horn relay and refer to Horn Test.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove cover from the intelligent power module.

(3) Remove relay from intelligent power module.

INSTALLATION

(1) Push relay into intelligent power module.

(2) Install cover.

(3) Reconnect battery negative cable.

HORN SWITCH

DESCRIPTION

The horn switch is molded into the airbag trim cover. The horn switch can not be serviced separately. For service procedures, refer to ELECTRICAL / RESTRAINTS.

IGNITION CONTROL

DESCRIPTION - IGNITION SYSTEM

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The distributorless ignition system used on these engines is referred to as the Direct Ignition System (DIS). The system's three main components are the coils, crankshaft position sensor, and camshaft position sensor. The coil on plug ignition system utilizes an ignition coil for every cylinder, it is mounted directly over the each spark plug.

OPERATION - IGNITION SYSTEM

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate pulses that are inputs to the PCM. The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft & camshaft position. For a description of both sensors, refer to Camshaft Position Sensor and Crankshaft Position Sensor.

AUTO SHUT DOWN RELAY

DESCRIPTION

The relay is located in the Power Distribution Center (PDC). For the location of the relay within the PDC, refer to the PDC cover for location. Check electrical terminals for corrosion and repair as necessary

OPERATION

The ASD sense circuit informs the PCM when the ASD relay energizes. A 12 volt signal at this input indicates to the PCM that the ASD has been activated. This input is used only to sense that the ASD relay is energized.

When energized, the ASD relay supplies battery voltage to the fuel injectors, ignition coils and the heating element in each oxygen sensor.

When energized, the ASD relay provides power to operate the injectors, ignition coil, generator field, O2 sensor heaters (both upstream and downstream), (EGR solenoid and PCV heater if equipped) and also provides a sense circuit to the PCM for diagnostic purposes. If the PCM does not receive 12 volts from this input after grounding the ASD relay, it sets a Diagnostic Trouble Code (DTC). The PCM energizes the ASD any time there is a Crankshaft Position sensor signal that exceeds a predetermined value. The ASD relay can also be energized after the engine has been turned off to perform an O2 sensor heater test, if vehicle is equipped with OBD II diagnostics.

As mentioned earlier, the PCM energizes the ASD relay during an O2 sensor heater test. This test is performed only after the engine has been shut off. The PCM still operates internally to perform several checks, including monitoring the O2 sensor heaters.

CAMSHAFT POSITION SENSOR

DESCRIPTION

The camshaft position sensorfor the 3.3/3.8L is mounted in the front of the timing case cover (Fig. 6) and the camshaft position sensor for the 2.4L is mounted on the end of the cylinder head (Fig. 3).

CAMSHAFT POSITION SENSOR (Continued)

OPERATION

The camshaft position sensor provides cylinder identification to the Powertrain Control Module (PCM) (Fig. 1). The sensor generates pulses as groups of notches on the camshaft sprocket pass underneath it (Fig. 2). The PCM keeps track of crankshaft rotation and identifies each cylinder by the pulses generated by the notches on the camshaft sprocket. Four crankshaft pulses follow each group of camshaft pulses.

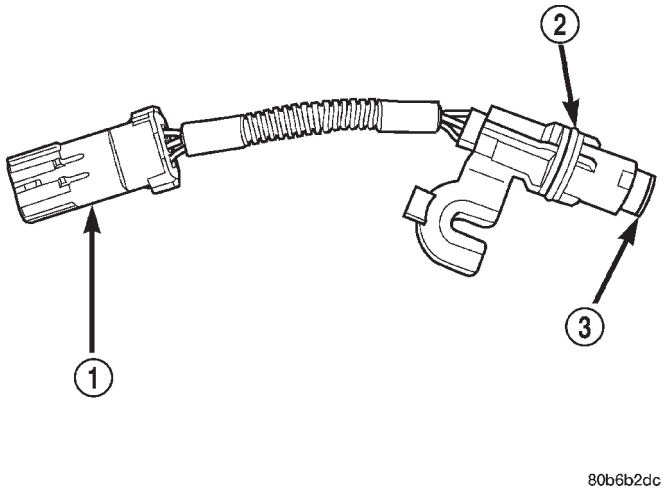

Fig. 1 Camshaft Position Sensor

1 - ELECTRICAL CONNECTOR
2 - O-RING
3 - PAPER SPACER

When the PCM receives 2 cam pulses followed by the long flat spot on the camshaft sprocket, it knows that the crankshaft timing marks for cylinder 1 are next (on driveplate). When the PCM receives one camshaft pulse after the long flat spot on the sprocket, cylinder number 2 crankshaft timing marks are next. After 3 camshaft pulses, the PCM knows cylinder 4 crankshaft timing marks follow. One camshaft pulse after the 3 pulses indicates cylinder 5. The 2 camshaft pulses after cylinder 5 signals cylinder 6 (Fig. 2). The PCM can synchronize on cylinders 1 or 4.

When metal aligns with the sensor, voltage goes low (less than 0.3 volts). When a notch aligns with the sensor, voltage switches high (5.0 volts). As a group of notches pass under the sensor, the voltage switches from low (metal) to high (notch) then back to low. The number of notches determine the amount of pulses. If available, an oscilloscope can display the square wave patterns of each timing event.

Top Dead Center (TDC) does not occur when notches on the camshaft sprocket pass below the cylinder. TDC occurs after the camshaft pulse (or pulses) and after the 4 crankshaft pulses associated with the particular cylinder. The arrows and cylinder call outs on (Fig. 2) represent which cylinder the flat spot and notches identify, they do not indicate TDC position.

REMOVAL

REMOVAL - 2.4L

The camshaft position sensor is mounted to the rear of the cylinder head.

(1) Remove the negative battery cable.

(2) Disconnect electrical connectors from the camshaft position sensor (Fig. 3).

(3) Remove camshaft position sensor mounting screws. Remove sensor.

(4) Loosen screw attaching target magnet to rear of camshaft and remove magnet (Fig. 4).

REMOVAL - 3.3/3.8L

(1) Disconnect the negative battery cable.

(2) Remove the air box cover and inlet tube (Fig. 5).

(3) Disconnect camshaft position sensor electrical connector from the wiring harness connector (Fig. 6).

(4) Remove bolt holding sensor.

(5) Rotate sensor away from block.

CAMSHAFT POSITION SENSOR (Continued)

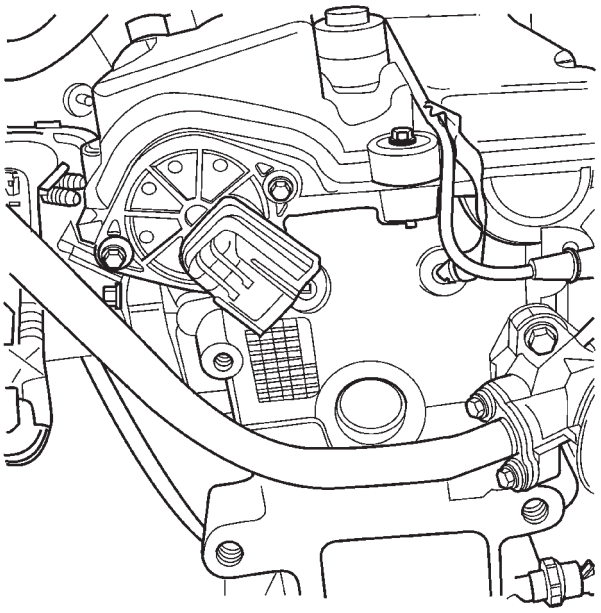

Fig. 3 EGR/CAM SENSOR 2.4L

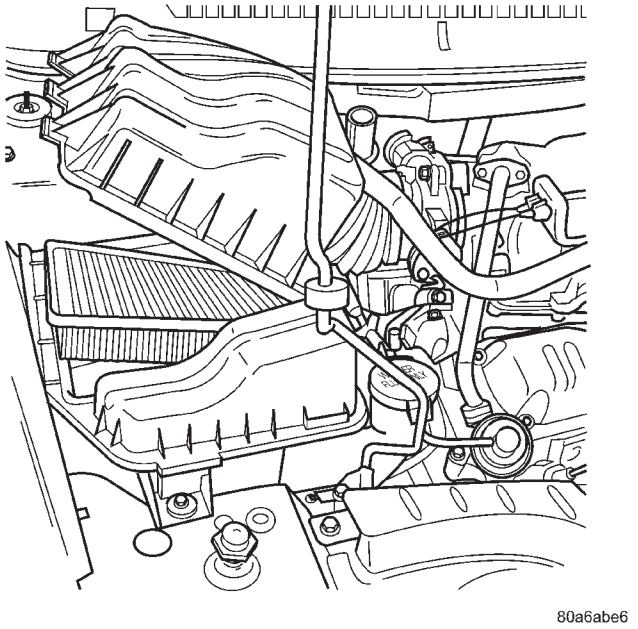

Fig. 5 AIR BOX COVER

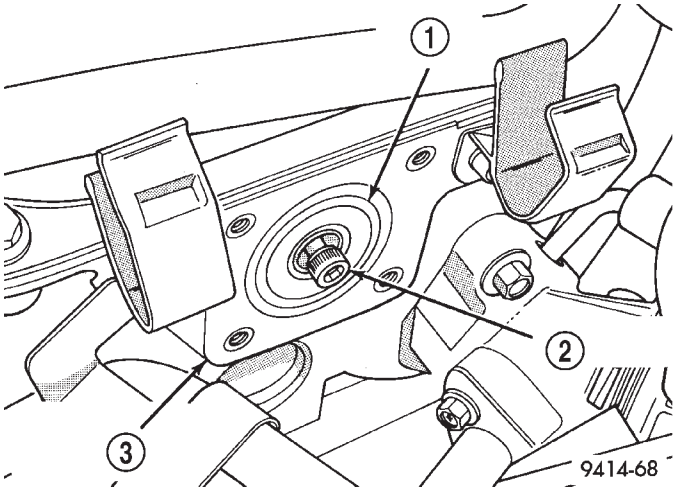

Fig. 4 Target Magnet Removal/Installation

1 - TARGET MAGNET
2 - MOUNTING BOLT

(6) Pull sensor up out of the chain case cover. **Do not pull on the sensor wiring.** There is an O-ring on the body of the sensor. The O-ring may make removal difficult. A light tap to top of sensor prior to removal may reduce force needed for removal.

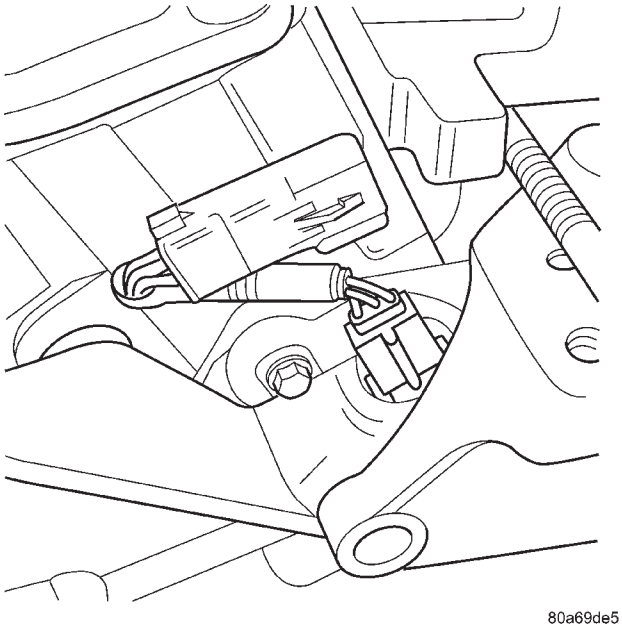

Fig. 6 CAMSHAFT POSITION SENSOR

CAMSHAFT POSITION SENSOR (Continued)

INSTALLATION

INSTALLATION - 2.4L

The target magnet has locating dowels that fit into machined locating holes in the end of the camshaft (Fig. 7).

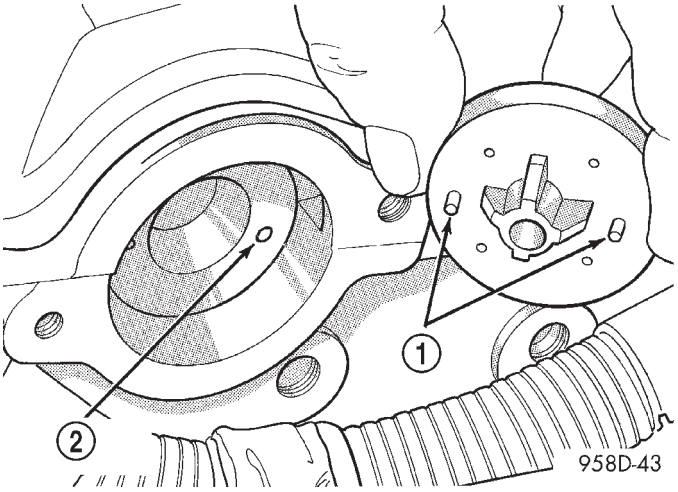

Fig. 7 Target Magnet Installation

1 - LOCATING DOWELS
2 - LOCATING HOLES (2)

(1) Install target magnet in end of camshaft. Tighten mounting screw to 3 N·m (30 in. lbs.) torque. Over torqueing could cause cracks in magnet. If magnet cracks replace it.

(2) Install camshaft position sensor. Tighten sensor mounting screws to 12.9 N·m (115 in. lbs.) torque.

(3) Carefully attach electrical connector to camshaft position sensor.

(4) Connect the negative battery cable.

INSTALLATION - 3.3/3.8L

If the removed sensor is reinstalled, clean off the old spacer on the sensor face. A NEW SPACER must be attached to the face before installation. Inspect O-ring for damage, replace if necessary. If the sensor is being replaced, confirm that the paper spacer is attached to the face and O-ring is positioned in groove of the new sensor (Fig. 8).

(1) Apply a couple drops of clean engine oil to the O-ring prior to installation.

(2) Install sensor in the chain case cover and rotate into position.

(3) Push sensor down until contact is made with the camshaft gear. While holding the sensor in this position, install and tighten the retaining bolt 14 N·m (125 in. lbs.) torque.

(4) Connect camshaft position sensor electrical connector to harness connector.

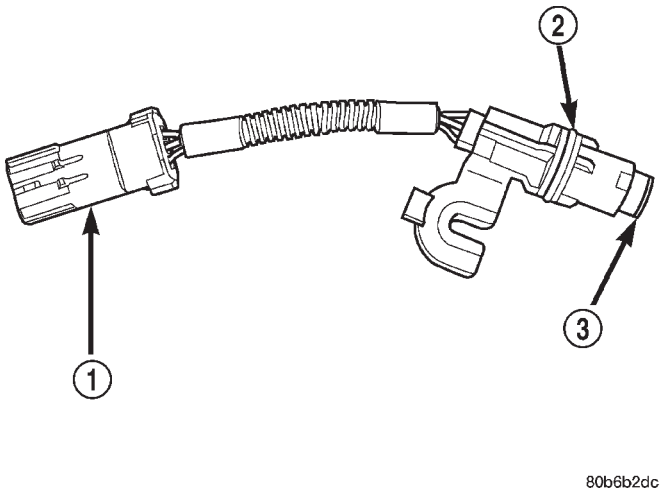

Fig. 8 Camshaft Position Sensor and Spacer

1 - ELECTRICAL CONNECTOR
2 - O-RING
3 - PAPER SPACER

(5) Install the air box cover and inlet hose (Fig. 5).

(6) Connect the negative battery cable.

IGNITION COIL

DESCRIPTION

The ignition coil assembly consists of 2 or 3 independent coils molded together (Fig. 9) or (Fig. 10). The coil assembly for the 3.3/3.8L is mounted on the intake manifold. The coil assembly for the 2.4L is mounted on the cylinder head cover. Spark plug cables route to each cylinder from the coil.

OPERATION

The coil fires two spark plugs every power stroke. One plug is the cylinder under compression, the other cylinder fires on the exhaust stroke. The Powertrain Control Module (PCM) determines which of the coils to charge and fire at the correct time.

The Auto Shutdown (ASD) relay provides battery voltage to the ignition coil. The PCM provides a ground contact (circuit) for energizing the coil. When the PCM breaks the contact, the magnetic energy in the coil transfers to the secondary causing the spark. The PCM will de-energize the ASD relay if it does not receive the crankshaft position sensor and camshaft position sensor inputs. Refer to Auto Shutdown (ASD) Relay—PCM Output, in this section for relay operation.

IGNITION COIL (Continued)

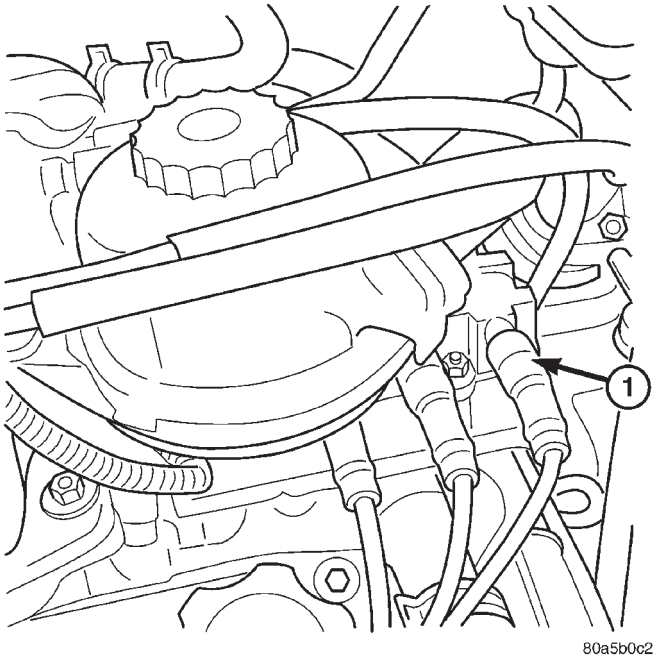

Fig. 10 IGNITION COIL - 3.3/3.8L

1 -Ignition Coil

REMOVAL

REMOVAL - 2.4L

The electronic ignition coil pack attaches directly to the valve cover.

(1) Diconnect the negative battery cable.
(2) Disconnect electrical connector from coil pack
(3) Remove coil pack mounting bolts.
(4) Remove coil pack and heat shield (Fig. 9).

REMOVAL - 3.3/3.8L

(1) Disconnect the negative battery cable.
(2) Remove the throttle and speed control cables from clip.
(3) Remove 2 bolts from the Power steering reservoir to intake manifold.
(4) Loosen the lower nut for the power steering reservoir from stud on ignition coil bracket.
(5) Reposition the Power steering reservoir (Fig. 11).

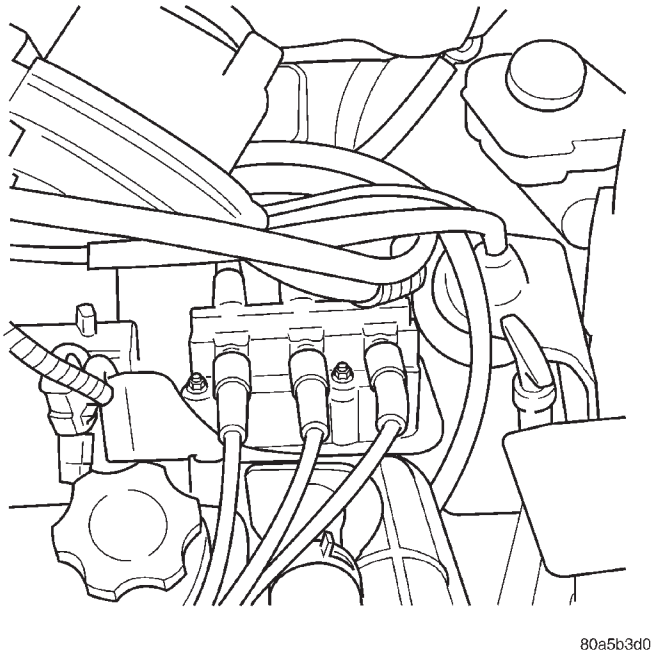

Fig. 11 IGNITION COIL BRACKET 3.3/3.8L

(6) Remove the ignition cables from the ignition coil.
(7) Disconnect the electrical connector from the ignition coil.
(8) Remove 2 nuts from the ignition coil studs.
(9) Remove 2 bolts from ignition coil, remove coil.

INSTALLATION

INSTALLATION - 2.4L

(1) Install ignition coil and heat shield to valve cover and tighten bolts.
(2) Connect the electrical connector to the ignition coil.
(3) Transfer spark plug cables to new coil pack. The coil pack towers are numbered with the cylinder identification. Be sure the ignition cables are fully seated onto the towers.
(4) Connect the negative battery cable.

IGNITION COIL (Continued)

INSTALLATION - 3.3/3.8L

(1) Install coil over studs on bracket.
(2) Install 2 bolts to ignition coil.
(3) Install 2 nuts to the ignition coil studs. Tighten nuts and bolts.
(4) Connect the electrical connector to the ignition coil.
(5) Install the ignition cables to the ignition coil.
(6) Reposition the Power steering reservoir. Slide bracket over the mounting stud (Fig. 11).
(7) Install 2 bolts to the Power steering reservoir to intake manifold.
(8) Tighten the lower nut to stud on ignition coil bracket.
(9) Install the throttle and speed control cables to clip.
(10) Connect the negative battery cable.

KNOCK SENSOR

DESCRIPTION

The knock sensor threads into the cylinder block. The knock sensor is designed to detect engine vibration that is caused by detonation.

OPERATION

When the knock sensor detects a knock in one of the cylinders, it sends an input signal to the PCM. In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric material which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives as an input the knock sensor voltage signal. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except WOT. The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening affects knock sensor performance, possibly causing improper spark control.

REMOVAL

REMOVAL - 2.4L

The knock sensor threads into the side of the cylinder block in front of the starter (Fig. 12).
(1) Disconnect electrical connector from knock sensor.
(2) Use a crow foot socket to remove the knock sensors.

REMOVAL - 3.8L

The knock sensor threads into the side of the cylinder block in the rear.
(1) Disconnect the negative battery cable.
(2) Raise vehicle and support.
(3) On All Wheel Drive vehicles remove the PTU (Power Transfer Unit), refer to the Transmission section for more information.
(4) Disconnect electrical connector from knock sensor.
(5) Use a crow foot socket to remove the knock sensor.

INSTALLATION

INSTALLATION - 2.4L

The knock sensor threads into the side of the cylinder block in front of the starter (Fig. 12).
(1) Install knock sensor. Tighten knock sensor to 10 N·m (7 ft. lbs.) torque. **Over or under tightening effects knock sensor performance, possibly causing improper spark control.**
(2) Attach electrical connector to knock sensor.

INSTALLATION - 3.8L

The knock sensor threads into the side of the cylinder block in the rear.
(1) Install knock sensor. Tighten knock sensor to 10 N·m (7 ft. lbs.) torque. **Over or under tightening effects knock sensor performance, possibly causing improper spark control.**
(2) Attach electrical connector to knock sensor.

KNOCK SENSOR (Continued)

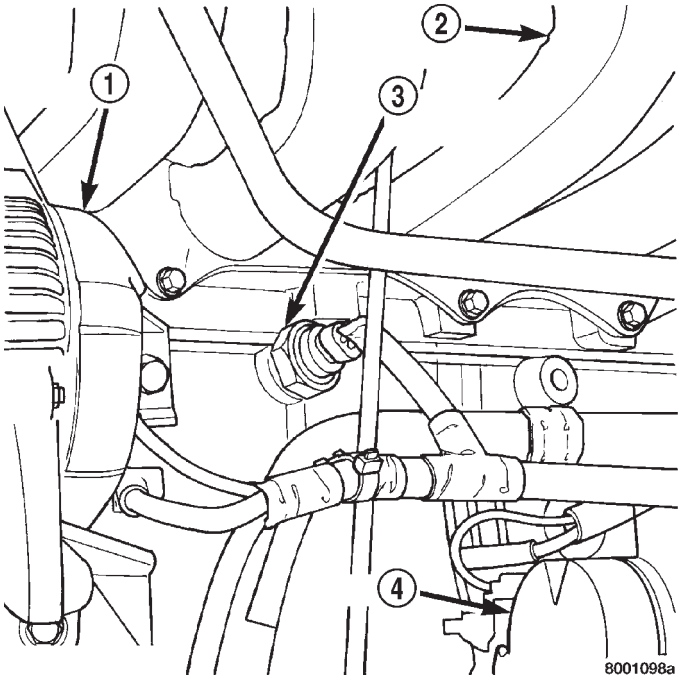

Fig. 12 Knock Sensor

1 - GENERATOR
2 - INTAKE MANIFOLD
3 - KNOCK SENSOR
4 - STARTER

(3) On All Wheel Drive vehicles install the PTU (Power Transfer Unit) for the rear wheels, refer to the Transmission section for more information.
(4) Lower vehicle.
(5) Connect the negative cable.

SPARK PLUG

DESCRIPTION

DESCRIPTION - STANDARD 4 CYLINDER

All engines use resistor spark plugs. They have resistance values ranging from 6,000 to 20,000 ohms when checked with at least a 1000 volt spark plug tester.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

Refer to the Specifications section for gap and type of spark plug.

DESCRIPTION - PLATINUM PLUGS

The V6 engines use platinum resistor spark plugs. They have resistance values of 6,000 to 20,000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications, Refer to the Specifications section.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

When the spark plugs use a single or double platinum tips and they have a recommended service life of 100,000 miles for normal driving conditions per schedule A in this manual. The spark plugs have a recommended service life of 75,000 miles for severe driving conditions per schedule B in this manual. A thin platinum pad is welded to both or center electrode end(s) as show in (Fig. 13). Extreme care must be used to prevent spark plug cross threading, misgaping (Fig. 14) and ceramic insulator damage during plug removal and installation.

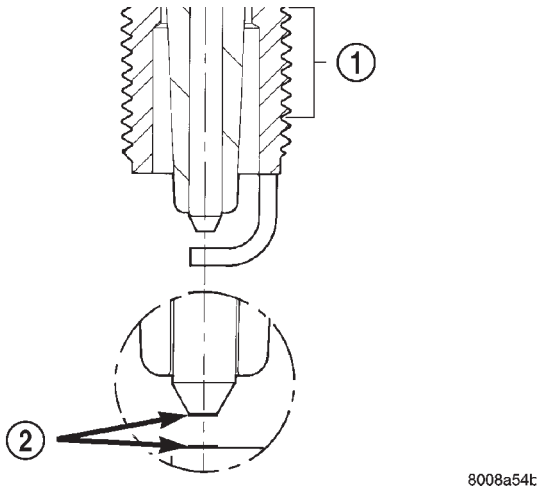

Fig. 13 Platinum Pads

1 - APPLY ANTI-SEIZE COMPOUND HERE ONLY
2 - PLATINUM SPARK SURFACE

CAUTION: Cleaning of the platinum plug may damage the platinum tip.

REMOVAL

When replacing the spark plugs and spark plug cables, route the cables correctly and secure them in the appropriate retainers. Failure to route the cables properly can cause the radio to reproduce ignition noise, cross ignition of the spark plugs or **short circuit the cables to ground.**

Always remove cables by grasping at the boot, rotating the boot 1/2 turn, and pulling straight back in a steady motion.

(1) Prior to removing the spark plug, spray compressed air around the spark plug hole and the area around the spark plug.
(2) Remove the spark plug using a quality socket with a foam insert.
(3) Inspect the spark plug condition.

SPARK PLUG (Continued)

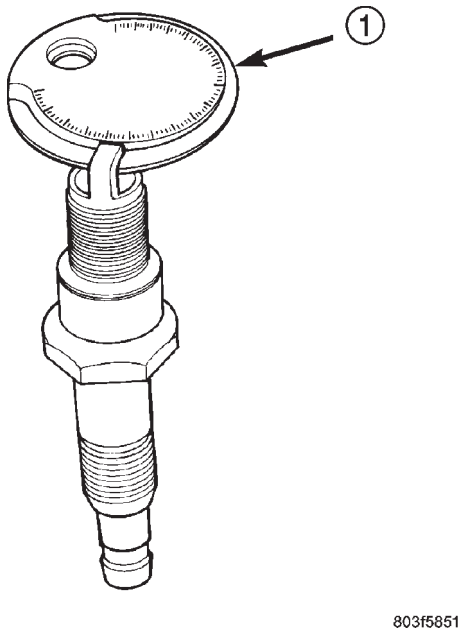

Fig. 14 Setting Spark Plug Electrode Gap

1 - TAPER GAUGE

INSTALLATION

When replacing the spark plugs and spark plug cables, route the cables correctly and secure them in the appropriate retainers. Failure to route the cables properly can cause the radio to reproduce ignition noise, cross ignition of the spark plugs or **short circuit the cables to ground.**

(1) To avoid cross threading, start the spark plug into the cylinder head by hand.

(2) Tighten spark plugs to 17.5 N·m (13 ft. lbs.) torque.

(3) Install spark plug cables over spark plugs. A click will be heard and felt when the cable properly attaches to the spark plug.

SPARK PLUG CABLE

DESCRIPTION

Spark Plug cables are sometimes referred to as secondary ignition wires. The wires transfer electrical current from the ignition coil pack to individual spark plugs at each cylinder. The resistive spark plug cables are of nonmetallic construction. The cables provide suppression of radio frequency emissions from the ignition system.

Check the spark plug cable connections for good contact at the coil, and spark plugs. Terminals should be fully seated. The insulators should be in good condition and should fit tightly on the coil, and spark plugs. Spark plug cables with insulators that are cracked or torn must be replaced.

Clean Spark Plug cables with a cloth moistened with a non-flammable solvent. Wipe the cables dry. Check for brittle or cracked insulation. The spark plug cables and spark plug boots are made from high temperature silicone materials. All spark plug cable leads are properly identified with cylinder numbers. The inside of most the spark plug boot is coated with a special high temperature silicone grease for greater sealing and to minimize boot bonding to the spark plug insulator.

REMOVAL

Failure to route the cables properly could cause the radio to reproduce ignition noise, cross ignition of the spark plugs or short circuit the cables to ground.

Remove spark plug cable from coil first.

Always remove the spark plug cable by grasping the top of the spark plug insulator, turning the boot 1/2 turn and pulling straight up in a steady motion.

INSTALLATION

Failure to route the cables properly could cause the radio to reproduce ignition noise, cross ignition of the spark plugs or short circuit the cables to ground.

Install spark plug insulators over spark plugs. Ensure the top of the spark plug insulator covers the upper end of the spark plug tube, then connect the other end to coil pack.

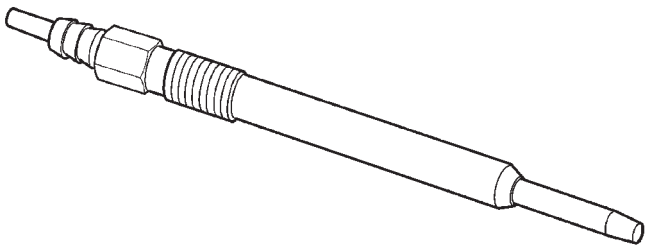
OPERATION 2
REMOVAL 2
INSTALLATION 2

GLOW PLUG

DESCRIPTION

Glow plugs are used to help start a cold or cool engine (Fig. 1). The glow plugs will heat up and glow to heat the combustion chamber of each cylinder. An individual glow plug is used for each cylinder. Each glow plug is threaded into the left side of the cylinder head below the cylinder head cover/intake manifold.



80c46ef8

Fig. 1 GLOW PLUG

OPERATION

Each glow plug will momentarily draw approximately 25 amps of electrical current during the initial key “ON” cycle. This is on a cold or cool engine. After heating the current draw will drop to approximately 9–12 amps per plug.

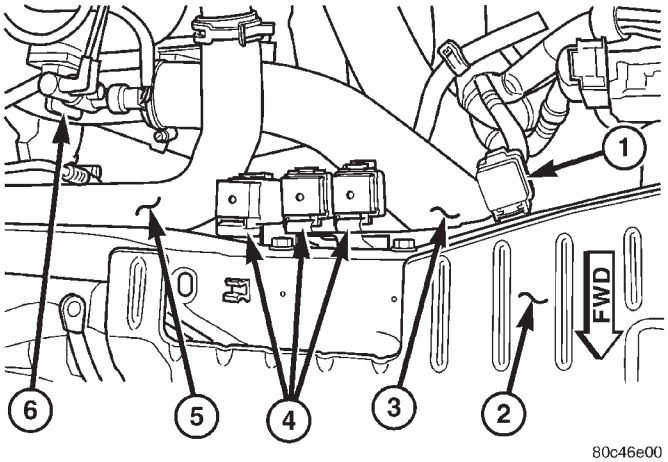
Total momentary cuurent draw for all four glow plugs is approximately 100 amps on a cold engine dropping to a total of approximately 40 amps after the plugs are heated.

Electrical operation of the glow plugs is controlled by two glow plug relays. Each glow plug relay controls two glow plugs. Refer to glow plug relays for more information.

GLOW PLUG RELAY

DESCRIPTION

There are two glow plug relays. These relays are located in the Power Distribution Center (PDC) in the engine compartment (Fig. 2).



80c46e00

Fig. 2 RELAY LOCATIONS

1 - GLOW PLUG RELAY
2 - RADIATOR SUPPORT
3 - CHARGE AIR COOLER OUTLET HOSE
4 - COOLING FAN RELAY
5 - UPPER RADIATOR HOSE
6 - EGR SOLENOID

OPERATION

When the ignition (key) switch is place in the ON position, a signal is sent to the ECM relating current engine coolant temperature. This signal is sent from the engine coolant temperature sensor.

After receiving this signal, the ECM will determine if, when and for how long of a period the glow plug relays should be activated. This is done before, during and after the engine is started. Whenever the glow plug relays are activated, it will control the 12 volt 100 amp circuit for the operation of the four glow plugs. Each relay control two glow plugs.

GLOW PLUG RELAY (Continued)

The Glow Plug lamp is tied to this circuit. Lamp operation is also controlled by the ECM.

With a cold engine, the glow plug relays and glow plugs may be activated for a maximum time of 200 seconds. Refer to the following Glow Plug Control chart for a temperature/time comparison of the glow plug relay operation.

In this chart, Pre-Heat and Post-Heat times are mentioned. Pre-Heat is the amount of time the glow plug relay control circuit is activated when the ignition (key) is switched ON, without the engine running. Post-Heat is the amount of time the glow plug relay control circuit is activated after the engine is operated. The Glow Plug lamp will not be activated during the post-heat cycle.

+70C	1 SEC.	16 SEC.	20 SEC.

CAMSHAFT POSITION SENSOR

DESCRIPTION

The camshaft position (CMP) sensor is mounted in the top of cylinder head cover/intake manifold at the rear of the engine. The CMP sensor is a hall effect device (Fig. 3).

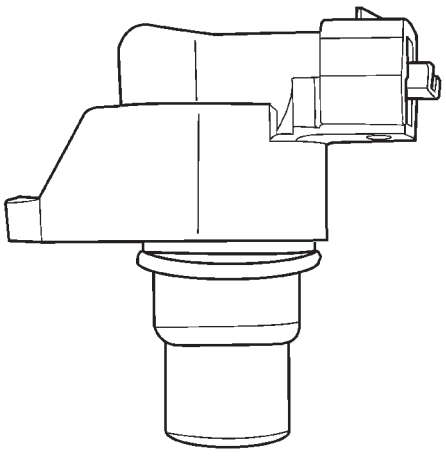

Fig. 3 CAMSHAFT POSITION SENSOR

OPERATION

The CMP sensor is a hall effect switch. A tooth made of a ferromagnetic material is attached to the camshaft. When this tooth passes the CMP sensor an lectronic signal is created. This signal is then sent to the engine control module (ECM). This signal is used by the ECM to determine which cylinder has just entered its compression phase.

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).

(3) Disconnect camshaft position sensor electrical connector (Fig. 4).

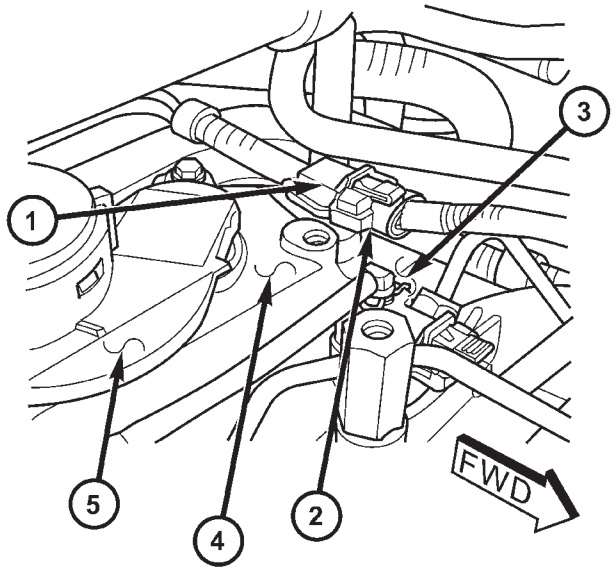

Fig. 4 CAMSHAFT POSITION SENSOR LOCATION

1 - CAMSHAFT POSITION SENSOR
2 - CAMSHAFT POSITION SENSOR ELCTRICAL SENSOR
3 - FUEL INJECTOR
4 - CYLINDER HEAD COVER
5 - OIL SEPARATOR

(4) Remove sensor retaining bolt and remove sensor from cylinder head cover.

INSTALLATION

(1) Lubricate O-ring and install sensor in cylinder head cover. Torque retaining bolt to 5.4 N·m.

(2) Connect camshaft position sensor electrical connector.

(3) Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).

(4) Connect negative battery cable.

DESCRIPTION	13
OPERATION	13

INSTRUMENT CLUSTER

DESCRIPTION

The instrumentation gauges are contained in a subdial assembly within the instrument cluster. The individual gauges are not serviceable. If one of the cluster gauges becomes faulty, the entire cluster would require replacement.

The mechanical instrument cluster with a tachometer is equipped with a electronic vacuum fluorescent transmission range indicator (PRND3L), odometer, and trip odometer display.

The mechanical instrument cluster without a tachometer is equipped with a cable operated transmission range indicator (PRND21) and a vacuum fluorescent odometer display. It also has the following indicators:

- Turn Signals
- High Beam
- Oil Pressure
- MIL

The instrument cluster is equipped with the following warning lamps.

- Lift Gate Ajar
- Low Fuel Level
- Low Windshield Washer Fluid Level
- Cruise
- Battery Voltage
- Fasten Seat Belt
- Door Ajar
- Coolant Temperature
- Anti-Lock Brake
- Brake
- Airbag
- Traction Control
- Autostick

The mechanical instrument cluster without a tachometer also has the following warning lamps:

- Turns Signals
- High Beam
- Oil Pressure
- Malfunction Indicator Lamp (MIL)

WATER IN FUEL LAMP - EXPORT

The Water In Fuel Lamp is located in the instrument cluster. When moisture is found within the fuel system, the sensor sends a message via the PCI data bus to the instrument cluster. The sensor is located underneath the vehicle, directly above the rear axle. The sensor is housed within the fuel filter/water separator assembly cover. The sensor is not serviced separately. If found defective, the entire assembly cover must be replaced.

OPERATION

Refer to the vehicle Owner's Manual for operation instructions and conditions for the Instrument Cluster Gauges.

WATER IN FUEL LAMP - EXPORT

The Water In Fuel Sensor is a resistive type switch. It is calibrated to sense the different resistance between diesel fuel and water. When water enters the fuel system, it is caught in the bottom of the fuel filter/water separator assembly, where the sensor is located. Water has less resistance than diesel fuel. The sensor then sends a PCI data bus message to the instrument cluster to illuminate the lamp.

If the lamp is inoperative, perform the self diagnostic test on the instrument cluster to check the lamp operation before continuing diagnosis.

INSTRUMENT CLUSTER (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SELF-DIAGNOSTICS

The instrument clusters are equipped with a self diagnostic test feature to help identify electronic problems. Prior to any test, perform the Self-Diagnostic Test. The self diagnostic system displays instrument cluster stored fault codes in the odometer display, sweeps the gauges to the calibration points, and bulb checks the warning indicators. When the key is in the ON position with the engine not running, the MIL will remain illuminated for regulatory purposes.

To activate the Self-Diagnostic program:

(1) With the ignition switch in the OFF position, depress the TRIP ODOMETER RESET button.

(2) Continue to hold the TRIP ODOMETER RESET button until **Sof** and a number (software version number (i.e. **Sof 3.2**) appears in the odometer window then release the button. If a fault code is present, the cluster will display it in the odometer display. When all fault codes have been displayed, the cluster will display **"end"** in the odometer display. Refer to the INSTRUMENT CLUSTER DTC'S table to determine what each trouble code means.

INSTRUMENT CLUSTER DTC'S

DTC	DESCRIPTION
100.0	LOOP-BACK FAILURE
100.1	ABS COMMUNICATION FAULT
100.2	BCM COMMUNICATION FAULT
100.3	EATX COMMUNICATION FAULT
100.4	FCM COMMUNICATION FAULT
100.5	ORC COMMUNICATION FAULT
100.6	SBEC/DEC/MCM COMMUNICATION FAULT
200.0	AIRBAG LED SHORT
200.1	AIRBAG LED OPEN

ODOMETER SEGMENT TEST

If a segment in the odometer does not illuminate normally, a problem exists in the display.

ELECTRONIC TRANSMISSION RANGE INDICATOR SEGMENT TEST

If a segment in the transmission range indicator does not illuminate normally, a problem exists in the display.

DIAGNOSIS AND TESTING - CLUSTER DIAGNOSIS

CONDITIONS

Refer to the following tables for possible problems, causes, and corrections.

- INSTRUMENT CLUSTER DIAGNOSIS
- SPEEDOMETER DIAGNOSIS
- TACHOMETER DIAGNOSIS
- FUEL GAUGE DIAGNOSIS
- TEMPERATURE GAUGE DIAGNOSIS
- ODOMETER DIAGNOSIS
- ELECTRONIC GEAR INDICATOR DISPLAY DIAGNOSIS
- MECHANICAL TRANSMISSION RANGE INDICATOR (PRND21) DIAGNOSIS

INSTRUMENT CLUSTER (Continued)

NOTE: Always check the functionality of the cluster by running the self test prior to troubleshooting.

INSTRUMENT CLUSTER DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
INSTRUMENT CLUSTER INOPERATIVE. NO RESPONSE FROM INSTRUMENT CLUSTER.	NO PCI BUS MESSAGES FROM THE BCM.	USE A DRB III® SCAN TOOL TO CHECK THE BCM. IF OK, LOOK FOR ANOTHER POSSIBLE CAUSE FOR CLUSTER FAILURE. IF NOT OK, REFER TO THE PROPER BODY DIAGNOSTIC PROCEDURES MANUAL.
	SPREAD TERMINAL(S) ON WIRING HARNESS CLUSTER CONNECTOR.	REMOVE CLUSTER FROM INSTRUMENT PANEL AND CHECK WIRING HARNESS CONNECTOR FOR SPREAD TERMINAL. IF OK, LOOK FOR ANOTHER POSSIBLE CAUSE FOR THE CLUSTER FAILURE. IF NOT OK, REPAIR CONNECTOR.
	BCM IS NOT RECEIVING PROPER INPUT FROM THE IGNITION SWITCH.	1. USE A DRB III® SCAN TOOL TO VERIFY IGNITION SWITCH STATUS INTO THE BCM. IF NOT OK, GO TO STEP (2). IF OK, LOOK AT ANOTHER POSSIBLE CAUSE OF FAILURE. 2. CHECK IGNITION SWITCH FUNCTION AND WIRING.
	INTERNAL CLUSTER FAILURE.	REPLACE CLUSTER.
	WAKE UP CIRCUIT FAULTY.	VERIFY CONTINUITY OF WAKE UP CIRCUIT FROM BCM TO MIC. CIRCUIT SHALL BE LOW WHENEVER BCM IS AWAKE.
	POWER OR GROUND MISSING.	IF NO RESPONSE FROM THE MIC, CHECK FOR POWER AND GROUND AT THE MIC CONNECTOR. REFER TO WIRING DIAGRAMS FOR CONNECTOR CALL OUTS.

INSTRUMENT CLUSTER (Continued)

SPEEDOMETER DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO POINTER MOVEMENT.	1. INTERNAL CLUSTER FAILURE.	1.A. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. • IF SPEEDOMETER POINTER MOVES TO CALIBRATION POINTS DURING TEST LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE. • IF THE POINTER DOESN'T MOVE DURING TEST, CHECK FOR POWER AND GROUND TO THE MIC. IF POWER AND GROUND ARE PRESENT GO TO STEP 1.B. 1.B. REPLACE CLUSTER. GO TO STEP 1.C. 1.C. CONNECT CLUSTER INTO INSTRUMENT PANEL WIRING HARNESS. PLACE IT BACK INTO THE PROPER POSITION IN THE INSTRUMENT PANEL. PUT IN THE TOP FOUR MOUNTING SCREWS AND SECURE THE CLUSTER TO THE INSTRUMENT PANEL.
	2. NO SPEED PCI BUS MESSAGE OR ZERO MPH PCI SPEED BUS MESSAGE.	2.A. CHECK THE PCM (CODE 10) USING A DRB III® SCAN TOOL. IF OK, GO TO STEP 2.B. IF NOT OK, REFER TO THE PROPER POWERTRAIN DIAGNOSTIC PROCEDURES MANUAL TO REPAIR THE PCM. 2.B. CHECK THE SPEED SIGNAL INPUT INTO THE PCM. THE SPEED SIGNAL ORIGINATES FROM ONE OF THE FOLLOWING SOURCES: • A DISTANCE SENSOR FOR VEHICLES WITH 3 SPEED AUTOMATIC TRANSMISSION. CHECK CONTINUITY FROM DISTANCE SENSOR TO PCM. IF OK, REPLACE DISTANCE SENSOR. IF NOT OK, REPAIR WIRING. • THE TCM FOR VEHICLES WITH THE 4 SPEED ELECTRONIC TRANSMISSIONS. CHECK CONTINUITY FROM TCM TO PCM. IF OK, USE A DRB III® SCAN TOOL TO CHECK TCM. REFER TO THE PROPER TRANSMISSION DIAGNOSTIC PROCEDURES MANUAL TO REPAIR THE TCM. IF NOT OK, REPAIR WIRING.

INSTRUMENT CLUSTER (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ERRATIC POINTER MOVEMENT.	1. ERRATIC MESSAGE FROM ANOTHER MODULE.	1.A. CHECK THE BCM USING A DRB III® SCAN TOOL IF OK, GO TO STEP 1.B. IF NOT OK, REFER TO THE PROPER BODY DIAGNOSTIC PROCEDURES MANUAL TO REPAIR THE BCM. 1.B. CHECK THE PCM USING A DRB III® SCAN TOOL. IF OK, GO TO STEP 1.C. IF NOT OK, REFER TO THE PROPER POWERTRAIN DIAGNOSTIC PROCEDURES MANUAL TO REPAIR THE PCM. 1.C. CHECK THE SPEED SIGNAL INPUT INTO THE PCM. THE SPEED SIGNAL ORIGINATES FROM ONE OF THE FOLLOWING SOURCES: • A DISTANCE SENSOR FOR VEHICLES WITH 3 SPEED AUTOMATIC TRANSMISSION. CHECK CONTINUITY FROM DISTANCE SENSOR TO PCM. IF OK, REPLACE DISTANCE SENSOR. IF NOT OK, REPAIR WIRING. • THE TCM FOR VEHICLES WITH THE 4 SPEED ELECTRONIC TRANSMISSIONS. CHECK CONTINUITY FROM TCM TO PCM. IF OK, USE A DRB III® SCAN TOOL TO CHECK TCM. REFER TO THE PROPER TRANSMISSION DIAGNOSTIC PROCEDURES MANUAL TO REPAIR THE TCM. IF NOT OK, REPAIR WIRING.
	2. INTERNAL CLUSTER FAILURE.	2.A. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. • IF THE POINTER MOVES DURING TEST BUT STILL APPEARS ERRATIC, THEN GO TO STEP 2.B. 2.B. REPLACE CLUSTER ASSEMBLY.

INSTRUMENT CLUSTER (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SPEEDOMETER INACCURATE.	1. SPEEDOMETER OUT OF CALIBRATION.	1. PERFORM CLUSTER SELF-DIAGNOSTIC TEST. • IF SPEEDOMETER IS ACCURATE TO THE CALIBRATION POINTS THEN LOOK FOR ANOTHER POSSIBLE CAUSE OF INACCURACY. • IF SPEEDOMETER IS NOT ACCURATE TO THE CALIBRATION POINTS, REPLACE CLUSTER ASSEMBLY.
	2. WRONG SPEEDOMETER PINION FOR TIRE SIZE.	2.A. IF VEHICLE HAS A 4 SPEED ELECTRONIC TRANSMISSION GO TO STEP 2.C. OTHERWISE GO TO STEP 2.B. 2.B. CHECK IF CORRECT SPEEDOMETER PINION IS BEING USED WITH TIRES ON VEHICLE. REFER TO TRANSMISSION FOR DIAGNOSIS AND TESTING. • IF THE INCORRECT PINION IS IN TRANSMISSION THEN REPLACE WITH CORRECT PINION. • IF THE CORRECT PINION IS IN THE TRANSMISSION, CHECK TIRE SIZE. 2.C. USE A DRB III® SCAN TOOL TO CHECK THE TCM TO SEE IF THE CORRECT TIRE SIZE HAS BEEN PROGRAMMED INTO THE TCM. • IF THE INCORRECT TIRE SIZE WAS SELECTED, SELECT THE PROPER TIRE SIZE. • IF THE CORRECT TIRE SIZE WAS SELECTED, CHECK SPEED SENSOR.
	3. BAD SPEED SENSOR.	3. REFER TO TRANSMISSION, SPEED SENSOR, DIAGNOSIS AND TESTING.

TACHOMETER DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO POINTER MOVEMENT.	1. INTERNAL CLUSTER FAILURE.	1.A. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. • IF TACHOMETER POINTER MOVES TO CALIBRATION POINTS DURING TEST, LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE. • IF THE POINTER DOESN'T MOVE DURING TEST, CHECK FOR POWER AND GROUND TO THE MIC. IF POWER AND GROUND ARE PRESENT GO TO STEP 1.B. 1.B. REPLACE CLUSTER. GO TO STEP 1.C.
	2. ″NO RPM″ PCI BUS MESSAGE OR ″ZERO RPM″ PCI BUS MESSAGE FROM PCM.	2. CHECK THE PCM USING A DRB III® SCAN TOOL. REFER TO THE PROPER POWERTRAIN DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR.

INSTRUMENT CLUSTER (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ERRATIC POINTER MOVEMENT.	1. BAD PCI BUS MESSAGE FROM PCM.	1. CHECK THE PCM USING A DRB III® SCAN TOOL. REFER TO THE PROPER POWERTRAIN DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR.
	2. INTERNAL CLUSTER FAILURE.	2. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. • IF THE POINTER MOVES DURING TEST BUT STILL APPEARS ERRATIC, REPLACE CLUSTER ASSEMBLY.
TACHOMETER INACCURATE.	TACHOMETER OUT OF CALIBRATION.	PERFORM CLUSTER SELF-DIAGNOSTIC TEST. • IF TACHOMETER IS ACCURATE TO THE CALIBRATION POINTS, LOOK FOR ANOTHER POSSIBLE CAUSE OF INACCURACY. • IF TACHOMETER IS NOT ACCURATE TO THE CALIBRATION POINTS, REPLACE CLUSTER ASSEMBLY.

FUEL GAUGE DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO POINTER MOVEMENT.	1. INTERNAL CLUSTER FAILURE.	1. PERFORM CLUSTER SELF-DIAGNOSTIC TEST. • IF FUEL GAUGE POINTER MOVES TO CALIBRATION POINTS, LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE. • IF THE POINTER DOESN'T MOVE DURING TEST, VERIFY POWER AND GROUND ARE BEING PROVIDED TO THE CLUSTER. IF YES, REPLACE CLUSTER ASSEMBLY. IF NO, DETERMINE CAUSE OF NO POWER OR GROUND.
	2. NO PCI FUEL MESSAGE OR EMPTY PCI BUS MESSAGE FROM BODY CONTROL MODULE.	2.A. CHECK THE BCM USING A DRB III® SCAN TOOL. IF OK, GO TO STEP 2.B. IF NOT OK, REFER TO THE PROPER BODY DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR. 2.B. REFER TO THE FUEL SECTION OF THE SERVICE MANUAL FOR THE FUEL LEVEL SENDING UNIT TEST PROCEDURE. TEST UNIT AND REPAIR AS INSTRUCTED.

INSTRUMENT CLUSTER (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ERRATIC POINTER MOVEMENT.	1. BAD PCI FUEL MESSAGE FROM THE BODY CONTROLLER.	1. USE A DRB III® SCAN TOOL TO CHECK THE BCM. IF OK, GO TO STEP 2. IF NOT OK, REFER TO THE PROPER BODY DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR.
		2. REFER TO THE FUEL SECTION OF THE SERVICE MANUAL FOR THE FUEL LEVEL SENDING UNIT TEST PROCEDURE. TEST UNIT. IF OK, LOOK FOR ANOTHER POSSIBLE CAUSE FOR FUEL GAUGE FAILURE. IF NOT OK, REPAIR SENDING UNIT.
	2. INTERNAL CLUSTER FAILURE.	2. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES.
		• IF THE POINTER MOVES DURING TEST BUT STILL APPEARS ERRATIC, REPLACE CLUSTER ASSEMBLY.
FUEL GAUGE INACCURATE.	1. FUEL GAUGE OUT OF CALIBRATION.	1. PERFORM CLUSTER SELF-DIAGNOSTIC TEST. IF POINTER IS ACCURATE TO THE CALIBRATION POINTS LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE. IF POINTER IS INACCURATE TO THE CALIBRATION POINTS, REPLACE CLUSTER ASSEMBLY.
	2. FUEL LEVEL SENDING UNIT IS OUT OF CALIBRATION.	2. REFER TO THE FUEL SECTION OF THE SERVICE MANUAL FOR TESTING AND REPAIR PROCEDURE.

TEMPERATURE GAUGE DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO POINTER MOVEMENT.	1. INTERNAL CLUSTER FAILURE.	1. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK.
		• IF TEMPERATURE GAUGE POINTER MOVES TO CALIBRATION POINTS, LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE.
		• IF THE POINTER DOESN'T MOVE DURING TEST, VERIFY POWER AND GROUND ARE BEING PROVIDED TO THE CLUSTER. IF YES, REPLACE CLUSTER. IF NO, DETERMINE CAUSE OF NO POWER OR NO GROUND.
	2. NO PCI TEMPERATURE MESSAGE OR COLD PCI BUS MESSAGE FROM THE POWERTRAIN CONTROL MODULE.	2.A. CHECK PCM FAULT CODES USING A DRB III® SCAN TOOL. IF THERE ARE NO FAULTS, GO TO STEP 2.B. IF THERE ARE FAULTS, REFER TO THE PROPER POWERTRAIN DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR.
		2.B. REFER TO FUEL, COOLANT TEMPERATURE SENSOR, DIAGNOSIS AND TESTING. REPAIR SENSOR AS NEEDED.

INSTRUMENT CLUSTER (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ERRATIC POINTER MOVEMENT.	1. BAD PCI BUS MESSAGE FROM THE POWERTRAIN CONTROL MODULE.	1.A. CHECK PCM FAULT CODES USING A DRB III® SCAN TOOL. IF THERE ARE NO FAULTS, GO TO STEP 1.B. IF THERE ARE FAULTS, REFER TO THE PROPER POWERTRAIN DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR. 1.B. REFER TO FUEL, COOLANT TEMPERATURE SENSOR, DIAGNOSIS AND TESTING. REPAIR SENSOR AS NEEDED.
	2. INTERNAL CLUSTER FAILURE.	2. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. • IF THE POINTER MOVES DURING TEST BUT STILL APPEARS ERRATIC, REPLACE CLUSTER ASSEMBLY.
TEMPERATURE GAUGE INACCURATE.	1. TEMPERATURE GAUGE OUT OF CALIBRATION.	1. PERFORM CLUSTER SELF-DIAGNOSTIC TEST. • IF POINTER IS ACCURATE TO THE CALIBRATION POINTS LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE. • IF POINTER IS INACCURATE TO THE CALIBRATION POINTS, REPLACE CLUSTER ASSEMBLY.
	2. COOLANT SENSOR OUT OF CALIBRATION.	2. REFER TO FUEL, COOLANT TEMPERATURE SENSOR FOR TEST AND REPAIR PROCEDURE.

ODOMETER DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DISPLAY.	1. NO PCI BUS ODOMETER MESSAGE FROM BCM.	1. USE A DRB III® SCAN TOOL TO CHECK THE BCM. REFER TO THE PROPER BODY DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR.
	2. INTERNAL CLUSTER FAILURE.	2. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. **• IF ODOMETER PASSES THE SEGMENT CHECK, LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE. IF IT FAILS VERIFY POWER AND GROUND ARE BEING PROVIDED TO THE CLUSTER. IF YES, REPLACE CLUSTER. IF NO, DETERMINE CAUSE OF NO POWER OR GROUND.**

INSTRUMENT CLUSTER (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ERRATIC DISPLAY	1. INTERNAL CLUSTER FAILURE.	1. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. • IF ODOMETER PASSES THE SEGMENT TEST, FAILURE MAY NOT BE IN THE CLUSTER. LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE. 2. VERIFY GOOD POWER AND GROUND CONNECTIONS. IF CONNECTIONS ARE GOOD AND NO OTHER PROBLEMS ARE FOUND, REPLACE CLUSTER ASSEMBLY.
	2. BAD PCI BUS MESSAGE FROM THE BCM.	2. USE A DRB III® SCAN TOOL TO CHECK THE BCM. REFER TO THE PROPER BODY DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR.
ODOMETER WON'T GO INTO TRIP MODE.	TRIP SWITCH DOESN'T WORK.	IF CLUSTER WILL NOT GO INTO SELF DIAGNOSTIC MODE AND CANNOT TOGGLE BETWEEN ODOMETER AND TRIP ODOMETER, REPLACE CLUSTER.
TRIP ODOMETER WON'T RESET.	RESET SWITCH DOESN'T WORK.	IF CLUSTER WILL NOT GO INTO SELF DIAGNOSTIC MODE AND TRIP ODOMETER WILL NOT RESET, REPLACE CLUSTER.

ELECTRONIC GEAR INDICATOR DISPLAY DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DISPLAY.	1. INTERNAL CLUSTER FAILURE.	1. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. • IF PRND3L (PRND1234 IF AUTOSTICK EQUIPPED) PASSES THE SEGMENT CHECK, THEN FAILURE MAY NOT BE IN THE CLUSTER. LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE. IF IT FAILS, REPLACE CLUSTER ASSEMBLY.
ERRATIC DISPLAY.	1. INTERNAL CLUSTER FAILURE.	1. PERFORM CLUSTER SELF-DIAGNOSTIC TEST AND CHECK FOR FAULT CODES. • IF PRND3L (PRND1234 IF AUTOSTICK EQUIPPED) PASSES THE SEGMENT CHECK, THEN FAILURE MAY NOT BE IN THE CLUSTER. LOOK FOR ANOTHER POSSIBLE CAUSE OF FAILURE.
	2. BAD PCI BUS MESSAGE FROM THE TCM.	2. USE A DRB III® SCAN TOOL TO CHECK THE TCM. REFER TO THE PROPER TRANSMISSION DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR.

INSTRUMENT CLUSTER (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ALL SEGMENTS ARE ON.	1. NO PCI BUS MESSAGE FROM THE TCM.	1.A. PERFORM CLUSTER SELF-DIAGNOSTIC TEST. IF PRND3L (PRND1234 IF AUTOSTICK EQUIPPED) PASSES TEST GO TO STEP 1.B. IF PRND3L (PRND1234 IF AUTOSTICK EQUIPPED) FAILS TEST, REPLACE CLUSTER ASSEMBLY. 1.B. CHECK THE TCM USING A DRB III® SCAN TOOL. REFER TO THE PROPER TRANSMISSION DIAGNOSTIC PROCEDURES MANUAL TO PROPERLY DIAGNOSE AND REPAIR.

MECHANICAL TRANSMISSION RANGE INDICATOR (PRND21) DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
INDICATOR DOES NOT SHOW PROPER GEAR OR NO INDICATION.	MIS-ADJUSTED.	1.A. VERIFY TRANSMISSION SHIFT SYSTEM IS CORRECTLY ADJUSTED. 1.B. VERIFY CORRECT ROUTING AND ATTACHMENT OF PRNDL CABLE AND GUIDE TUBE. 1.C. RE-ADJUST PRNDL INDICATOR IN NEUTRAL USING ADJUSTER WHEEL BELOW STEERING COLUMN.
INDICATOR DOES NOT FOLLOW GEAR SHIFT LEVER.	NOT ATTACHED.	1.A. VERIFY INDICATOR CABLE CONNECTED TO SHIFT LEVER PIN IN THE GROOVE. 1.B. VERIFY THAT THE INDICATOR CLIP IS SECURE, AND ATTACHED TO THE MOUNTING BRACKET. MAKE SURE THAT THE CLIP IS NOT BROKEN. IF THE CLIP IS BROKEN, REPLACE CLIP ON INDICATOR.
INDICATOR DOES NOT MAKE FULL TRAVEL (“P” < > “1”).	1. CABLE DISLODGED FROM ITS PATH ON THE INDICATOR BASE. 2. INCORRECT ATTACHMENT OF CABLE TO SHIFT LEVER PIN.	1. VERIFY CORRECT ATTACHMENT OF INDICATOR CABLE TO SHIFT LEVER PIN (UNDER HOOP OF TRANS. SHIFT CABLE) AND CLIP ONTO THE MOUNTING BRACKET. 2. VERIFY INDICATOR TRAVEL BY PULLING ON CABLE GENTLY OVER FULL TRAVEL RANGE. IF THERE IS STILL A PROBLEM, REMOVE CLUSTER TO ACCESS INDICATOR BASE AND CONFIRM CABLE PATH.

REMOVAL

WITH ELECTRONIC TRANSMISSION RANGE INDICATOR

(1) Disconnect and isolate the battery negative cable.
(2) Remove Over Steering Column Bezel by lifting it straight up with a firm pull.
(3) Remove the four cluster bezel attaching screws.
(4) Tilt the steering column in the full down position.
(5) Pull rearward on the cluster bezel and remove.
(6) Remove the four screws holding instrument cluster to instrument panel.
(7) Rotate top of cluster outward.
(8) Disconnect the cluster harness connector.
(9) Remove instrument cluster from instrument panel.

WITH MECHANICAL TRANSMISSION RANGE INDICATOR

(1) Disconnect and isolate the battery negative cable.
(2) Remove the lower steering column cover. Refer to Body, Instrument Panel, Lower Steering Column Cover, Removal.

INSTRUMENT CLUSTER (Continued)

(3) Remove the plastic knee blocker reinforcement. Refer to Body, Instrument Panel, Knee Blocker Reinforcement, Removal.

(4) Disconnect the transmission range indicator cable end from shift lever by flexing the HOOP on the transmission shift cable rearward and slip the indicator cable loop off the lever pin.

(5) Disconnect the clip holding the indicator cable to the mounting bracket.

(6) Remove Over Steering Column Bezel by lifting it straight up with a firm pull.

(7) Remove the four bezel attaching screws.

(8) Tilt the steering column in the full down position.

(9) Pull rearward on the cluster bezel and remove.

(10) Remove the four cluster attaching screws.

(11) Rotate top of the cluster rearward.

(12) Disconnect the cluster harness connector.

(13) Remove the instrument cluster carefully while guiding the range indicator cable and guide tube through the opening to avoid any damage.

INSTALLATION

WITH ELECTRONIC TRANSMISSION RANGE INDICATOR

(1) Connect the instrument cluster wire connector.

(2) Rotate top of cluster inward as placing into instrument panel opening.

(3) Install the four screws holding instrument cluster to instrument panel.

(4) Position cluster bezel into place.

(5) Install the four bezel attaching screws.

(6) Install the Over Steering Column Bezel by firmly snapping into place.

(7) Connect the battery negative cable.

WITH MECHANICAL TRANSMISSION RANGE INDICATOR

(1) Guide the range indicator cable and guide tube through the opening of instrument panel.

(2) Connect the instrument cluster wire connector.

(3) Rotate top of cluster inward as placing into instrument panel opening.

(4) Install the four screws holding instrument cluster to instrument panel.

(5) Position cluster bezel into place.

(6) Install the four bezel attaching screws.

(7) Install the Over Steering Column Bezel by firmly snapping into place.

(8) Connect the clip holding the indicator cable to the mounting bracket.

(9) Connect the transmission range indicator cable end to the shift lever by flexing the HOOP on the transmission shift cable forward and slip the indicator cable loop on the lever pin.

(10) Install the plastic knee blocker reinforcement. Refer to Body, Instrument Panel, Knee Blocker Reinforcement, Installation.

(11) Install the lower steering column cover. Refer to Body, Instrument Panel, Lower Steering Column Cover, Installation.

(12) Connect the battery negative cable.

CLUSTER LENS

REMOVAL

(1) Remove the instrument cluster. Refer to Electrical, Instrument Cluster, Removal.

(2) Remove the screws holding the lens to the instrument cluster.

(3) Press down on the snap features of the lens and remove the lens from the cluster.

INSTALLATION

(1) Insert the lens snap features into the cluster.

(2) Install the screws holding the lens to the instrument cluster.

(3) Install the instrument cluster. Refer to Electrical, Instrument Cluster, Installation.

MECHANICAL TRANSMISSION RANGE INDICATOR

REMOVAL

(1) Remove the instrument cluster and disconnect the range indicator cable at both attaching points. Refer to Electrical, Instrument Cluster, Removal.

(2) From the backside of the cluster, remove two screws holding the mechanical transmission range indicator and then remove it fromt instrument cluster.

INSTALLATION

(1) Insert the mechanical transmission range indicator into the backside of the instrument cluster and install the two screws.

(2) Install the instrument cluster. Refer to Electrical, Instrument Cluster, Installation.

RED BRAKE WARNING INDICATOR

DESCRIPTION

The red BRAKE warning indicator (lamp) is located in the instrument panel cluster and is used to indicate a low brake fluid condition or that the parking brake is applied. In addition, the brake warning indicator is turned on as a bulb check by the ignition switch every time the ignition switch is placed in the crank position.

OPERATION

The red BRAKE warning indicator (lamp) is supplied a 12-volt ignition feed anytime the ignition switch is on. The bulb is then illuminated by completing the ground circuit either through the switch on the parking brake lever, the brake fluid level switch in the master cylinder reservoir, or the ignition switch when it is placed in the crank position.

LAMPS/LIGHTING - EXTERIOR

DESCRIPTION

LAMP SYSTEMS

Lighting circuits are protected by fuses. Lighting circuits require an overload protected power source, on/off device, lamps and body ground to operate properly. Plastic lamps require a wire in the harness to supply body ground to the lamp socket. Replace sockets and bulbs that are corroded.

Some of the interior and exterior lighting functions are governed by the Body Control Module (BCM). The headlamp, dome, and the door ajar switches provide signals to the BCM. The BCM in turn sends a Programmable Communication Interface (PCI) bus message to the Front Control Module (FCM) to enable the necessary drivers to set the required illumination configuration.

Wire connectors can make intermittent contact or become corroded. Before coupling wire connectors, inspect the terminals inside the connector. Male terminals should not be bent or disengaged from the insulator. Female terminals should not be sprung open or disengaged from the insulator. Bent and sprung terminals can be repaired using needle nose pliers and pick tool. Corroded terminals appear chalky or green. Corroded terminals should be replaced to avoid recurrence of the problem symptoms.

Begin electrical system failure diagnosis by testing related fuses in the fuse block and intelligent power module. Verify that bulbs are in good condition and test continuity of the circuit ground. Refer to the appropriate wiring information.

AUTOMATIC HEADLAMP SYSTEM

The Automatic Headlamp system turns the instrumentation and exterior illumination lamps ON when the ambient light levels are Night and the engine RPM is 450 or above, and OFF when light levels are Day.

DAYTIME RUNNING LAMPS

Operating the high-beam headlamps at reduced power provides daytime running lamps, which are required on all new Canadian vehicles.

HEADLAMPS ON WITH WINDSHIELD WIPERS

For vehicles equipped with the Automatic Headlamp System, the instrumentation and exterior illumination lamps will be turned ON when the headlamp switch is in the AUTO position, RPM > 450 and the windshield wipers have been in the intermittent, low or high mode of operation for more than ten seconds. When the windshield wipers are turned OFF the Body Control Module will determine if the instrumentation and exterior illumination lamps should remain ON base upon the current ambient light level.

HEADLAMP SYSTEM

The configuration of the headlamp system of headlamps, park lamps and fog lamps is determined by the BCM. The BCM determines the lighting configuration as a result of the inputs from the ignition switch, headlamp switch and multi-function switch. A PCI bus is transmitted from the BCM to the FCM to enable the necessary drivers to set the illumination configuration. Four wires are connected between the headlamp switch and the BCM. The first wire contains information regarding the position of the headlamp switch (Off, Automatic Headlamps, Automatic Headlamp switch fog, Park with Fog, Head, or Head with Fog Lamps). The second wire contains information regarding the position of the dimmer switch (Dome Lamp, Daytime Brightness, Dimming Level or Off). The third wire is a dedicated signal return (ground) wire. The fourth wire provides power to the front fog lamp indicator.

HEADLAMP TIME DELAY SYSTEM

The headlamp time delay system is controlled by the Body Control Module (BCM) via a PCI bus mes-

sage transmitted by the BCM to the FCM to turn off the headlamps.

OPERATION

AUTOMATIC HEADLAMP SYSTEM

Automatic headlamps are controlled by the Body Control Module (BCM). With the headlamp switch in the AUTO position, the BCM will control the headlamp, parking, side marker, tail and instrumentation lamps based on ambient light levels. Ambient light levels are monitored by the BCM using the Day/Night signal and Electrochromatic Mirror (ECM) present from the Compass Mini Trip (CMTC) located on the front windshield in front of the rear view mirror ECM. Ambient light readings are averaged to limit cycling the lamps ON and OFF when passing through areas with varying light levels. The automatic headlamps will only function when the engine is running with RPM > 450. When the headlamp switch is in the AUTO position (Automatic mode), the Headlamp Time Delay system will function when the ignition switch is placed in any position other than run/start.

DAYTIME RUNNING LAMPS

Power is reduced using pulse-width modulation to the high beams, where by the power is switched on and off rapidly instead of remaining on continuously. The duration and interval of the power pulses is programmed into the FCM.

HEADLAMP SYSTEM

The headlamp system will default to headlamps ON position when ignition switch is ON and when an open or short circuit failure occurs on the headlamp switch input. The system will return to normal operation when the open or short is repaired. A fault will be reported by the BCM when a failure occurs on the dimmer or headlamp switch input.

If the exterior lamps are ON and the headlamp switch is in any position other than OFF or AUTO and with the ignition switch OFF (LOCK) after 3 minutes the BCM sends a message via PCI bus to the FCM informing the FCM to turn off the headlamps, park lamps and fog lamps. This feature prevents the vehicle battery from being discharged when the vehicle lights have been left ON.

HEADLAMP TIME DELAY SYSTEM

The headlamp time delay system is activated by turning the headlamps ON (high or low beam) while the engine is running, turning the ignition switch OFF, and then turning the headlamp switch OFF within 45 seconds. The system will not activate if more than 45 seconds elapse between ignition switch OFF and headlamp switch OFF. The BCM will allow the headlamps to remain ON for 90 seconds (configurable) before they automatically turn off (If the key is in the ignition during the headlamp time delay mode, then both the headlamps and park lamps (including panel dimming) will be ON). Refer to the Owner's Manual for more information.

If the headlamp switch is in the Auto Headlamp Position, the headlamps are ON due to the night signal from the CMTC and the ignition switch is in any position other than run/start, the BCM shall enter a 90 second (configurable) Auto Headlamps time delay mode. If the key is in the ignition during the headlamp time delay mode, then both the headlamps and park lamps (including panel dimming) will be ON. If the key is not in the ignition, then only the headlamps will be ON. The BCM will allow the headlamps to remain ON for 90 seconds before they automatically turn OFF. Refer to the Owner's Manual for more information.

OPTICAL HORN/HIGH BEAMS

When the multi-function switch is pulled to the first detent (optical horn) signal, the headlamps are ON, key-in the ignition the BCM shall send a message via PCI bus to the FCM to turn on the headlamps drivers to illuminate all four filaments (Low and High beams). When the multi-function switch is pulled to the second detent (high beam) signal and the headlamps are ON, the BCM shall send a message via PCI bus to the FCM to turn on the headlamps drivers. The High Beams are illuminated and the Low Beams and Fog Lamps (if ON) are extinguished. If the headlamps were in the high beam configuration when power was removed from the headlamps, the headlamps will be configured as low beam the next time they are activated.

WARNING

WARNING: EYE PROTECTION SHOULD BE USED WHEN SERVICING GLASS COMPONENTS. PERSONAL INJURY CAN RESULT.

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result. Do not use bulbs other than those indicated in the Bulb Application table. Damage to lamp and/or Daytime Running Lamp Module can result. Do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owners Manual.

CAUTION: Do not use bulbs other than those listed in the Bulb Application Table. Damage to lamp can result. Do not touch halogen bulbs with fingers or other oily surfaces. Bulb life will be reduced.

BRAKE LAMP SWITCH

DESCRIPTION

The brake lamp switch is located under the instrument panel, at the brake pedal arm (Fig. 3). It has three internal switches controlling various functions of the vehicle. It's main function is to control operation of the vehicle's brake lamps. Other functions include speed control deactivation, brake sense for the antilock brake system and brake sense for the brake transmission shift interlock.

CAUTION: The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

OPERATION

When the brake pedal is pressed, the plunger on the outside of the brake lamp switch extends outward. This action opens or closes the contacts of the three switches inside the brake lamp switch.

With the brake pedal pressed down (plunger extended), the switch for terminals 1 and 2 is closed completing the circuit. The switch for terminals 3 and 4 is open and so is the switch for terminals 5 and 6.

When the brake pedal is released (plunger pushed in), the three switches assume the opposite positions. The switch for terminals 1 and 2 is now open while the other two switches are now closed, completing their circuits.

A lever on the back of the switch is used to set the switch into the "adjusted" position. A non-adjusted switch will have the lever set to the diagonal position in relation to the switch housing. The plunger can be moved in and out, but the states of the internal switches will not change.

CAUTION: Never move the adjustment lever of the new brake lamp switch without it being properly installed in the vehicle first. Such action will render the switch unusable and the switch must be discarded.

Once installed in the vehicle as described in the brake lamp switch installation procedure (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ BRAKE LAMP SWITCH - INSTALLATION), the new switch's adjustment lever is rotated to the adjusted position as indicated (Fig. 4). This action locks the plunger to the internal switches. **Once in this position the switch is permanently adjusted (or locked) and cannot be readjusted or released even if the lever is moved back.**

DIAGNOSIS AND TESTING - BRAKE LAMP SWITCH

NOTE: Before proceeding with this diagnostic test, verify the adjustment lever on the back of the switch is in the adjusted position. If the lever is in the non-adjusted (diagonal) position it may have never been adjusted (Refer to 8 - ELECTRICAL/ LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - OPERATION). For adjustment, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ BRAKE LAMP SWITCH - INSTALLATION)

If the electrical circuit has been tested and the brake lamp switch is suspected of being faulty, it can be tested using the following method.

BRAKE LAMP SWITCH (Continued)

(1) Remove the switch from the vehicle. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ BRAKE LAMP SWITCH - REMOVAL)

(2) With the switch in the released position (plunger extended), use an ohmmeter to test each of the three internal switches as shown (Fig. 1). You should achieve the results as listed in the figure.

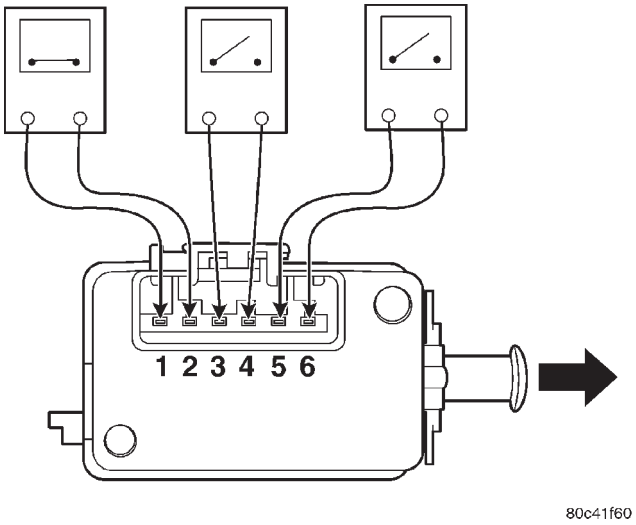

Fig. 1 SWITCH TEST - RELEASED POSITION

(3) Gently push the plunger on the brake lamp switch in until it stops.

(4) With the switch in this depressed position (plunger pushed in), use an ohmmeter to test each of the three internal switches as shown (Fig. 2). You should achieve the results as listed in the figure.

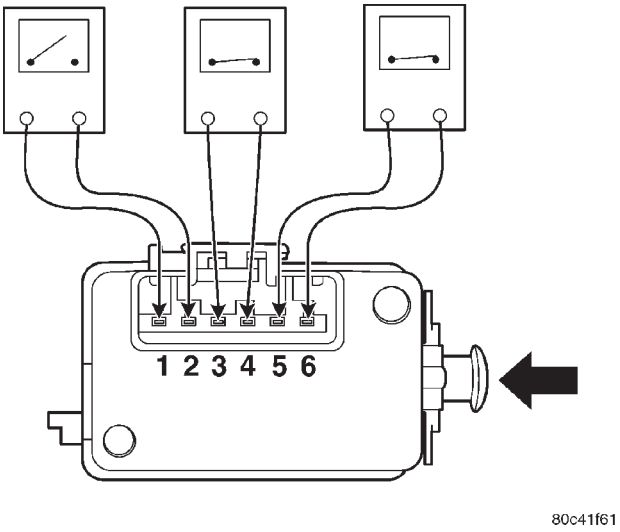

Fig. 2 SWITCH TEST - DEPRESSED POSITION

If you do not achieve the results as listed in both figures, the switch is faulty and must be replaced. Refer to Removal And Installation in this section.

If the switch is found to be operating properly, it may be misadjusted. Do not reinstall the switch, replace it. (Refer to 8 - ELECTRICAL/LAMPS/ LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION)

CAUTION: The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for any reason, a new switch must be installed and adjusted.

REMOVAL

(1) Disconnect and isolate the battery negative cable from its post on the battery.

(2) Remove silencer panel below steering column and knee blocker.

(3) Remove the brake lamp switch by rotating the switch in a counterclockwise direction approximately 30 degrees and pulling it out of the bracket (Fig. 3).

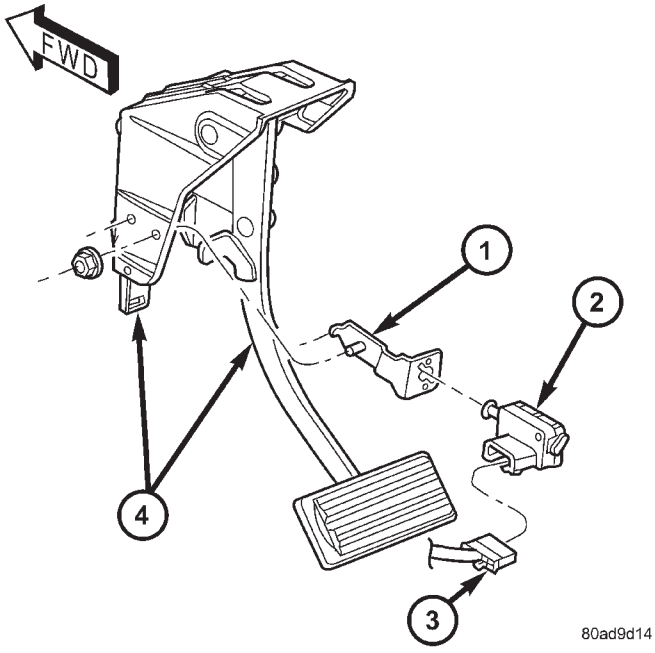

Fig. 3 Pedal And Brake Lamp Switch

1 - SWITCH BRACKET
2 - BRAKE LAMP SWITCH
3 - WIRING CONNECTOR
4 - PEDAL AND BRACKET

(4) Release the locking tab and disconnect the wiring connector from the switch.

(5) Discard the brake lamp switch. It must not be reused.

BRAKE LAMP SWITCH (Continued)

INSTALLATION

CAUTION: Do not reuse the original brake lamp switch. The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

(1) Mount and adjust the NEW brake lamp switch using the following procedure:

(a) Connect the wiring connector to the switch and latch the locking tab.

(b) Install the switch in its bracket by aligning the index tab on the switch with the slot in the mounting bracket.

(c) When the switch is fully seated in its bracket, rotate the switch clockwise approximately 30° to lock the switch into place (Fig. 3).

(d) With the brake pedal in the fully released position, move the lever on the back of the brake lamp switch from the angled non-adjusted position to the full vertical position as shown (Fig. 4). This will adjust the brake lamp switch to the vehicle.

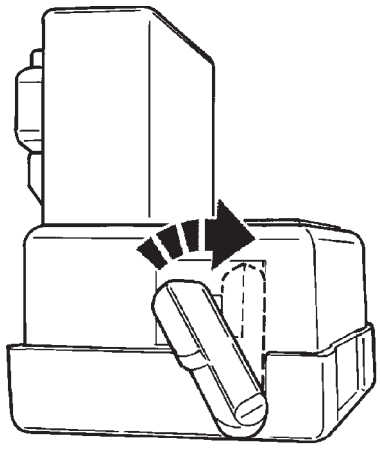

Fig. 4 Adjustment Lever Movement

(2) Install silencer panel below steering column knee blocker.

(3) Reconnect the battery negative terminal.

(4) Check the stop lamps to verify they are operating properly and not staying on when the pedal is in the released position.

(5) Road test the vehicle to ensure proper operation of the brakes including ABS and speed control (if equipped).

CENTER HIGH MOUNTED STOP LAMP

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove two retaining screws (Fig. 5).

(3) Twist socket counter-clockwise and remove from lamp.

(4) Pull bulb from socket (Fig. 6).

INSTALLATION

(1) Push bulb into socket.

(2) Install socket into the lamp unit.

(3) Install the retaining screws.

(4) Reconnect the battery negative cable.

CENTER HIGH MOUNTED STOP LAMP UNIT

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the two retaining screws (Fig. 5).

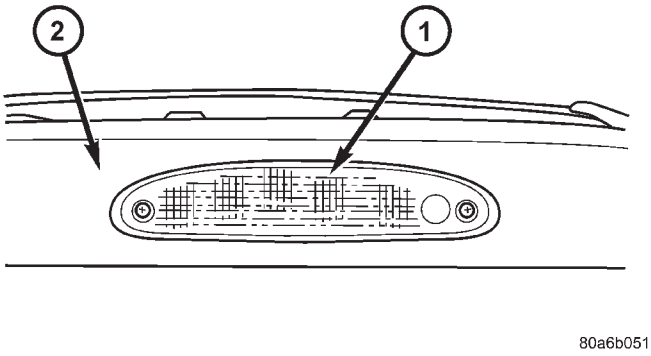

Fig. 5 CHMSL

1 - CHMSL UNIT
2 - LIFTGATE

(3) Disconnect the rear window washer hose.

(4) Remove bulb socket from lamp unit (Fig. 6).

INSTALLATION

(1) Install bulb socket to lamp unit.

(2) Reconnect the rear window washer hose.

CENTER HIGH MOUNTED STOP LAMP UNIT (Continued)

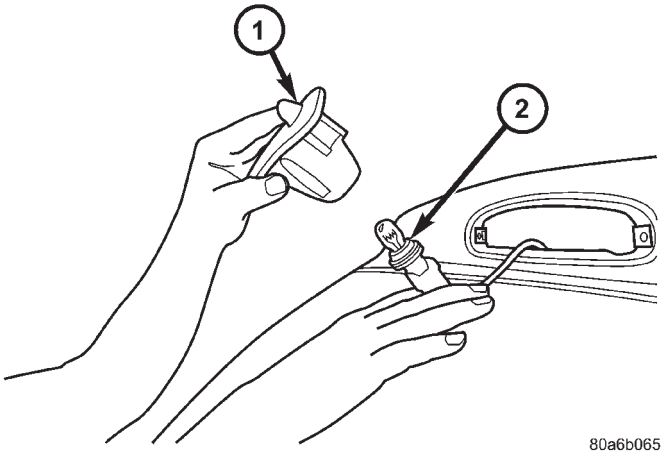

Fig. 6 CHMSL BULB

1 - CHMSL UNIT
2 - CHMSL BULB

(3) Install the retaining screws.
(4) Reconnect the battery negative cable.

FOG LAMP

DIAGNOSIS AND TESTING - FOG LAMP

When a vehicle experiences problems with the fog lamp system, verify the condition of the battery connections, fuses, charging system, fog lamp bulbs, wire connectors, relay, high beam switch, and headlamp switch. Refer to the appropriate wiring information.

Each vehicle is equipped with various lamp assemblies. A good ground is necessary for proper lighting operation. Grounding is provided by the lamp socket when it comes in contact with the metal body, or through a separate ground wire.

When changing lamp bulbs check the socket for corrosion. If corrosion is present, clean it with a wire brush.

When it is necessary to remove components to service another, it should not be necessary to apply excessive force or bend a component to remove it. Before damaging a trim component, verify hidden fasteners or captured edges are not holding the component in place.

FOG LAMP DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
FOG LAMPS ARE DIM WITH ENGINE IDLING OR IGNITION TURNED OFF.	1. Loose or corroded battery cables.	1. Clean and secure battery cable clamps and posts.
	2. Loose or worn generator drive belt.	2. Adjust or replace generator drive belt.
	3. Charging system output too low.	3. Test and repair charging system. Refer to Electrical, Charging,
	4. Battery has insufficient charge.	4. Test battery state-of-charge. Refer to Electrical, Battery System.
	5. Battery is sulfated or shorted.	5. Load test battery. Refer to Electrical, Battery System.
	6. Poor lighting circuit Z349/Z248 ground.	6. Test for voltage drop across Z349/248 ground locations. Refer to Electrical, Wiring Information.
FOG LAMP BULBS BURN OUT FREQUENTLY	1. Charging system output too high.	1. Test and repair charging system. Refer to Electrical, Charging.
	2. Loose or corroded terminals or splices in circuit.	2. Inspect and repair all connectors and splices. Refer to Electrical, Wiring Information.

FOG LAMP (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
FOG LAMPS ARE DIM WITH ENGINE RUNNING ABOVE IDLE	1. Charging system output too low.	1. Test and repair charging system. Refer to Electrical, Charging.
	2. Poor lighting circuit Z349/Z248 ground.	2. Test for voltage drop across Z349/Z248 ground locations. Refer to Electrical, Wiring Information.
	3. High resistance in fog lamp circuit.	3. Test amperage draw of fog lamp circuit.
FOG LAMPS FLASH RANDOMLY	1. Poor lighting circuit Z349/Z248 ground.	1. Test for voltage drop across Z349/Z248 ground locations. Refer to Electrical, Wiring Information.
	2. Variable resistance in fog lamp circuit.	2. Test amperage draw of fog lamp circuit.
	3. Faulty fog lamp switch (part of headlamp switch).	3. Replace headlamp switch.
	4. Loose or corroded terminals or splices in circuit.	4. Inspect and repair all connectors and splices. Refer to Electrical, Wiring Information.
	5. Is relay engaging properly?	5. Verify function of fog lamp relay in IPM.
	6. PCI Bus Communication.	6. Verify PCI bus message (fog lamp info) transmitted from BCM and received by FCM.
FOG LAMPS DO NOT ILLUMINATE	1. Blown fuse for fog lamp.	1. Replace fuse. Refer to Electrical, Wiring Information.
	2. No Z349/Z248 ground at fog lamps.	2. Repair circuit ground. Refer to Electrical, Wiring Information.
	3. Faulty fog lamp switch (part of headlamp switch).	3. Replace headlamp switch.
	4. Broken connector terminal or wire splice in fog lamp circuit.	4. Repair connector terminal or wire splice.
	5. Faulty or burned out bulb.	5. Replace bulb.
	6. Is relay engaging?	6. Verify function of fog lamp relay in IPM.
	7. PCI Bus Communication.	7. Verify PCI bus message (fog lamp info) transmitted from BCM and received by FCM.

FOG LAMP (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) From behind the bumper fascia, twist bulb counter-clockwise, and remove bulb. (Fig. 7).

(3) Remove the wire connector from the fog lamp bulb.

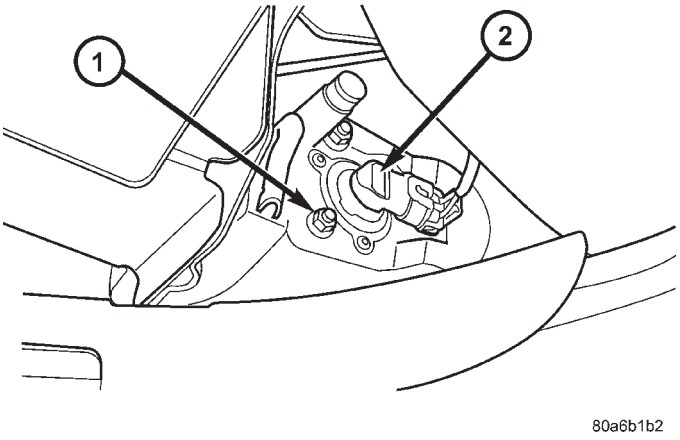

Fig. 7 FOG LAMP

1 - FOGLAMP MOUNTING NUT
2 - FOGLAMP

INSTALLATION

(1) Reconnect wire harness to bulb.
(2) Install bulb and twist clockwise.
(3) Install battery negative cable.

FOG LAMP - EXPORT

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove access cover from under bumper fascia.

(3) Disengage spring clip from fog lamp (Fig. 8).

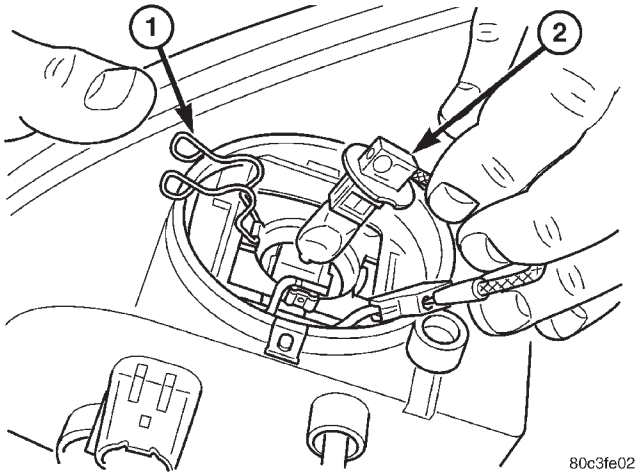

Fig. 8 FOG LAMP

1 - SPRING CLIP
2 - FOG LAMP

(4) Remove bulb from lamp.

(5) Disconnect wire harness connector.

INSTALLATION

(1) Connect wire harness connector.
(2) Install bulb to lamp.
(3) Engage spring clip to fog lamp.
(4) Install access cover under bumper fascia.
(5) Connect battery negative cable.

FOG LAMP UNIT

STANDARD PROCEDURE

STANDARD PROCEDURE - FOG LAMP UNIT ALIGNMENT

FOG LAMP UNIT ALIGNMENT

Prepare an alignment screen (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - STANDARD PROCEDURE). A properly aligned fog lamp will project a pattern on the alignment screen 100 mm (4 in.) below the fog lamp center line and straight ahead (Fig. 9). To improve visual interpretation of the fog lamp pattern on the alignment screen, the headlamps should be in the “off” position.

The fog lamps are adjusted by a adjustment screw located through the lens on Dodge vehicles, and by a knob on the back of the lamp.

STANDARD PROCEDURE - FOG LAMP UNIT ALIGNMENT - EXPORT

Prepare an alignment screen (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - STANDARD PROCEDURE). A properly aligned fog lamp will project a pattern on the alignment screen 200 mm (8 in.) below the fog lamp center line and straight ahead (Fig. 10). To improve visual interpretation of the fog lamp pattern on the alignment screen, the headlamps should be in the “off” position.

3 - HORIZONTAL CENTER OF FOG LAMP
4 - 100MM (4 IN.)
5 - 7.62 METERS (25 FT.)
6 - FRONT OF FOG LAMP

FOG LAMP UNIT (Continued)

The fog lamps are adjusted by a adjustment screw located on the underside of the fog lamp unit.

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) From behind the bumper fascia, disconnect the wire harness from the fog lamp bulb (Fig. 7).
(3) Remove mounting nuts.

INSTALLATION

(1) Install mounting nuts.
(2) Reconnect the wire harness to the fog lamp bulb.
(3) Reconnect the battery negative cable.

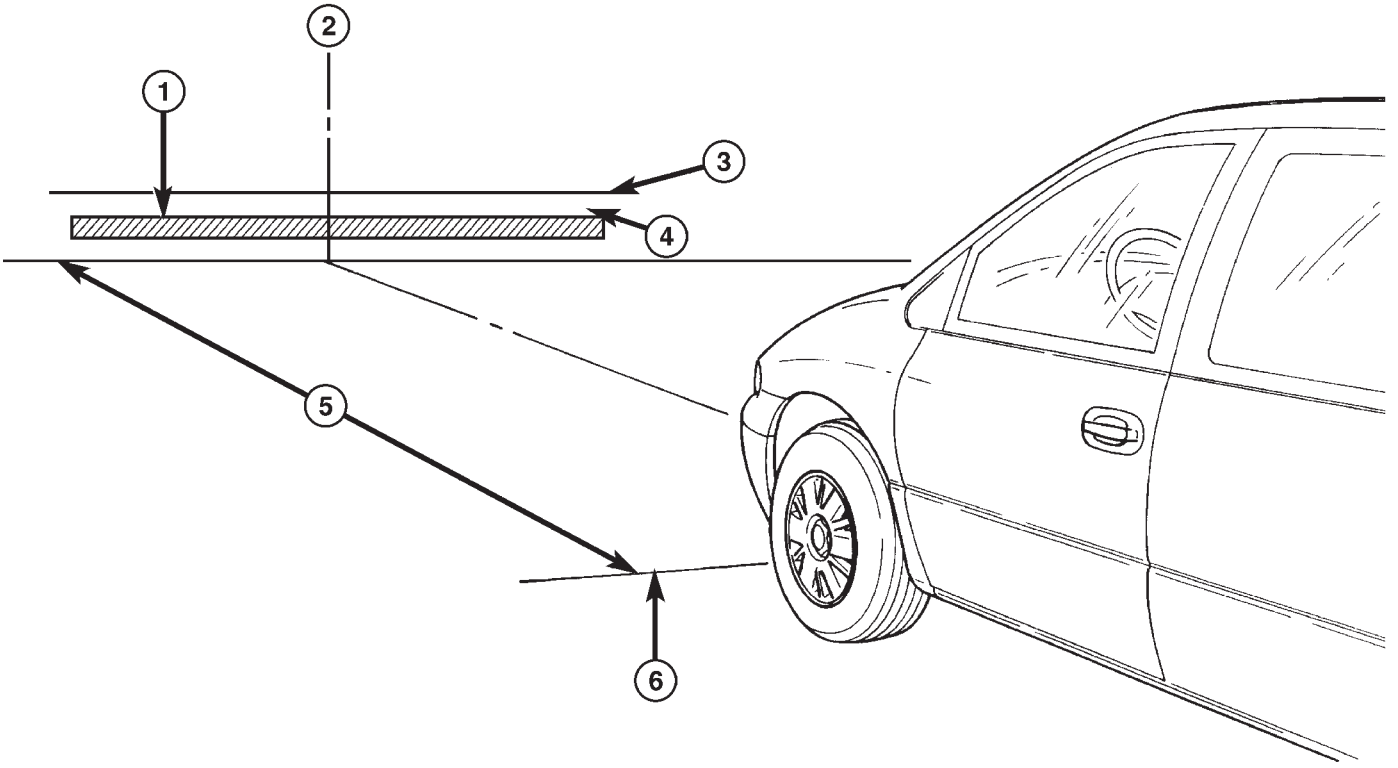
FRONT POSITION LAMP - EXPORT

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the headlamp unit (Fig. 11).
(3) Remove the plastic cover from the back of the headlamp unit.
(4) Pull front position lamp socket from headlamp unit.
(5) Pull bulb straight out of socket.

INSTALLATION

(1) Push bulb into the bulb socket.
(2) Insert bulb socket into headlamp unit.
(3) Install cover to the back of the headlamp unit.



80aac150

(5) Connect the battery negative cable.

HEADLAMP

DIAGNOSIS AND TESTING - HEADLAMP

When a vehicle experiences problems with the headlamp system, verify the condition of the battery connections, fuses, charging system, headlamp bulbs, wire connectors, relay, high beam switch, dimmer switch, and headlamp switch. Refer to the appropriate wiring information.

Each vehicle is equipped with various lamp assemblies. A good ground is necessary for proper lighting operation. Grounding is provided by the lamp socket when it comes in contact with the metal body, or through a separate ground wire.

When changing lamp bulbs check the socket for corrosion. If corrosion is present, clean it with a wire brush.

When it is necessary to remove components to service another, it should not be necessary to apply excessive force or bend a component to remove it. Before damaging a trim component, verify hidden fasteners or captured edges are not holding the component in place.

HEADLAMP DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMPS ARE DIM WITH ENGINE IDLING OR IGNITION TURNED OFF.	1. Loose or corroded battery cables.	1. Clean and secure battery cable clamps and posts.
	2. Loose or worn generator drive belt.	2. Adjust or replace generator drive belt.
	3. Charging system output too low.	3. Test and repair charging system, refer to Electrical, Charging
	4. Battery has insufficient charge.	4. Test battery state-of-charge, refer to Electrical, Battery System.
	5. Battery is sulfated or shorted.	5. Load test battery, refer to Electrical, Battery System.
	6. Poor lighting circuit Z343/Z344-ground.	6. Test for voltage drop across Z343/Z344-ground locations, refer to Electrical, Wiring Diagram Information.
HEADLAMP BULBS BURN OUT FREQUENTLY.	1. Integrated Power Module (IPM) not controlling voltage.	1. Test and repair Integrated Power Module.
	2. Loose or corroded terminals or splices in circuit.	2. Inspect and repair all connectors and splices. Refer to Electrical, Wiring Information.

HEADLAMP (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMPS ARE DIM WITH ENGINE RUNNING ABOVE IDLE.	1. Charging system output too low.	1. Test and repair charging system, refer to Electrical, Wiring Information.
	2. Poor lighting circuit Z343/Z344-ground.	2. Test for voltage drop across Z343/Z344-ground locations, refer to Electrical, Wiring Information.
	3. High resistance in headlamp circuit.	3. Test amperage draw of headlamp circuit.
HEADLAMPS FLASH RANDOMLY	1. Poor lighting circuit Z343/Z344-ground.	1. Test for voltage drop across Z343/Z344-ground locations, refer to Electrical, Wiring Information.
	2. Variable resistance in headlamp circuit.	2. Test amperage draw of headlamp circuit.
	3. Loose or corroded terminals or splices in circuit.	3. Inspect and repair all connectors and splices, refer to Electrical, Wiring Information.
	4. Faulty headlamp switch.	4. Replace headlamp switch.
HEADLAMPS DO NOT ILLUMINATE.	1. No voltage to headlamps.	1. Repair open headlamp circuit, refer to Electrical, Wiring Information.
	2. No Z343/Z344-ground at headlamps.	2. Repair circuit ground, refer to Electrical, Wiring Information.
	3. Broken connector terminal or wire splice in headlamp circuit.	3. Repair connector terminal or wire splice.
	4. Faulty or burned out bulb.	4. Replace headlamp bulb(s).
	5. Body Control Module malfunction.	5. Refer to appropriate Body Control Module diagnostics.
	6. PCI Bus Communication	6. Verify messages being transmitted by BCM and received by FCM.
	7. IPM/FCM Malfunction.	7. Refer to appropriate IPM/FCM diagnostics.
HEADLAMPS ON WITH IGNITION IN RUN, WITH HEADLAMP SWITCH OFF.	1. Faulty headlamp switch.	1. Replace headlamp switch (review BCM logged faults).
	2. Diagnostic tool indicates (4.7 - 5.0V) on headlamp switch input to BCM.	2. Inspect and repair terminals, connectors and open circuits.
	3. PCI Bus Communication.	3. Verify messages being transmitted by BCM and received by FCM.

HEADLAMP (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove headlamp unit retaining screws.
(3) Remove headlamp unit to expose back of unit.
(4) Remove wiring connector from bulb.
(5) Rotate headlamp bulb retaining ring counter-clockwise.

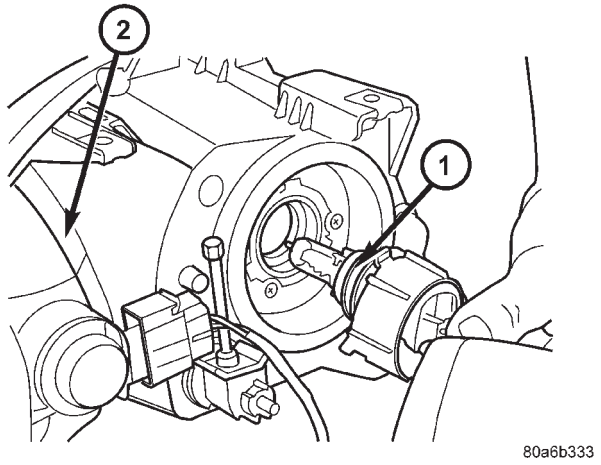

Fig. 12 HEADLAMP

1 - HEADLAMP
2 - HEADLAMP UNIT

(6) Pull headlamp bulb and remove from headlamp unit (Fig. 12).

INSTALLATION

(1) Install headlamp bulb to the headlamp unit.
(2) Install headlamp bulb retaining ring.
(3) Connect wiring connector to bulb.
(4) Install the headlamp unit.
(5) Install headlamp unit retaining screws.
(6) Reconnect the battery negative cable.

HEADLAMP - EXPORT

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the headlamp unit.
(3) Remove the cover (high beam lamp) or rubber boot (low beam lamp) to access bulbs (Fig. 13).

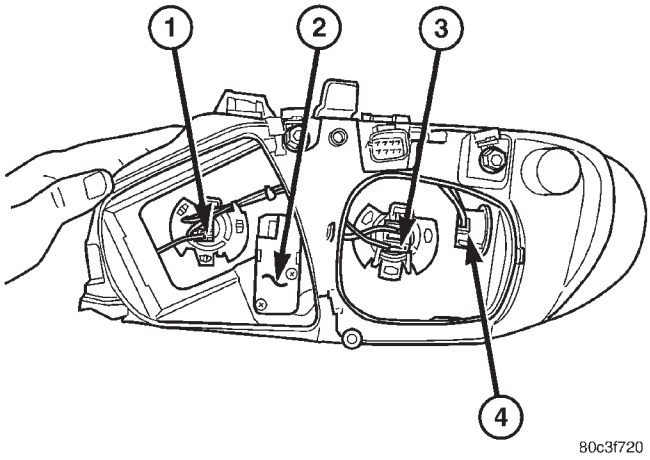

Fig. 13 HEADLAMP UNIT

1 - HIGH BEAM LAMP
2 - HEADLAMP LEVELING MOTOR
3 - LOW BEAM LAMP
4 - TURN LAMP

(4) Disconnect the wire harness connector.
(5) Disengage spring clip from headlamp.
(6) Pull headlamp bulb from back of headlamp unit.

INSTALLATION

(1) Insert headlamp bulb into headlamp unit.
(2) Engage spring clip to headlamp.
(3) Connect wire harness connector.
(4) Install the cover (high beam lamp) or rubber boot (low beam lamp) to headlamp unit.
(5) Install the headlamp unit.
(6) Connect the battery negative cable.

HEADLAMP LEVELING MOTOR - EXPORT

DIAGNOSIS AND TESTING - HEADLAMP LEVELING MOTOR - EXPORT

HEADLAMP LEVELING MOTOR DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE MOTOR DOES NOT OPERATE.	1. Poor electrical connection at motor	1. Check for proper electrical connection at motor
	2. No voltage at motor	2. Repair no voltage condition. Refer to Wiring Diagrams
	3. No ground at motor	3. Repair no ground condition. Refer to Wiring Diagrams
	4. Defective motor	4. Replace leveling motor
BOTH MOTORS DO NOT OPERATE	1. No voltage at or from headlamp leveling switch	1. Repair no voltage condition. Check for proper headlamp leveling switch operation
	2. No voltage at leveling motors	2. Repair no voltage condition. Refer to Wiring Diagrams
	3. No ground at leveling motors	3. Repair no ground condition. Refer to Wiring Diagrams
	4. Both motors defective	4. Replace both motors

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove headlamp unit.
(3) Disconnect electrical connector from headlamp leveling motor.
(4) Remove the two mounting screws.
(5) Gently pry motor from headlamp unit (Fig. 14).

INSTALLATION

(1) Press motor into position.
(2) Install the two mounting screws.
(3) Connect the electrical connector to motor.
(4) Install the headlamp unit.
(5) Connect the battery negative cable.

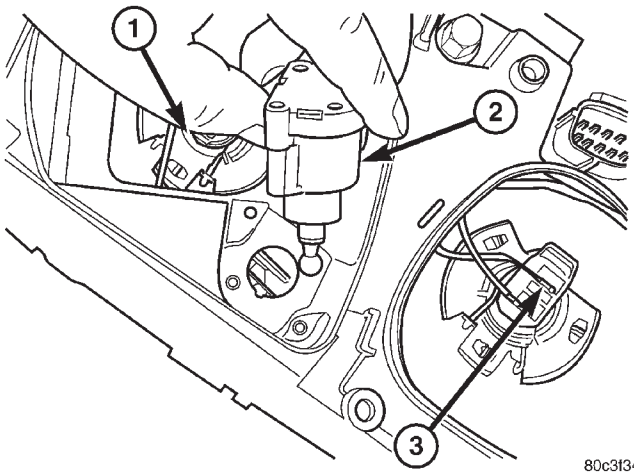

Fig. 14 HEADLAMP LEVELING MOTOR - EXPORT

1 - HIGH BEAM HEADLAMP
2 - HEADLAMP LEVELING MOTOR
3 - LOW BEAM HEADLAMP

HEADLAMP LEVELING SWITCH - EXPORT

DESCRIPTION

Some vehicles are equipped with a remote headlamp leveling system. This system allows the driver to adjust the vertical headlamp aim from the interior of the vehicle to compensate for passenger or cargo load.

The headlamp leveling switch is located next to the headlamp switch on the instrument panel (Fig. 15). If the headlamp leveling switch is faulty or damaged, the headlamp switch must be replaced.

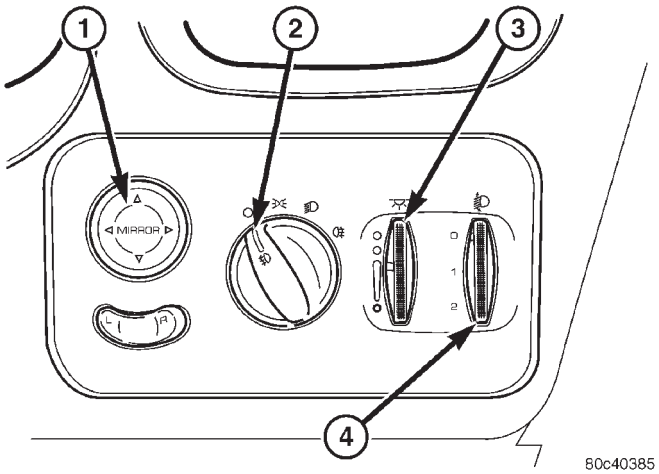

Fig. 15 HEADLAMP LEVELING SWITCH

1 - POWER MIRROR SWITCH
2 - HEADLAMP SWITCH
3 - INTERIOR DIMMER
4 - HEADLAMP LEVELING SWITCH

DIAGNOSIS AND TESTING - HEADLAMP LEVELING SWITCH - EXPORT

The headlamp leveling switch is located next to the headlamp switch on the instrument panel. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ HEADLAMP SWITCH - DIAGNOSIS AND TESTING) for diagnosis of the headlamp leveling switch. If the headlamp leveling switch is faulty, the headlamp switch must be replaced.

HEADLAMP SWITCH

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEADLAMP SWITCH

Using a Digital Multi-meter, perform the HEADLAMP SWITCH CONTINUITY test and refer to (Fig. 16).

If the Headlamp Switch is not within specifications replace the switch.

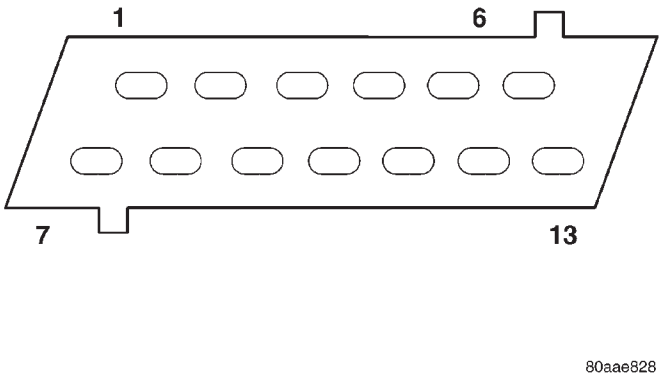

Fig. 16 HEADLAMP SWITCH CONNECTOR

HEADLAMP SWITCH CONTINUITY

HEADLAMP SWITCH POSITION	13 - WAY CONNECTOR TERMINAL	RESISTANCE
OFF	11 TO 6	3651 - 3729 Ω

0	1 TO 7 1 TO 2	3238 - 3456 Ω 3181 - 3400 Ω
1	1 TO 7	1195 - 1225 Ω
2	1 TO 7	746 - 765 Ω

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the Instrument Panel Lower Steering Column Cover. Refer to Body, Instrument Panel, Lower Steering Column Cover, Removal.

(3) Reach up behind the left side of the instrument panel and depress spring clip on top or bottom of headlamp switch. Firmly push out on the headlamp switch assembly.

(4) Disconnect the wiring connectors.

(5) Remove switch from vehicle.

INSTALLATION

(1) Connect the wiring connectors.

(2) Place headlamp switch assembly into position and firmly snap into place.

(3) Install the Instrument Panel Lower Steering Column Cover. Refer to Body, Instrument Panel, Lower Steering Column Cover, Installation.

(4) Connect the battery negative cable.

HEADLAMP UNIT

STANDARD PROCEDURE

STANDARD PROCEDURE - HEADLAMP UNIT ALIGNMENT

HEADLAMP UNIT ALIGNMENT PREPARATION

(1) Verify headlamp dimmer switch and high beam indicator operation.

(2) Inspect and correct damaged or defective components that could interfere with proper headlamp alignment.

HEADLAMP UNIT (Continued)

(3) Verify proper tire inflation.
(4) Clean headlamp lenses.
(5) Verify that luggage area is loaded as the vehicle is routinely used.
(6) Fuel tank should be FULL. Add 2.94 kg (6.5 lbs.) of weight over the fuel tank for each estimated gallon of missing fuel.

ALIGNMENT SCREEN PREPARATION

(1) Position vehicle on a level surface perpendicular to a flat wall 7.62 meters (25 ft.) away from front of headlamp lens (Fig. 18).
(2) If necessary, tape a line on the floor 7.62 meters (25 ft.) away from and parallel to the wall.
(3) Rock vehicle side-to-side three times and allow suspension to stabilize.
(4) Jounce front suspension three times by pushing downward on front bumper and releasing.
(5) Measure the distance from the center of headlamp lens to the floor. Transfer measurement to the alignment screen (with tape). Use this line for up/down adjustment reference.

Fig. 18 HEADLAMP ALIGNMENT SCREEN

1 - CENTER OF HEADLAMPS
2 - HEADLAMP BEAM
3 - FRONT OF HEADLAMP
4 - 7.62 METERS (25 FT.)

HEADLAMP UNIT (Continued)

HEADLAMP ADJUSTMENT

The low beam headlamp will project on the screen upper edge of the beam (cut-off) at the horizontal lamp centerline ± 50 mm (2 in.). Horizontal aim is preset and can not be adjusted. The high beam pattern should be correct when the low beams are aligned properly (Fig. 19). To adjust headlamp vertical alignment, rotate adjustment screw to achieve the specified low beam cut-off location.

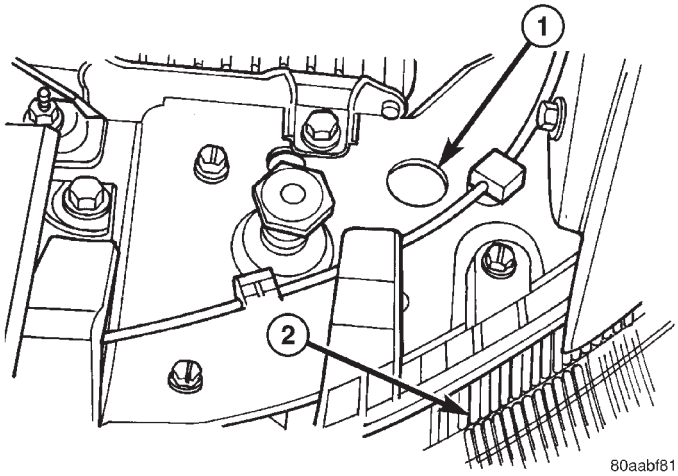

Fig. 19 HEADLAMP ADJUSTMENT

1 - ADJUSTMENT LOCATION
2 - HEADLAMP UNIT

STANDARD PROCEDURE - HEADLAMP UNIT ALIGNMENT - EXPORT

HEADLAMP UNIT ALIGNMENT PREPARATION

(1) Verify headlamp dimmer switch and high beam indicator operation.

(2) Verify that the headlamp leveling switch is in the “0” position.

(3) Inspect and correct damaged or defective components that could interfere with proper headlamp alignment.

(4) Verify proper tire inflation.

(5) Clean headlamp lenses.

(6) Verify that luggage area is loaded as the vehicle is routinely used.

(7) Fuel tank should be FULL. Add 2.94 kg (6.5 lbs.) of weight over the fuel tank for each estimated gallon of missing fuel.

ALIGNMENT SCREEN PREPARATION

(1) Position vehicle on a level surface perpendicular to a flat wall 10 meters (32.8 ft.) away from front of headlamp lens (Fig. 20).

(2) If necessary, tape a line on the floor 10 meters (32.8 ft.) away from and parallel to the wall.

(3) Rock vehicle side-to-side three times and allow suspension to stabilize.

(4) Jounce front suspension three times by pushing downward on front bumper and releasing.

(5) Measure the distance from the center of headlamp lens to the floor. Transfer measurement to the alignment screen (with tape). Use this line for up/down adjustment reference.

HEADLAMP UNIT ADJUSTMENT

The low beam headlamp will project on the screen upper edge of the beam (cut-off) at the horizontal lamp centerline ± 20 mm (0.75 in.). The high beam pattern should be correct when the low beams are aligned properly (Fig. 21). To adjust headlamp alignment, rotate adjustment screws to achieve the specified low beam cut-off location.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the three retaining screws (Fig. 22).

(3) Disconnect the wiring harness from the bulbs (Fig. 23).

(4) Remove wire harness retainer from back of headlamp unit.

(5) Remove the headlamp unit.

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove two screws (Fig. 24).

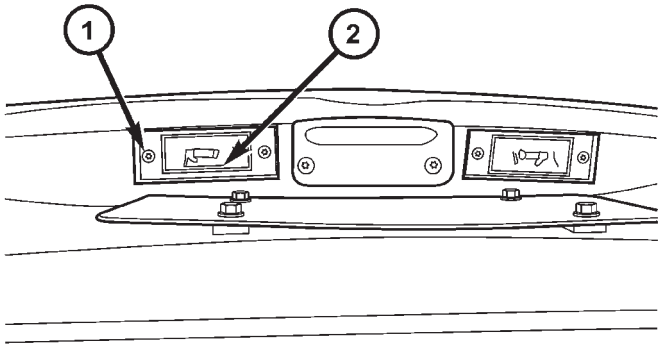

Fig. 24 LICENSE PLATE LAMP UNITS

1 - SCREW
2 - LICENSE PLATE LAMP

(3) Twist bulb socket and remove (Fig. 25).
(4) Pull bulb from socket.

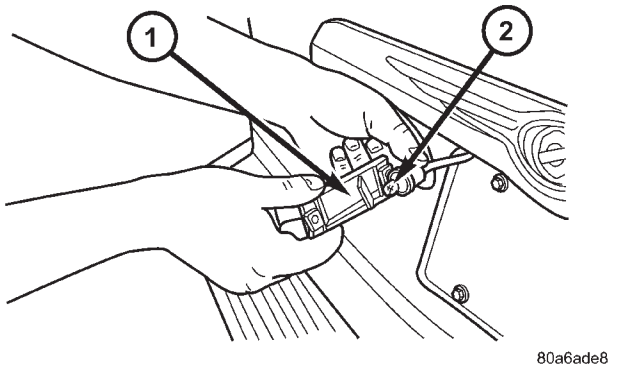

Fig. 25 LICENSE PLATE LAMP - REMOVE/INSTALL

1 - LICENSE PLATE LAMP UNIT
2 - BULB

INSTALLATION

(1) Push bulb into socket.
(2) Install socket into lamp.
(3) Install two screws.
(4) Reconnect the battery negative cable.

MULTI-FUNCTION SWITCH

DESCRIPTION - TURN SIGNAL SYSTEM

The turn signals are actuated with a lever on Multi-Function Switch, located on the left side of the steering wheel. The signals are automatically turned off by a canceling cam (two lobes molded to the clock spring mechanism). The cam comes in contact with the cancel actuator on the turn signal (multi-function) switch assembly. Either cam lobe, pushing on the cancel actuator, returns the switch to the OFF position. The multi-function switch is a resistive MUX switch that feeds inputs to the BCM.

OPERATION - TURN SIGNAL SYSTEM

Lane change signaling is actuated by applying partial turn signal stalk movement toward the direction desired until the indicator lamps flashes in the instrument cluster. When the switch stalk is released the stalk will spring back into the neutral position turning OFF the turn signal.

With the ignition switch ON and the turn signal switch stalk actuated left or right, current flows through the:

- Multi-function switch
- Body Control Module
- Integrated Power Module (IPM)
- Turn indicator lamp
- Front and rear turn signal bulbs.

A chime will sound after the vehicle has traveled a distance of approximately 1.0 mile and a speed of 15 mph, with the turn signal ON.

MULTI-FUNCTION SWITCH (Continued)

DIAGNOSIS AND TESTING - MULTI-FUNCTION SWITCH

To test turn signal, headlamp beam select and optical horn portion of the multi-function switch:

(1) Remove the multi-function switch, refer to Electrical, Lamps/Lighting - Exterior, Multi-Function Switch, Removal, and Installation.

(2) Using an ohmmeter check the resistance readings between multi-function switch pins. Refer to Wiring Diagrams for proper pin numbers and the MULTI-FUNCTION SWITCH RESISTANCE table.

MULTI-FUNCTION SWITCH RESISTANCE

SWITCH POSITION	PIN NUMBER	RESISTANCE
LEFT	2 AND 3	1.7 Ω ± 5%
RIGHT	2 AND 3	1K Ω ± 5%
OPTICAL HORN	1 AND 3	4.87K Ω ± 5%
HI BEAM	1 AND 3	2.32K Ω ± 5%

REMOVAL

(1) Disconnect and isolate battery negative cable.

(2) Remove upper and lower steering column shrouds. Refer to Steering, Column, Shroud, Removal.

(3) Disconnect wire connector from back of multi-function switch.

(4) Remove screws holding multi-function switch to steering column adapter collar.

(5) Remove the multi-function switch.

INSTALLATION

(1) Position the switch on to the steering column.

(2) Install the two retaining screws.

(3) Connect the wire harness connector.

(4) Install the upper and lower steering column shrouds. Refer to Steering, Column, Shroud, Installation.

(5) Connect the battery negative cable.

PARK/TURN SIGNAL LAMP

REMOVAL

(1) Disconnect and isolate battery negative cable.

(2) Remove headlamp retaining screws.

(3) Twist socket counter - clockwise and remove (Fig. 26).

(4) Pull bulb from socket.

INSTALLATION

(1) Push bulb into socket.

(2) Twist socket into headlamp.

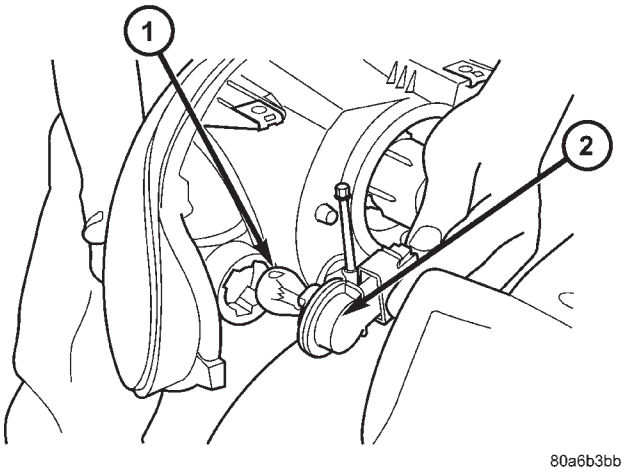

Fig. 26 PARK/TURN SIGNAL LAMP

1 - PARK/TURN SIGNAL LAMP
2 - LAMP SOCKET

(3) Install headlamp retaining screws.

(4) Reconnect battery negative cable.

PARK/TURN SIGNAL LAMP - EXPORT

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the headlamp unit.

(3) Twist bulb socket and remove from headlamp unit (Fig. 27).

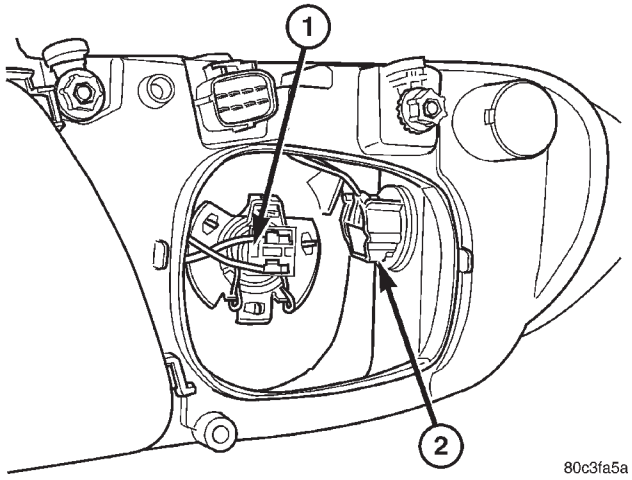

Fig. 27 PARK/TURN SIGNAL LAMP

1 - LOW BEAM HEADLAMP
2 - PARK/TURN SIGNAL LAMP

(4) Twist bulb and remove from bulb socket.

PARK/TURN SIGNAL LAMP - EXPORT (Continued)

INSTALLATION

(1) Install bulb to bulb socket.
(2) Install bulb socket to headlamp unit.
(3) Install headlamp unit.
(4) Connect battery negative cable.

REAR FOG LAMP - EXPORT

DESCRIPTION

The rear fog lamps are incorporated into the tail lamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - REMOVAL) for service procedures.

REPEATER LAMP - EXPORT

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Push the side repeater lamp to one side and release retaining tab.
(3) Pull side repeater lamp out and disengage bulb socket from lamp.
(4) Depress, then rotate and pull bulb from socket.

INSTALLATION

(1) Install bulb to socket.
(2) Push lamp socket into the side repeater lamp.
(3) Position side repeater lamp to hole in fender.
(4) Push side repeater lamp to one side and seat retaining tab into fender.
(5) Connect battery negative cable.

TAIL LAMP

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the tail lamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - REMOVAL).
(3) Squeeze the tabs on the bulb socket and remove from tail lamp unit (Fig. 28).
(4) Pull bulb from lamp socket.

INSTALLATION

(1) Push bulb into the lamp socket.
(2) Install bulb socket into the tail lamp unit. Ensure that both retaining tabs engage with an audible click.
(3) Install the tail lamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - INSTALLATION).

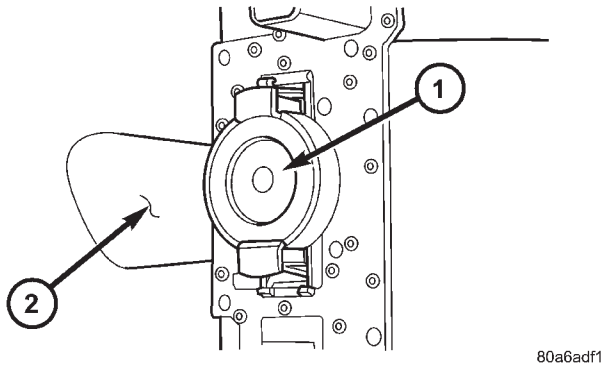

Fig. 28 TAIL LAMP SOCKET

1 - LAMP SOCKET
2 - TAIL LAMP UNIT

(4) Reconnect the battery negative cable.

TAIL LAMP - EXPORT

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the tail lamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - REMOVAL).
(3) Squeeze the tabs on housing retaining the bulbs and remove from the tail lamp unit (Fig. 29).

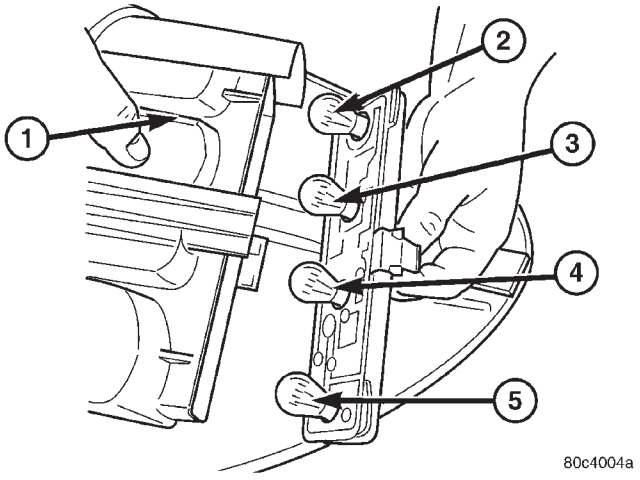

Fig. 29 TAIL LAMP BULBS

1 - TAIL LAMP UNIT
2 - BRAKE/PARK LAMP
3 - TURN SIGNAL LAMP
4 - BACK UP LAMP
5 - REAR FOG LAMP

(4) Remove bulbs by depressing, then turning counter-clockwise.

TAIL LAMP - EXPORT (Continued)

INSTALLATION

(1) Install bulbs by turning clockwise.
(2) Install housing to tail lamp unit.
(3) Install the tail lamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - INSTALLATION).
(4) Connect the battery negative cable.

TAIL LAMP UNIT

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Raise the liftgate.
(3) Remove the two retaining fasteners by prying under the head of the fastener with a flat bladed tool (Fig. 30).

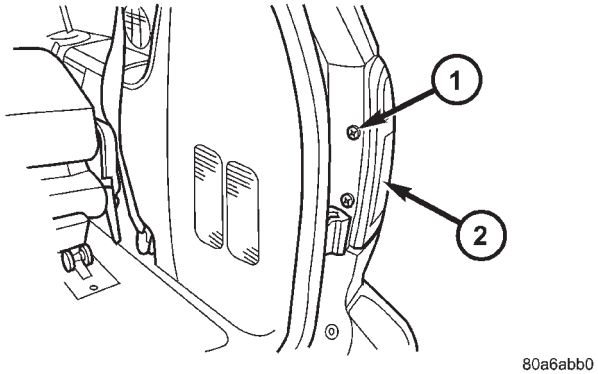

Fig. 30 TAIL LAMP UNIT FASTENERS

1 - TAIL LAMP UNIT FASTENER
2 - TAIL LAMP UNIT

(4) Disengage hook attaching forward end of lamp to quarter panel opening.
(5) Disconnect wire harness connector from tail lamp unit by sliding the red lock, then pressing release tab (Fig. 31).

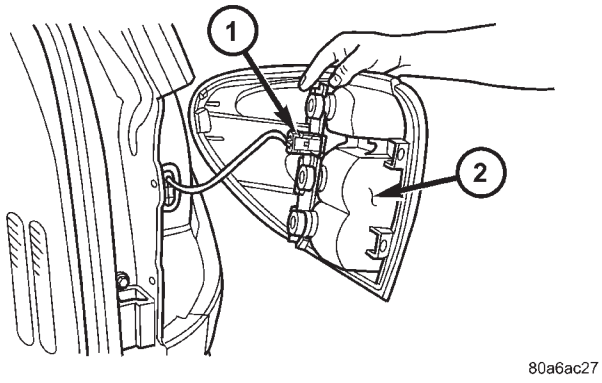

Fig. 31 TAIL LAMP UNIT - REMOVE/INSTALL

1 - WIRE HARNESS CONNECTOR
2 - TAIL LAMP UNIT

INSTALLATION

(1) Reconnect wire harness connector to the tail lamp. Slide lock into position.
(2) Place lamp into position on quarter panel.
(3) Engage hook attaching forward end of lamp to quarter panel.
(4) Insert the two retaining fasteners by pressing into position. Ensure that the head of the fastener is open before inserting.
(5) Close the liftgate.
(6) Reconnect the battery negative cable.

CENTER CONSOLE LAMP SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Open console lid and remove tray.
(3) Using a flat bladed tool, pry up on the switch.
(4) Remove bulb from switch.

INSTALLATION

(1) Install bulb into switch.
(2) Push switch into console opening.
(3) Install tray and close lid.
(4) Connect battery negative cable.

CLUSTER ILLUMINATION LAMPS

REMOVAL

(1) Remove the Instrument Cluster. Refer to Electrical, Instrument Cluster, Removal.
(2) Turn over cluster and expose the illumination bulb sockets.
(3) Identify which bulb is defective and twist it out of the cluster using a counterclockwise motion.

INSTALLATION

(1) Install the new bulb socket into the cluster using a clockwise motion.
(2) Install the Instrument Cluster. Refer to Electrical, Instrument Cluster, Installation.

COURTESY LAMP

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Using a trim stick, pry lamp from door panel (Fig. 1).
(3) Disconnect wire harness from the lamp.
(4) Remove lens from the lamp and remove bulb.

INSTALLATION

(1) Install bulb and lens to lamp.
(2) Reconnect wire harness to lamp.
(3) Press lamp into the door panel.
(4) Reconnect battery negative cable.

DOME LAMP

REMOVAL

(1) Disconnect and isolate the battery negative cable.

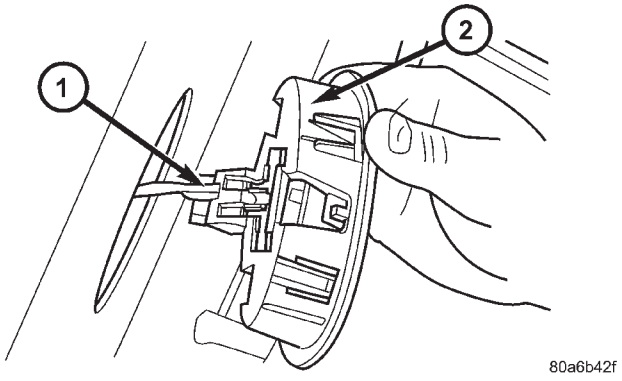

Fig. 1 COURTESY LAMP

1 - WIRE HARNESS
2 - COURTESY LAMP

(2) Using a flat bladed tool, pry off the lamp lens.
(3) Remove bulb from lamp.

INSTALLATION

(1) Install bulb to lamp.
(2) Press lens into place.
(3) Connect battery negative cable.

GLOVE BOX LAMP SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Open glove box door.
(3) Push switch through from behind (Fig. 2).

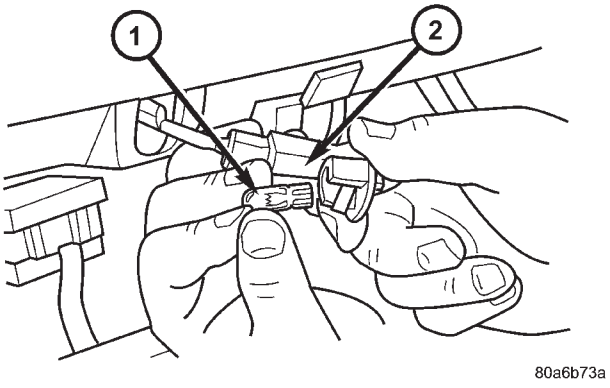

Fig. 2 GLOVE BOX LAMP/SWITCH

1 - GLOVE BOX BULB
2 - GLOVE BOX LAMP SWITCH

(4) Disconnect wire harness from switch.
(5) Pull bulb from switch.

GLOVE BOX LAMP SWITCH (Continued)

INSTALLATION

(1) Push bulb into switch.
(2) Connect wire harness to switch.
(3) Push switch into instrument panel.
(4) Close glove box door.
(5) Reconnect the battery negative cable.

LIFTGATE LAMP

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Using a flat bladed tool, pry lamp from trim panel (Fig. 3).

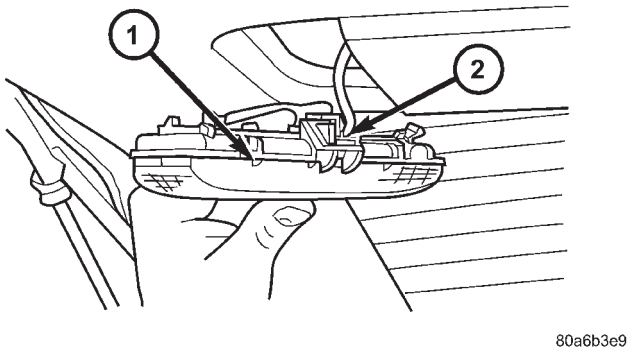

Fig. 3 LIFTGATE LAMP

1 - LIFTGATE LAMP
2 - WIRE HARNESS

(3) Disconnect wire harness connector from lamp.
(4) Pry off lens and remove bulb.

INSTALLATION

(1) Install bulb and snap lens into place.
(2) Reconnect wire harness connector to lamp.
(3) Position lamp onto trim panel and snap into place.
(4) Reconnect battery negative cable.

READING LAMP

REMOVAL

The front reading lamps are incorporated into the overhead console. If the reading lamps require replacement, the overhead console must be replaced. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL). The rear reading lamps are incorporated into the assist handle. If the rear reading lamps require replacement, the assist handle must be replaced. (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL). The bulbs can be serviced separately.

(1) Disconnect and isolate the battery negative cable.
(2) Using a flat bladed tool, pry off the lamp lens (Fig. 4), (Fig. 5).

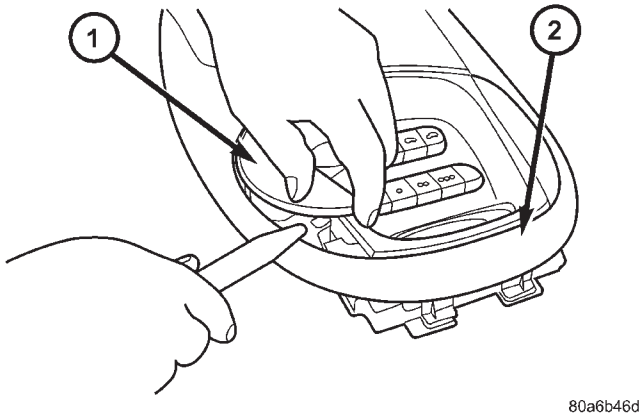

Fig. 4 OVERHEAD CONSOLE

OVERHEAD CONSOLE

DESCRIPTION

Three overhead consoles are available on RS/RG models. These are the Electronic Vehicle Information Center (EVIC), Compass Mini-Trip Computer (CMTC) or a Compass Temperature Computer (CT). All consoles are equipped with two reading/courtesy lamps and if the vehicle is equipped with a power liftgate or power sliding door(s) the overhead console will also include command switches for these features. The overhead console is mounted with one screw and two snap clips to a molded plastic retainer bracket located above the headliner.

DESCRIPTION - COMPASS

All the available overhead consoles on this model include Compass information. While in the compass/ temperature mode, the compass will display the direction in which the vehicle is pointed using the eight major compass headings (Examples: north is N, northeast is NE). The self-calibrating compass unit requires no adjusting in normal use. The only calibration that may prove necessary is to drive the vehicle in three complete circles at 5 to 8 kilometers-per-hour (3 to 5 miles-per-hour), on level ground, in not less than forty-eight seconds. This will reorient the compass unit to its vehicle.

The compass unit also will compensate for magnetism the body of the vehicle may acquire during normal use. However, avoid placing anything magnetic directly on the roof of the vehicle. Magnetic mounts for an antenna, a repair order hat, or a funeral procession flag can exceed the compensating ability of the compass unit if placed on the roof panel. Magnetic bit drivers used on the fasteners that hold the overhead console assembly to the roof header can also affect compass operation. If the vehicle roof should become magnetized, the demagnetizing and calibration procedures found in this section may be required to restore proper compass operation.

DESCRIPTION - TEMPERATURE

All the available overhead consoles on this model include Temperature information. The temperature displays the outside ambient temperature in whole degrees. The temperature display can be toggled

OVERHEAD CONSOLE (Continued)

from Fahrenheit to Celsius by selecting the desired U.S./Metric option from the customer programmable features. The displayed temperature is not an instant reading of conditions, but an average temperature. It may take the temperature display several minutes to respond to a major temperature change, such as driving out of a heated garage into winter temperatures.

When the ignition switch is turned to the Off position, the last displayed temperature reading stays in the electronic control modules (CT, CMTC, EVIC) memory. When the ignition switch is turned to the On position again, the electronic module will display the memory temperature for one minute; then update the display to the current average temperature reading within five minutes.

The temperature function is supported by an ambient temperature sensor. The sensor is mounted outside the passenger compartment near the front and center of the vehicle, and is hard wired to the Front Control Module (FCM). The FCM sends temperature status messages to the module over the J1850 PCI data bus circuit.

Following are general descriptions of the major components used in the overhead console. Refer to Wiring Diagrams for complete circuit schematics.

OPERATION

Refer to the vehicle Owner's Manual for specific operation of each overhead console and its systems.

DIAGNOSIS AND TESTING - OVERHEAD CONSOLE

If the problem with the overhead console is an inaccurate or scrambled display, refer to **Self-Diagnostic Test** below. If the problem with the overhead console is incorrect Vacuum Fluorescent Display (VFD) dimming levels, use a DRB III® scan tool and the proper Diagnostic Procedures manual to test for the correct dimming message inputs being received from the Body Control Module (BCM) or Front Control Module (FCM) over the J1850 Programmable Communications Interface (PCI) data bus circuit. If the problem is a no-display condition, use the following procedures. For complete circuit diagrams, refer to **Overhead Console** in the Wiring Diagrams section of the service manual.

(1) Check the fused B(+) fuse in the integrated power module. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the integrated power module. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the fused B(+) fuse in the integrated power module as required.

(3) Check the fused ignition switch output (run/start) fuse in the integrated power module. If OK, go to Step 4. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(4) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) fuse in the integrated power module. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (run/start) circuit to the ignition switch as required.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the overhead console. Check for continuity between the ground circuit cavity of the roof wire harness connector for the electronics module and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the roof wire harness connector for the electronics module. If OK, go to Step 7. If not OK, repair the open fused B(+) circuit to the fused B(+) fuse in the integrated power module as required.

(7) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the roof wire harness connector for the electronics module. If OK, refer to **Self-Diagnostic Test** later this group for further diagnosis of the electronics module and the J1850 PCI data bus circuit. If not OK, repair the open fused ignition switch output (run/start) circuit to the fuse in the integrated power module as required.

SELF-DIAGNOSTIC TEST

A self-diagnostic test is used to determine that the electronics module is operating properly, and that all the J1850 PCI data bus messages are being received for initial operation. Initiate the self-diagnostic test as follows:

(1) With the ignition switch in the Off position, on Electronic Vehicle Information Center (EVIC) and Compass Mini-Trip Computer (CMTC) equipped vehicles simultaneously depress and hold the **STEP and the RESET buttons**. On Compass Temperature Module (CT) equipped vehicles depress the **C/T and the US/M push buttons**.

(2) Turn the ignition switch to the On position.

(3) Following completion of these tests, the electronics module will display one of the following messages:

a. **Pass Self Test (EVIC only), PASS (CT, CMTC)** - The electronics module is working properly.

b. **Failed Self Test (EVIC only), FAIL (CT, CMTC)** - The electronics module has an internal fail-

OVERHEAD CONSOLE (Continued)

ure. The electronics module is faulty and must be replaced.

c. **Failed J1850 Communication (EVIC only), BUS (CT, CMTC)** - The electronics module is not receiving proper message input through the J1850 PCI data bus circuit. This can result from one or more faulty electronic modules in the vehicle, or from a faulty PCI data bus. The use of a DRB III® scan tool and the proper Diagnostic Procedures manual are required for further diagnosis.

NOTE: If the compass functions, but accuracy is suspect, it may be necessary to perform a variation adjustment. This procedure allows the compass unit to accommodate variations in the earth's magnetic field strength, based on geographic location. Refer to Compass Variation Adjustment in the Service Procedures section of this group.

NOTE: If the compass reading displays dashes, and only "CAL" appears in the display, demagnetizing may be necessary to remove excessive residual magnetic fields from the vehicle. Refer to Compass Demagnetizing in the Service Procedures section of this group.

STANDARD PROCEDURE

STANDARD PROCEDURE - READING/ COURTESY LAMP REPLACEMENT

(1) Open hood, disconnect and isolate the negative battery cable remote terminal from the remote battery post.

(2) Remove the reading/courtesy lamp lens. Using a trim stick, gently pry the forward edge of the reading/courtesy lamp lens outward.

(3) Remove the reading/courtesy lamp socket from the overhead console. Rotate the reading/courtesy lamp socket one quarter turn counter clockwise.

(4) Remove the lamp and socket assembly.

(5) Reverse the above procedure to install.

STANDARD PROCEDURE - COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not use magnetic tools when servicing the overhead console.

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or out of calibration, perform the following calibration procedure. Also, new service replacement Electronic Modules (EVIC, CMTC, CT) must have their compass calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

NOTE: Whenever the compass is calibrated manually, the variance number must also be reset. Refer to Compass Variation Adjustment in this group.

Calibrate the compass manually as follows:

(1) Turn the ignition switch to the On position. If the compass/thermometer data is not currently being displayed, momentarily depress and release the C/T push button to reach the compass/thermometer display.

(2) On Electronic Vehicle Information Center (EVIC) and Compass Mini-Trip Computer (CMTC) equipped vehicles depress the Reset push button and hold the button down until "CAL" appears in the display. This takes about ten seconds, and appears about five seconds after "VAR = XX" is displayed. On Compass Temperature Module (CT) equipped vehicles depress the C/T push button and US/M push button down until "CAL" appears in the display. This takes about ten seconds, and appears about five seconds after "VAR = XX" is displayed.

(3) Release the push button(s).

(4) Drive the vehicle on a level surface, away from large metal objects and power lines, through three or more complete circles at between five and eight kilometers-per-hour (three and five miles-per-hour) in not less than 48 seconds. The "CAL" message will disappear from the display to indicate that the compass is now calibrated.

NOTE: If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the unit is faulty. Repeat the calibration procedure one more time.

NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the calibration procedure in another location.

OVERHEAD CONSOLE (Continued)

STANDARD PROCEDURE - COMPASS DEMAGNETIZING

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the overhead console forward mounting screw and the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

To demagnetize the roof panel and the overhead console forward mounting screw, proceed as follows:

(1) Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.

(2) Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.

(3) Slowly approach the head of the overhead console forward mounting screw with the degaussing tool connected.

(4) Contact the head of the screw with the plastic coated tip of the degaussing tool for about two seconds.

(5) With the degaussing tool still energized, slowly back it away from the screw. When the tip of the tool is at least 61 centimeters (2 feet) from the screw head, disconnect the tool.

(6) Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header (Fig. 1). The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.

(7) Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.

(8) Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.

(9) Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) back from the windshield header.

(10) With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.

(11) Calibrate the compass and adjust the compass variance (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - STANDARD PROCEDURE).

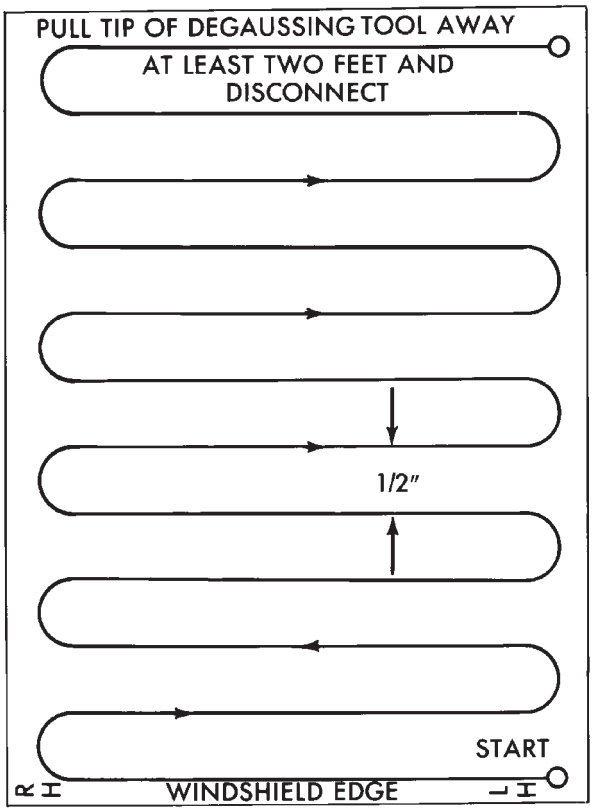

Fig. 1 Roof Demagnetizing Pattern

STANDARD PROCEDURE - COMPASS VARIATION ADJUSTMENT

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance setting may need to be changed.

To set the compass variance:

(1) Using the Variance Settings map, find your geographic location and note the zone number (Fig. 2).

(2) Turn the ignition switch to the On position. If the compass/thermometer data is not currently being displayed, momentarily depress and release the C/T push button to reach the compass/thermometer display.

(3) On Electronic Vehicle Information Center (EVIC) and Compass Mini-Trip Computer (CMTC) equipped vehicles depress the Reset push button and hold the button down until “VAR = XX” appears in the display. This takes about five seconds. On Compass Temperature Module (CT) equipped vehicles depress the C/T push button and US/M push button

OVERHEAD CONSOLE (Continued)

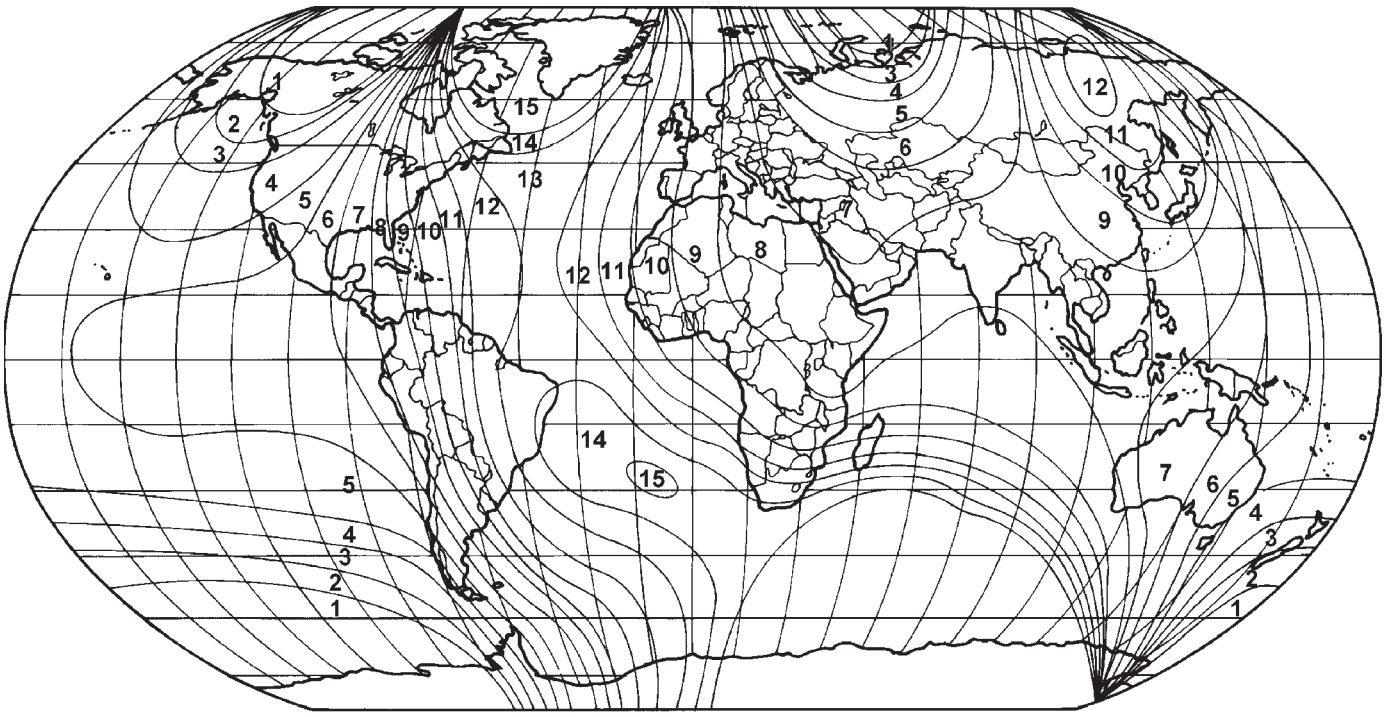

Fig. 2 Variance Settings

down until “VAR = XX” appears in the display. This takes about five seconds.

(4) Release the push button(s). “VAR =XX ” will remain in the display. “XX” equals the current variance zone setting.

(5) On Electronic Vehicle Information Center (EVIC) and Compass Mini-Trip Computer (CMTC) equipped vehicles momentarily depress and release the **Step push button** to step through the zone numbers, until the zone number for your geographic location appears in the display. On Compass Temperature Module (CT) equipped vehicles depress the **US/M push button** to step through the zone numbers, until the zone number for your geographic location appears in the display.

(6) On Electronic Vehicle Information Center (EVIC) and Compass Mini-Trip Computer (CMTC) equipped vehicles momentarily depress and release the **Reset push button** to enter the displayed zone number into the EVIC/CMTC module memory. On Compass Temperature Module (CT) equipped vehicles depress the **C/T push button** to enter the displayed zone number into the electronic module memory.

(7) Confirm that the correct directions are now indicated by the compass.

REMOVAL - OVERHEAD CONSOLE

(1) Disconnect and isolate the remote negative battery cable.

(2) Remove the overhead console retaining screw, located in the front of console.

(3) Using your fingertips, grasp the sides of the overhead console and pull straight down evenly to disengage the two snap clips at the rear of the unit.

(4) Lower the overhead console far enough to access the wire harness connectors.

(5) Disconnect the EVIC, CMTC or CT electronic module and the reading/courtesy lamps electrical connector.

(6) Remove the overhead console from the vehicle.

INSTALLATION

(1) Position the overhead console in the vehicle.

(2) Connect the EVIC, CMTC or CT electronic module and the reading/courtesy lamps electrical connector.

(3) Using your fingertips, grasp the sides of the overhead console and push straight up evenly to engage the two snap clips at the rear of the unit.

CAUTION: DO NOT PRESS ON THE SUNGLASS STORAGE BIN DOOR. DAMAGE TO THE DOOR MAY RESULT.

(4) Install the overhead console retaining screw, located in the front of console. Torque the screw to 1.2 N·m (10 in. lbs.).

(5) Connect the remote negative battery cable.

ELECTRONIC VEHICLE INFO CENTER

DESCRIPTION

The Electronic Vehicle Information Center (EVIC) is a module located in the overhead console on some models. The EVIC module features a large Vacuum Fluorescent Display (VFD) screen for displaying information, and back-lit push button switches labeled C/T (compass/thermometer), RESET, STEP, and MENU.

The EVIC module contains a central processing unit and interfaces with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) J1850 data bus circuit. The PCI data bus circuit allows the sharing of sensor information. This helps to reduce wire harness complexity, reduce internal controller hardware, and reduce component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities.

The EVIC "Menu" push button provides the vehicle operator with a user interface, which allows the selection of several optional customer programmable electronic features to suit individual preferences. Refer to **ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING** in the Service Procedures section of this group for more information on the customer programmable feature options.

If the vehicle is equipped with the optional universal transmitter transceiver, the EVIC will also display messages and an icon indicating when the universal transmitter transceiver is being trained, which of the three transmitter buttons is transmitting, and when the transceiver is cleared.

Data input for all EVIC functions, including VFD dimming level, is received through the J1850 PCI data bus circuit. The EVIC module uses its internal programming and all of its data inputs to calculate and display the requested data. If the data displayed is incorrect, perform the self-diagnostic tests as described in this group. If these tests prove inconclusive, the use of a DRBIII® scan tool and the proper Diagnostic Procedures manual are recommended for further testing of the EVIC module and the J1850 PCI data bus circuit.

The EVIC module cannot be repaired, and is available for service only as a unit. This unit includes the plastic module and display lens. If any of these components is faulty or damaged, the complete EVIC module must be replaced.

OPERATION

The EVIC has access to both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the On position. When the ignition switch is turned to the On position, the EVIC module VFD will return to the last function being displayed before the ignition was turned to the Off position.

The compass/thermometer display is the normal EVIC display. With the ignition switch in the On position, momentarily depressing and releasing the C/T (compass/thermometer) push button switch will cause the EVIC to return to the compass/thermometer/trip computer display mode from any other mode. While in the compass/thermometer/trip computer display mode, momentarily depressing and releasing the Step push button will step through the available trip computer display options.

The EVIC trip computer features several functions that can be reset. The functions that can be reset are: average fuel economy, trip odometer and elapsed time. With the ignition switch in the On position and with one of the functions of the trip computer that can be reset currently displayed, depressing the Reset push button twice within three seconds will perform a global reset, and all of the trip computer information that can be reset will be reset to zero. With the ignition switch in the On position and the function that is to be reset currently displayed, momentarily depressing and releasing the Reset push button once will perform a local reset, and only the value of the displayed function will be reset to zero. A global or local reset will only occur if the function currently displayed is a function that can be reset. The distance to service function can also be reset using the local reset method, but it will reset back to the Service Interval distance that is set in the EVIC programmable features mode. Refer to **ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING** in the Service Procedures section of this group for more information on setting the Service Interval.

For more information on the features, control functions and setting procedures for the EVIC module, see the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING - ELECTRONIC VEHICLE INFORMATION CENTER

Electronic Vehicle Information Center (EVIC) data is obtained from the Body Control Module (BCM) on the J1850 Data Bus circuit. The EVIC will display dashes (- -) for any of the screens it did not receive the bus messages. The label corresponding to the missing information will be lit. If no EVIC data is displayed, check the J1850 Data Bus circuit commu-

ELECTRONIC VEHICLE INFO CENTER (Continued)

nications and the BCM. If the brightness level is improper check the J1850 Data Bus circuit.

The DRB III® is recommended for checking the J1850 Data Bus circuit and the BCM. Perform the EVIC self diagnosis before replacing the EVIC module.

STANDARD PROCEDURE - ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING

EVIC PROGRAMMING MODE

Some vehicles are equipped with a Electronic Vehicle Information Center (EVIC) equipped overhead console. The Electronic Vehicle Information Center (EVIC) provides the vehicle operator with a user interface, which allows the selection of several optional customer programmable electronic features to suit individual preferences. The EVIC must be placed into its programming mode in order to view or change the programmable features. To enter the EVIC programming mode and to view or change the selected programmable features options, proceed as follows:

(1) Turn the ignition switch to the On position.

(2) Depress and release the Menu push button. The first item in the programmable features menu list will appear in the EVIC display.

(3) Momentarily depress and release the Menu push button to step through the programmable features list. Each programmable feature and its currently selected option will appear on the EVIC display in the sequence shown in the Programmable Features list that follows.

(4) Momentarily depress and release the Step push button to step through the available options for the programmable feature being displayed.

(5) The option that last appears in the display with a programmable feature before exiting the programming mode, becomes the newly selected programmable feature option.

(6) The EVIC exits the programming mode and returns to its normal operating mode when the C/T push button is depressed or when the end of the programmable features menu list is reached, whichever occurs first.

PROGRAMMABLE FEATURES

NOTE: TIRE PRESSURE MONITORING (TPM) SYSTEM INFORMATION IS NOT COVERED IN THIS SECTION OF THE SERVICE MANUAL. REFER TO THE TIRES/WHEELS SECTION OF THIS MANUAL FOR DETAILED TPM SYSTEM INFORMATION.

- **LANGUAGE?** - The options include English, Francaise, Deutsch, Italiana, or Espanol. The default is English. All EVIC display nomenclature, including the trip computer functions, warning messages and the programmable features appear in the selected language.
- **DISPLAY U.S. OR METRIC?** - The options include U.S. and M. The default is U.S. This feature toggles the trip computer temperature, fuel economy and odometer display readings between U.S. and metric units of measure. It also changes the odometer display in the instrument cluster.
- **SERVICE INTV. =** - The options include from 1000 to 12000 kilometers in 1000 kilometer increments (2000 to 7500 miles in 500 mile increments). The default is 12000 kilometers (7500 miles). The selected distance becomes the interval at which the Perform Service warning message will be displayed by the EVIC. If a new distance is selected, a second programmable feature appears, **RESET SERVICE DISTANCE?** - The options include No and Yes. The default is Yes. When Yes is selected, the accumulated distance since the last previous Perform Service warning message will be reset to zero because the service interval has been changed. When No is selected, the distance until the next Perform Service warning message is reduced by the accumulated distance since the last previous message.
- **USE FACTORY SETTINGS?** - The options include Yes and No. The default is Yes. When yes is selected all the programmable features will return to there defaults and the rest of the programmable features will not be displayed. If No is selected the rest of the programmable features will be displayed at there default values. This feature will automatically return to the Yes default under two conditions. First, if no programmable features are changed from there defaults. Second, if all the programmable features equal there defaults.
- **AUTO DOOR LOCKS?** - The options include Yes and No. The default is Yes. When Yes is selected, all doors and the liftgate lock automatically when vehicle speed reaches 25 kilometers-per-hour (15 miles-per-hour). If YES is selected, a second programmable feature appears, **AUTO UNLOCK ON EXIT?** - The options again include Yes and No. The default is No. When Yes is selected, following each Auto Door Lock event all doors and the liftgate will automatically unlock when the driver door is opened, if the vehicle is stopped and the transmission gear selector is in Park or Neutral. The Auto Door Unlock event will only occur once following each Auto Door Lock event.
- **REMOTE UNLOCK** - The options include Driver Door 1st and All Doors. The default is Driver Door 1st. When Diver Door 1st is selected, only the

ELECTRONIC VEHICLE INFO CENTER (Continued)

driver door unlocks when the Unlock button of the Remote Keyless Entry (RKE) transmitter is depressed once. The Unlock button of the RKE transmitter must be depressed twice to unlock all doors. When All Doors is selected, all doors unlock when the Unlock button of the RKE transmitter is depressed once.

- **REMOTE LINKED TO MEMORY?** - This programmable feature only applies to vehicles equipped with the optional memory / heated system. The options include Yes and No. The default is No. When Yes is selected, the memory system will recall the Driver 1 or Driver 2 memory settings assigned to the RKE transmitter being used to unlock the vehicle. When No is selected, the memory system will only recall memory settings when the Driver 1 or Driver 2 push buttons of the memory switch on the driver side front door trim panel are depressed.
- **SOUND HORN ON LOCK?** - The options include Yes and No. The default is No. When Yes is selected, a short horn chirp will provide an audible confirmation when the RKE receiver recognizes a valid Lock signal from an RKE transmitter. When No is selected, no horn chirp will occur with the RKE Lock event. This feature may be selected independent of the **FLASH LIGHTS WITH LOCKS?** programmable feature.
- **FLASH LIGHTS WITH LOCKS?** - The options include Yes and No. The default is Yes. When Yes is selected, a single flash of the hazard warning lamps will provide an optical confirmation when the RKE receiver recognizes a valid Lock signal from an RKE transmitter, and two flashes of the same lamps will occur when the RKE receiver recognizes a valid Unlock signal from an RKE transmitter. When No is selected, no lamp flash will occur with the RKE Lock or Unlock event. This feature may be selected independent of the **SOUND HORN ON LOCK?** programmable feature.
- **HEADLAMP DELAY =** - The options include Off, 30 Sec, 60 Sec, and 90 Sec. The default is 90 Sec. When a time interval is selected, the headlamps will remain on for that length of time when the headlamps are turned off after the ignition is turned off, or if the Auto mode is selected on vehicles with the Auto Headlamps option. When Off is selected, the headlamp delay feature is disabled.
- **HEADLAMPS ON WITH WIPERS?** - This programmable feature only applies to vehicles equipped with the optional Auto Headlamps. The options include Yes and No. The default is No. When Yes is selected, the headlamps will turn on automatically when the windshield wipers are turned on. The headlamps will turn off when the wipers are turned off, as long as the headlamp switch is in the Auto or Off positions. When No is selected, the headlamps will only turn on if manually selected or if the Auto mode is selected and the outside ambient light levels dictate that they should be on.
- **RETRAIN TIRE SENSORS?** - This programmable feature only applies to vehicles equipped with the optional Tire Pressure Monitoring System. The options include Yes and No. The default is No. When Yes is selected, and the menu button is depressed the EVIC will enter the training mode, starting with the left front tire.
- **POWER ACCESSORY DELAY?** - The options include Yes and No. The default is Yes. When No is selected, the accessory powered components will turn off automatically when the ignition key is turned off. When Yes is selected, the accessory powered components will remain on for 45 seconds when the ignition key is turned off.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove overhead console. Refer to Overhead Console Removal and Installation in this section(Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(3) Remove the ten screws holding the EVIC module in the overhead console.

(4) Remove EVIC module from console assembly.

NOTE: IF THE EVIC MODULE IS BEING REPLACED THE TIRE PRESSURE MONITORING SYSTEM (if equipped) MUST BE RETRAINED. REFER TO THE TIRES/WHEELS SECTION OF THIS MANUAL FOR DETAILED INSTRUCTIONS.

INSTALLATION

(1) Position the EVIC module in the overhead console.

(2) Install the ten screws holding the EVIC module in the overhead console.

(3) Install the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).

(4) Connect the battery negative cable.

NOTE: IF THE EVIC MODULE IS BEING REPLACED THE TIRE PRESSURE MONITORING SYSTEM (if equipped) MUST BE RETRAINED. REFER TO THE TIRES/WHEELS SECTION OF THIS MANUAL FOR DETAILED INSTRUCTIONS.

ELECTRONIC VEHICLE INFO CENTER (Continued)

NOTE: IF A NEW EVIC MODULE HAS BEEN INSTALLED, THE COMPASS WILL HAVE TO BE CALIBRATED AND THE VARIANCE SET. REFER TO COMPASS VARIATION ADJUSTMENT AND COMPASS CALIBRATION IN THE SERVICE PROCEDURES SECTION OF THIS GROUP FOR THE PROCEDURES.

COMPASS/MINI-TRIP COMPUTER

DESCRIPTION

The Compass Mini-Trip Computer (CMTC) and Compass Temperature (CT) computer are modules located in the overhead console. Vehicles are equipped with either the CMTC or the CT computers not both. The CMTC is different in the fact that it is equipped with the mini-trip feature. The CMTC, CT consists of a electronic control module with a vacuum fluorescent display (VFD) and function switches. The CMTC, CT consists of a electronic module that displays compass, trip computer (CMTC only), and temperature features. Actuating the STEP push button (CMTC only) will cause the CMTC to change mode of operation when ignition is ON. Actuating the STEP push button (CMTC only) will cause the CMTC to change mode of operation when ignition is ON. Example:

- Average miles per gallon (ECO)
- Distance to empty (DTE)
- Instant miles per gallon (ECO)
- Trip odometer (ODO)
- Elapsed time (ET)
- Off

Actuating the C/T push button will cause the CMTC, CT to change to Compass/Temperature display.

OPERATION

The Compass Mini-Trip Computer (CMTC), Compass Temperature (CT) module in the overhead console has buttons used to select various functions. The CMTC, CT selector buttons will not operate until the ignition is in the RUN position.

When the ignition switch is first turned to the RUN position the CMTC, CT display;

- Blanks momentarily
- All segments of the VFD will light for one second
- Blanks momentarily
- Returns to the last mode setting selected before the ignition was last switched OFF.

DIAGNOSIS AND TESTING - COMPASS MINI-TRIP COMPUTER

Compass Mini-Trip Computer (CMTC) and Compass Temperature (CT) data is obtained from the Body Control Module (BCM) on the J1850 Data Bus circuit. The CMTC and CT will display dashes (- -) for any of the screens it did not receive the bus messages. The label corresponding to the missing information will be lit. If no compass mini-trip computer data is displayed, check the J1850 Data Bus circuit communications and the BCM. If the brightness level is improper check the J1850 Data Bus circuit.

The DRB III® is recommended for checking the J1850 Data Bus circuit and the BCM. Perform the CMTC, CT self diagnosis before replacing the CMTC or CT module.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove overhead console. Refer to Overhead Console Removal and Installation in this section(Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(3) Remove the screws holding Compass Mini-Trip Computer module in the overhead console.

(4) Remove CMTC module from console assembly.

INSTALLATION

(1) Position the compass mini-trip computer module in the overhead console.

(2) Install the ten screws holding the compass mini-trip computer module in the overhead console.

(3) Install the overhead console. Refer to Overhead Console Removal and Installation in this section.

(4) Connect the battery negative cable.

NOTE: If a new module has been installed, the compass will have to be calibrated and the variance set. Refer to Compass Variation Adjustment and Compass Calibration in the Service Procedures section of this group for the procedures.

UNIVERSAL TRANSMITTER

DESCRIPTION

On some RS models a Universal Transmitter transceiver is standard factory-installed equipment. The universal transmitter transceiver is integral to the Electronic Vehicle Information Center (EVIC) and the Compass Mini-Trip Computer (CMTC), which is located in the overhead console. The only visible component of the universal transmitter are the three transmitter push buttons centered between the mod-

UNIVERSAL TRANSMITTER (Continued)

ules push buttons located just rearward of the display screen in the overhead console. The three universal transmitter push buttons are identified with one, two or three light indicators so that they be easily identified by sight or by feel.

Each of the three universal transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 286 to 399 MegaHertz (MHz) frequency range for remote operation. The universal transmitter is capable of operating systems using either rolling code or non-rolling code technology.

The electronics module displays messages and a small house-shaped icon with one, two or three dots corresponding to the three transmitter buttons to indicate the status of the universal transmitter. The EVIC messages are:

- **Cleared Channels** - Indicates that all of the transmitter codes stored in the universal transmitter have been successfully cleared.
- **Training** - Indicates that the universal transmitter is in its transmitter learning mode.
- **Trained** - Indicates that the universal transmitter has successfully acquired a new transmitter code.
- **Transmit** - Indicates that a trained universal transmitter button has been depressed and that the universal transmitter is transmitting.

The universal transmitter cannot be repaired, and is available for service only as a unit with the EVIC or CMTC modules. If any of these components is faulty or damaged, the complete EVIC or CMTC module must be replaced.

OPERATION

The universal transmitter operates on a non-switched source of battery current so the unit will remain functional, regardless of the ignition switch position. For more information on the features, programming procedures and operation of the universal transmitter, see the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING - UNIVERSAL TRANSMITTER

If the universal transmitter is inoperative, but the Electronic Vehicle Information Center (EVIC) or Compass Mini-Trip Computer is operating normally, see the owner's manual in the vehicle glove box for instructions on training the universal transmitter. Retrain the universal transmitter with a known good transmitter as instructed in the owner's manual and test the universal transmitter operation again. If the unit is still inoperative, replace the faulty universal transmitter and EVIC/CMTC module as a unit. If both the universal transmitter and the EVIC/CMTC module are inoperative, refer to **Overhead Console Diagnosis and Testing** earlier in this group for further diagnosis. For complete circuit diagrams, refer to **Overhead Console** in Wiring Diagrams.

AMBIENT TEMP SENSOR

DESCRIPTION

Ambient air temperature is monitored by the overhead console through ambient temperature messages received from the Front Control Module (FCM) over the Programmable Communications Interface (PCI) J1850 data bus circuit. The FCM receives a hard wired input from the ambient temperature sensor. The ambient temperature sensor is a variable resistor mounted to a bracket that is secured with a screw to the right side of the headlamp mounting module grille opening, behind the radiator grille and in front of the engine compartment.

Refer to **Front Control Module** in Electronic Control Modules. For complete circuit diagrams, refer to the appropriate wiring information. The ambient temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal sent to it by the Front Control Module. The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the Front Control Module. Based upon the resistance in the sensor, the Front Control Module senses a specific voltage on the temperature sensor signal circuit, which it is programmed to correspond to a specific temperature. The Front Control Module then sends the proper ambient temperature messages to the EVIC, CMTC over the PCI J1850 data bus.

The thermometer function is supported by the ambient temperature sensor, a wiring circuit, the Front Control Module, the Programmable Communications Interface (PCI) data bus, and a portion of the Electronics module. If any portion of the ambient temperature sensor circuit fails, the Front Control Module will self-diagnose the circuit.

The ambient temperature sensor circuit can also be diagnosed by referring to **Diagnosis and Testing - Ambient Temperature Sensor, and Diagnosis and Testing - Ambient Temperature Sensor Circuit**. If the temperature sensor and circuit are con-

firmed to be OK, but the temperature display is inoperative or incorrect, refer to **Diagnosis and Testing - Overhead Console** in this group. For complete circuit diagrams, refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AMBIENT TEMPERATURE SENSOR

(1) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor wire harness connector.

(2) Measure the resistance of the ambient temperature sensor. At –40° C (–40° F), the sensor resistance is 336.6 kilohms. At 60° C (140° F), the sensor resistance is 2.49 kilohms. The sensor resistance should read between these two values. If OK, refer to **Diagnosis and Testing - Ambient Temperature Sensor Circuit** in this group. If not OK, replace the faulty ambient temperature sensor.

DIAGNOSIS AND TESTING - AMBIENT TEMPERATURE SENSOR CIRCUIT

(1) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor wire harness connector and the Front Control Module wire harness connector.

(2) Connect a jumper wire between the two terminals in the body half of the ambient temperature sensor wire harness connector.

(3) Check for continuity between the sensor return circuit and the ambient temperature sensor signal circuit cavities of the Front Control Module wire harness connector. There should be continuity. If OK, go to Step 4. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.

(4) Remove the jumper wire from the body half of the ambient temperature sensor wire harness connector. Check for continuity between the sensor return circuit cavity of the Front Control Module wire harness connector and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted sensor return circuit as required.

(5) Check for continuity between the ambient temperature sensor signal circuit cavity of the Front Control Module wire harness connector and a good ground. There should be no continuity. If OK, refer to **Diagnosis and Testing - Overhead Console** in this group. If not OK, repair the shorted ambient temperature sensor signal circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Raise and support vehicle on safety stands.

(3) From behind front bumper fascia, remove screw holding sensor to radiator closure panel.

(4) Remove sensor from vehicle.

INSTALLATION

(1) Position the sensor in the vehicle.

(2) From behind the front bumper fascia, install the screw holding sensor to radiator closure panel.

(3) Connect the battery negative cable.

POWER LIFTGATE SYSTEM

DESCRIPTION

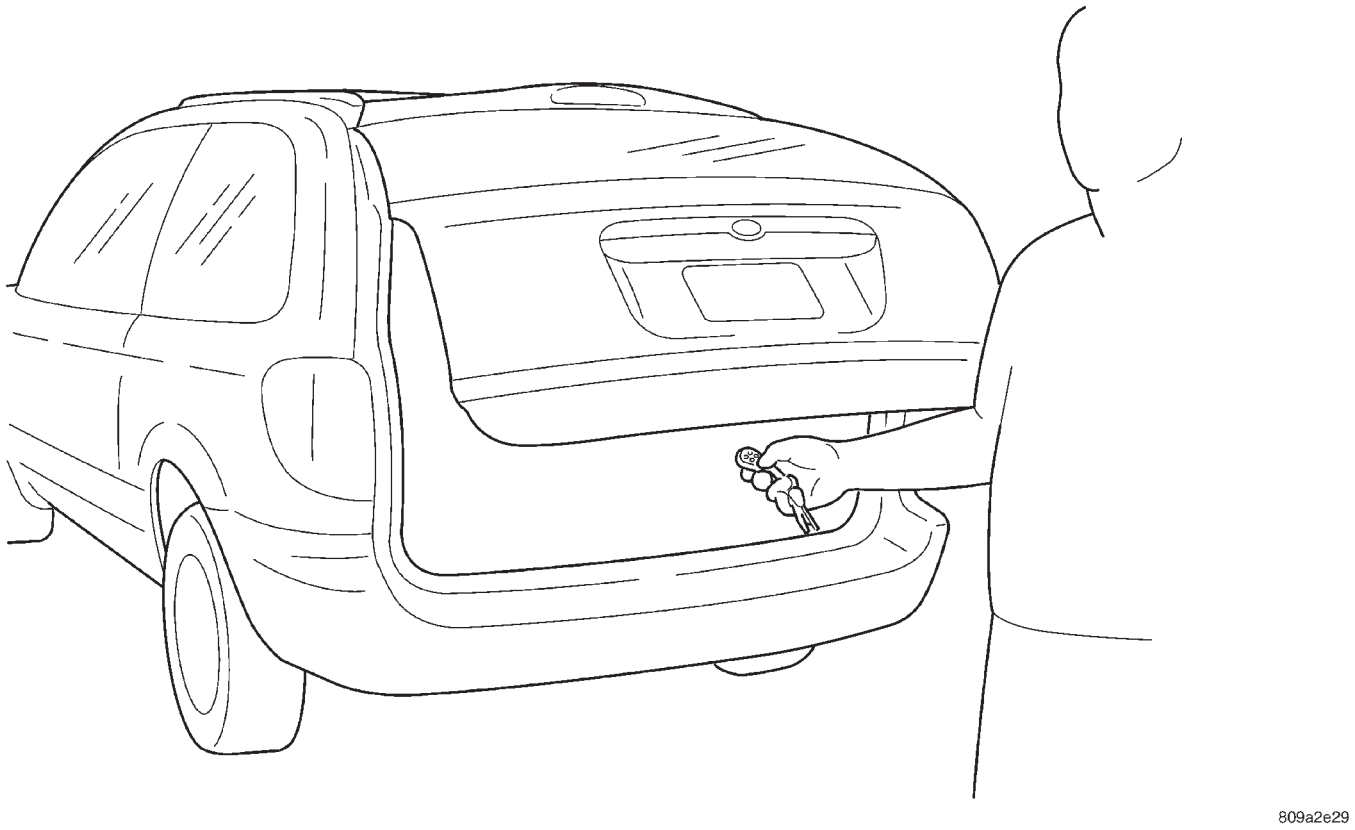

Fig. 1 POWER LIFTGATE INTRODUCTION

Some vehicles are equipped with an automatic opening and closing power liftgate system (Fig. 1). This power liftgate system is a complex system consisting of many components. Some of these components are the liftgate gear motor assembly, latch assembly, lift gear and rod, liftgate control module, chime/thermistor, full open switch, engage actuator, pinch sensor, liftgate handle switch, overhead console switch, key fob switches (Fig. 2), pawl switch and ratchet switch.

The power liftgate system has its own door control module, located on the vehicles left body D-pillar behind the trim panel. (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/DOOR CONTROL MODULE - DESCRIPTION) The power liftgate gear motor assembly is located just above the control module. The latch assembly is located in the bottom center of the power liftgate, below the exterior liftgate handle switch. The power liftgate full open switch, engage actuator, lift gear and rod are part of the liftgate gear motor assembly. The pawl and ratchet switches are part of the latch assembly. The pinch sensor or sensors are located along the right and left sides of the power liftgate, just above the body line. The liftgate handle switch is an power release switch and is located in the rear light bar assembly, just above the license plate. The overhead console switch is an power open and close command switch located in the vehicles overhead console.

Safety is of the utmost concern with the power liftgate system. Software technology has enabled the power liftgate control module to detect resistance to liftgate travel, which allows the power liftgate to stop and reverse direction anytime an obstruction is felt or any of the command switches are operated (only in closing direction). Battery voltage is supplied to the power liftgate system through a 40 amp fuse, located in the Intelligent Power Module (IPM) assembly (Fig. 3). In the unlikely event that the power liftgate system develops a fault the power liftgate can still be operated manually with a key, just like a standard manual liftgate.

POWER LIFTGATE SYSTEM (Continued)

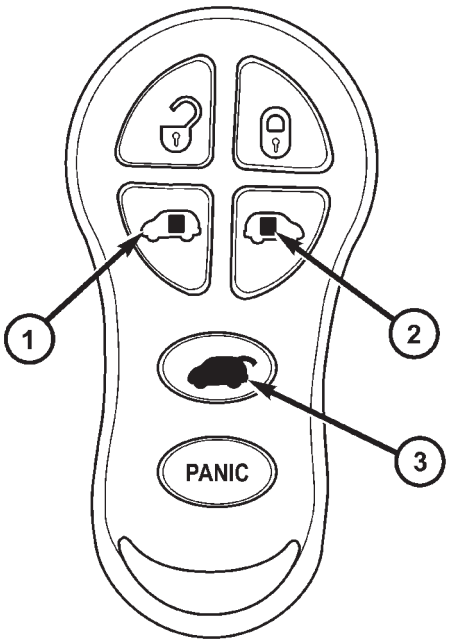

Fig. 2 KEY FOB

1 - Left Sliding Door Switch
2 - Right Sliding Door Switch
3 - Liftgate Switch

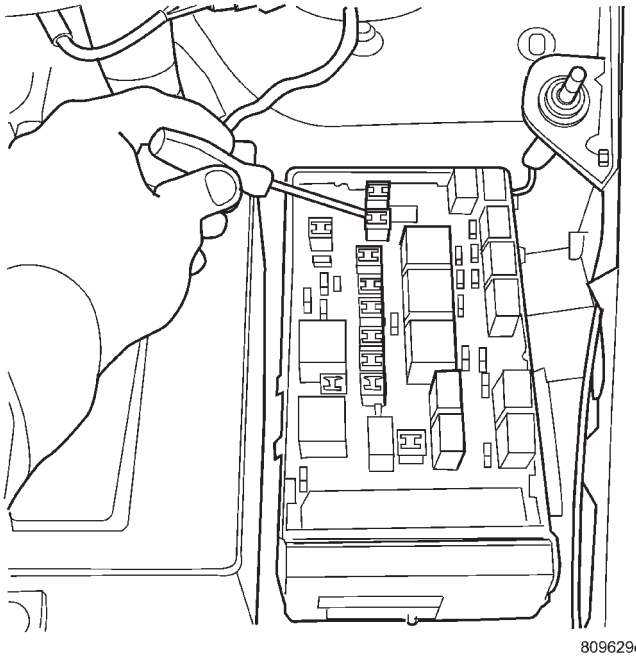

Fig. 3 LIFTGATE FUSE LOCATION

The power liftgate control module communicates on the J1850 Programmable Communication Interface (PCI) Bus Circuit. Therefore, the power liftgate control module can generate and store its own Diagnostic Trouble Codes (DTC). The vehicles Body Control Module (BCM) receives and supplies messages to the power liftgate control module via the PCI bus circuit. A diagnostic scan tool, such as the DRB III® is used to read and troubleshoot these Diagnostic Trouble Codes (DTC). Refer to the Body Diagnostic Manual for a complete list of diagnostic routines.

For additional information refer to Power Liftgate Operation. For a complete system wiring schematic refer to Wiring Diagrams. For system operation instructions refer to the vehicles owner manual. **Refer to the Body section of the service manual** for additional information on liftgate components such as the prop rods, hinges, door alignment and striker alignment.

WARNING: BE CERTAIN TO READ ALL WARNINGS AND CAUTIONS (NOTED BELOW) IN POWER LIFTGATE SYSTEM OPERATION BEFORE ATTEMPTING ANY SERVICE OF THE POWER LIFTGATE SYSTEM OR COMPONENTS.

OPERATION

With the push of a power liftgate open/close command switch (key fob or overhead console mounted) a signal is sent out on the J1850 PCI Data Bus circuit. This signal is detected at the body control module (BCM). The BCM then sends a signal out on the J1850 PCI Data Bus circuit to the power liftgate module. The power liftgate module then signals the power liftgate motor to start an open or close cycle, depending on what position the liftgate is in open or closed.

During a liftgate open or close cycle, if the power liftgate module detects sufficient resistance to liftgate travel, such as an obstruction in the liftgates path, the power liftgate control module will immediately stop the liftgate movement and reverse travel to the full open or closed position. The ability for the power liftgate module to detect resistance to liftgate travel is accomplished by hall effect sensors, drive motor speed and pinch sensors (tape switches).

The power liftgate control module has the ability to learn. Anytime the liftgate is opened or closed using the power liftgate system the module learns from its cycle. If a replacement power liftgate component is installed or a liftgate adjustment is made, the module will relearn the effort and/or time required to open or close the door. This learn cycle can be performed with a Diagnostic Scan Tool, such as the DRB III® or with a complete cycle of the liftgate, using any one of the command switches. Refer to Standard Procedures in this section for detailed instructions.

The power liftgate system is designed with a number of system inhibitors. These inhibitors are necessary for safety and / or feasibility of the power liftgate system. Refer to power liftgate system inhibitors noted below:

POWER LIFTGATE SYSTEM INHIBITORS

- The Power Liftgate may not operate in extreme temperatures. These extreme temperatures will be approximately -12° F (-24.4° C) on the low side and 143° F (61.6° C) for the high side. A chime/thermister assembly in the rear light bar assembly monitors the outside temperature.
- The vehicles transmission must be in park or neutral for the power liftgate to start a cycle.
- If multiple obstacles are detected during the same power open or close cycle the liftgate goes into manual operation.
- If severe Diagnostic Trouble Codes (DTC) are stored in the power liftgate control module.

POWER LIFTGATE SYSTEM CAUTIONS AND WARNINGS

WARNING: ALWAYS DISCONNECT THE NEGATIVE BATTERY CABLE BEFORE ATTEMPTING ANY POWER LIFTGATE SYSTEM SERVICE.

WARNING: THERE IS A SMALL AREA ON BOTH SIDES OF THE LOWER POWER LIFTGATE WHICH ARE NOT PROTECTED BY PINCH SENSORS. EXTREME CARE MUST BE TAKEN TO PREVENT OBJECTS FROM ENTERING THIS AREA ONCE THE LIFTGATE REACHES THE SECONDARY LATCH CONTACT (APPROXIMATELY 1/2 INCH BEFORE FULLY CLOSED).

WARNING: NEVER ATTEMPT TO ENTER OR EXIT THE VEHICLE WITH THE LIFTGATE IN MOTION. YOU COULD DAMAGE THE POWER LIFTGATE SYSTEM AND/OR COMPONENTS AND/OR CAUSE PERSONAL INJURY.

WARNING: NEVER STICK OBJECTS IN THE POWER LIFTGATE WHEN CINCHING CLOSED. YOU COULD DAMAGE THE VEHICLE, POWER LIFTGATE SYSTEM COMPONENTS AND/OR CAUSE PERSONAL INJURY.

DIAGNOSIS AND TESTING - POWER LIFTGATE SYSTEM

The power opening and closing power liftgate system is a complex system containing many components and modules. In order to obtain conclusive testing the Programmable Communications Interface (J1850) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the power liftgate system must be checked.

The power liftgate system was designed to be diagnosed with an appropriate diagnostic scan tool, such as the DRB III®. The most reliable, efficient, and accurate means to diagnose the power liftgate system requires the use of a DRB III® scan tool and the proper Body Diagnostic Procedures manual. The DRB III® can be used to observe various switch statuses throughout the power liftgate system to help the technician diagnose a defective switch or component. The DRB III® can also be used to actuate various components throughout the power liftgate system to help the technician diagnose a defective component.

Before any testing of the power liftgate system is attempted, the battery should be fully charged, all built-in power liftgate system inhibitors read and understood (Refer to power liftgate system operation) and all wire harness and ground connections inspected around the affected areas on the vehicle.

Following are quick reference diagnostic tables to help when diagnosing and testing the power liftgate system.

POWER LIFTGATE SYSTEM (Continued)

LIFTGATE SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
Liftgate opens unexpectedly	Failure of Power Liftgate or Body Control module	Disconnect then reconnect battery to reset module, function liftgate, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of latch assembly	Check wiring connections and for blown fuse
		Check for trouble codes, replace latch if necessary
	Failure of open/close command switch	Check for shorted or defective switch
Liftgate will not open from outside of vehicle manually	Failure of key cylinder assembly	Check for broken key cylinder assembly
		Check link rod connections at the latch and key cylinder assembly
		Check for binds or kinks in link rod Check for foreign matter preventing the operation of key cylinder assembly Replace the necessary components
	Failure of latch assembly	Check wire connections and for blown fuse
		Check for foreign matter preventing the operation of latch assembly Replace latch assembly, if necessary
	Binding or sticking of components	Check for foreign matter preventing the operation of door
		Establish location of binding
		Replace necessary components
Liftgate will not open/close under power	Failure of Power Liftgate or Body Control Module	Disconnect then reconnect battery to reset module, function liftgate, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of latch assembly	Check wire connections and for blown fuse
		Check for foreign matter preventing the operation of latch assembly Troubleshoot using Body Diagnostic Manual Replace latch assembly, if necessary
	Failure of motor assembly	Troubleshoot using Body Diagnostic Manual
	Failure of full open switch	Troubleshoot using Body Diagnostic Manual

POWER LIFTGATE SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	Binding or sticking of components	Establish location of binding and replace necessary components
	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams
Power loss during Liftgate operation	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams
	Low battery voltage	Charge battery
	Failure of Power Liftgate or Body Control Module	Disconnect then reconnect battery to reset module, function liftgate, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of motor assembly	Check for no drive condition
No power latching in primary and/or secondary positions	Failure of latch assembly	Check wire connections and for blown fuse
		Check for foreign matter preventing the operation of latch assembly Troubleshoot using Body Diagnostic Manual. Replace latch assembly, if necessary
	Binding or sticking of components	Establish location of binding and replace necessary components
	Failure of Power Liftgate or Body Control Module	Disconnect then reconnect battery to reset module, function liftgate, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Door seal force too high	Inspect seals for damage, mis-assembly, foreign matter or other possible obstruction
	Failure of motor assembly	Check for no drive condition
Latch will not fully release from primary position	Failure of latch assembly	Check wire connections and for blown fuse
		Check for foreign matter or damaged components preventing the operation of latch assembly Troubleshoot using body electrical troubleshooting manual Replace latch assembly, if necessary
	Failure of outside handle switch	Troubleshoot using Body Diagnostic Manual Replace switch, if necessary
	Failure of Power Liftgate or Body Control Module	Disconnect then reconnect battery to reset module, function liftgate, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Binding or sticking of components	Establish location of binding and replace necessary components

POWER LIFTGATE SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
Key fob, Outside Handle or overhead console switches do not power operate liftgate	Blown Fuse	Check fuse and replace
	Battery voltage low	Charge or replace battery in key fob or vehicle
	Failure of latch assembly	Check for foreign matter preventing the operation of latch assembly
		Check wire connection Pawl and/or ratchet switch inoperative Replace latch if necessary
	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams
	Failure of Body Control Module (BCM)	Check electrical connections
		Refer to the Body electrical troubleshooting guide for additional checks Replace BCM if necessary
	Failure of key fob	Reprogram key fob
		Replace key fob if necessary
	Failure of Power Liftgate Module	Disconnect then reconnect battery to reset module, function liftgate, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of liftgate motor assembly	Check for foreign matter preventing the operation of gear motor assembly
		Check wire connections Motor clutch does not engage, replace assembly Full open switch inoperative, replace switch, if necessary Troubleshoot using Body Diagnostic Manual Replace motor, if necessary
Liftgate does not stay open	Failure of liftgate prop rods	Replace prop rods, if necessary
		Check for broken attachments
High inside/outside opening effort	Failure of liftgate prop rods	Replace prop rods, if necessary
		Check for broken attachments
	Gear motor did not disengage	Troubleshoot using Body Diagnostic Manual Replace components, if necessary
	Binding or sticking of components	Establish location of binding and replace necessary components

POWER LIFTGATE SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
Liftgate continues to cinch closed during power mode	Failure of latch assembly	Check wire connections and for blown fuse
		Check for foreign matter preventing the operation of latch assembly Troubleshoot using Body Diagnostic Manual Replace components, if necessary
	Failure of Power Liftgate or Body Control Module	Disconnect then reconnect battery to reset module, function liftgate, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams
Liftgate continues to open during power mode (runaway motor)	Failure of Power Liftgate or Body Control Module	Disconnect then reconnect battery to reset module, function liftgate, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of full open switch	Check wire connections
		Replace switch, if necessary
	Failure of motor assembly	Check for continuous drive condition
	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to Wiring Diagrams
Liftgate opens very slowly	Failure of liftgate motor assembly	Check wire connections
		Replace motor assembly, if necessary
	Failure of liftgate prop rods	Replace prop rods, if necessary
	Binding or sticking of components	Establish location of binding and replace necessary components
	Grade of vehicle too steep for power operation	Operate liftgate manually
Squeaks, Noises and rattles	Foreign material in door compartment	Remove foreign material
	Loose components	Check and tighten loose components

STANDARD PROCEDURE

STANDARD PROCEDURE - LIFTGATE ADJUSTMENT

In order for the power liftgate system to function properly the liftgate must move freely and smoothly. The power liftgate system can acommodate for some minor changes in the effort required to move the liftgate. However, in extreme conditions the liftgate may need to be mechanicaly adjusted for proper fit and finish. Refer to the Liftgate Adjustment procedure in the Body section of the service manual for detailed instructions.

If a problem exists with the power liftgate and it is suspected to be extreme effort check the liftgate prop rods and hinges for free movement. Use a known good vehicle for liftgate effort comparison.

NOTE: Routine application of Mopar MP-50® or equivalent on the chrome prop rod shafts and liftgate latch and hinges will help keep the liftgate in good working order.

POWER LIFTGATE SYSTEM (Continued)

STANDARD PROCEDURE - POWER LIFTGATE LEARN CYCLE

Any time a power liftgate component is removed, replaced or a liftgate adjustment is performed a learn cycle must be performed. This learn cycle enables the power liftgate control module to learn or relearn information (travel limits, resistance to door travel, etc.) which allows it to perform properly and safely. To perform a learn cycle do the following:

(1) Obtain a DRB III® scan tool.

(2) Connect the DRB III® to the vehicle and check for any power liftgate system stored trouble codes, correct and erase any stored codes.

(3) Using the DRB III®, Go into Test Routine Menu and select the power open command.

(4) Select the power close command.

(5) The liftgate learn cycle is complete.

If a DRB III® scan tool is not available the learn cycle can be performed by actuating the liftgate by using any of the normal command switches. Be certain to cycle the liftgate through a complete open and close cycle before returning the vehicle to service.

NOTE: If the power liftgate will not complete a full cycle a problem exists with the power liftgate system. (Refer to 8 - ELECTRICAL/POWER DOORS - DIAGNOSIS AND TESTING).

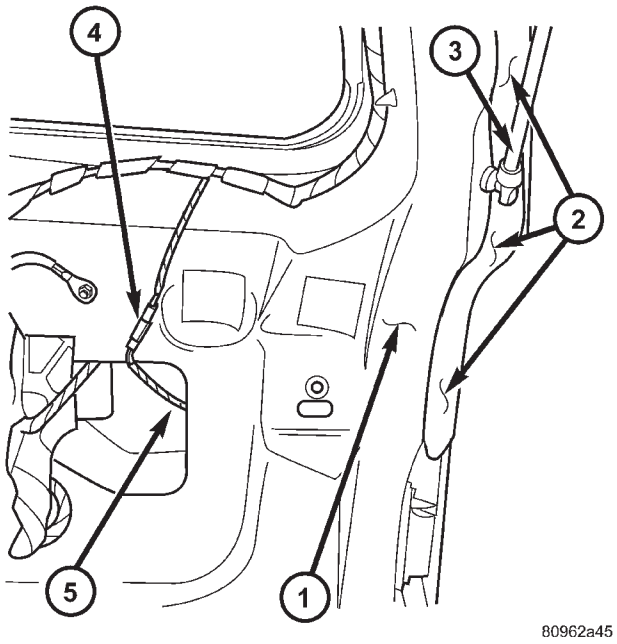

Fig. 4 PINCH SENSOR LOCATION

1 - LIFTGATE
2 - PINCH SENSOR ASSEMBLY
3 - POWER LIFTGATE LINK ROD
4 - PINCH SENSOR WIRE HARNESS CONNECTOR
5 - PINCH SENSOR WIRE HARNESS

PINCH SENSOR

DESCRIPTION

Vehicles equipped with a power liftgate utilize two pinch sensors, one is located on each side of the liftgate (Fig. 4). These sensors look like weather-strips, however they consist of pieces of electrically conductive rubber (tapeswitch), wires, resistor, double sided tape, and a plastic carrier. They are used to indicate an obstruction during a power close cycle.

OPERATION

During a power liftgate close cycle, if either of the two conductive rubber strips (tapeswitch) of the pinch sensor come in contact with an obstacle, the pinch sensor circuit is completed. This tells the power liftgate control module that a obstruction is felt. The control module will stop the liftgate immediately and return it to the full open position.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove trim panel from liftgate. Refer to Body for the procedure.

(3) Disconnect the pinch sensor wire harness connector (Fig. 4).

(4) Remove screws holding the pinch sensor to liftgate.

(5) Feed the pinch sensor wire harness out of the liftgate and remove the sensor from the vehicle.

INSTALLATION

(1) Position the pinch sensor and install screws holding the sensor to the liftgate. Torque screws to 25 in. lbs.

(2) Install wire harness grommet in liftgate flange and route, connect the pinch sensor wire harness connector.

(3) Install the trim panel on the liftgate. Refer to the Body section for the procedure.

(4) Connect the negative battery cable.

(5) Using an appropriate scan tool, check and erase any power liftgate control module diagnostic trouble codes related to the pinch sensor.

(6) Verify power liftgate system and pinch sensor operation. Cycle the power liftgate through one complete open and close cycle, during the final close cycle press the pinch sensor to verify the power liftgate detects an obstruction and returns to the full open position.

PINCH SENSOR (Continued)

WARNING: USE EXTREME CAUTION WHEN TESTING PINCH SENSOR OPERATION.

FULL OPEN SWITCH

DESCRIPTION

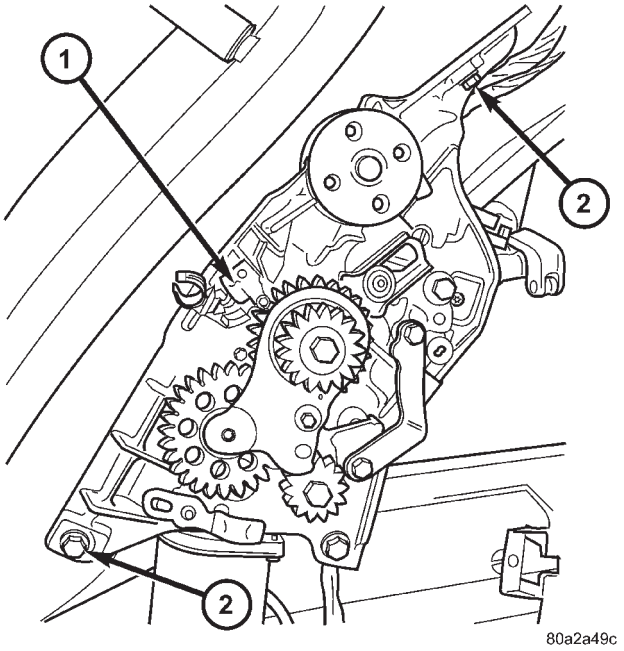

Fig. 5 FULL OPEN SWITCH LOCATION

1 - FULL OPEN SWITCH
2 - GEAR MOTOR ASSEMBLY RETAINING BOLT (1 OF 3)

Vehicles equipped with a power liftgate utilize a full open switch. This switch is located on the gear motor housing (Fig. 5) and is used to signal the power liftgate module when the liftgate is in the full open position. Two wires are used from the full open switch contacts to the gear motor assemblies main electrical connector.

The full open switch is a serviceable component. Consult your Mopar parts catalog for a specific part number.

OPERATION

When the power liftgate reaches the full open position, the gear motor housing mounted full open switch electrical contacts come in contact with each other. This sends a ground signal to the power liftgate control module, telling the module that the liftgate has reached the full open position.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the lift gear and link rod assembly from the vehicle(Refer to 8 - ELECTRICAL/POWER DOORS/CONTROL ROD - REMOVAL).

(3) Cut the two wires leading to the full open switch or back the wires out of the electrical connector (Fig. 5). Refer to the Wiring section of the service manual for detailed instructions.

(4) Remove the full open switch retaining screw and remove the full open switch from the gear motor housing assembly.

INSTALLATION

(1) Perform a wiring repair on the full open switch wires following the approved procedure in the Wiring section of the service manual. Or install new terminals on the wire ends and reinstall in the main liftgate motor electrical connector.

(2) Position and install the full open switch retaining screw.

(3) Install the power liftgate lift gear and link rod assembly. (Refer to 8 - ELECTRICAL/POWER DOORS/CONTROL ROD - INSTALLATION)

(4) Connect the negative battery cable.

(5) Using an appropriate scan tool, check any erase any power liftgate control module diagnostic trouble codes.

(6) Verify power liftgate system and full open switch operation. Cycle the power liftgate through one complete open and close cycle, this will allow the power liftgate control module to relearn its cycle with the new components.

LIFTGATE MOTOR

DESCRIPTION

Vehicles equipped with a power liftgate, utilize a liftgate gear motor assembly (Fig. 6). The gear motor assembly consists of a DC motor, hall effect sensor, engage actuator, full open switch, lift gear, aluminum housing, drive gears and wire harness. The gears and motor portion of the assembly provides the power and torque required to open or close the liftgate under the worst case conditions. The hall effect sensor is used to provide the liftgate control module with a speed reading, which is used to monitor the resistance of liftgate travel. This speed reading also allows the power liftgate control module to detect obstructions and move the liftgate accordingly. The engage actuator is used to toggle between power open/close mode and full manual mode when desired. The full open switch is used to let the power liftgate control module know when the liftgate is approaching the full open position.

LIFTGATE MOTOR (Continued)

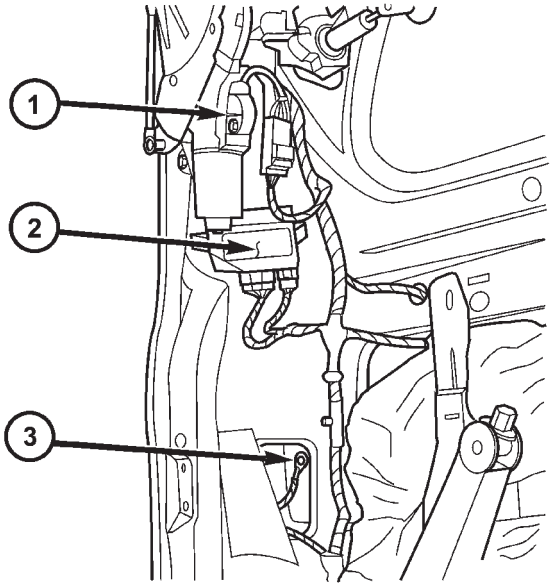

Fig. 6 POWER LIFTGATE COMPONENTS

1 - POWER LIFTGATE GEAR MOTOR ASSEMBLY
2 - POWER LIFTGATE CONTROL MODULE
3 - ELECTRICAL GROUND LOCATION

Serviceable components of the power liftgate gear motor assembly are the complete gear motor assembly, motor and wire harness, lift gear and control rod, engage actuator, full open switch and the transverse bracket. Refer to additional information in this group for more component details.

OPERATION

With the push of a power liftgate command switch (liftgate closed), the power liftgate control module will signal the latch assembly to release the door from its primary closed and latched position to the released and movable position. The liftgate motor mounted, engage actuator then engages the liftgate motor assembly, which moves the liftgate into the open position. The liftgate motor provides the torque and power to move the door to its full open or closed position(Refer to 8 - ELECTRICAL/POWER DOORS - OPERATION) for additional information.

REMOVAL

The power liftgate motor can be serviced in two different ways. The first of which is called out here, the complete gear motor assembly. The second way includes the motor, aluminum housing, drive gears and wire harness assembly. To perform this service procedure, use the following procedure to remove the gear motor assembly from the vehicle. Then refer to the other procedures called out this section to transfer the remaining components (engage actuator, full open switch, transverse bracket and lift gear and rod) to the replacement motor assembly.

(1) Disconnect and isolate the negative battery cable.

(2) Remove the left rear D-pillar trim panel from the vehicle. Refer to the Body section for the procedure.

(3) Disconnect the wire harness connector from the motor assembly (Fig. 6).

(4) Remove the two bolts from the motor housing and the one bolt from the transverse mount bracket.

(5) Grab the liftgate motor assembly and lift upward and out to unhook the motor assembly from the D-pillar.

(6) Remove the liftgate motor assembly from the vehicle.

INSTALLATION

(1) Using the motor housing tab, hook the liftgate motor assembly on the D-pillar.

(2) Install the three motor assembly retaining bolts. Torque the two rear most bolts first to 9.5 N·m (85 in. lbs.). Torque the remaining bolt next to the window actuator to 9.5 N·m (85 in. lbs.).

(3) Connect the liftgate motor assembly electrical connector.

(4) Install the D-pillar trim panel on the vehicle. Refer to Body for the procedure.

(5) Connect the negative battery cable.

(6) Using an appropriate scan tool, check any erase any power liftgate control module diagnostic trouble codes related to the door motor assembly.

(7) Verify power liftgate system operation. Cycle the power liftgate through one complete open and close cycle, this will allow the power liftgate control module to relearn its cycle with the new components.

ENGAGE ACTUATOR

DESCRIPTION

Vehicles equipped with a power liftgate utilize a power liftgate engage actuator (Fig. 7). The 12 volt engage actuator provides the engagement and disengagement of the liftgate gear motor to the lift gear by way of an over center link, activated by a lever.

The engage actuator is a serviceable component and cannot be repaired, if found to be faulty it must be replaced.

OPERATION

The engage actuators normal position is disengaged. When a power liftgate open or close command is generated from any of the command switches, the power liftgate control module signals the engage

ENGAGE ACTUATOR (Continued)

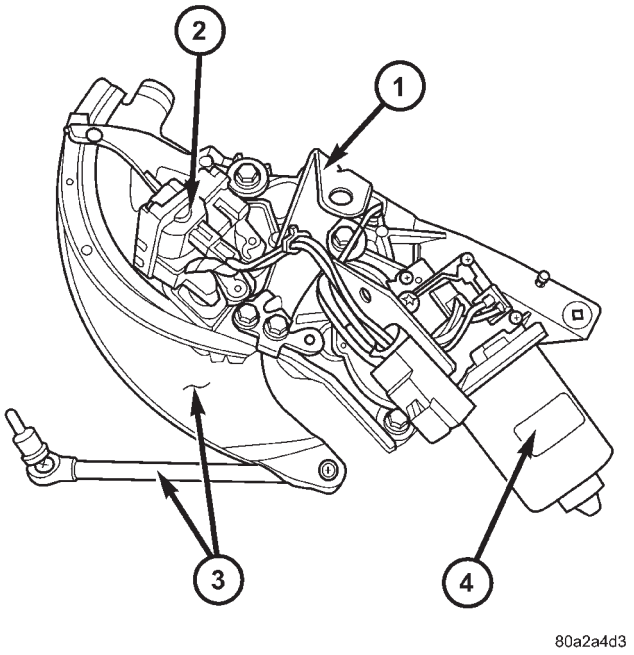

Fig. 7 LIFTGATE GEAR MOTOR ASSEMBLY

2 - LIFT GEAR RETAINING BOLTS

actuator to move its lever to the engaged position. This engages the gear motor to the lift gear, so when the motor turns the lift gate moves upward or downwards depending on its current position.

During a manual liftgate open or close cycle the engage actuator is disengaged, allowing unrestricted liftgate movement.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the left rear D-pillar trim from the vehicle. Refer to Body for the procedure.

(3) Using your hand manually engage the actuator link rod, this must be done to access one of the engage actuator retaining screws.

(4) Remove the two engage actuator retaining screws (Fig. 8).

(5) Disconnect the engage actuator electrical connector and remove the engage actuator from the vehicle.

INSTALLATION

(1) Position the engage actuator and connect the engage actuator electrical connector.

(2) Install the two engage actuator retaining screws.

(3) Manually disengage the actuator.

(4) Install the left rear D-pillar trim on the vehicle. Refer to Body for the procedure.

(5) Connect the negative battery cable.

(6) Using an appropriate scan tool, check and erase any power liftgate control module diagnostic trouble codes.

(7) Verify power liftgate system and engage actuator operation. Cycle the power liftgate through one complete open and close cycle.

TRANSVERSE BRACKET

DESCRIPTION

Vehicles equipped with a power liftgate utilize a transverse bracket (Fig. 9). This bracket is not different than any other metal bracket which is used to support and secure the power liftgate gear motor assembly to the vehicles left rear body D-pillar.

The transverse bracket is a serviceable power liftgate component. Consult your Mopar™ parts catalog for a specific part number.

OPERATION

The power liftgate transverse bracket supports the gear motor assembly by supplying an additional attachment point. Located on the leading edge of the gear motor assembly, one end of the transverse bracket attaches to the motor assembly the other to the leading edge of the vehicles D-pillar.

TRANSVERSE BRACKET (Continued)

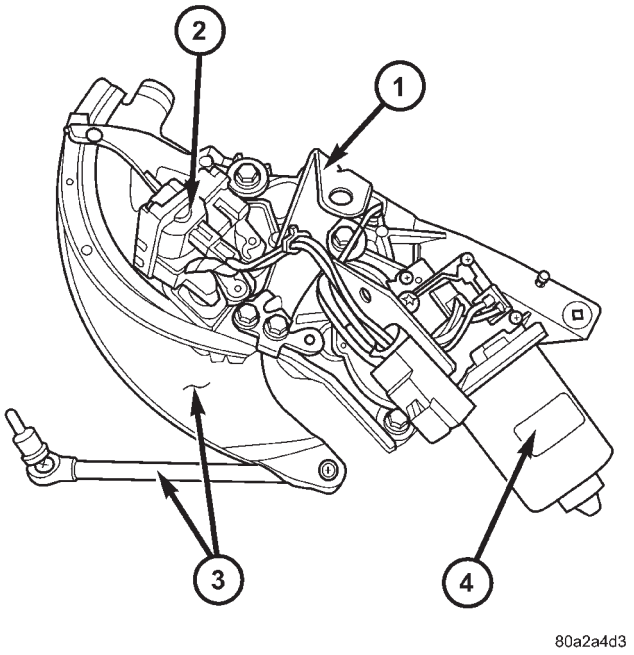

Fig. 9 LIFTGATE GEAR MOTOR ASSEMBLY

1 - TRANSVERSE BRACKET
2 - ENGAGE ACTUATOR
3 - LIFT GEAR AND ROD ASSEMBLY
4 - LIFTGATE MOTOR

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the left D-pillar trim from the vehicle. Refer to Body for the procedure.

(3) Disconnect the gear motor assembly electrical connector and disengage retaining pushpin.

(4) Loosen the gear motor assembly retaining bolts to allow room for transverse bracket to be removed.

(5) Remove the transverse bracket retaining bolts (Fig. 10).

(6) Remove the transverse bracket from the vehicle.

INSTALLATION

(1) Position the transverse bracket in the vehicle. Be certain the transverse bracket is properly positioned. The bracket should just touch the engage actuator arm and be positioned between the actuator arm and the motor housing.

(2) Torque the transverse bracket retaining bolts to the gear motor assembly to 9.5 N·m (85 in. lbs.).. Do not tighten the transverse bracket retaining bolt, located under the window actuator at this time.

(3) Torque the gear motor assembly retaining bolts to 9.5 N·m (85 in. lbs.)..

(4) Torque the final transverse bracket retaining bolt to 9.5 N·m (85 in. lbs.).

(5) Connect the gear motor assembly electrical connector and engage retaining pushpin.

(6) Install the appropriate D-pillar trim from the vehicle. Refer to Body for the procedure.

LIFT GEAR & LINK ROD

DESCRIPTION

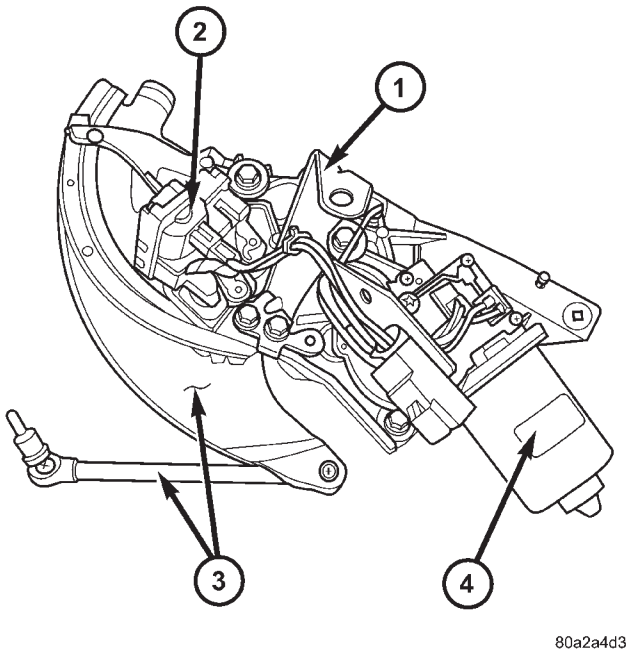

Fig. 10 LIFTGATE GEAR MOTOR ASSEMBLY

1 - TRANSVERSE BRACKET
2 - ENGAGE ACTUATOR
3 - LIFT GEAR AND ROD ASSEMBLY
4 - LIFTGATE MOTOR

Vehicles equipped with a power liftgate utilize a lift gear and rod assembly. This lift gear and rod assembly are located in the left rear of the vehicle and are visible without removing the D-pillar trim (Fig. 10). The lift gear provides the leverage to move the liftgate from the closed to the open position. The lift gear attaches to a bearing on the gear motor assembly with four bolts. On the outboard side of the lift gear are rivited on teeth, which mesh with the gear motor assembly drive gears during a open or close operation. The rod assembly is a steel shaft, equipped with two spherical rod ends which attaches the lift gear to the liftgate.

The lift gear and rod assembly are serviceable components. Consult your Mopar™ parts catalog for a part number.

LIFT GEAR & LINK ROD (Continued)

OPERATION

One end of the rod assembly is attached to the liftgate, the other attached to the lift gear. When the lift gear is driven by the gear motor assembly the liftgate is moved to the open or closed position.

REMOVAL

(1) Remove the left rear D-pillar trim from the vehicle. Refer to Body for the procedure.

(2) Remove the lift gear retaining bolts (Fig. 11).

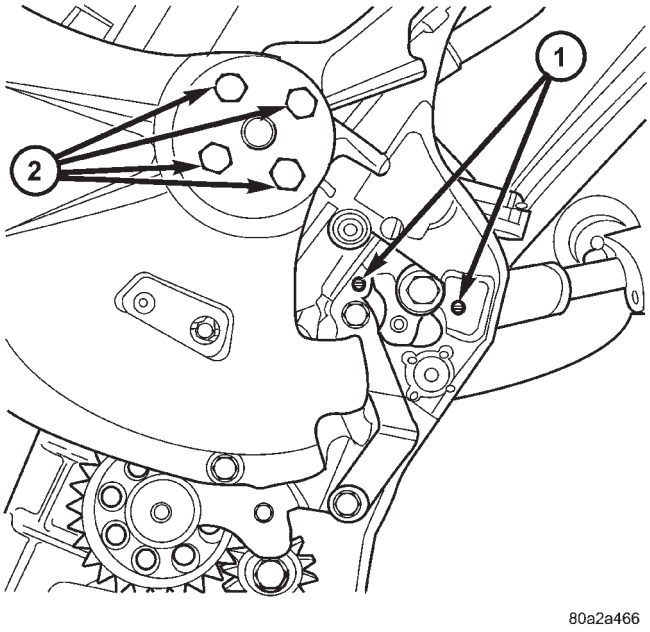

Fig. 11 LIFTGATE GEAR MOTOR ASSEMBLY

1 - ENGAGE ACTUATOR RETAINING SCREWS
2 - LIFT GEAR RETAINING BOLTS

(3) Remove the lift gear and rod from the vehicle.

INSTALLATION

(1) Position the lift gear assembly and install the retaining bolts. Torque the bolts to 28 N·m (21 ft. lbs.).

(2) Install the left rear D-pillar trim on the vehicle. Refer to Body for the procedure.

CAUTION: Torque link rod to liftgate attachment bolt to 250 in. lbs. Care must be taken not to overtorque link rod bolt.

LATCH

DESCRIPTION

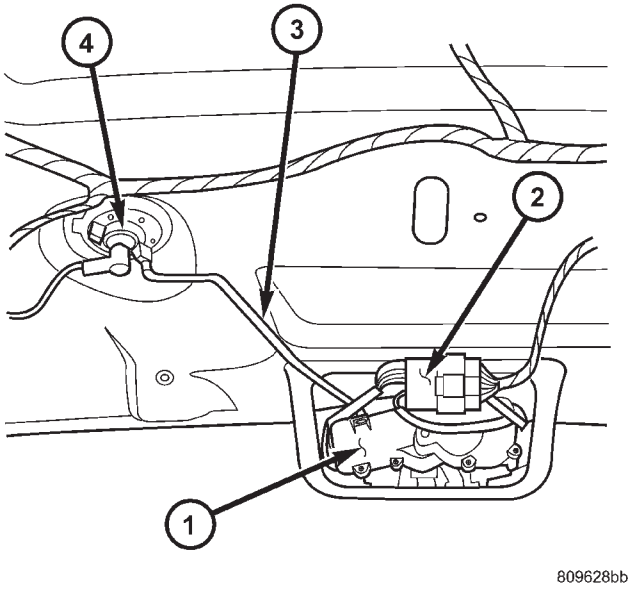

Fig. 12 POWER LATCH ORIENTATION

1 - LATCH & ACTUATOR ASSEMBLY
2 - LATCH ELECTRICAL CONNECTOR
3 - LOCK CYLINDER LINK ROD
4 - LIFTGATE LOCK CYLINDER

Vehicles equipped with a power liftgate, utilize a power cinch/release latch. This latch performs the same features as a manual liftgate latch as well as the power cinch and / or release capability. A second type of power latch can also be found on some RS models, this latch is designed to perform a power release only. The power cinch and release capability is accomplished by an actuator mounted to the leading edge of the latch assembly. The latch is located in the lower center of the liftgate assembly (Fig. 12) and contains integral pawl and ratchet switches. The ratchet switch acts as a liftgate ajar switch.

The power latch assembly can be serviced as a complete assembly, latch without actuator or just the actuator. Consult your Mopar parts catalog for specific part numbers.

LATCH (Continued)

OPERATION

On the power cinch/release latch, the latch mounted actuator provides the torque required to close the power liftgate from the secondary to the primary closed and latched position. On the power cinch/release latch and the power release only latch, the actuator releases the liftgate from the primary closed and latched position to the fully unlatched and movable position.

REMOVAL

(1) Open the hood, disconnect and isolate the negative battery cable.

(2) Open the liftgate and remove the liftgate trim panel. Refer to Body for the procedure.

(3) Disconnect the power latch electrical connector (Fig. 12).

(4) Remove the power latch retaining bolts.

(5) Disconnect the liftgate lock cylinder link rod from the key cylinder or latch assembly. To disconnect from latch, rotate the plastic retaining clip 90 ° to unsnap clip from linkrod. Then pull link rod straight out of latch arm.

INSTALLATION

(1) Connect the liftgate lock cylinder link rod on the cinch latch assembly. Rotate the plastic retaining clip 90 ° to lock retaining clip on linkrod.

(2) Connect the link rod on the lock cylinder.

(3) Install the power latch retaining bolts. Torque to 10 N·m (90 in. lbs.).

(4) Connect the power latch electrical connector and secure push pin retainers.

(5) Connect the negative battery cable.

(6) Using an appropriate scan tool, check and erase any power liftgate control module diagnostic trouble codes related to the power latch.

(7) Verify power liftgate system and power cinch / release latch operation. Cycle the power liftgate through one complete open and close cycle, this will allow the power liftgate control module to relearn its cycle with the new components.

(8) Verify power liftgate manual operation. Using liftgate key rotate the lock cylinder to verify door operation. Pull door open using exterior liftgate handle / switch.

(9) Install the liftgate trim panel. Refer to Body for the procedure.

LATCH ACTUATOR

DESCRIPTION

Vehicles equipped with a power liftgate utilize a power cinch latch or power release latch (Fig. 13). The power cinch and/or power release is made possible by a latch actuator attached to the leading edge of the power latch assembly. This 12 volt latch actuator contains a small drive gear that meshes with the latch assemblies internal gears to perform the power cinch close / power release operations. Refer to the Latch assembly for more information.

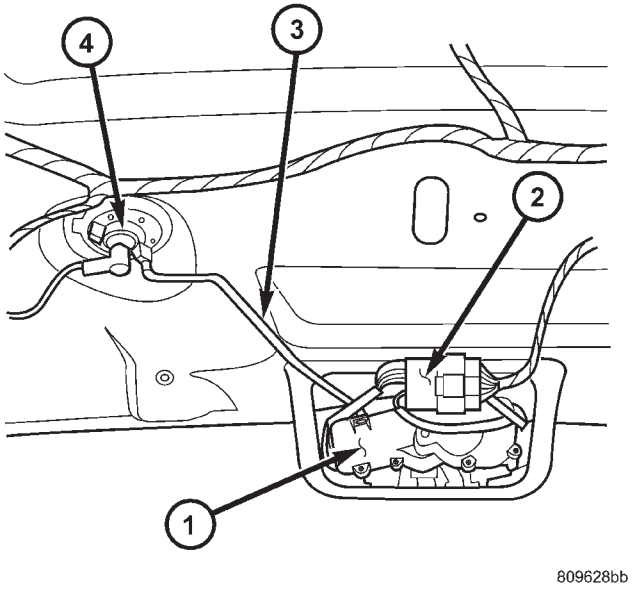

Fig. 13 POWER LATCH ORIENTATION

1 - LATCH & ACTUATOR ASSEMBLY
2 - LATCH ELECTRICAL CONNECTOR
3 - LOCK CYLINDER LINK ROD
4 - LIFTGATE LOCK CYLINDER

The power cinch/release actuator is serviceable component. Consult your Mopar™ parts catalog for specific part numbers.

OPERATION

During a power close cycle, the power cinch actuator provides the torque required to close the power liftgate from the secondary to the primary closed and latched position. During a power open cycle, the power release actuator releases the liftgate from the primary closed and latched position to the fully unlatched and movable position.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Open the liftgate and remove the lower liftgate trim panel. Refer to Body for the procedure.

(3) Disconnect the power latch electrical connector (Fig. 13).

(4) Remove the three latch retaining bolts.

LATCH ACTUATOR (Continued)

(5) Grab the latch assembly and unhook the key cylinder link rod from the key cylinder (Fig. 13).

(6) Place the latch assembly on a bench and locate the three wires leading from the actuator portion of the latch assembly.

(7) Disengage the main connector retaining push pins from the latch actuator housing.

(8) Back the three wires out of the main latch electrical connector. Refer to the wiring section of the service manual for detailed instructions.

(9) Flip the latch assembly over and remove the latch actuator retaining screw(s).

(10) Remove the latch actuator from the latch assembly.

INSTALLATION

(1) Install the latch actuator on the latch assembly.

(2) Install the three latch actuator retaining screws. Torque the screws to 4 in. lbs.

(3) Install the three wires in the main latch electrical connector. Refer to the wiring section of the service manual for detailed instructions.

NOTE: Be certain wires are reinstalled in the correct wire cavities. Failure to do so could result in damage to the latch actuator. Refer to Wiring Diagrams if previous notes were not made.

(4) Secure the main connector retaining push pins on the latch actuator housing.

(5) Grab the latch assembly and hook the key cylinder link rod on the key cylinder.

(6) Position the latch and install the three latch retaining bolts. Torque to 10 N·m (90 in. lbs.).

(7) Connect the power latch electrical connector.

(8) Install the lower liftgate trim panel. Refer to Body for the procedure.

(9) Connect the negative battery cable.

EXTERIOR HANDLE SWITCH

DESCRIPTION

Vehicles equipped with a power liftgate or power locks utilize a exterior handle switch. The exterior handle switch is a electronic release switch mounted to the rear license plate lamp housing assembly, located just above the license plate. This switch controls the power liftgate release function and is also capable of reversing the power liftgate when it is in motion. A full power open cycle cannot be performed using this switch, only one of the power open command switches (key fob and overhead console mounted) can be used to perform a full power open cycle.

The exterior handle switch is a serviceable component. Consult your Mopar™ parts catalog for a specific part number.

OPERATION

When the exterior handle switch is depressed, with the liftgate in the closed position. A message is sent to the Body Control Module (BCM). The Body Control Module then sends a signal to the power liftgate control module via the J1850 PCI data bus circuit. The power liftgate control module then sends a signal to the power latch mounted actuator, which moves the liftgate from the primary closed and latched position to the open and movable position. If the liftgate is not pulled open once the latch releases within a few seconds, the latch will cinch closed again.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Open the liftgate and remove the liftgate trim panel. Refer to the Body section of the service manual for the procedure.

(3) Remove the rear lamp bar assembly from the vehicle. Refer to the Body section of the service manual for the procedure.

(4) Locate the two wires going to the exterior handle switch. Cut the tie strap and trace the wires to the large electrical connector and back the wires out of the large connector and through the grommet. Refer to the Wiring section of the service manual for detailed instructions.

(5) Depress the two exterior handle switch retaining tabs and roll the switch out of the light bar assembly (Fig. 14).

INSTALLATION

(1) Install the handle switch in the light bar assembly.

(2) Locate the two wires going to the exterior handle switch. Install the wires through the grommet and in the large connector. Secure with a tie strap. Refer to the Wiring section of the service manual for detailed instructions.

NOTE: Be certain wires are reinstalled in the correct wire cavities. Failure to do so could result in damage to the handle switch. Refer to Wiring Diagrams if previous notes were not made.

(3) Install the rear light bar. Refer to the Body section of the service manual for the procedure.

(4) Install the liftgate trim panel. Refer to the Body section of the service manual for the procedure.

(5) Connect the negative battery cable.

EXTERIOR HANDLE SWITCH (Continued)

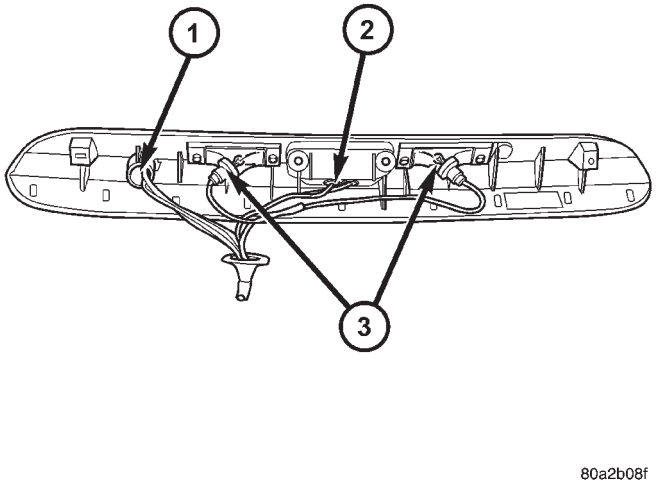

Fig. 14 REAR LIGHT BAR

1 - CHIME / THERMISTOR
2 - ELECTRIC RELEASE HANDLE SWITCH
3 - LICENSE PLATE LAMPS

(6) Using an appropriate scan tool, check any erase any power liftgate control module diagnostic trouble codes.

(7) Verify power liftgate system and handle switch operation. Cycle the power liftgate through one complete open and close cycle, this will allow the power liftgate control module to relearn its cycle with the new components.

CHIME/THERMISTOR

DESCRIPTION

Vehicles equipped with a power liftgate utilize a chime/thermistor assembly. The chime/thermistor assembly is a small capacitor shaped electrical component mounted to the rear license plate lamp housing assembly (Fig. 15) , located just above the license plate. The chime portion of the assembly controls the audible chime sound heard at the rear of the vehicle when the power liftgate is in motion. The thermistor portion of the assembly is a temperature sensor, used by the power liftgate module.

The chime/thermistor assembly is a serviceable component. Consult your Mopar™ parts catalog for a specific part number.

OPERATION

The chime/thermistor assembly performs two different functions for the power liftgate system. First, the chime portion provides an audible chime sound which is controlled by the power liftgate module. The chime/thermistor assembly is hardwired to the power liftgate module. Second the thermistor provides a outside temperature reading by way of a resistance reading (Ω - ohms) supplied to the power liftgate module. As temperature increases the resistance reading (Ω - ohms) increases , as temperature decreases the resistance reading (Ω - ohms) decreases.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the rear light bar assembly from the vehicle. Refer to Body for the procedure.

(3) Using your hands, grasp the light bar at its sides next to thermistor/chime assembly and gently pull the two sides of the light bar apart until the thermistor/chime assembly can be removed.

INSTALLATION

(1) Gently pull the two sides of the light bar apart until the thermistor/chime assembly can be installed.

(2) Install the rear light bar assembly on the vehicle. Refer to the Body section of the service manual for the procedure.

(3) Connect the negative battery cable.

POWER SLIDING DOOR SYSTEM

DESCRIPTION

Some vehicles are equipped with a power opening and closing sliding door system (Fig. 1). Depending on how the vehicle is ordered it may be equipped with only a right side power door or right and left side power doors. This power sliding door system is a complex system consisting of many components. Some of these components are the door motor, latch assembly, sliding door control module, lower drive unit, flex drive assembly, wire harness and track, lower drive unit track and rack assembly, full open switch, B-pillar switch, overhead console switch, key fob switches (Fig. 2), pawl switch, ratchet switch and child lockout and handle switches.

Each power side door has its own door control module, located in the center of the door behind the door trim panel. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/DOOR CONTROL MODULE - DESCRIPTION) The power side door motor is located in the front portion of the door, on the inner door panel sheet metal. The latch assembly is located in the rear of the power side door, near the body line. The lower drive unit is attached to the lower door hinge. The flex drive assembly connects the door motor to the lower drive unit. The wire harness and track and the lower drive unit track are visible with the door open in the lower door sill area. The power side door full open switch is located under the lower drive unit and is part of the hold open latch assembly. The pawl, ratchet, handle and child lockout switches are all located on the power side door latch assembly. The B-pillar switch, as it will be

POWER SLIDING DOOR SYSTEM (Continued)

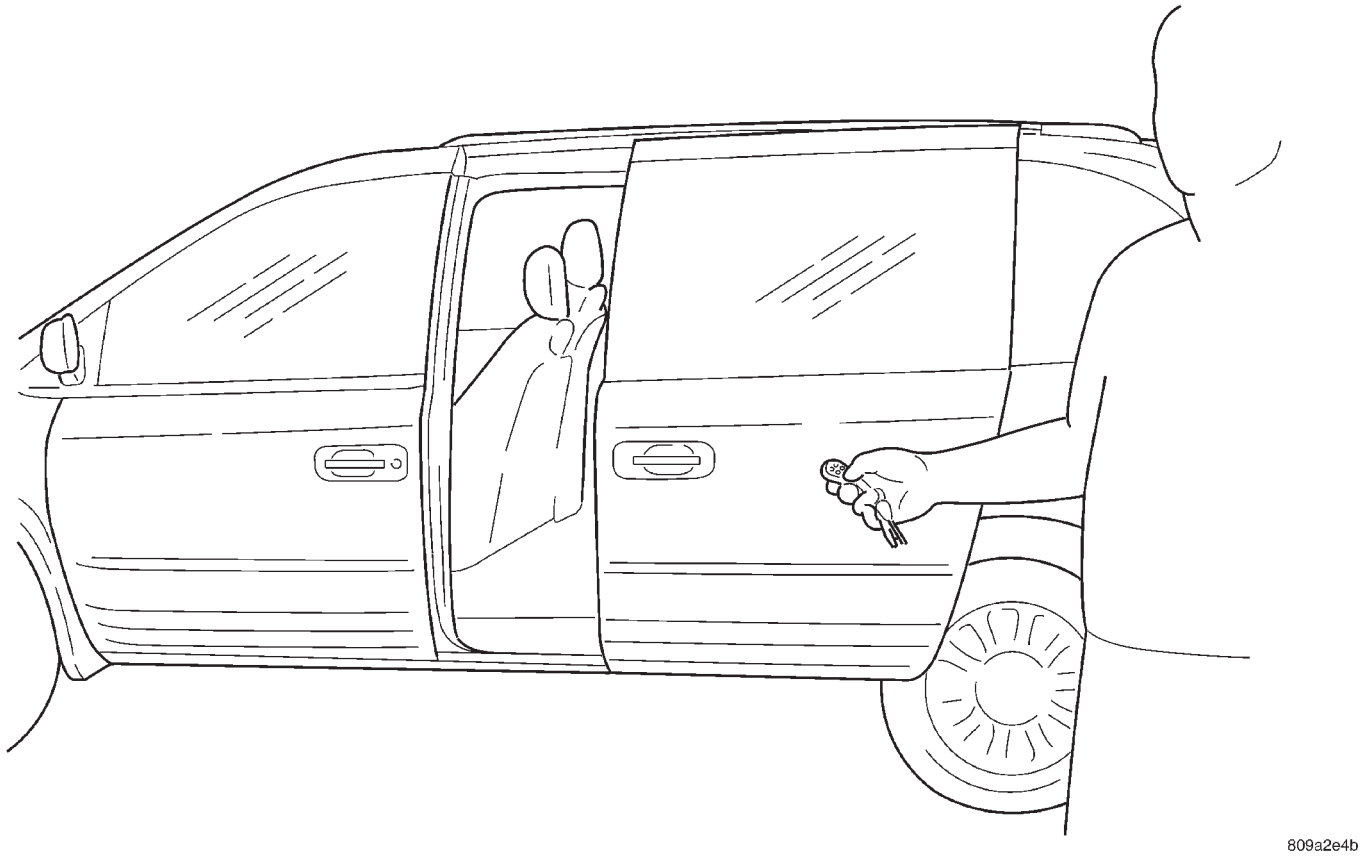

Fig. 1 Power Sliding Door Introduction

referred to, is an open and close command switch located on the vehicles interior body side B-pillar trim. The overhead console switch, is an open and close command switch located in the vehicle's overhead console. More detailed information can be found on these components later in this section.

Safety is of the utmost concern with the power sliding door system. Software technology has enabled the power sliding door control module to detect resistance to door travel. This allows the power sliding door to stop and reverse direction any time an obstruction is felt or any of the command switches are operated (while closing only). Battery voltage is supplied to the power sliding door system through a 40 amp fuse, located in the Intelligent Power Module (IPM) assembly (Fig. 3). The child lockout switch prevents children from opening or actuating the power sliding door system when desired. In the unlikely event that the power sliding door system develops a fault, the power sliding door can still be operated manually from the interior or exterior door handle, just like a standard manual sliding door.

The power sliding door control module communicates on the J1850 PCI Data Bus Circuit. Therefore, the power sliding door control module can generate and store its own diagnostic trouble codes (DTC). A diagnostic scan tool, such as the DRB III® is used to

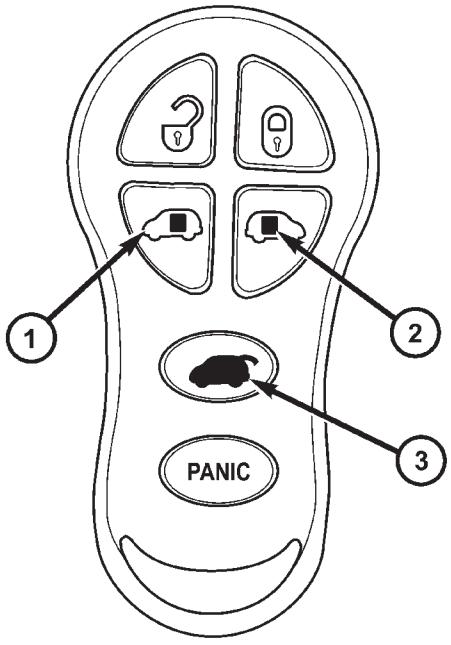

Fig. 2 Key Fob

1 - Left Sliding Door Switch
2 - Right Sliding Door Switch
3 - Liftgate Switch

POWER SLIDING DOOR SYSTEM (Continued)

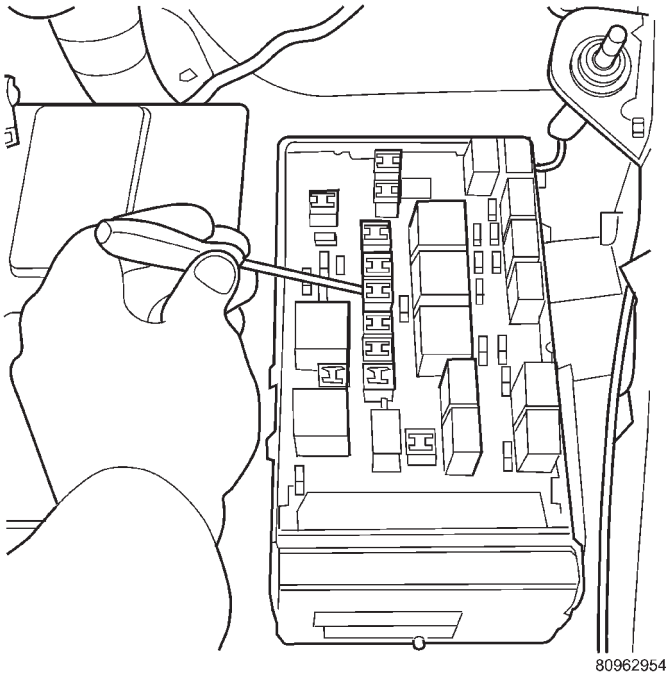

Fig. 3 Power Side Door Fuse Location

read and diagnose these trouble codes. Refer to the Body Diagnostic Manual for a complete list of diagnostic routines.

NOTE: It may be possible to generate Sliding Door Diagnostic Trouble Codes during normal power sliding door operation. Refer to the Body Diagnostic Manual for a complete list of diagnostic routines.

For additional information, (Refer to 8 - ELECTRICAL/POWER DOORS - OPERATION). For a complete power sliding door system wiring schematic, refer to Wiring Diagrams. For power sliding door system operation instructions, refer to the vehicle owner manual.

WARNING: BE CERTAIN TO READ ALL WARNINGS AND CAUTIONS IN POWER SLIDING DOOR OPERATION BEFORE ATTEMPTING ANY SERVICE OF POWER SLIDING DOOR SYSTEM OR COMPONENTS.

OPERATION

With the push of a power sliding door open/close command switch (key fob, overhead console or B-pillar mounted) a signal is sent out to the Body Control Module (BCM). The BCM then sends a signal out on the PCI Data Bus circuit (J1850) to the power sliding door module. The power sliding door module then signals the power sliding door latch to release the door to the unlatched and movable position. The motor then starts an open cycle.

During the door open cycle, if the power sliding door module detects sufficient resistance to door travel, such as an obstruction in the door's path, the power sliding door module will immediately stop door movement and reverse door travel to the full open or closed position. The ability for the power sliding door module to detect resistance to door travel is accomplished by hall effect sensors and the door motor speed.

The power sliding door control module has the ability to learn. Anytime a door is opened or closed using the power sliding door system the module learns from its cycle. If a replacement power sliding door component is installed or a door adjustment is made, the module must re-learn the effort required to open or close the door. A learn cycle can be performed with a Diagnostic Scan Tool, such as the DRB III®, or with a complete cycle of the door, using any one of the command switches. Refer to Standard Procedures in this section for detailed instructions.

The power sliding door system is designed with a number of system inhibitors. These inhibitors are necessary for safety and/or feasibility of the power sliding door system. See the power sliding door system inhibitors noted below:

POWER SLIDING DOOR SYSTEM INHIBITORS

- The power sliding door must be in the **full** open or closed position in order for the power sliding door system to start a cycle. If the door is not in this position (based on the input from the full open, pawl or ratchet switches) the door control module will not respond to command switch inputs.
- The vehicles transmission must be in **park or neutral** in order for the power sliding door system to start a cycle.
- The vehicles child lockout switch must be in the "UNLOCKED" position in order for the power sliding door systems B-pillar switches to function.
- If multiple obstacles are detected during the same power open or close cycle the power sliding door may go into full manual mode.
- If severe Diagnostic Trouble Codes (DTC) are stored in the power sliding door control module the power sliding door may go into full manual mode.
- Due to the high pressure created in the passenger compartment with the blower motor on high, the power sliding door may not complete a power close cycle unless a window is cracked, allowing the pressure to escape. This situation will only be experienced on some vehicles, or vehicles with brand new side door weather seals installed. Refer to the Side Door Adjustment procedure in the Standard Procedures section of this group.
- The vehicles fuel tank filler door must be in the closed position. Due to the sliding door interference

with the open fuel tank filler door, mechanical linkage prevents the side door from opening and striking the fuel door. Refer to the Body section of this manual for detailed information on the fuel door lockout feature.

POWER SLIDING DOOR SYSTEM WARNINGS

WARNING: ALWAYS DISCONNECT THE NEGATIVE BATTERY CABLE BEFORE ATTEMPTING ANY POWER SLIDING DOOR SYSTEM SERVICE.

WARNING: EXTREME CARE MUST BE TAKEN TO PREVENT OBJECTS FROM ENTERING THE DOORS PATH ONCE THE DOOR REACHES THE CINCH MOTOR CONTACT (APPROXIMATELY 1 INCH BEFORE FULLY CLOSED).

WARNING: NEVER ATTEMPT TO ENTER OR EXIT THE VEHICLE WHILE THE POWER SLIDING DOOR IS IN MOTION. YOU COULD DAMAGE THE POWER SLIDING DOOR SYSTEM OR COMPONENTS AND/OR CAUSE PERSONAL INJURY.

WARNING: NEVER ATTEMPT TO DRIVE AWAY WITH THE POWER SLIDING DOOR IN MOTION. YOU COULD DAMAGE THE POWER SLIDING DOOR SYSTEM OR COMPONENTS AND/OR CAUSE PERSONAL INJURY.

WARNING: NEVER PLACE OBJECTS IN THE POWER SLIDING DOOR WHEN CINCHING CLOSED. YOU COULD DAMAGE THE VEHICLE, POWER SLIDING DOOR SYSTEM OR COMPONENTS AND/OR CAUSE PERSONAL INJURY.

DIAGNOSIS AND TESTING - POWER SLIDING DOOR SYSTEM

The power opening and closing power sliding door system is a complex system containing many components and modules. In order to obtain conclusive testing, the Programmable Communications Interface (J1850) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the power sliding door system must be checked.

The power sliding door system was designed to be diagnosed with an appropriate diagnostic scan tool, such as the DRB III®. The most reliable, efficient, and accurate means to diagnose the power sliding door system requires the use of a DRB III® scan tool and the proper Body Diagnostic Procedures manual. The DRB III® can be used to observe various switch statuses throughout the power sliding door system to help the technician diagnose a defective switch or component. The DRB III® can also be used to actuate various components throughout the power sliding door system to help the technician diagnose a defective component.

Before any testing of the power sliding door system is attempted, the battery should be fully charged, all built-in power sliding door system inhibitors read and understood (Refer to 8 - ELECTRICAL/POWER DOORS - OPERATION) and all wire harness and ground connections inspected around the affected areas on the vehicle.

The following are quick reference diagnostic tables to help when diagnosing and testing the power sliding door system.

POWER SLIDING DOOR SYSTEM (Continued)

POWER SLIDING DOOR SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
Door opens unexpectedly	Failure of sliding door control or body control module	Disconnect then reconnect battery to reset module, function door, if no function exists check for loose wire connections, Refer to the Body Diagnostic Manual for detailed procedures
	Failure of latch assembly	Check wiring/cable connections and for blown fuse
		Check for trouble codes, replace latch if necessary
	Failure of open/close command switch	Check for shorted or defective switch
	Failure of striker	Striker misaligned or loose
		Striker damaged Replace striker if necessary
Door will not open manually using inside handle	Failure of inside handle assembly	Check for broken inside handle assembly
		Check cable connections at latch and handle assembly.
		Check for binds or kinks in cable.
		Check for foreign matter preventing the operation of handle assembly Replace the handle if necessary
	Failure of latch assembly	Check cable connections
		Check for foreign matter preventing the operation of latch assembly Replace latch if necessary
	Failure of inside handle cable assembly	Check cable for binding
		Check cable for broken condition Replace the cable, if necessary
	Binding or sticking of components	Check for foreign matter preventing the operation of door
		Establish location of binding Replace necessary components
Door will not open manually using outside handle	Failure of outside handle assembly	Check for broken outside handle assembly
		Check cable connections at latch and handle assembly.
		Check for binds or kinks in cable. Check for foreign matter preventing the operation of handle assembly

POWER SLIDING DOOR SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
		Replace the handle if necessary
	Failure of latch assembly	Check cable connections
		Check for foreign matter preventing the operation of latch assembly
		Replace latch assembly, if necessary
	Failure of outside handle cable assembly	Check cable for binding
		Check cable for broken condition
		Replace the cable, if necessary
	Binding or sticking of components	Check for foreign matter preventing the operation of door
		Establish location of binding
		Replace necessary components
Sliding door will not open/close manually	Binding or sticking of components	Establish location of binding. Disconnect flex drive and recheck. Replace necessary components
	Failure of latch assembly	Check cable connections
		Check for foreign matter preventing the operation of latch assembly
		Replace latch assembly, if necessary
Sliding door will not open/close under power	Failure of sliding door control or body control module	Disconnect then reconnect battery to reset module, function door, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of latch assembly	Check wire connections and for blown fuse
		Check cable connections
		Check for foreign matter preventing the operation of latch assembly
		Troubleshoot using body diagnostic manual
		Replace latch assembly, if necessary
	Failure of motor assembly	Troubleshoot using body diagnostic manual
	Failure of full open switch assembly	Troubleshoot using body diagnostic manual
	Failure of flex drive assembly	Disconnect flex drive and check for broken condition
	Failure of lower drive unit assembly	Remove lower drive unit and check for broken condition
	Binding or sticking of components	Establish location of binding and replace necessary components
	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams
Power loss during power door operation	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams

POWER SLIDING DOOR SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	Low battery voltage	Charge battery
	Failure of sliding door control or body control module	Disconnect then reconnect battery to reset module, function door, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of drive assembly	Remove lower drive unit and check for no drive condition
No latching in primary and/or secondary positions	Failure of inside/outside handle assembly	Go to that ″POSSIBLE CAUSE″ and review ″CORRECTIONS″
	Failure of latch assembly	Check wire connections and for blown fuse
		Check cable connections Check for foreign matter preventing the operation of latch assembly Troubleshoot using body diagnostic manual Replace latch assembly, if necessary
	Binding or sticking of components	Establish location of binding and replace necessary components
	Failure of sliding door control or body control module	Disconnect then reconnect battery to reset module, function door, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Door seal force too high	Inspect seals for damage, mis-assembly, foreign matter. Refer to Door adjustment in the Body section of the service manual for specifications
	Failure of drive assembly	Remove lower drive unit and check for no drive condition
	Failure of striker	Striker misaligned or loose
		Striker damaged Replace striker if necessary
Latch will not fully release from primary position	Failure of latch assembly	Check wire connections and for blown fuse
		Check cable connections Check for foreign matter preventing the operation of latch assembly Troubleshoot using body diagnostic manual Replace latch assembly, if necessary
	Failure of fuel filler door lockout mechanism	Check operation of fuel filler door lockout mechanism. Refer to the Body section for information
	Failure of sliding door control or body control module	Disconnect then reconnect battery to reset module, function door, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of striker	Striker misaligned or loose

POWER SLIDING DOOR SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
		Striker damaged Replace striker if necessary
	Cables worn and stretched	Replace cables as necessary
	Binding or sticking of components	Establish location of binding and replace necessary components
Key fob, B-pillar or overhead console switch does not power operate door	Blown Fuse	Check fuse and replace
	Battery voltage low	Charge or replace battery
	Failure of latch assembly	Check for foreign matter preventing the operation of latch assembly
		Check wire connection Pawl and/or ratchet switch inoperative Replace latch if necessary
	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams
	Failure of body control module	Check electrical connections
		Refer to the body diagnostic manual for additional checks Replace BCM if necessary
	Failure of key fob	Replace key fob battery
		Replace key fob if necessary
	Failure of sliding door control module	Disconnect then reconnect battery to reset module, function door, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of door motor assembly	Check for foreign matter preventing the operation of gear motor assembly
		Check wire connections Gear motor clutch does not engage, replace assembly Full open switch inoperative, replace hold open latch assembly Replace motor assembly. if necessary
Door does not stay open	Failure of hold open latch assembly	Check wire/cable connections
		Replace hold open latch, if necessary
	Failure of hold open latch striker	Replace hold open latch striker, if necessary
High inside/outside opening effort	Failure of latch assembly	Check wire connections and for blown fuse
		Check cable connections

POWER SLIDING DOOR SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
		Check for foreign matter preventing the operation of latch assembly Troubleshoot using body diagnostic manual Replace latch assembly, if necessary
	Failure of inside/outside handle assembly	Go to that ″POSSIBLE CAUSE″ and review ″CORRECTIONS″
	Binding or sticking of components	Establish location of binding and replace necessary components
Door continues to cinch closed during power mode	Failure of latch assembly	Check wire connections and for blown fuse
		Check for foreign matter preventing the operation of latch assembly Troubleshoot using body diagnostic manual Replace latch assembly, if necessary
	Failure of sliding door control or body control module	Disconnect then reconnect battery to reset module, function door, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams
Door continues to open during power mode (runaway motor)	Failure of sliding door control or body control module	Disconnect then reconnect battery to reset module, function door, if no function exists check for loose wire connections, see Body Diagnostic Manual for detailed procedures
	Failure of hold open latch assembly	Check wire/cable connections
		Replace hold open latch, if necessary
	Failure of drive assembly	Remove lower drive unit and check for no drive condition
	Wiring problems (system or vehicle)	Troubleshoot using electrical schematics. Refer to wiring diagrams
Door opens very slowly	Failure of door motor assembly	Check wire/cable connections
		Replace motor assembly, if necessary
	Binding or sticking of components	Establish location of binding and replace necessary components
Squeaks, Noises and rattles	Foreign material in door compartment	Remove foreign material
	Loose components	Check and tighten loose components
	Poor door track lubrication	Lubricate the front portions of the side door tracks with ″Door Ease®″ or equivalent

POWER SLIDING DOOR SYSTEM (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURE - WELLNUT REPLACEMENT

Vehicles equipped with a power sliding door utilize wellnuts. These wellnuts are used to hold and isolate the power sliding door motor to and from the door inner panel. The wellnut functions like a expandable rubber core plug, as the screw fastener is threaded into the wellnut and tightened the wellnuts diameter increases. This secures the door motor assembly to the inner panel and keeps the audible motor vibrations to a minimum. If a wellnut shows signs of wear, it must be replaced. Follow the procedure below if replacement is necessary.

(1) Remove the door motor from the door inner panel. (Refer to 8 - ELECTRICAL/POWER DOORS/ MOTOR - REMOVAL).

(2) Remove the wellnuts from the inner panel by pulling them straight out (Fig. 4). If a wellnut is difficult to remove, use a high leverage cutting tool to cut the wellnut in half and remove the two halves from the door assembly.

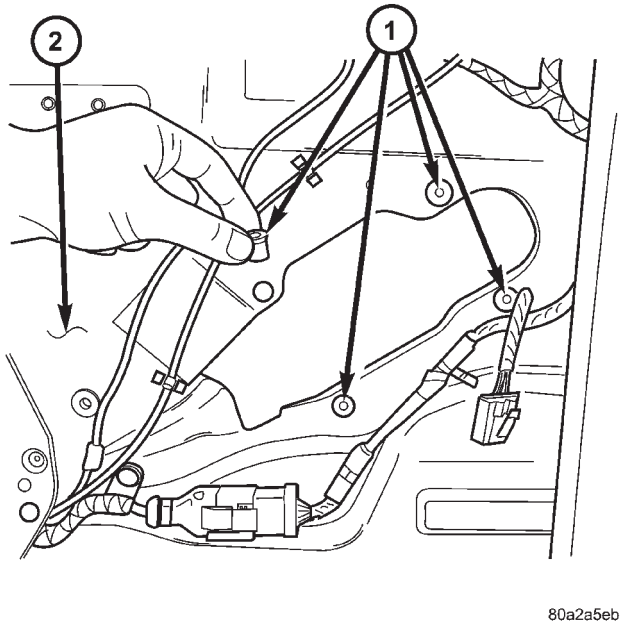

Fig. 4 Side Door Motor Wellnuts

1 - Wellnuts
2 - Side Door Inner Panel

(3) Install the replacement wellnuts in the inner panel and install the door motor(Refer to 8 - ELECTRICAL/POWER DOORS/MOTOR - INSTALLATION) .

CAUTION: Be certain to use the correct torque specification (35 in.lbs.) when installing the door motor retaining screws.

STANDARD PROCEDURE - POWER DOOR LEARN CYCLE

Any time a power side door component is removed, replaced, door adjustment is performed or diagnostic trouble codes are addressed and erased, a learn cycle **must** be performed. This learn cycle enables the power side door control module to learn or relearn its critical information (travel limits, resistance to door travel, etc.) which allows it to perform properly and safely. It also tells the technician that the system is performing properly and is able to be returned to service. To perform a power door learn cycle do the following:

(1) Obtain a DRB III® scan tool.

Connect the DRB III® to the vehicle and check for any power side door system stored diagnostic trouble codes, erase any stored codes. Operate the system and check to see if any trouble codes return. If any diagnostic trouble codes return, diagnose, correct and erase the codes before performing the learn cycle. If a DRB III® scan tool is not available, the learn cycle can be performed by opening and closing the power side door using any of the normal open/close command switches. Be certain to cycle the side door through a complete open **and** close cycle or the procedure will not be complete.

(2) Using the DRB III®, Go into Test Routine Menu and select a power open command.

(3) Select a power close command.

(4) The power side door learn cycle is complete.

NOTE: If the power side door will not complete a full cycle, a problem exists with the power side door system. Refer to Power Side Door Diagnosis and Testing.

STANDARD PROCEDURE - SLIDING DOOR ADJUSTMENT

In order for the power sliding door system to function properly the door must move freely and smoothly. The power sliding door system can accommodate for some minor changes in the effort required to move the door. However, in extreme conditions the door may need to be mechanically adjusted for proper fit. (Refer to 23 - BODY/DOORS - SLIDING/SLIDING DOOR - ADJUSTMENTS).

If a problem exists with the power sliding door and it is suspected to be extreme effort, check for proper door alignment and adjustment first, then check the door tracks and drive unit for free manual operation.

POWER SLIDING DOOR SYSTEM (Continued)

Use a known good vehicle for side door comparison data. Refer to the Side Door Adjustment procedure in the Body section of the service manual for detailed instructions.

LATCH

DESCRIPTION

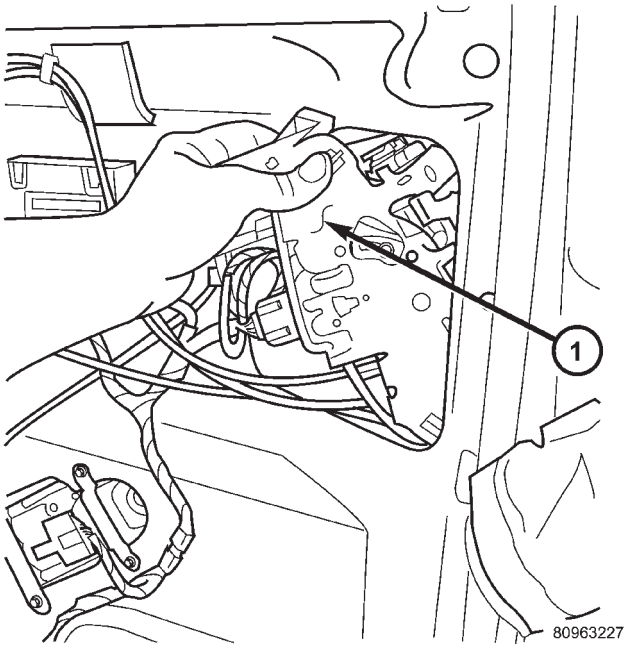

Fig. 5 Removing/Installing Power Latch in Sliding Door

1 - Power Latch Assembly

Vehicles equipped with a power side door or doors utilize a power latch. One power latch is used for each power door. The latch is located on the trailing edge of the side door assembly (Fig. 5). This power latch assembly is comprised of many different components which have the ability to perform the power cinch, release, lock, unlock and safety related operations. These components are the door latch, lock/unlock actuator, cinch/release actuator and child lockout, pawl, ratchet and handle switches. The pawl and ratchet switches are used to indicate the primary and secondary latched positions. The cinch latch also provides a connection point for the interior handle, exterior handle and hold open latch cables.

The power latch is a replaceable component. Consult your Mopar parts catalog for specific part numbers.

OPERATION

The power latch performs the same operation as a full manual door latch as well as power cinch, release, lock and unlock operations. The power latch mounted actuator cinches the door closed and latches it in its primary latched position. During a power close cycle, the power cinch actuator will not operate until the side door has reached its secondary latch position (determined by pawl and ratchet switches). During a power open cycle, the power release actuator will stop once the side door has moved from primary latch position.

The power latch uses inputs from the lock/unlock actuator, power side door control module and child lockout, pawl, ratchet and handle switches to provide safe power cinch and release operations. Refer to Power Side Door Operation for additional information.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the appropriate side door trim panel. Refer to the Body section for the procedure.

(3) Remove the weather shield if necessary. Refer to the Body section for the procedure.

(4) Open the side door all the way and remove the door latch retaining bolts (Fig. 6).

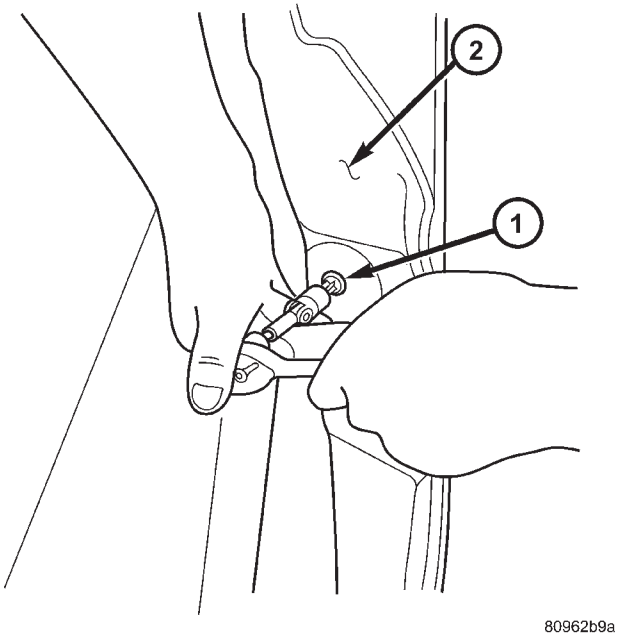

Fig. 6 Removing Latch Retaining Bolts

1 - Latch Retaining Bolts
2 - Side Door

LATCH (Continued)

(5) Partially close the door and pull the latch assembly out of the side door inner panel.
(6) Disconnect all electrical connectors leading to the latch assembly.
(7) Disconnect the inside and outside handle cables from the latch assembly. Refer to the Body Section of the service manual for the procedure.
(8) Disconnect the hold open latch cable from the latch assembly. Refer to the Body Section of the service manual for the procedure.
(9) Disconnect lock actuator link rod from the latch assembly.
(10) Remove the latch assembly from the vehicle.

INSTALLATION

(1) Position the latch assembly in the vehicle. Be certain all latch mounted components are installed on the replacement latch assembly. If not, transfer components from the old latch to the new latch assembly.
(2) Connect the lock actuator link rod on the latch assembly.
(3) Connect the hold open latch cable on the latch assembly. Refer to the procedure in this section for detailed instructions.
(4) Connect the inside and outside handle cables on the latch assembly. Refer to the procedure in the Body section for detailed instructions.
(5) Connect all electrical connectors leading to the latch assembly.
(6) With assistance from another person, position the side door and install the door latch retaining bolts. Torque to 10 - 12 N·m (100 in. lbs.).
(7) Install the weathershield if necessary. Refer to the procedure in the Body section for detailed instructions.
(8) Install the appropriate side door trim panel. Refer to the procedure in the Body section for detailed instructions.
(9) Connect the negative battery cable.

SLIDING DOOR MOTOR

DESCRIPTION

Vehicles equipped with a power sliding door utilize a door motor assembly. The door motor is located in the center of the side door (Fig. 7) and is comprised of three parts. The three parts of the door motor assembly are the motor, gear reduction and clutch assembly. The door motor assembly provides the power and torque to move the sliding door from the open/closed position to full closed/open position, after the power latching mechanism has released.

Special wellnuts and screws are used in the side door inner panel to retain the door motor to the door panel. Refer to Standard Procedures in this section for additional wellnut information.

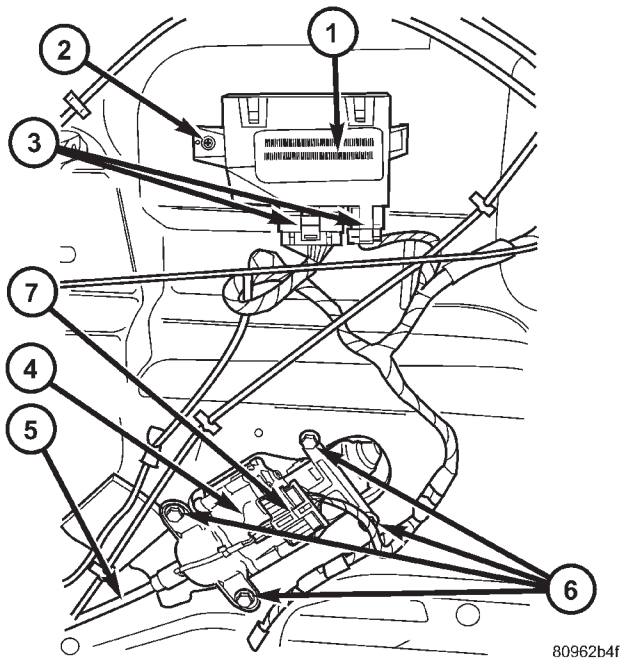

Fig. 7 Side Door Components

1 - Sliding Door Control Module
2 - Module Retaining Screw
3 - Module Electrical Connectors
4 - Door Motor Assembly
5 - Flex Drive Assembly
6 - Door Motor Retaining Fasteners
7 - Door Motor Electrical Connector

The door motor is replaced as a complete assembly, which includes the DC motor, gear reduction and clutch assemblies. Consult your Mopar parts catalog for specific part numbers.

OPERATION

With the push of a Power Side Door (PSD) command switch, the PSD control module will signal the latch assembly to release the door from its primary locked position. The drive motor will then take over to provide the power to open the door to its full open or closed position. The gear reduction portion of the motor assembly reduces the speed of the motor from 5800 to 260 rpm and also increases the torque to the lower drive unit. The clutch portion of the motor assembly engages the motor to drive the door under power and disengages it so the door can be moved easily under manual operation.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

SLIDING DOOR MOTOR (Continued)

(2) Remove the door trim panel from the appropriate side door. Refer to the Body section for the procedure.

(3) Remove water shield as necessary to gain access to motor assembly.

(4) Remove retaining clip holding flex drive assembly to the motor (Fig. 8). Pull flex drive cable straight out of the motor assembly.

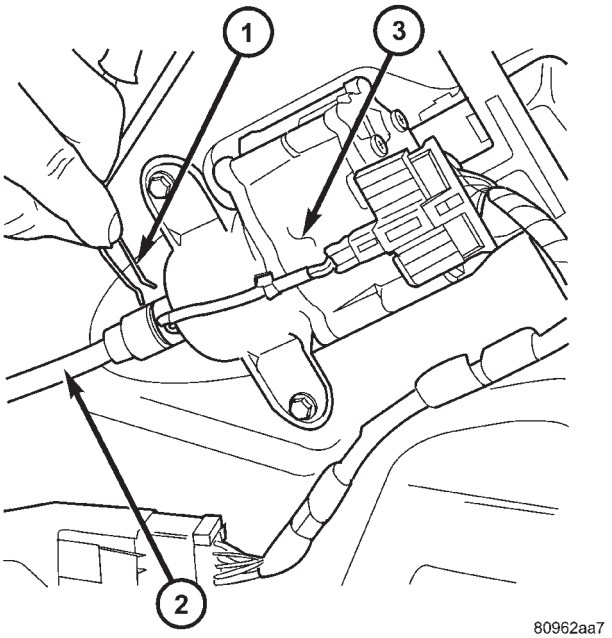

Fig. 8 Flex Drive Retaining Clip

1 - Flex Drive Cable Retaining Clip
2 - Flex Drive Cable
3 - Side Door Motor Assembly

(5) Disconnect door motor electrical connector.

(6) Remove the 4 screws holding the motor to the inner door panel.

(7) Remove the motor assembly from the vehicle.

INSTALLATION

(1) Position the motor assembly on the door inner panel.

(2) Install the 4 screws holding the motor to the inner door panel. Torque to 35 in. lbs.

(3) Install the flex shaft by lining up the square shaped drive shaft with corresponding hole in motor drive unit and push straight in.

(4) Install the E-clip to secure flex-shaft.

(5) Connect the negative battery cable.

(6) Install the weather shield. Refer to the Body section of the service manual for the procedure.

(7) Install the door trim panel on the side door. Refer to Body for the procedure.

FULL OPEN SWITCH

DESCRIPTION

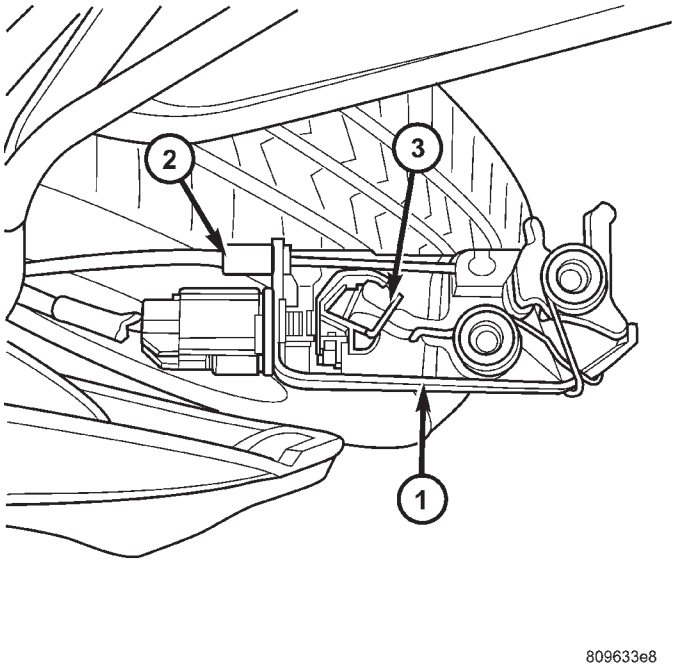

Fig. 9 Full Open Switch Position & Orientation

1 - Hold Open Latch Assembly
2 - Hold Open Latch Cable
3 - Full Open Switch

Vehicles equipped with a power sliding door utilize a full open switch. This switch is located in the hold open latch (Fig. 9) under the side door lower hinge. When the power side door module receives a ground signal input from the full open switch, and as long as the cinching latch actuator is not in power mode or the handle switch is open, the signal indicates that the door is at the full open position.

The full open switch is incorporated into the hold open latch. If the full open switch proves faulty, the entire hold open latch assembly must be replaced.

OPERATION

The full open switch is triggered by a pawl lever in the hold open latch. When the full open switch is closed (circuit to ground) the ratchet has engaged on the hold open striker and the pawl lever has engaged on the ratchet, locking the latch from opening and holding the door in the full open position.

LEFT B-PILLAR SWITCH

DESCRIPTION

Vehicles equipped with power sliding side door/s utilize B-pillar switches. These switches are located on the interior of the vehicle, on the B-pillar trim panels. These switches serve as an open and close command switch for the appropriate power side door.

The B-pillar switches are replaceable. Consult your Mopar parts catalog for a specific part number.

OPERATION

When the Pillar switch is depressed a signal is sent to the Body Control Module (BCM), this signal is then sent to the Power Sliding Door Module, telling it to start a power open or close cycle. The child lockout feature must be disabled and the side door must be unlocked in order for the Pillar switch to function.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Using a trim stick or other small flat-bladed pry tool, gently pry the leading upper edge of the B-pillar switch away from the B-pillar trim.

(3) Once the upper edge is free from pillar trim, rock the switch out of the switch opening.

(4) Disconnect the B-pillar switch electrical connector. First, slide the connector lock away from the switch then, depress connector retaining tab while pulling straight apart.

(5) Remove the B-pillar switch from the vehicle.

INSTALLATION

(1) Connect the B-pillar switch electrical connector. Slide connector lock toward the switch to lock in place.

(2) Hook the lower edge of the B-pillar switch on the B-pillar trim and then push the switch firmly into position.

(3) Connect the negative battery cable.

RIGHT B-PILLAR SWITCH

DESCRIPTION

Vehicles equipped with power sliding side door/s utilize B-pillar switches. These switches are located on the interior of the vehicle, on the B-pillar trim panels. These switches serve as an open and close command switch for the appropriate power side door.

The B-pillar switches are replaceable. Consult your Mopar parts catalog for a specific part number.

OPERATION

When the Pillar switch is depressed a signal is sent to the Body Control Module (BCM), this signal is then sent to the Power Sliding Door Module, telling it to start a power open or close cycle. The child lockout feature must be disabled and the side door must be unlocked in order for the Pillar switch to function.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Using a trim stick or other small flat-bladed pry tool, gently pry the leading upper edge of the B-pillar switch away from the B-pillar trim.

(3) Once the upper edge is free from pillar trim, rock the switch out of the switch opening.

(4) Disconnect the B-pillar switch electrical connector. First, slide the connector lock away from the switch then, depress connector retaining tab while pulling straight apart.

(5) Remove the B-pillar switch from the vehicle.

INSTALLATION

(1) Connect the B-pillar switch electrical connector. Slide connector lock toward the switch to lock in place.

(2) Hook the lower edge of the B-pillar switch on the B-pillar trim and then push the switch firmly into position.

(3) Connect the negative battery cable.

LOWER DRIVE UNIT

DESCRIPTION

Vehicles equipped with a power sliding side door utilize a lower drive unit. The lower drive unit is located on the sliding door lower hinge assembly (Fig. 10). This drive unit is used to transfer the lateral rotation of the flex drive assembly into longitudinal movement via the drive unit gear and door track rack teeth (Fig. 10).

The lower drive unit is a replaceable component. Consult your Mopar parts catalog for specific part numbers.

OPERATION

During a power open or close cycle, the power drive unit is driven by the flex drive assembly. The lower drive units main gear engages the lower door tracks rack teeth, this moves the side door assembly accordingly.

LOWER DRIVE UNIT (Continued)

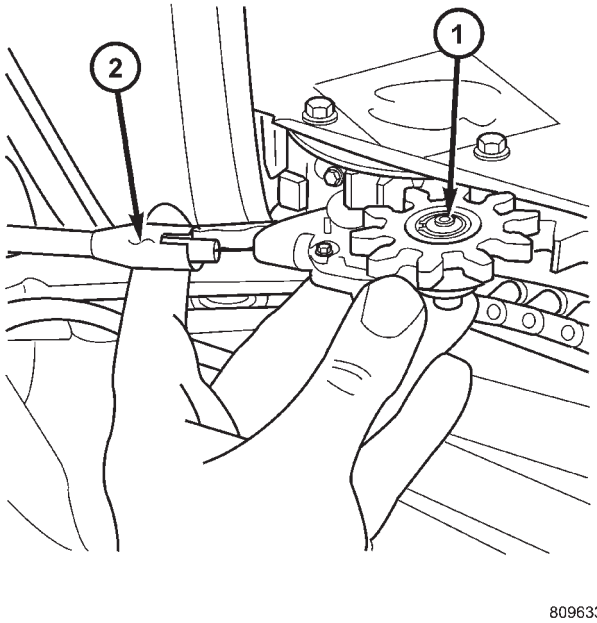

Fig. 10 Lower Drive Unit

1 - Lower Drive Unit
2 - Flex Drive Assembly

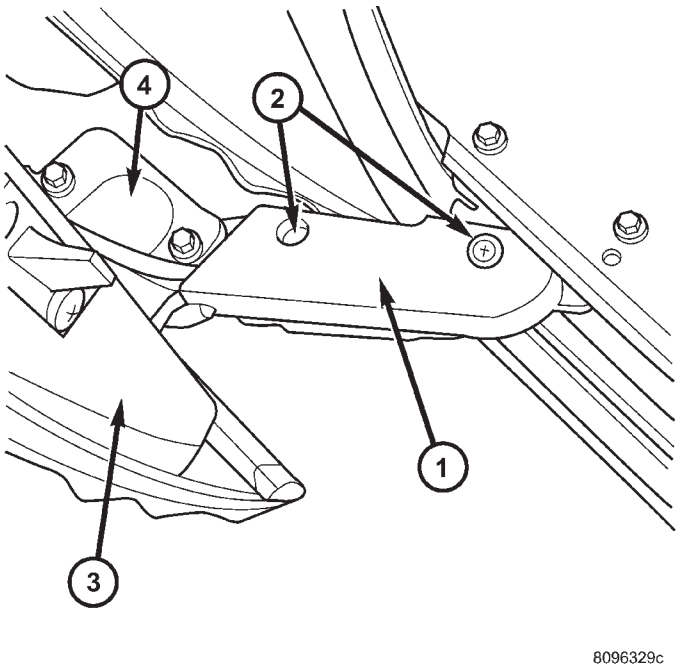

Fig. 11 Sliding Door Lower Hinge Assembly

1 - Lower Drive Unit Cover
2 - Lower Drive Unit Cover Retaining Screws
3 - Sliding Door
4 - Lower Hinge Arm Bracket

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Open the appropriate side door and remove the lower drive unit cover retaining screws (Fig. 11).

(3) Remove the lower drive unit retaining fasteners (Fig. 12).

(4) Disconnect the flex drive assembly from the lower drive unit. Expand the flex drive collar until the lower drive unit can be pulled straight off.

(5) Remove the lower drive unit from the vehicle.

INSTALLATION

(1) Position the lower drive unit near the lower hinge.

(2) Connect the flex drive assembly on the lower drive unit. Push the flex drive collar straight on until the it snaps in place (Fig. 12).

(3) Install the lower drive unit retaining fasteners (Fig. 12). Torque the larger allen headed center stud to 9 N·m (80 in. lbs.). Torque the smaller screw to 3 N·m (28 in. lbs.).

(4) Install the lower drive unit cover and retaining screws (Fig. 11).

(5) Connect the negative battery cable.

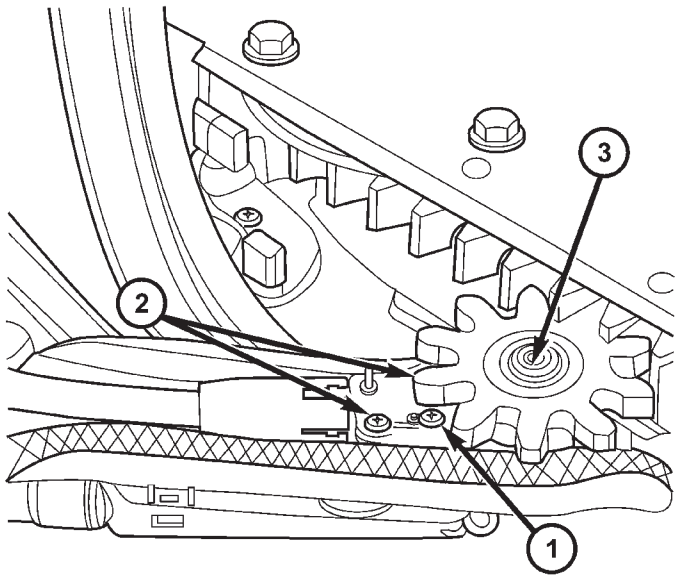

Fig. 12 Lower Drive Unit Retaining Fasteners

LOWER DRIVE UNIT TRACK & RACK

DESCRIPTION

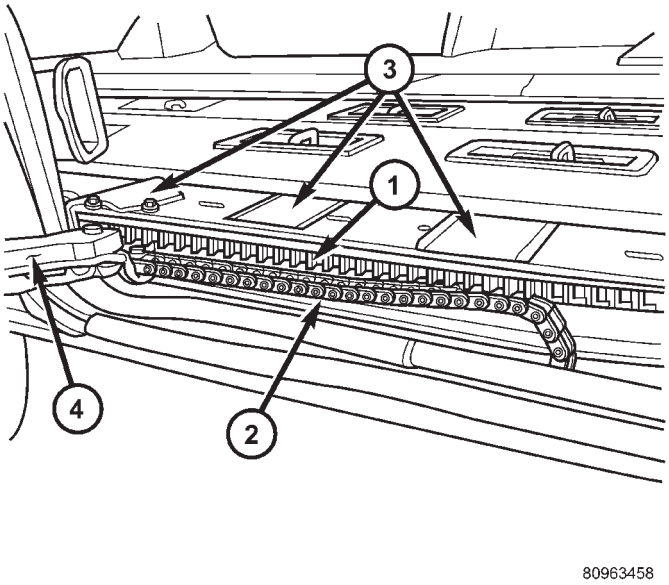

Fig. 13 Rack Access Hole Locations

1 - Lower Door Track and Rack Assembly
2 - Wire Harness
3 - Rack Access Hole Sealing Patches
4 - Lower Drive Unit Cover

Vehicles equipped with a power sliding side door utilize a lower drive unit track or door track and rack assembly. This track provides a mating rack gear (Fig. 13) for the lower drive unit to engage. The track also accepts the lower hinge rollers, which helps support the weight of the side door as well as providing a smooth surface for the hinge rollers to move upon.

The lower door track is a replaceable component. Consult your Mopar parts catalog for specific part numbers.

OPERATION

With the start of a power door open cycle, the door motor drives the flex drive assembly. The flex drive assembly drives the lower drive unit. A metal drive gear which is part of the lower drive unit, meshes with the door track rack teeth and moves the door into the full open position. The same operation repeats itself, during a power close cycle only the system rotates in the opposite direction.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the side door sill plate from the lower of the door opening. Refer to the Body section for the procedure.

(3) Remove the hold-open striker. Refer to Body for the procedure.

(4) Position a floor jack, with a block of wood under the leading edge of the side door to support it (Fig. 14).

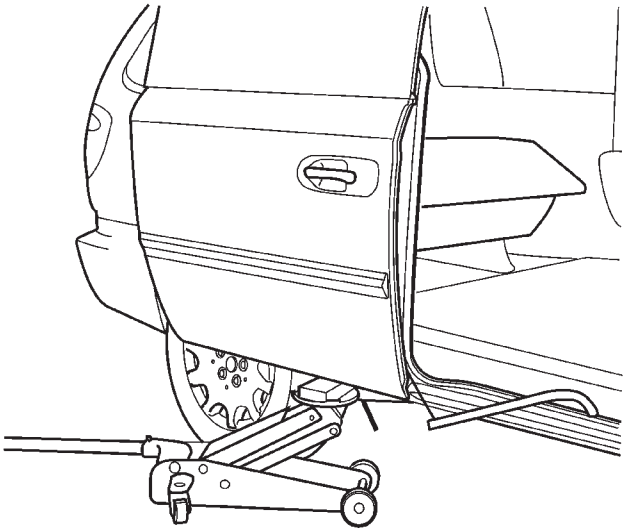

Fig. 14 Supporting Side Door

(5) Remove the lower hinge assembly from the door. Refer to the Body section of the service manual for the procedure.

(6) Position the wire harness assembly out of door opening (Fig. 13), this will allow sufficient room to remove the door track.

(7) Pull back the sealing patches (Fig. 13) and remove the lower track retaining nuts (Fig. 15).

(8) Carefully remove the lower door track from the vehicle.

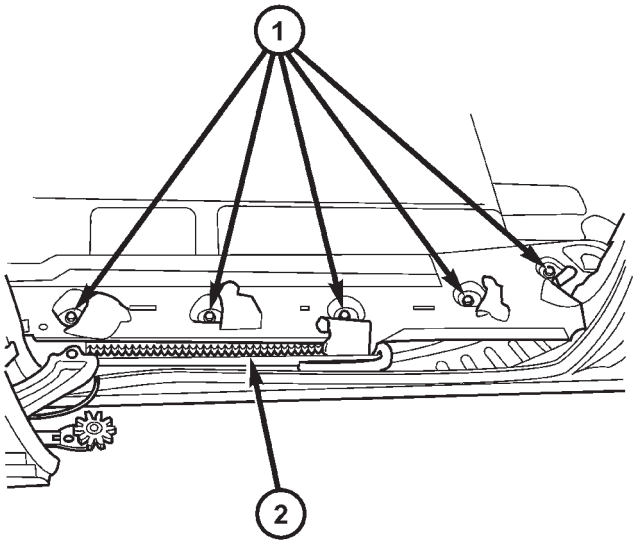
INSTALLATION

(1) Carefully position the lower door track in the vehicle.

(2) Install the lower track retaining nuts (Fig. 15) and install the sealing patches. Torque the fasteners to 70 in. lbs.

(3) Install the lower hinge assembly on the door. Refer to the Body section of the service manual for the procedure.

LOWER DRIVE UNIT TRACK & RACK (Continued)



80963356

Fig. 15 Lower Track Retaining Bolts

1 - Lower Track Retaining Bolts
2 - Lower Door Track

NOTE: Take care to locate the lower hinge assembly on the door in its original position (ie. match screw washer with rings left on hinge). Adjust door fit if required.

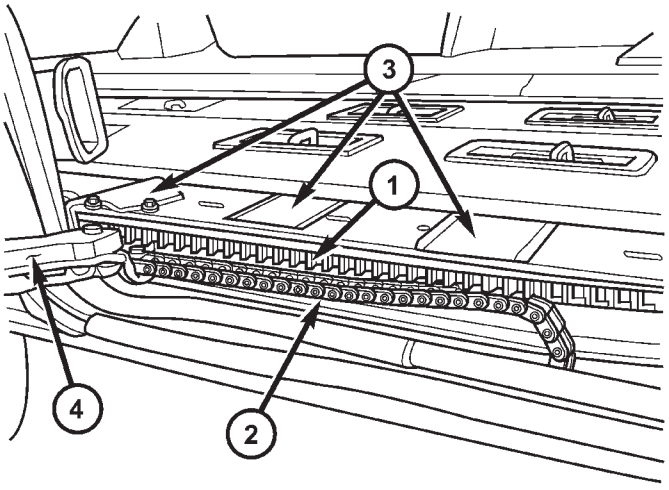
(4) Remove the floor jack (Fig. 14).
(5) Install the hold-open striker. Refer to the Body section for the procedure.
(6) Install the side door sill plate on the lower of the door opening. Refer to the Body section for the procedure.
(7) Connect the negative battery cable.

WIRING HARNESS

DESCRIPTION

The wire harness supplies power (12v), ground and various electrical signals to the side sliding door for various power door functions. A plastic chain or wiring track covers the wire harness assembly (Fig. 16) and is used to protect the wire harness from abrasion and/or tangling. This wiring track is replaced with the wire harness assembly.

The wire harness assembly is a replaceable component. Consult your Mopar parts catalog for specific part numbers.



80963458

Fig. 16 Wire Harness Position and Orientation

1 - Lower Door Track and Rack Assembly
2 - Wire Harness
3 - Rack Access Hole Sealing Patches
4 - Lower Drive Unit Cover

OPERATION

The wire harness and plastic wiring track provide a safe and reliable means of supplying power, ground and other various electrical connections to the side sliding door. During sliding door movement the wiring track folds and unfolds like the links in a chain.

REMOVAL

(1) Disconnect and isolate the negative battery cable.
(2) Remove the appropriate door trim panel from the sliding side door. Refer to the Body section for the procedure.
(3) Remove the lower drive unit cover retaining screws and remove the cover (Fig. 17).
(4) Disconnect the power side door electrical connector, located just behind the lower drive unit assembly.
(5) Disengage retaining pushpin and pull wire harness away from its power side door mounting location (Fig. 16).
(6) Using a flat bladed screwdriver, unsnap the wire harness retaining clip from the lower drive unit.
(7) Slide the wire harness off the forward lower drive unit stud.
(8) Using a pushpin removal tool, unsnap wire harness retaining pushpins from the rocker panel.

WIRING HARNESS (Continued)

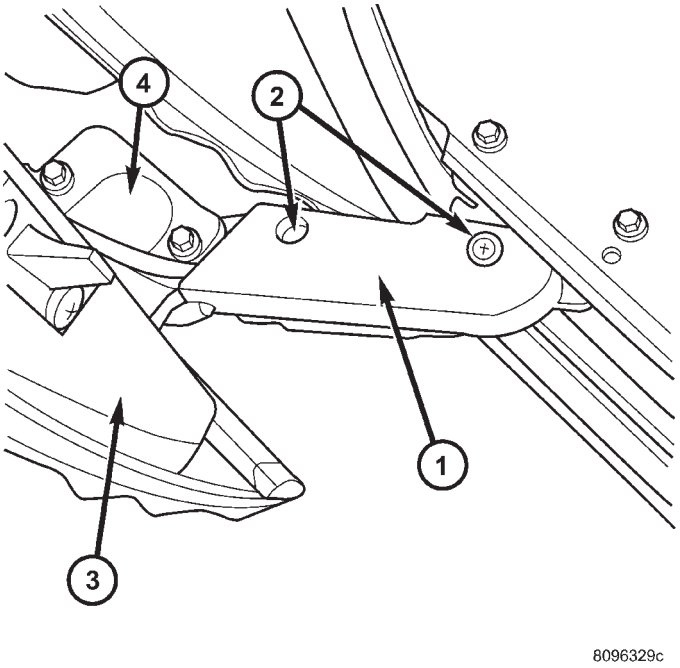


Fig. 17 Lower Hinge/Drive Assembly

1 - Lower Drive Unit Cover
2 - Lower Drive Unit Cover Retaining Screws
3 - Sliding Door
4 - Lower Hinge Arm Bracket

(9) Remove side door lower sill plate. Refer to Body for the procedure.

(10) Pull back the rearward edge of the B-pillar trim to access the wire harness connector and disconnect connector.

(11) Remove the wire harness assembly from the vehicle.

INSTALLATION

(1) Position the wire harness assembly in the vehicle.

(2) Connect the wire harness connector located at the rearward edge of the B-pillar.

(3) Install the side door lower sill plate. Refer to the Body section for the procedure.

(4) Snap the wire harness retaining pushpins in the rocker panel.

(5) Slide the wire harness on the lower drive unit stud.

(6) Install the wire harness retaining clip on the lower drive unit stud.

(7) Connect the power side door electrical connector, located just behind the lower drive unit.

(8) Install the lower drive unit cover and retaining screws.

(9) Install the appropriate door trim panel on the sliding side door. Refer to the Body section for the procedure.

(10) Connect the negative battery cable.

FLEX DRIVE

DESCRIPTION

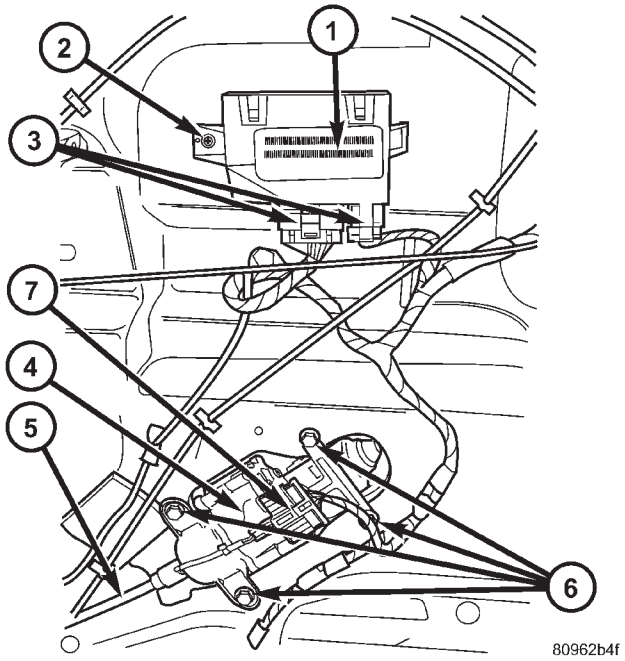

Fig. 18 Side Door Components

1 - Sliding Door Control Module
2 - Module Retaining Screw
3 - Module Electrical Connectors
4 - Door Motor Assembly
5 - Flex Drive Assembly
6 - Door Motor Retaining Fasteners
7 - Door Motor Electrical Connector

Vehicles equipped with a power sliding side door utilize a flex drive assembly. The flex drive assembly is located in the lower portion of the door (Fig. 18) and is used to connect the door motor to the lower drive unit. An E-clip is used to secure the flexdrive to the motor assembly, while the flex drive collar is used to secure the drive to the lower drive unit. The flex drive assembly is basically a flexible drive shaft for the power side door system.

The flex drive assembly is a replaceable component. Consult your Mopar parts catalog for specific part numbers.

FLEX DRIVE (Continued)

OPERATION

With one end of the flex drive attached to the door motor and the other attached to the lower drive unit, the flex drive transfers the power and torque from the motor to the drive unit. A square shaped drive cable, inside the flex drive assembly engages the motor drive and rotates to move the door accordingly.

REMOVAL

(1) Disconnect and isolate the negative cable.

(2) Remove the side door trim panel from the vehicle. Refer to the Body section for the procedure.

(3) Remove the weathershield. Refer to the Body section for the procedure.

(4) Remove the E-clip from the flex drive assembly (Fig. 19).

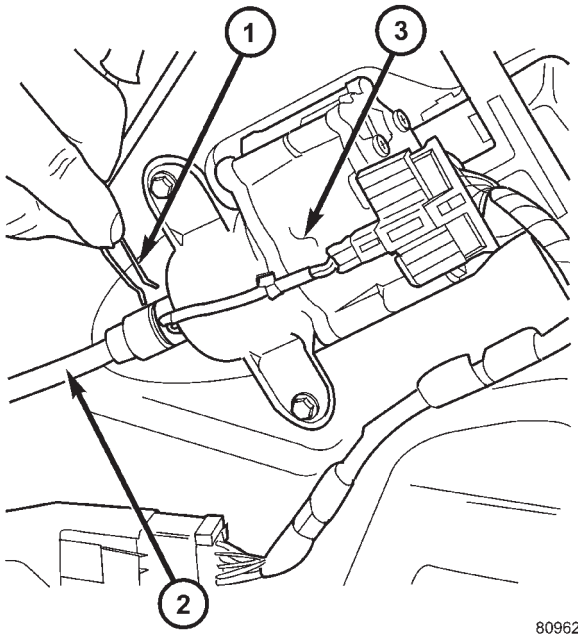

Fig. 19 Flex Drive E-Clip

1 - Flex Drive Cable Retaining Clip
2 - Flex Drive Cable
3 - Side Door Motor Assembly

(5) Pull the flex drive straight out of the motor assembly.

(6) Remove the lower drive unit cover retaining screws and remove the cover (Fig. 20).

(7) Expand the flex drive collar, next to the lower drive unit until the flex drive can be pulled straight off the lower drive unit.

(8) Remove the flex drive assembly from the vehicle.

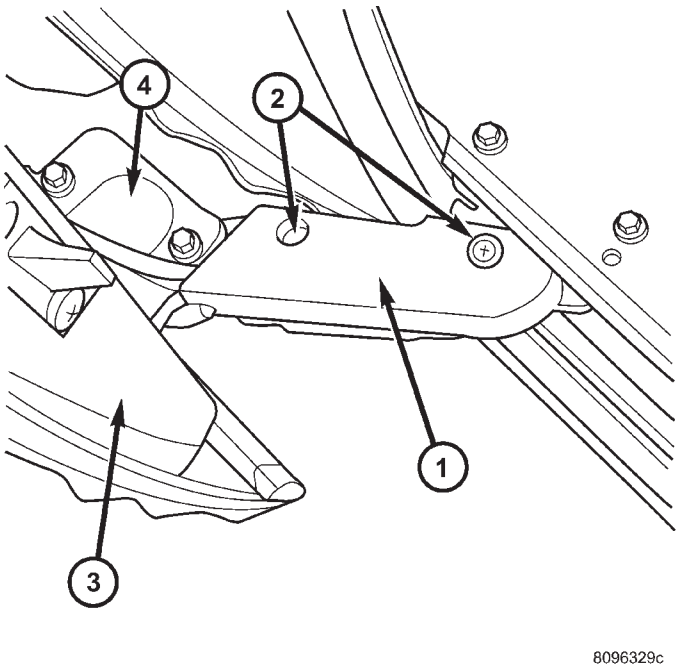

Fig. 20 Lower Hinge/Drive Assembly

1 - Lower Drive Unit Cover
2 - Lower Drive Unit Cover Retaining Screws
3 - Sliding Door
4 - Lower Hinge Arm Bracket

INSTALLATION

(1) Position the flex drive assembly in the vehicle.

(2) Install the flex drive on the lower drive unit. Push straight on until it snaps in place. It may be necessary to rotate drive unit gear slightly until the flex drive seats in place.

(3) Install the lower drive unit cover and retaining screws.

(4) Install the flex drive in the motor assembly. Line up the square shaped inner shaft and push straight on (Fig. 21).

(5) Install the E-clip on the flex drive assembly (Fig. 19).

(6) Install the weathershield. Refer to Body for the procedure.

(7) Install the side door trim panel on the vehicle. Refer to Body for the procedure.

(8) Connect the negative cable.

SLIDING DOOR MODULE

DESCRIPTION

Vehicles equipped with a power sliding door utilize a sliding door control module. The sliding door control module is located behind the sliding door trim panel in the center of the door, just above the sliding door motor (Fig. 22). This module controls the operation of the door through the Programmable Communication Interface (PCI) J1850 data bus circuit and the Body Control Module. The sliding door control module contains software technology which enables it to detect resistance to door travel and to reverse door travel in order to avoid damage to the door or to avoid possible personal injury if the obstruction is a person. This feature functions in both the opening and closing cycles. If the power sliding door system develops any problems the control module will store and recall Diagnostic Trouble Codes (DTC). The use of a diagnostic scan tool, such as the DRB III® is required to read and troubleshoot these trouble codes. The sliding door control module can be reflashed if necessary. Refer to the latest Technical Service Bulletin (TSB) Information for any updates.

The power door control module is a replaceable component and cannot be repaired, if found to be faulty it must be replaced. Consult your Mopar™ parts catalog for a specific part number.

OPERATION

The power sliding door control module serves as the main computer for the power sliding side door system. All power door functions are processed through the power door control module and/or the vehicles body control module (BCM). At the start of a power open command, a signal is sent to the BCM and then to the power door control module via the J1850 data bus circuit. This signal, generated by any of the power door command switches, tells the power door control module to activate a power latch release, engage the clutch assembly and drive the door into the full open position. If an obstacle is felt during this power open cycle, the module will reverse direction and close the door. This process is also enabled during a power close cycle. This process will repeat three times, and if a fourth obstacle is detected, the door will go into full manual mode. Once the full open position is obtained, a hold open latch assembly mounted full open switch tells the control module that the door has reached the full open position. If the power sliding door system develops any problems the control module will store and recall Diagnostic Trouble Codes (DTC). The use of a diagnostic scan tool, such as the DRB III® is required to read and troubleshoot these trouble codes.

SLIDING DOOR MODULE (Continued)

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the appropriate door trim panel from the vehicle. Refer to Body for the procedure.

(3) Remove the weather shield. Refer to Body for the procedure.

(4) Disconnect the power door control module electrical connectors. Slide the red locking tab out (away from module) and depress connector retaining tab, while pulling straight apart.

(5) Remove the control module retaining screw (Fig. 22).

(6) Remove the module from the vehicle.

INSTALLATION

(1) Position the control module and install the retaining screw.

(2) Connect the control module electrical connectors. Slide the locking tab into the locked position.

(3) Install the appropriate door trim panel on the vehicle. Refer to Body for the procedure.

(4) Install the weather shield. Refer to Body for the procedure.

(5) Connect the negative battery cable.

(6) Using an appropriate scan tool, check and erase any power door control module diagnostic trouble codes.

(7) Verify power door system operation. Cycle the power door through one complete open and close cycle.

POWER LOCKS

DESCRIPTION

POWER DOOR LOCK SYSTEM

The front doors, sliding door(s) and liftgate are equipped with actuator motors to lock or unlock the latch mechanisms. The door lock actuator motor is not serviced separately from the door latch, except for the sliding door(s).

AUTOMATIC DOOR LOCK

The vehicle comes with two options for power door locks:

- Rolling automatic lock (ENABLE), doors automatically lock at approximately at 25.7 Km/h (16 mph).
- No rolling automatic lock (DISABLE), doors do not automatically lock when the vehicle is moving.

AUTOMATIC DOOR UNLOCK

The doors will unlock automatically on vehicles equipped with power door locks if:

- Auto door locks feature is enabled and automatic unlock is enabled.
- The transmission was in gear and speed is above zero.
- The transmission in park or neutral and speed is zero.
- Any door (excluding liftgate) opens.

DOOR LOCK INHIBIT

The BCM cancels out the door lock switch actuation, when the key is in the Ignition Switch and either front door is open.

Pressing the key fob RKE lock/unlock under these conditions results in normal lock/unlock activation.

CENTRAL LOCKING

If equipped with Vehicle Theft Security System (VTSS), all the doors can be locked with the key by using any of the door lock cylinders. Turning the key to the lock position will lock all the doors.

DOOR LOCK CIRCUIT PROTECTION

The door lock system is protected by a 40 amp fuse located in the IPM. The BCM receives lock/unlock input and will turn on the appropriate drivers and provide a voltage level to the door lock motor for a specific time. The IPM is located along the side of the vehicle battery in the engine compartment.

POWER LOCKS (Continued)

REMOTE KEYLESS ENTRY SYSTEM

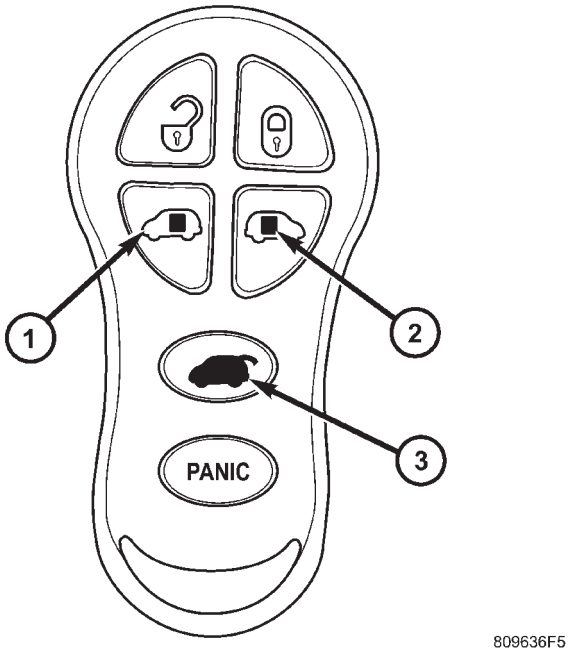

Fig. 1 KEY FOB

1 - LEFT SLIDING DOOR BUTTON
2 - RIGHT SLIDING DOOR BUTTON
3 - LIFTGATE SWITCH

The key fob transmitter (Fig. 1) has six buttons. Three of them, LOCK, UNLOCK, and PANIC, are used to actuate parts of, and program the Remote Keyless Entry (RKE) system via the customer programming mode. It is not necessary to use the PANIC button with the DRB III® scan tool mode of programming.

OPERATION

POWER DOOR LOCK SYSTEM

The Body Control Module (BCM) locks or unlocks the doors when an actuation input signal from a door lock switch or Remote Keyless Entry Module (RKE) is received. The BCM turns on the output drivers and provides a voltage level to the door lock motor for a specified time. The BCM locks the doors automatically when the vehicle is driven beyond the speed of 25.7 Km/h (16 mph). The rolling door lock feature can be disabled if desired. All doors and liftgate can be locked or unlocked using mechanical button or key cylinder methods (Liftgate cylinder does not lock/unlock vehicle. It only unlocks the liftgate).

AUTOMATIC DOOR LOCKS

The BCM is equipped with a disable feature to stop the speed sensitive automatic door locks from functioning. The DISABLE feature can be switched ON or OFF as desired. When the system is DISABLED the door locks will operate normally, but will not lock automatically when the vehicle is rolling. When the door locks are ENABLED the door locks will automatically lock when the vehicle is moving at about 25.7 Km/h (16 mph). All doors are closed, the PCM has set the “OK TO LOCK” bit, and doors were not previously locked.

DOOR LOCK INHIBIT

If the key is in the ignition, in any position, and either front door is ajar, all power door lock functioning shall be disabled when activating either door lock switch. Also, if the Vehicle Theft Alarm (VTA) is armed, the door lock switch “UNLOCK” feature will be disabled until the vehicle is disarmed. Pressing the RKE lock/unlock button under these conditions will result in a normal lock/unlock activation.

After the key is removed from the Ignition Switch, or the doors are closed, the power door locks will operate normally.

CENTRAL LOCKING

If equipped with Vehicle Theft Security System (VTSS), all the doors can be locked with the key by using any of the door lock cylinders. Turning the key to the LOCK position will lock all the doors.

When either of the front key cylinder switches is detected active, the BCM will activate the illuminated entry feature and the individual front doors will become mechanically unlocked. To central unlock all doors, a second transition from OFF to UNLOCK has to occur within 2 seconds of the first complete UNLOCK cycle.

To central unlock the driver door, turn the key to the rear of the vehicle. This indicates an unlock signal to the BCM. For the passenger door, turn the key toward the front of the vehicle. When either key cylinder switch is detected as active, the BCM will activate the illuminated entry feature. The individual doors will become mechanically unlocked.

To central lock the vehicle, the driver door lock cylinder is turned toward the front of the vehicle. The passenger door lock cylinder is turned toward the rear of the vehicle. When a lock input from either key cylinder is detected as active, the BCM will cancel the illuminated entry feature and perform the central lock operation.

POWER LOCKS (Continued)

DOOR LOCK CIRCUIT PROTECTION

The BCM controls the door lock output drivers. If the door lock switch is actuated continuously for more than one second the BCM will turn the output driver OFF (the BCM would consider the switch stuck). The lock motors are protected with Positive Temperature Coefficient (PTC) device that prevents motor burn out.

REMOTE KEYLESS ENTRY SYSTEM

- **LOCK**: Pressing the LOCK button locks all doors and sounds horn (chirp) and arm the Vehicle Theft Security System, if equipped. The chirp verifies that the RKE receiver has sent a message to the BCM for door lock operation. If a door has not been closed before pressing the LOCK button, the vehicle may not be secured and the VTSS will not arm until the door is closed.
- **UNLOCK**: Pressing the UNLOCK button once will unlock the driver's side doors and activate the illuminated entry system and disarm Vehicle Theft Security System, if equipped. Pressing the UNLOCK button twice within five seconds will unlock all doors and activate the illuminated entry system.
- **LEFT SLIDING DOOR**: Pressing the LEFT SLIDING DOOR BUTTON opens/closes the left power sliding door remotely.
- **RIGHT SLIDING DOOR**: Pressing the RIGHT SLIDING DOOR BUTTON opens/closes the right power sliding door remotely.
- **LIFTGATE**: Pressing the LIFTGATE BUTTON opens/closes the liftgate remotely, if equipped.If not equipped with power liftgate, pressing the liftgate button will allow a one time 30 second access to liftgate.
- **PANIC**: Pressing the PANIC button sounds the horns at half second intervals, flashes the exterior lamps, and turns ON the interior lamps. The panic alarm will remain on for three minutes, or until the PANIC button is actuated again or the ignition switch is turned to the RUN position.

The Remote Keyless Entry Module is capable of retaining the transmitter Vehicle Access Code(s) (VAC) in its memory even after vehicle power has been interrupted.

NOTE: Additional features available to the customer are described in the Vehicle Owners Manual.

The RKE system activates the optional memory seat, mirror system and adjustable pedals, if equipped. Two primary key fob transmitters can be programmed to actuate memory seat and mirror setting 1 or 2. Two additional key fob transmitters can be added, but they will not be able to operate the memory seat and mirror system (Refer to 8 - ELECTRICAL/POWER SEATS - OPERATION) and (Refer to 8 - ELECTRICAL/POWER MIRRORS - OPERATION).

DOOR CYLINDER LOCK SWITCH

DESCRIPTION

The Door Cylinder Lock Switch is used to:

- Unlock/Lock all the doors via the Central Locking feature.
- Arm/Disarm the Vehicle Theft Security System.
- Trigger the Illuminated Entry feature.

The door cylinder lock switch is mounted to the rear of the driver and passenger door lock cylinders. When installed on the rear of the cylinder, there is a tab on the lock cylinder that aligns with the switch to prevent it from turning. An anti-rotating device. The door cylinder lock switch is a one time use switch. Once it is removed from the rear of the door lock cylinder, it may not be reinstalled and a new switch must be used.

OPERATION

When the Door Cylinder Lock Switch is turned either way using the door key cylinder, the BCM reads a direct message signal from the switch, via the Programmable Communication Interface (PCI) bus.

If turning the key cylinder once, toward the front of the vehicle (for either driver or passenger doors), this will:

(1) Mechanically unlock the door lock.

(2) Disarm the Vehicle Theft Security System (if equipped).

(3) Turn on the Illuminated Entry (if equipped) for approximately 30 seconds.

If the key cylinder is turned to the unlock position (toward the front of vehicle) twice within two seconds, all the doors and liftgate will unlock (if equipped with the central locking feature).

To lock the vehicle using the door cylinder lock switch, turn the key cylinder toward the rear of the vehicle (either passenger or driver doors) once. This will lock the door that you are using the key on. If equipped with the central locking feature, this will lock all the other doors and liftgate. Furthermore, this will arm the vehicle theft security system and turn off the illuminated entry.

DIAGNOSIS AND TESTING - DOOR CYLINDER LOCK SWITCH

(1) Visually inspect the switch for proper installation. Make sure it is seated on the rear of the key cylinder, with the tab of the door key cylinder properly aligned with the slot on the door cylinder lock switch.

(2) Disconnect the switch at the harness connector and check the resistance in each switch position.

DOOR CYLINDER LOCK SWITCH (Continued)

CAUTION: Do not disconnect the switch from the rear of the door key cylinder. This switch is a one time use switch. Once it is removed from the rear of the switch, it is not reusable and must be replaced. Test the switch at the harness connector.

DOOR CYLINDER LOCK SWITCH RESISTANCE

SWITCH POSITION	RESISTANCE VALUE
COUNTERCLOCKWISE	5.4K OHMS
NEUTRAL	18.4K OHMS
CLOCKWISE	2K OHMS

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the door trim panel of the effected door cylinder lock switch (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
(3) Close the door window.
(4) Disconnect the door cylinder lock switch wire connector from the door harness, and wiring clip from the impact beam.
(5) Remove the outer door handle from the door.
(6) Remove the switch from the key cylinder in the door handle and remove from vehicle.

INSTALLATION

(1) Install the switch on the key cylinder in the door handle.
(2) Install the door handle.
(3) Connect the door cylinder lock switch wire connector to the door harness, and the wiring clip to the impact beam.
(4) Install the door trim panel of the affected door cylinder lock switch (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
(5) Connect the battery negative cable.
(6) Verify system operation.

DOOR LOCK MOTOR

DIAGNOSIS AND TESTING - DOOR LOCK MOTOR

Verify battery condition before testing door lock motor(s) (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - DIAGNOSIS AND TESTING).

To determine which motor is faulty, check each individual door for electrical lock and unlock or disconnect the motor connectors one at a time, while operating the door lock switch. In the event that none of the motors work, the problem may be caused by a shorted motor or a bad switch. Disconnecting the defective motor will allow the others to work.

To test an individual door lock motor, disconnect the electrical connector from the motor. To lock the door, connect a 12 volt power source to the positive pin of the lock motor and a ground wire to the other pin. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds. To unlock the door reverse the wire connections at the motor pin terminals. If these results are NOT obtained, replace the motor.

DOOR LOCK SWITCH

DIAGNOSIS AND TESTING - DOOR LOCK SWITCH

(1) Remove door trim panel. Refer to Body, Door - Front, Trim Panel, Removal and Installation.
(2) Disconnect wire connector from back of door lock switch.
(3) Depress switch to LOCK position.
(4) Using an ohmmeter, test switch resistance between Pins 2 and 3. Refer to the DOOR LOCK SWITCH CONTINUITY test and (Fig. 2).
(5) Depress switch to UNLOCK position.
(6) Test resistance between Pins 2 and 3.
(7) Test resistance between pins 2 and 3 while switch is in its normal unactuated mode.
(8) If resistance values are not within the parameters shown replace the door lock switch.

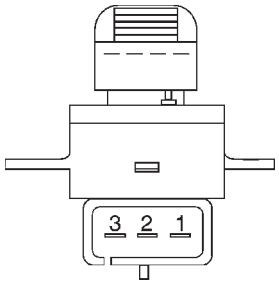

Fig. 2 DOOR LOCK SWITCH

DOOR LOCK SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
LOCK	2 and 3	5.3K Ohm ± 5%
UNLOCK	2 and 3	2.0K Ohm ± 5%
UNACTUATED	2 and 3	18.3K Ohms ± 5%

DOOR LOCK SWITCH (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove door trim panel. Refer to Body, Door - Front, Trim Panel, Removal.
(3) Disconnect wire connector from back of door lock switch.
(4) Remove two screws to door lock switch.
(5) Remove switch from vehicle.

INSTALLATION

(1) Install the switch into the vehicle.
(2) Install the two screws to door lock switch.
(3) Connect wire connector to back of door lock switch.
(4) Install door trim panel. Refer to Body, Door - Front, Trim Panel, Installation.
(5) Connect the battery negative cable.

KEYLESS ENTRY TRANSMITTER

STANDARD PROCEDURE

STANDARD PROCEDURE - HORN CHIRP PREFERENCE

DISABLING

The horn chirp can be toggled using a DRB III® or by using the Remote Keyless Entry (RKE) transmitter.

To DISABLE (cancelling) the horn chirp feature, press and hold the transmitter LOCK button for a minimum of five seconds. While pressing the LOCK button in, press the UNLOCK button. The horn chirp feature will not function until the above procedure is repeated.

ENABLING

The horn chirp can be toggled using a DRB III® or by using the Remote Keyless Entry (RKE) transmitter.

To ENABLE (reinstate) the horn chirp feature, use any one of the four key fob transmitters and reverse the above procedures. It will ENABLE the horn chirp feature for all transmitters.

STANDARD PROCEDURE - BATTERY REPLACEMENT

(1) With the transmitter buttons facing down, use a coin (a penny is suggested) to pry the two halves of the transmitter apart (Fig. 3). Make sure not to damage the rubber gasket during separation of the housing halves.

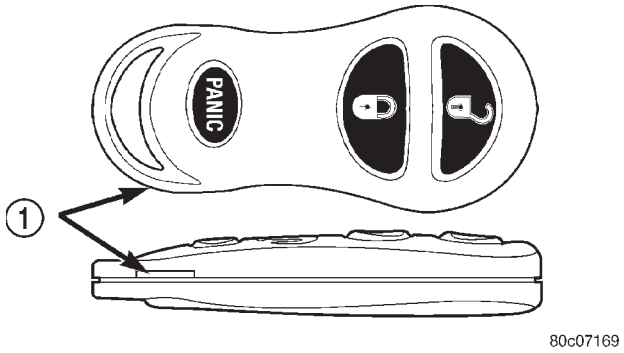

Fig. 3 RKE TRANSMITTER BATTERY REPLACEMENT - TYPICAL

1 - INSERT THIN COIN

(2) Remove the battery from the transmitter back housing holder.
(3) Replace the batteries. Avoid touching the new batteries with your fingers, Skin oils may cause battery deterioration. If you touch a battery, clean it off with rubbing alcohol.
(4) To assemble the transmitter case, snap the two halves together.

SPECIFICATIONS

RANGE

Normal operation range is up to a distance of 7 meters (23 ft.) of the vehicle. Range may be better or worse depending on the environment around the vehicle. Closeness to a radio frequency transmitter such as a radio station tower that is broadcasting on 105 MHz FM or a 156 MHz 2–way communication station, may degrade operational range, while range in an open field will be enhanced.

BATTERY

The batteries can be removed without special tools and are readily available at local retail stores. The recommended battery is Duracell DL 2016 or equivalent, TWO cells are required. Battery life is about three years minimum.

CAUTION: Do not touch the battery terminals or handle the batteries any more than necessary. Hands must be clean and dry.

REMOTE KEYLESS ENTRY MODULE

DESCRIPTION

The RKE module is capable of retaining up to four different Vehicle Access Codes.

OPERATION

Whenever the vehicle battery power is interrupted the RKE Module will retain all vehicle access codes in its memory. When replacing or adding a key fob transmitter (maximum 4) a DRB III® scan tool is required to program the RKE Module to accept the new Vehicle Access Code if a customer owned transmitter is not available. Refer to Electrical, Remote Keyless Entry Module, Standard Procedure - Programming RKE Module or the Proper Body Diagnostic Procedures manual.

DIAGNOSIS AND TESTING - REMOTE KEYLESS ENTRY MODULE

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds. Refer to the proper Body Diagnostic Procedures Manual for testing the Remote Keyless Entry system using a DRB III® scan tool. Also refer to other interrelated systems groups within this manual:

- Vehicle Theft Security System
- Power Seats
- Power Mirrors

STANDARD PROCEDURE - PROGRAMMING RKE MODULE

(1) Using a functional key fob transmitter, unlock the vehicle and disarm the Vehicle Theft Security System.

(2) Insert ignition key into the ignition switch.

(3) Turn the ignition switch to RUN position without starting engine.

(4) Using a functional key fob transmitter, press and hold the UNLOCK button for a minimum five seconds (maximum ten seconds).

(5) While still holding UNLOCK button, and before ten seconds passes, press the PANIC button and release both at the same time. A single chime will sound to verify that the RKE module is set to receive the new Vehicle Access Code(s).

(6) Within 30 seconds of the chime, press and release the “LOCK” and “UNLOCK” buttons on the transmitter at the same time. Then press and release any one of the buttons. The BCM will sound an abbreviated chime to acknowledge that the programming of the transmitter has been completed and was successful.

(7) Repeat step 6 for all transmitters that will be used with this vehicle (up to 4 total).

(8) Programming mode will last for 30 seconds. To get out of programming mode sooner, turn the ignition OFF. A single chime will sound to verify that the RKE module will no longer accept additional Vehicle Access Code(s).

(9) When Vehicle Access Code(s) programming is complete, turn the ignition switch to the OFF position and verify RKE system operation using each key fob.

NOTE:
Only the two key fob transmitters that have been programmed to the memory seat and mirror system will operate it. If any key fob is replaced, the memory seat and mirror module will require programming. (Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING).

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - REMOVAL).

(3) Remove screws holding RKE module to instrument panel.

(4) Disconnect wire connector from RKE module (Fig. 4).

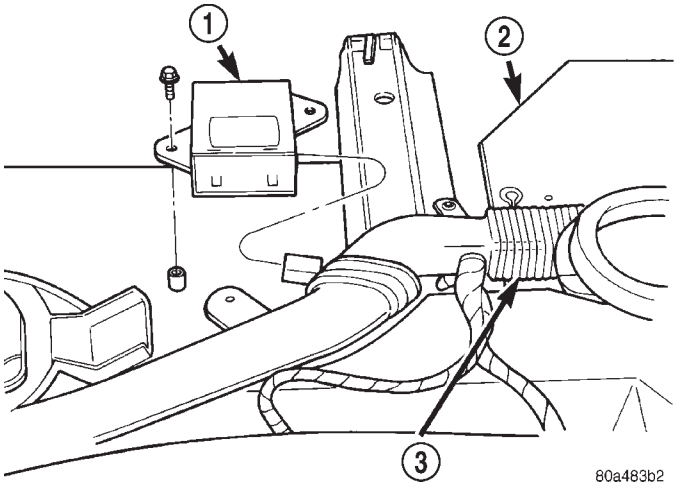

Fig. 4 RKE MODULE

1 - REMOTE KEYLESS ENTRY MODULE
2 - INSTRUMENT PANEL
3 - DEMISTER DUCT

(5) Remove the RKE module from vehicle.

REMOTE KEYLESS ENTRY MODULE (Continued)

INSTALLATION

(1) Position the RKE module and install the screws.
(2) Connect the wire connector to the RKE module (Fig. 4).
(3) Install the instrument panel top pad.
(4) Connect the battery negative cable.

SLIDING DOOR LOCK MOTOR

REMOVAL

(1) Disconnect and isolate the negative battery cable.
(2) Remove sliding door trim panel (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL).
(3) Remove sound pad as necessary.
(4) Remove latch/lock control cover.
(5) Remove latch/lock control.
(6) Remove screws holding door lock motor to latch/lock control (Fig. 5).
(7) Remove lock motor from control.

INSTALLATION

(1) Position the lock motor on the latch/lock.
(2) Install the screws retaining the motor to the latch/lock.
(3) Install the latch/lock control.

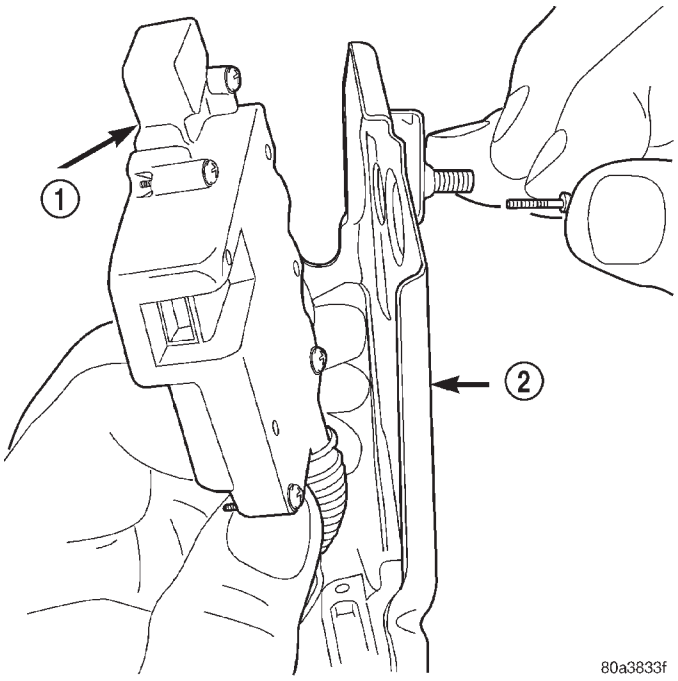

Fig. 5 SLIDING DOOR LOCK MOTOR

1 - SLIDING DOOR POWER LOCK MOTOR
2 - LATCH/LOCK CONTROL

(4) Install the latch/lock control cover.
(5) Install the sound pad and trim panel to the sliding door.

POWER MIRRORS

DESCRIPTION

If equipped with power mirrors, the control switch is located on the instrument panel to the left of the headlamp switch.

OPERATION

The power mirrors are connected to battery feed at all times. Each mirror head contains two electric motors, two drive mechanisms, an electric heating element, and the mirror glass. If the vehicle is equipped with the optional memory system, each mirror head also contains both a horizontal and a vertical motor position sensor. One motor and drive controls mirror up-and-down movement, and the other controls right-and-left movement.

An optional driver side outside electrochromic mirror is able to automatically change its reflectance level. This mirror is controlled by the circuitry of the automatic day/night inside rear view mirror. A thin layer of electrochromic material between two pieces of conductive glass make up the face of the mirror. Two photocell sensors on the inside rear view mirror are used to monitor light levels and adjust the reflectance of both the inside and driver side outside mirrors. This change in reflectance helps to reduce the glare of headlamps approaching the vehicle from the rear. (Refer to 8 - ELECTRICAL/POWER MIRRORS/ AUTOMATIC DAY / NIGHT MIRROR - DESCRIPTION) for more information on this system.

The motors which operate the mirrors are part of the mirror assembly and cannot be serviced separately.

DIAGNOSIS AND TESTING - POWER MIRRORS

(1) Remove Power Mirror Switch. (Refer to 8 - ELECTRICAL/POWER MIRRORS/POWER MIRROR SWITCH - REMOVAL).

(2) Disconnect wiring harness connector to the power mirror switch and headlamp switch.

(3) Using two jumper wires:

- Connect one to a 12-volt source
- Connect the other to a good body ground
- Refer to the Mirror Test Chart for wire hookups at the switch connector (Fig. 1).

(4) If results shown in table are not obtained, check for broken or shorted circuit, or replace mirror assembly as necessary.

AUTOMATIC DAY / NIGHT MIRROR

DESCRIPTION

An automatic dimming inside day/night rear view mirror and an automatic dimming driver side outside rear view mirror are available factory-installed options on this model. Following is a general description of this optional equipment.

The automatic day/night mirror is able to automatically change its reflectance. A thin layer of electrochromic material between two pieces of conductive glass make up the face of the mirror. Two photocell sensors are used to monitor light levels and adjust the reflectance of the mirror to reduce the glare of headlamps approaching the vehicle from the rear.

For removal procedures, (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL).

OPERATION

The ambient photocell sensor faces forward, to detect the outside light levels. A second sensor faces rearward to detect the light level received through the vehicles back window. When the difference between the two light levels becomes too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), the mirror begins to darken.

AUTOMATIC DAY / NIGHT MIRROR (Continued)

The mirror switch allows the driver a manual control of whether the automatic dimming feature is operational. When AUTO is selected a small Light-Emitting Diode (LED), to the right of the mirror switch, is illuminated. The automatic dimming feature will only operate when the ignition switch is in the On position. The mirror also senses the backup lamp circuit, and will automatically disable its self-dimming feature whenever the transmission gear selector is in the Reverse position.

NOTE: The mirror always defaults to an ON state upon ignition.

The driver side automatic dimming mirror is standard with the automatic dimming inside mirror. The signal to control the dimming of that mirror is generated by the automatic day/night inside rear view mirror circuitry. That signal is then delivered to the driver side outside rear view mirror on a hard wired circuit.

The automatic day/night mirror cannot be repaired. If faulty or damaged, the entire inside rear view mirror assembly must be replaced.

DIAGNOSIS AND TESTING - AUTOMATIC DAY / NIGHT MIRROR

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Check the fuse in the intelligent power module. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fuse in the intelligent power module. If OK, go to Step 3. If not OK, repair the open circuit to the ignition switch as required.

(3) Unplug the wire harness connector from the automatic day/night mirror. Check for battery voltage at the fused ignition switch output circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the junction block as required.

(4) Turn the ignition switch to the Off position. Check for continuity between the ground circuit cavity of the automatic day/night mirror wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the circuit to ground as required.

(5) Turn the ignition switch to the On position. Set the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the automatic day/night mirror wire harness connector. If voltage is present, reinstall the automatic day/night mirror wire harness connector and go to Step 6. If not OK, repair the open circuit as required.

(6) Place the transmission gear selector lever in the Neutral position. Place the automatic day/night mirror switch in the On (LED in the switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

NOTE: The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.

(7) Shine a light into the rearward facing headlamp photocell sensor. The automatic day/night mirror should darken. The automatic day/night mirror should darken within 2 minutes if testing for the first time. For immediate response, turn the vehicle OFF and back ON with the forward-facing light sensor still covered. This defeats the day-detect logic. If OK, go to Step 8. If not OK, replace the faulty mirror unit.

(8) With the mirror darkened, place the transmission gear selector lever in the Reverse position. The automatic day/night mirror should return to its normal reflectance. If not OK, replace the faulty mirror unit.

Bench testing both mirrors can be done, of care is exercised. For an inside mirror, the pin closest to he mount is 12V (+), the next is 12V (-). The third is reverse override. The fourth is outside mirror (+), and the fifth is outside mirror (-). **Do not apply 12 volts to the fourth and fifth pins.** With 12 volts on pins 1 and 2, the mirror can be tested by blocking the rear sensor and shining a light into the forward sensor. For an outside mirror, there is a 2–pin connector. Applying 1.2 volts will cause the mirror to dim. If the mirror does not dim, the entire glass assembly can be replaced just as it is when the glass is broken.

WARNING: Do not apply 12 volts to the outside mirror. Damage to the mirror will result.

REMOTE SWITCH

DIAGNOSIS AND TESTING - REMOTE SWITCH

(1) Remove power mirror switch. (Refer to 8 - ELECTRICAL/POWER MIRRORS/POWER MIRROR SWITCH - REMOVAL).

(2) Disconnect wiring harness at switch connector.

(3) Using a ohmmeter, test for continuity between the terminals of the switch (Fig. 2).

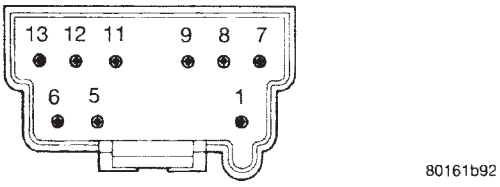

Fig. 2 Mirror Switch

MIRROR SWITCH TEST

MIRROR SELECT SWITCH IN "LEFT" POSITION	
Move Button	**Continuity Between**
UP	PIN 9 - PIN 12, PIN 6 - PIN 11, PIN 9 - PIN 13
LEFT	PIN 9 - PIN 7, PIN 6 - PIN 11, PIN 9 - PIN 8
DOWN	PIN 9 - PIN 6, PIN 12 - PIN 11, PIN 13 - PIN 11
RIGHT	PIN 9 - PIN 6, PIN 7 - PIN 11, PIN 8 - PIN 11
MIRROR SELECT SWITCH IN "RIGHT" POSITION	
Move Button	**Continuity Between**
UP	PIN 9 - PIN 13, PIN 1 - PIN 11, PIN 9 - PIN 12
LEFT	PIN 9 - PIN 8, PIN 1 - PIN 11, PIN 9 - PIN 7
DOWN	PIN 9 - PIN 1, PIN 13 - PIN 11, PIN 12 - PIN 11
RIGHT	PIN 9 - PIN 1, PIN 8 - PIN 11, PIN 7 - PIN 11
LAMP	PIN 5 - PIN 11

(4) If results shown in the table are not obtained, replace the switch.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove instrument panel lower cover.

(3) From behind headlamp switch assembly, depress retaining tabs and push switch from instrument panel.

(4) Disconnect wire connector from power mirror switch.

(5) Disengage lock tabs above and below the mirror switch.

(6) Remove power mirror switch from headlamp switch bezel.

INSTALLATION

(1) Install power mirror switch to the headlamp switch bezel.

(2) Connect wire connector to the power mirror switch.

(3) Insert headlamp switch assembly into instrument panel.

(4) Install instrument panel lower cover.

(5) Connect battery negative cable.

SIDEVIEW MIRROR

REMOVAL

For service procedures, (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - REMOVAL).

POWER FOLDAWAY MIRROR SWITCH - EXPORT

DESCRIPTION

These vehicles may be equipped with Power Foldaway Mirrors. This feature allows both the driver and passenger side view mirrors to fold inward (retract) on demand. The vehicle has an additional switch located on the steering column that controls the folding function of the mirror assembly (Fig. 3).

The fold-away side view mirror is attached to the vehicle's door in the same manner as mirrors without the fold-away option. The fold-away mirrors unique option is the internal motor which allows the mirrors to fold inward on demand. The fold-away mirror motor is not serviceable separately and if a motor is found to be faulty the entire side view mirror must be replaced.

POWER FOLDAWAY MIRROR SWITCH - EXPORT (Continued)

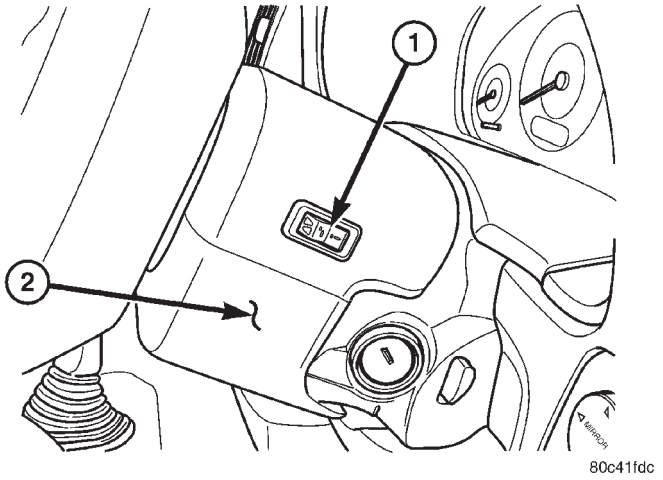

Fig. 3 POWER FOLDAWAY MIRROR SWITCH

1 - POWER FOLDAWAY MIRROR SWITCH
2 - STEERING COLUMN

OPERATION

When the mirror retract switch is depressed, both of the side view mirrors will fold inward, Thus making the overall width of the vehicle the smallest possible. This can be helpful were parking space is a absolute minimum.

When the driver's door is opened, only the driver's door mirror will unfold. If the passenger door is opened, both mirrors will unfold.

The power fold away mirror system consists of the following components: mirror switch, side view mirror, relay, wires and fuse. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the upper and lower steering column shroud (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - REMOVAL).

(3) Disconnect electrical harness connector.

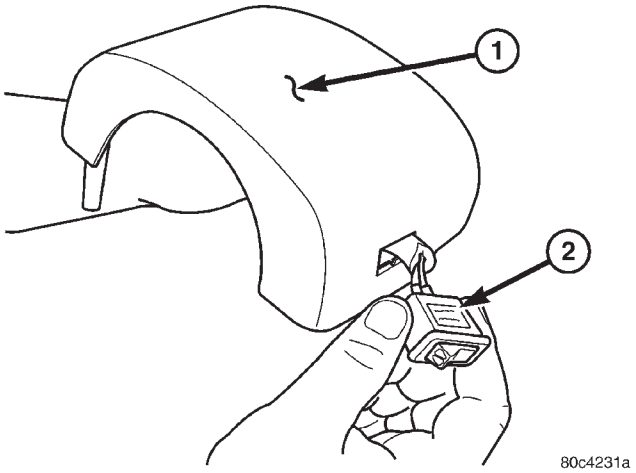

Fig. 4 POWER FOLDING MIRROR SWITCH

1 - STEERING COLUMN SHROUD
2 - POWER FOLDAWAY SWITCH

(4) Remove switch from steering column shroud (Fig. 4).

INSTALLATION

(1) Install switch to steering column shroud.

(2) Connect wire harness connector.

(3) Install the upper and lower steering column shroud (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - INSTALLATION).

(4) Connect the battery negative cable.

POWER SEAT SYSTEM

DESCRIPTION

DESCRIPTION

The power seat system option allows the driver and front seat passenger to electrically adjust their seating positions for optimum control and comfort using the power seat switches located on the outboard seat cushion side shield of each front seat. Both power front seats can be adjusted in eight different directions up, down, front up, front down, rear up, rear down, forward, rearward and recliner forward and rearward.

The power seat system receives battery current through a 40 amp fuse in the Intelligent Power Module and a 30 amp circuit breaker under the seat so that the power seats remain operational, regardless of the ignition switch position.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS (Fig. 1). BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

A eight-way power seat is standard on highline models and optional on others. This option includes a eight-way adjustable seat cushion track and a two-way power seat back.

POWER SEAT SYSTEM (Continued)

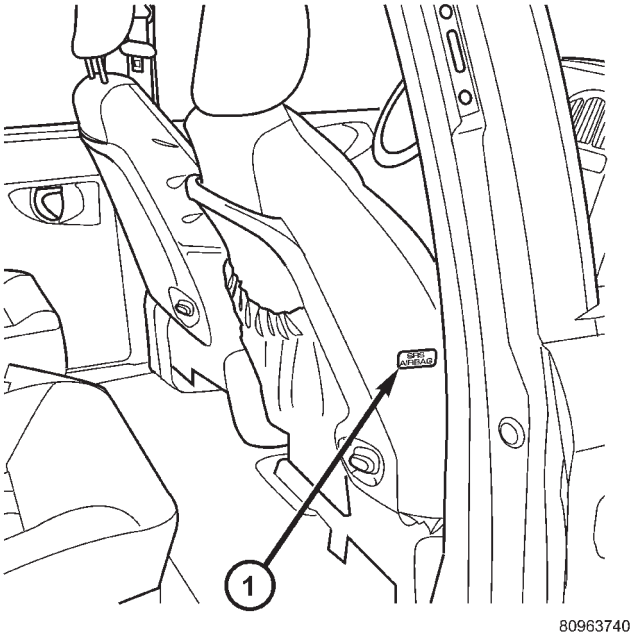

Fig. 1 Identifying a Side Airbag Equipped Seat

1 - Airbag Label

The eight-way power seat is also available with the heated seat and memory seat system that automatically positions the power seat for two different drivers. Refer to **Heated Seats** for more information on the heated seat option. Refer to **Description Memory Seat System** in this section for more information on the memory seat system.

The power seat system includes the following components:

- Power seat recliners
- Power seat switches
- Power seat tracks
- Circuit breaker

The power seat system with memory and heated seat options includes the following components:

- Power seat recliner
- Power seat switch
- Power seat track.
- Memory Seat Mirror Module (MSMM)
- Memory set switch
- Heated Seat Module (HSM)
- Heated seat switch
- Electronic Vehicle Information Center (EVIC)
- Programmable Communications Interface (PCI) data bus network

Refer to Wiring Diagrams for complete circuit diagrams. Following are general descriptions and operations for the major components in the power seat system and memory seat system.

DESCRIPTION - MEMORY SYSTEM

An electronic memory system is available on some models. The memory system is able to store and recall the driver side power seat positions (including the power recliner position) and both outside side view mirrors positions for two drivers. On vehicles equipped with a factory radio, the memory system is also able to store and recall radio station presets for two drivers. The memory system also will store and recall the last station listened to for each driver, even if it is not one of the preset stations.

The memory system will automatically return to its preset settings when the corresponding numbered button of the memory switch is depressed, or when the doors are unlocked using the corresponding Remote Keyless Entry (RKE) transmitter. A customer programmable feature of the memory system allows the RKE recall of memory features to be disabled, if desired. This programmable feature is internal in the EVIC module, which is located in the overhead console.

A Memory Seat Mirror Module (MSMM) is used on some models to control and integrate the many electronic functions and features included in the memory seat and mirror systems.

The memory system includes the following components:

- Memory Seat Mirror Module (MSMM)
- Memory set switch
- Position potentiometers on both outside side view mirrors
- Position potentiometers on the driver side power seat track and power seat recliner motors.
- Electronic Vehicle Information Center (EVIC)
- Radio receiver (if PCI data bus capable).

Certain functions of the memory system rely upon resources shared with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) J1850 data bus network. The PCI data bus network allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. Initial diagnosis of these electronic modules or the PCI data bus network requires the use of a DRB III® scan tool and the proper Diagnostic Procedures manual. If this method does not prove conclusive, the use of a automotive meter such as the Fluke®, the proper wiring schematics and the service manual diagnostic routines are required.

The other electronic modules that may affect memory system operation are as follows:

POWER SEAT SYSTEM (Continued)

- **Body Control Module (BCM)** - Refer to **Body Control Module** in Electronic Control Modules for more information.
- **Powertrain Control Module (PCM)** - Refer to **Powertrain Control Module** in Electronic Control Modules for more information.

Refer to **Heated Seat System** for more information on the heated seat system. Refer to **Remote Keyless Entry System** in Power Lock Systems for more information on the RKE system.

Refer to **Wiring Diagrams** for complete circuit diagrams. Following are descriptions, theory of operation, diagnosis/testing procedures and removal/installation procedures of the major components in the memory and power seat systems.

OPERATION

OPERATION - POWER SEAT SYSTEM

The power seat system receives battery current through fuse #22 in the Intelligent Power Module and a circuit breaker under the front seats, regardless of the ignition switch position.

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the appropriate power seat track adjuster motor. The selected adjuster motor operates to move the seat track through its drive unit in the selected direction until the switch is released, or until the travel limit of the seat track is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the seat track has reached its travel limit. The power seat track each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged. Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the power seat system.

OPERATION - MEMORY SYSTEM

The memory system receives battery current through fuse #22 in the Intelligent Power Module and the power seat system circuit breaker, located under each front seat near the rear edge of the seat cushion pans. The Memory Seat Mirror Module (MSMM) will drive a maximum of 2 motors at a time in a given direction. If conflicting directions are requested, the priority for response will be as follows:

- Seat Track Rearward or Forward
- Seat Front Down or Up
- Seat Rear Down or Up
- Recliner Rearward or Forward

The inputs from these switches to the MSMM is a current limited battery source fed by the MSMM. This protects the MSMM printed circuit board traces from acting as fuses. All of these switch contact inputs to the MSMM are normally closed to ground, except when actuated.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the memory system. For diagnosis of the MSMM, the PCI data bus, or the other electronic modules on the PCI data bus that provide inputs and outputs for the memory system, the use of a DRBIII® scan tool and the proper Diagnostic Procedures manual are recommended.

ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) serves as the user interface for the memory system. It displays memory system status messages and provides the user with the means for enabling and disabling the many customer programmable features available on the vehicle, including those for the memory system.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the EVIC. Refer to **Electronic Vehicle Information Center** in Overhead Console Systems for more information on the EVIC.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEAT SYSTEM

Following are tests that will help to diagnose the hard wired components and circuits of the power seat system. However, if the vehicle is also equipped with the optional memory system, these tests may not prove conclusive in the diagnosis of the driver side power seat. In order to obtain conclusive testing of the driver side power seat with the memory system option, the Programmable Communications Interface (PCI) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked.

The most reliable, efficient, and accurate means to diagnose the driver side power seat with the memory system option requires the use of a DRB III® scan tool and the proper Diagnostic Procedures manual. The DRB III® scan tool can provide confirmation that the PCI data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the PCI data bus, and that the memory

system is receiving the proper hard wired inputs and relaying the proper hard wired outputs to perform its driver side power seat functions.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) If the driver power seat exhibits a interrupted or jerky motion, there is a possibility that the wires leading from the memory seat module to the memory seat motor are mis-wired. To check the concern, obtain a DRB III® scan tool and energize each axis one at a time. If any axis stops in approximately 2 seconds (without hitting the end of travel), the feedback for that axis may have an open, short or be miswired. Check the wiring to that axis (module to motor). Fix any wiring problems and retry that axis.

(2) If any power seat is not operational in any direction, check the power seat circuit breaker, located under the trailing edge of the appropriate power seat. Refer to the Power Distribution section of this service manual for the circuit breaker diagnosis and testing procedure.

(3) If the power seat circuit breaker is OK, check for proper 12v and ground connections at the power seat switch and/or memory seat module. Fix any wiring problems and retry.

(4) Check the power seat system wire harness connections and pins to ensure proper circuit continuity and ground paths. For complete circuit diagrams, refer to **Wiring Diagrams**.

(5) With the dome lamp on, apply the power seat switch in the direction of the failure. If the dome lamp dims, the seat may be jamming. Check under and behind the seat for binding or obstructions. If the dome lamp does not dim, proceed with testing of the individual components and circuits in the power seat system.

DIAGNOSIS AND TESTING - MEMORY SYSTEM

In order to obtain conclusive testing of the memory system, the Programmable Communications Interface (PCI) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked.

The most reliable, efficient, and accurate means to diagnose the memory system requires the use of a DRB III® scan tool and the proper Diagnostic Procedures manual. The DRB III® scan tool can provide confirmation that the PCI data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the PCI data bus, and that the memory system is receiving the proper hard wired inputs and relaying the proper hard wired outputs to perform its functions.

(1) If the driver power seat exhibits a interrupted or jerky motion, there is a possibility that the wires leading from the memory seat module to the memory seat motor are mis-wired. To check the concern, obtain a DRB III® scan tool and energize each axis one at a time. If any axis stops in approximately 2 seconds (without hitting the end of travel), the feedback for that axis may have an open, short or be miswired. Check the wiring to that axis (module to motor). Fix any wiring problems and retry that axis. Refer to Wiring Diagrams for complete circuit schematic or connector pin-out information.

DRIVER SEAT SWITCH

DESCRIPTION

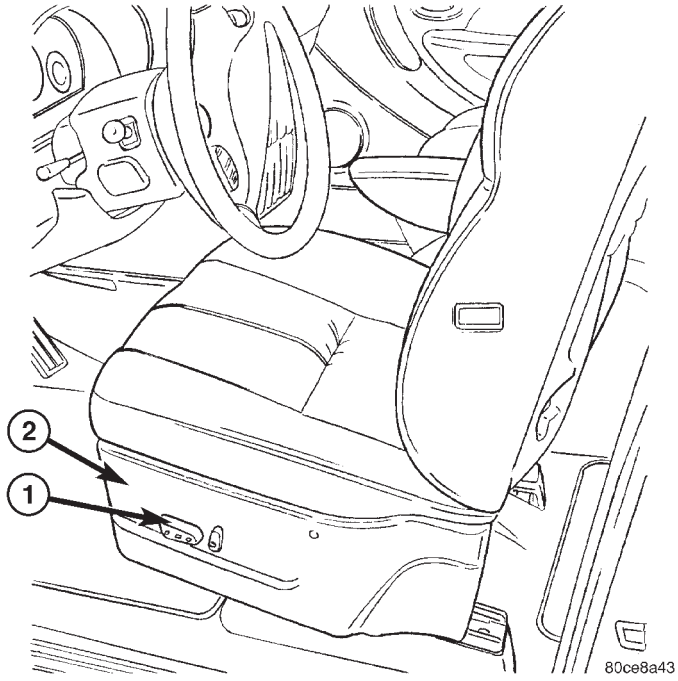

Fig. 2 Power Seat Switch Location

1 - Power Seat Switch
2 - Seat Cushion Side Shield

Vehicles equipped with power seats utilize a eight-way power seat switch. This eight-way power seat switch features two knobs ganged together on the outboard seat cushion side shield (Fig. 2).

DRIVER SEAT SWITCH (Continued)

The switch is secured to the back of the seat cushion side shield with two screws. However, the control knobs for the seat switch unit must be removed before the seat switch can be removed from the side shield.

The power seat switch cannot be repaired. If one switch is damaged or faulty, the entire power seat switch unit must be replaced.

OPERATION

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged. See the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

DIAGNOSIS AND TESTING - DRIVER SEAT SWITCH

(1) Remove the power seat switch, refer to the Switch Removal and Installation procedures in this section.

(2) Using an ohmmeter, check pin #1 of the power seat switch connector for continuity to ground. It should be present, If OK go to Step 3 , If NOT OK repair the open ground circuit as required.

(3) Using an voltmeter, check pin #5 of the power seat switch connector for approx. 12v. It should be present, If OK go to Step 4 , If NOT OK repair the open voltage supply circuit as required.

(4) Using an ohmmeter, verify the Seat Switch Continuity Test table, using the seat switch connector (Fig. 3). If there is no continuity at any of the switch positions, replace the power seat switch.

DRIVER SEAT SWITCH CONTINUITY TEST TABLE

SWITCH POSITION	CONTINUITY BETWEEN PINS
	DRIVER
OFF	PIN 5 & 4 PIN 5 & 3 PIN 5 & 2 PIN 5 & 10 PIN 5 & 9 PIN 5 & 8 PIN 5 & 7 PIN 5 & 6
FRONT RISER UP	PIN 5 & 6 PIN 1 & 9
FRONT RISER DOWN	PIN 5 & 9 PIN 1 & 6
CENTER SWITCH FORWARD	PIN 5 & 3 PIN 1 & 10
CENTER SWITCH REARWARD	PIN 5 & 10 PIN 3 & 1
REAR RISER UP	PIN 5 & 7 PIN 1 & 8
REAR RISER DOWN	PIN 5 & 8 PIN 1 & 7
RECLINER UP	PIN 5 & 2 PIN 4 & 1
RECLINER DOWN	PIN 5 & 4 PIN 2 & 1

REMOVAL

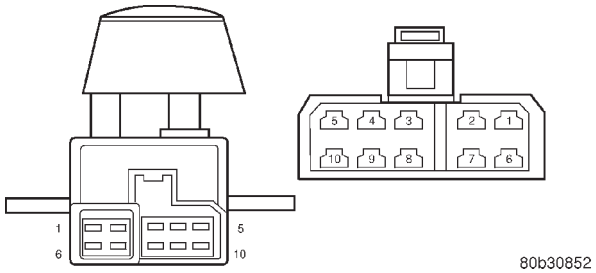

Fig. 3 Seat Switch Pin Call-Out

(1) Disconnect and isolate the battery negative cable.

(2) On models equipped with the eight-way power seat, using a push pin remover or another suitable wide flat-bladed tool, gently pry the power seat and power recliner switch knobs off of the switch levers (Fig. 4).

DRIVER SEAT SWITCH (Continued)

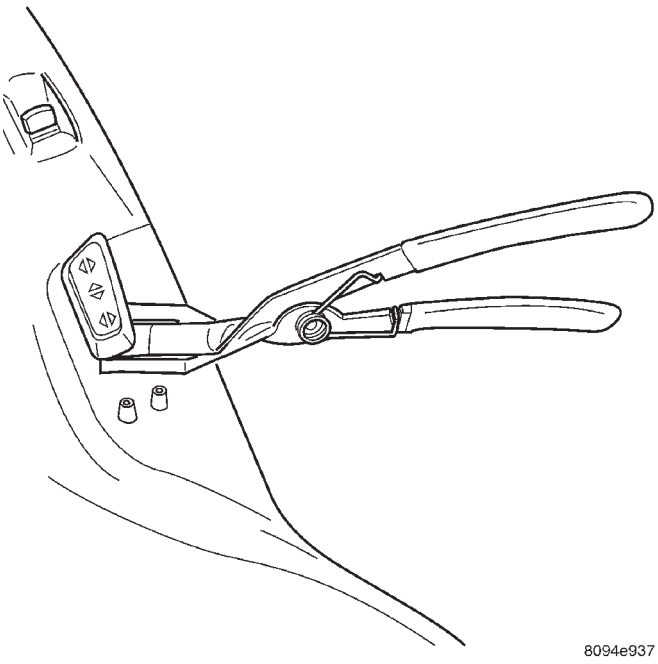

Fig. 4 Removing Switch Control Knobs - Typical

(3) Remove the screws that secure the outboard seat cushion side shield to the seat cushion frame. Refer to the Body section of the service manual for the procedure.

(4) Pull the outboard seat cushion side shield away from the seat cushion frame far enough to access the power seat switch wire harness connector.

(5) Disconnect the power seat wire harness connector from the power seat switch connector receptacle.

(6) Remove the screws that secure the power seat switch to the inside of the outboard seat cushion side shield.

(7) Remove the power seat switch from the outboard seat cushion side shield.

INSTALLATION

(1) Position the power seat switch onto the outboard seat cushion side shield.

(2) Install and tighten the screws that secure the power seat switch to the inside of the outboard seat cushion side shield. Tighten the screws to 1.5 N·m (14 in. lbs.).

(3) Reconnect the power seat wire harness connector to the power seat switch connector receptacle.

(4) Position the outboard seat cushion side shield onto the seat cushion frame

(5) Install and tighten the screws that secure the outboard seat cushion side shield to the seat cushion frame. Tighten the screws to 1.5 N·m (14 in. lbs.).

(6) Install the switch knobs on the switch control levers, if equipped.

(7) Reconnect the battery negative cable.

MEMORY SET SWITCH

DESCRIPTION

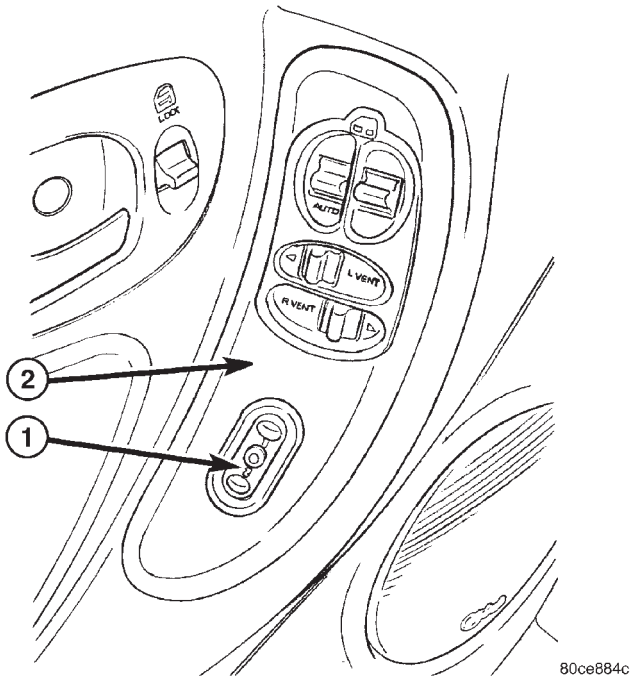

Fig. 5 Memory Switch Location

1 - Memory Switch
2 - Switch Bezel

Vehicles equipped with the memory system have a memory switch mounted to the driver side front door trim panel (Fig. 5). This switch is used to set and recall all of the memory system settings for up to two drivers. The memory switch is a resistor multiplexed unit that is hard wired to the Body Control Module (BCM). The BCM sends out the memory system set and recall requests to the other electronic modules over the Programmable Communications Interface (PCI) data bus.

The memory switch cannot be adjusted or repaired and, if faulty or damaged, it must be replaced. For complete circuit diagrams, refer to **Wiring Diagrams**.

OPERATION

The memory switch has three momentary switch buttons labeled Set, 1 and 2. The Driver 1 and Driver 2 buttons are back-lit with Light-Emitting Diodes (LED) for visibility. When the memory set switch is depressed, a resistance value is sent to the Body Control Module via hard wired connections. When the memory system is in “set” mode a chime will be generated by the body control module.

MEMORY SET SWITCH (Continued)

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the memory switch.

DIAGNOSIS AND TESTING - MEMORY SWITCH

(1) Remove the memory set switch from the drivers door panel (Refer to 8 - ELECTRICAL/POWER SEATS/MEMORY SET SWITCH - REMOVAL).

(2) Using an ohmmeter, check for continuity on the memory select switch MUX circuit between the body control module C2 electrical connector and the memory switch connector. Continuity should be present, If OK go to Step 3, If NOT OK repair the open or shorted MUX circuit as required.

(3) Using an ohmmeter, check for continuity on the memory select switch RETURN circuit between the body control module C2 electrical connector and the memory switch connector. Continuity should be present, If OK go to Step 4, If NOT OK repair the open or shorted RETURN circuit as required.

(4) Using an ohmmeter, test the resistances of the memory switch in each switch position. See the Memory Switch Test Table. If OK, refer to **Diagnosis and Testing Memory System** in this section. If not OK, replace the faulty memory set switch.

MEMORY SWITCH TEST TABLE

MEMORY SWITCH POSITION	RESISTANCE BETWEEN PINS	RESISTANCE RANGE (OHMS)
NEUTRAL	1&2	24650 ± 5% (24.65 k)
MEMORY 1	1&2	6850 ± 5% (6.85 k)
MEMORY 2	1&2	2100 ± 5% (2.10 k)
SET	1&2	4490 ± 5% (4.49 k)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the front door trim panel switch bezel from the driver side front door. Using a thin flat-bladed pry tool, gently pry the switch bezel away from the drivers door trim panel.

(3) Disconnect the memory switch wire harness connector from the memory switch.

(4) Remove the two screws that secure the memory switch to the back of the driver side front door trim panel switch bezel.

(5) Remove the memory switch.

INSTALLATION

(1) Position the memory switch and install and tighten the two screws that secure the memory switch to the back of the driver side front door trim panel switch bezel. Tighten the screws to 2.2 N·m (20 in. lbs.).

(2) Reconnect the memory switch wire harness connector to the memory switch.

(3) Install the trim panel switch bezel onto the driver side front door.

(4) Reconnect the battery negative cable.

PASSENGER SEAT SWITCH

DESCRIPTION

Vehicles equipped with power seats utilize a ten-way power seat switch. This ten-way power seat switch features two knobs ganged together on the outboard seat cushion side shield.

The switch is secured to the back of the seat cushion side shield with two screws. However, the control knobs for the seat switch unit must be removed before the seat switch can be removed from the side shield.

The power seat switch cannot be repaired. If one switch is damaged or faulty, the entire power seat switch unit must be replaced.

OPERATION

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged. See the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

PASSENGER SEAT SWITCH (Continued)

DIAGNOSIS AND TESTING - PASSENGER SEAT SWITCH

(1) Remove the power seat switch, refer to the Switch Removal and Installation procedures in this section.

(2) Using an ohmmeter, check pin #1 of the power seat switch connector for continuity to ground. It should be present, If OK go to Step 3 , If NOT OK repair the open ground circuit as required.

(3) Using an voltmeter, check pin #5 of the power seat switch connector for approx. 12v. It should be present, If OK go to Step 4 , If NOT OK repair the open voltage supply circuit as required.

(4) Using an ohmmeter, perform the Seat Switch Continuity Test table using (Fig. 6). If there is no continuity at any of the switch positions, replace the power seat switch.

PASSENGER SEAT SWITCH CONTINUITY TEST TABLE

SWITCH POSITION	CONTINUITY BETWEEN PINS
	PASSENGER
OFF	PIN 5 & 4 PIN 5 & 3 PIN 5 & 2 PIN 5 & 10 PIN 5 & 9 PIN 5 & 8 PIN 5 & 7 PIN 5 & 6
FRONT RISER UP	PIN 5 & 9 PIN 1 & 6
FRONT RISER DOWN	PIN 5 & 6 PIN 1 & 9
CENTER SWITCH FORWARD	PIN 5 & 3 PIN 1 & 10
CENTER SWITCH REARWARD	PIN 5 & 10 PIN 3 & 1
REAR RISER UP	PIN 5 & 8 PIN 1 & 7

RECLINER UP	PIN 5 & 2 PIN 4 & 1
RECLINER DOWN	PIN 5 & 4 PIN 2 & 1

REMOVAL

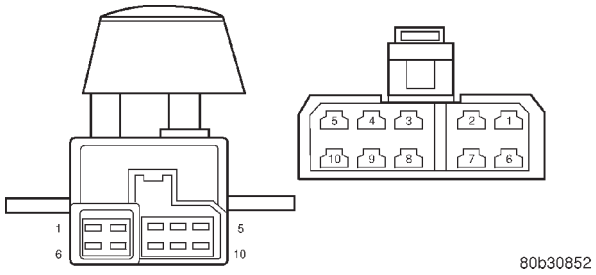

Fig. 6 Seat Switch Pin Call-Out

(1) Disconnect and isolate the battery negative cable.

(2) On models equipped with the eight-way power seat, using a push pin remover or another suitable wide flat-bladed tool, gently pry the power seat and power recliner switch knobs off of the switch levers (Fig. 7).

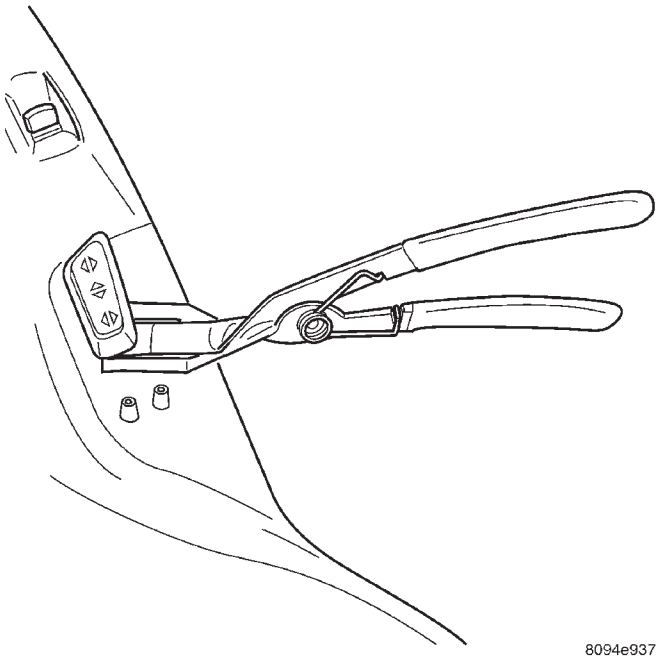

Fig. 7 Removing Switch Control Knobs - Typical

(3) Remove the screws that secure the outboard seat cushion side shield to the seat cushion frame. Refer to the Body section of the service manual for the procedure.

(4) Pull the outboard seat cushion side shield away from the seat cushion frame far enough to access the power seat switch wire harness connector.

(5) Disconnect the power seat wire harness connector from the power seat switch connector receptacle.

(6) Remove the screws that secure the power seat switch to the inside of the outboard seat cushion side shield.

PASSENGER SEAT SWITCH (Continued)

(7) Remove the power seat switch from the outboard seat cushion side shield.

INSTALLATION

(1) Position the power seat switch onto the outboard seat cushion side shield.

(2) Install and tighten the screws that secure the power seat switch to the inside of the outboard seat cushion side shield. Tighten the screws to 1.5 N·m (14 in. lbs.).

(3) Reconnect the power seat wire harness connector to the power seat switch connector receptacle.

(4) Position the outboard seat cushion side shield onto the seat cushion frame

(5) Install and tighten the screws that secure the outboard seat cushion side shield to the seat cushion frame. Tighten the screws to 1.5 N·m (14 in. lbs.).

(6) Install the switch knobs on the switch control levers, if equipped.

(7) Reconnect the battery negative cable.

MEMORY MIRROR/SEAT MODULE

DESCRIPTION

Vehicles equipped with the memory mirror/seat option, utilize a memory module located under the drivers front seat. This module is basically wired in-line between the power seat switch and the power seat track/adjuster motors, or in-line between the power mirror switch and the power side view mirror. The MSMM contains a central processing unit that communicates with other modules on the Programmable Communications Interface (PCI) data bus network.

The Memory Seat/Mirror Module (MSMM) receives hard wired inputs from the driver power seat switch and the potentiometers on each of the driver side power seat track motors, or from the power mirror switch and the potentiometers on the side view mirror. The MSMM receives messages over the PCI data bus from the Body Control Module (BCM) (memory switch status), the Powertrain Control Module (PCM) (vehicle speed status). The MSMM will prevent the seat memory recall function from being initiated if the driver side seat belt is buckled, if the transmission gear selector lever is not in the Park or Neutral positions, or if the vehicle is moving.

For diagnosis of the MSMM or the PCI data bus, a DRBIII® scan tool and the proper Diagnostic Procedures manual are recommended. The MSMM cannot be repaired and, if faulty or damaged, it must be replaced. Refer to **Memory System** in the Power Seat or Power Mirror section of this manual for more information on the memory system option.

OPERATION

When memory system operation is requested (depressing of the memory switch), a resistor multiplexed signal is sent from the memory switch to the body control module (BCM). The body control module will then send the appropriate signals out to the memory/mirror seat module, the memory/mirror seat module then applies the voltage supply to the power seat track or side-view mirror if the proper requirements are met. The vehicle speed must equal zero and the transmission must be in park or neutral in order for the memory system to function.

DIAGNOSIS AND TESTING - MEMORY MIRROR/SEAT MODULE

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. If any of the above conditions are present, repair as necessary. If not, use a DRB III® scan tool and the proper Diagnostic Procedures Manual to test the memory/mirror seat module. For complete circuit diagrams, refer to **Wiring Diagrams**.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the driver side front bucket seat retaining nuts from under the vehicle (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(3) Lift the drivers seat up and out of the mounting holes in the floor pan and lay the seat rearward to access the module located under the seat. It is not necessary to disconnect the seat electrical, just use care not to damage the wiring by over-extending.

(4) Disconnect the memory/mirror seat module electrical connectors. Depress the retaining tab and pull straight apart.

(5) Remove the module retaining bolts and remove the module from the bracket.

INSTALLATION

(1) Position and install the module retaining bolts.

(2) Connect the memory/mirror seat module electrical connectors.

(3) Position the drivers seat in the mounting holes in the floor pan.

(4) Install the driver side front bucket seat retaining nuts from under the vehicle (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

(5) Connect the battery negative cable.

DRIVER POWER SEAT TRACK

DESCRIPTION

The eight-way power seat option includes a electrically operated power seat track located under each front seat. The left side power seat track also provides the mounting location for the body control module on this vehicle. The power seat circuit breakers are mounted on the rear of each power seat track, just behind the seat rear trim panel. The lower half of the power seat track is secured to the floor panel via four studs and nuts that must be accessed from the underside of the vehicle. Four bolts secure the bottom of the seat cushion pan to the upper half of the power seat track unit. Four additional bolts secure the seat back frame to the power seat track unit.

The power seat track unit includes four reversible electric motors that are secured to the upper half of the track unit. Each motor moves the seat adjuster through a combination of worm-drive gearboxes and screw-type drive units. Each of the four power seat track motors used on models equipped with the optional memory system incorporates a position potentiometer integral to the motor assembly, which electronically monitors the motor position. This enables the memory system to function by referencing the motor positions programmed into the memory seat/mirror module.

The front and rear of the seat are operated by two separate vertical adjustment motors. These motors can be operated independently of each other, tilting the entire seat assembly forward or rearward; or, they can be operated in unison by selecting the proper power seat switch functions, which will raise or lower the entire seat assembly. A third motor is the horizontal adjustment motor, which moves the seat track in the forward and rearward directions. The forth motor is the recliner adjustment motor, which moves the seat back in the forward and rearward directions.

The power seat track unit cannot be repaired, and is serviced only as a complete unit. If any component in this unit is faulty or damaged, the entire power seat track unit must be replaced.

OPERATION

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged.

See the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

DIAGNOSIS AND TESTING - DRIVER POWER SEAT TRACK

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

Actuate the power seat switch to move all three power seat track adjusters in each direction. The power seat track adjusters should move in each of the selected directions. If a power seat track adjuster fails to operate in only one direction, move the adjuster a short distance in the opposite direction and test again to be certain that the adjuster is not at its travel limit. If the power seat track adjuster still fails to operate in only one direction, refer to **Diagnosis and Testing Power Seat Switch** in this section. If the power seat track adjuster fails to operate in more than one direction, perform the following tests. For complete circuit diagrams, refer to **Wiring Diagrams**.

TESTING POWER SEAT TRACK MOTORS

(1) Check the power seat circuit breaker under the seat. If OK, go to Step 2. If not OK, replace the faulty power seat circuit breaker.

(2) Check for battery voltage at the power seat circuit breaker under the seat. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the fuse in the Intelligent Power Module as required.

(3) Remove the outboard seat cushion side shield from the seat. Disconnect the seat wire harness connector from the power seat switch connector recepta-

DRIVER POWER SEAT TRACK (Continued)

cle. Check for battery voltage at the fused B(+) circuit cavity of the power seat wire harness connector for the power seat switch. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the power seat circuit breaker under the seat as required.

(4) Check for continuity between the ground circuit cavity of the power seat wire harness connector for the power seat switch and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open ground circuit to ground as required.

(5) Test the power seat switch. Refer to **Diagnosis and Testing Power Seat Switch** in this section. If the switch tests OK, test the circuits of the power seat wire harness between the inoperative power seat track adjuster motor and the power seat switch for shorts or opens. If the circuits check OK, replace the faulty power seat track unit. If the circuits are not OK, repair the power seat wire harness as required.

REMOVAL

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the appropriate seat from the vehicle and place it on a clean work surface(Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(2) Remove the Body Control Module retaining screws.

(3) Disconnect the body control module electrical connectors and remove the body control module from the power seat track.

(4) Remove the rear fabric blocker trim panel from the rear of the front seat.

(5) Remove the seat side cover and power seat switch as an assembly (Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE COVERS - REMOVAL).

(6) Disconnect all electrical connectors connecting the power seat track to the seat assembly.

(7) Pull the seat back trim cover up slightly to access and remove the two seat back frame mounting bolts and also remove two seat back recliner bolts.

(8) Remove four seat track mounting bolts from the seat cushion pan.

(9) Remove the power seat track from the seat.

INSTALLATION

(1) Position the seat cushion on the seat track.

(2) Install the four seat track retaining bolts in the seat cushion pan. Torque the bolts to 28.5 N·m.

(3) Position the seat back and install the two seat back frame mounting bolts and the two seat back recliner bolts. Torque the bolts to 55 N·m.

(4) Route and connect the electrical connectors between the power seat track and the seat assembly.

(5) Install the seat side cover and power seat switch as an assembly (Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE COVERS - INSTALLATION).

(6) Install the rear fabric blocker trim panel on the rear of the front seat.

(7) Position the body control module and connect the body control module electrical connectors.

(8) Install the Body Control Module retaining screws.

(9) Install the seat assembly in the vehicle (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

PASSENGER POWER SEAT TRACK

DESCRIPTION

The eight-way power seat option includes a electrically operated power seat track unit located under each front seat. The power seat circuit breaker is mounted on the rear of the power seat track, just behind the seat rear trim panel. The lower half of the power seat track is secured to the floor panel via four studs and nuts that must be accessed from the underside of the vehicle. Four bolts secure the bottom of the seat cushion frame to the upper half of the power seat track unit. Four additional bolts secure the seat back frame to the power seat track unit.

The power seat track unit includes four reversible electric motors that are secured to the upper half of the track unit. Each motor moves the seat adjuster through a combination of worm-drive gearboxes and screw-type drive units.

The front and rear of the seat are operated by two separate vertical adjustment motors. These motors can be operated independently of each other, tilting the entire seat assembly forward or rearward; or, they can be operated in unison by selecting the proper power seat switch functions, which will raise or lower the entire seat assembly. A third motor is the horizontal adjustment motor, which moves the seat track in the forward and rearward directions. The forth motor is the recliner adjustment motor, which moves the seat back in the forward and rearward directions.

PASSENGER POWER SEAT TRACK (Continued)

The power seat track unit cannot be repaired, and is serviced only as a complete unit. If any component in this unit is faulty or damaged, the entire power seat track unit must be replaced.

OPERATION

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged.

See the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

DIAGNOSIS AND TESTING - POWER SEAT TRACK

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

Actuate the power seat switch to move all three power seat track adjusters in each direction. The power seat track adjusters should move in each of the selected directions. If a power seat track adjuster fails to operate in only one direction, move the adjuster a short distance in the opposite direction and test again to be certain that the adjuster is not at its travel limit. If the power seat track adjuster still fails to operate in only one direction, refer to **Diagnosis and Testing Power Seat Switch** in this section. If the power seat track adjuster fails to operate in more than one direction, perform the following tests. For complete circuit diagrams, refer to **Wiring Diagrams**.

(1) Check the power seat circuit breaker under the seat. If OK, go to Step 2. If not OK, replace the faulty power seat circuit breaker.

(2) Check for battery voltage at the power seat circuit breaker under the seat. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the fuse in the Intelligent Power Module as required.

(3) Remove the outboard seat cushion side shield from the seat. Disconnect the seat wire harness connector from the power seat switch connector receptacle. Check for battery voltage at the fused B(+) circuit cavity of the power seat wire harness connector for the power seat switch. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the power seat circuit breaker under the seat as required.

(4) Check for continuity between the ground circuit cavity of the power seat wire harness connector for the power seat switch and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open ground circuit to ground as required.

(5) Test the power seat switch. Refer to **Diagnosis and Testing Power Seat Switch** in this section. If the switch tests OK, test the circuits of the power seat wire harness between the inoperative power seat track adjuster motor and the power seat switch for shorts or opens. If the circuits check OK, replace the faulty power seat track unit. If the circuits are not OK, repair the power seat wire harness as required.

REMOVAL

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

PASSENGER POWER SEAT TRACK (Continued)

(1) Remove the appropriate seat from the vehicle (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(2) Remove the rear fabric blocker trim panel from the rear of the front seat.

(3) Remove the seat side cover and power seat switch as an assembly (Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE COVERS - REMOVAL).

(4) Disconnect all electrical connectors connecting the power seat track to the seat assembly.

(5) Pull the seat back trim cover up slightly to access and remove the two seat back frame mounting bolts and seat back recliner bolts.

(6) Remove four seat track mounting bolts from the seat cushion pan.

(7) Remove the power seat track from the seat.

INSTALLATION

(1) Position the seat cushion on the seat track.

(2) Install the four seat track retaining bolts in the seat cushion pan. Torque the bolts to 28.5 N·m.

(3) Position the seat back and install the two seat back frame mounting bolts and the two seat back recliner bolts. Torque the bolts to 55 N·m.

(4) Route and connect the electrical connectors between the power seat track and the seat assembly.

(5) Install the seat side cover and power seat switch as an assembly (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).

(6) Install the rear fabric blocker trim panel on the rear of the front seat.

(7) Install the seat assembly in the vehicle (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

POWER WINDOWS

DESCRIPTION

The Power Window System is activated through switches mounted on the driver and passenger door panels.

OPERATION

Front door window lift motors use permanent type magnets. The B+ and ground applied at the motor terminal pins will cause the motor to rotate in one direction. Reversing current through the motor terminals will cause the motor to rotate in the opposite direction.

The power window motors ground through the master switch in the driver door by a black wire attached to the left cowl panel. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The power rear vent windows, if equipped, are operated by switches mounted in the driver door switch bezel. A separate switch is used for each window. Permanent magnet type motors connected to a crank system are used to open and close the rear vent windows. A battery positive and negative connection to either of the two motor terminals will cause the motor to rotate in one direction. Reversing current through these same two connections will cause the motor to rotate in the opposite direction. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING - POWER WINDOWS

POWER WINDOW MOTOR TEST

If the power window motor is receiving proper current and ground and does not operate, proceed with motor test. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Remove front door trim panel and sound pad as necessary to gain access to power window motor wire connector, (Refer to 23 - BODY/DOOR - FRONT/ TRIM PANEL - REMOVAL).

(2) Disconnect power window motor wire connector from door harness.

(3) Using two jumper wires, connect one to a battery (+) source and the other to a good ground (-).

(4) Connect the Negative (-) jumper probe to one of the motor connector terminals.

(5) Momentarily touch the Positive (+) jumper probe to the other motor connector terminal.

When positive probe is connected the motor should rotate in one direction to either move window up or down. If window is all the way up or down the motor will grunt and the inner door panel will flex when actuated in that one direction.

(6) Reverse jumper probes at the motor connector terminals and window should now move in opposite direction. If window does not move or grunt, replace the motor.

POWER WINDOWS (Continued)

If window moved completely up or down, reverse the jumper probes and cycle window to the opposite position to verify full operation.

If motor grunts and does not move, verify that regulator is not binding.

WIRING VOLTAGE TEST

The following wiring test determines whether or not voltage is continuous through the body harness to switch.

(1) Remove the power window switch and bezel assembly from the driver door. (Refer to 8 - ELECTRICAL/POWER WINDOWS/POWER WINDOW SWITCH - REMOVAL).

(2) Disconnect wire connector from back of power window switch.

(3) Switch ignition ON position.

(4) Connect the clip end of a 12 volt test light to Pin 13 in door harness connector at the window switch. Touch the test light probe to Pin 9 and then to Pin 11.

- If the test light illuminates, the wiring circuit between the battery and switch is OK.
- If the lamp does not illuminate, first check the 25 amp circuit breaker attached to the electrical distribution wiring bracket. If the circuit breaker is OK, then check the 40 amp fuse (#28) in the Integrated Power Module (IPM). If both components are OK, then check for a broken wire.
- Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

VENT WINDOW MOTOR

DIAGNOSIS AND TESTING - VENT WINDOW MOTOR

If the power vent window motor is receiving proper current and ground and does not operate proceed with motor test. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Remove D-pillar trim panel necessary to gain access to power vent window motor wire connector, (Refer to 23 - BODY/INTERIOR/LEFT D-PILLAR TRIM PANEL - REMOVAL) or (Refer to 23 - BODY/INTERIOR/RIGHT D-PILLAR TRIM PANEL - REMOVAL).

(2) Disconnect power vent window motor wire connector from body harness.

(3) Using two jumper wires, connect one to a battery (+) source and the other to a good ground (-).

(4) Connect the Negative (-) jumper probe to one of the motor connector terminals.

(5) Momentarily touch the Positive (+) jumper probe to the other motor connector terminal.

When positive probe is connected the motor should rotate in one direction to either move window open or closed. If window is all the way open or closed the motor will grunt and the crank system will flex when actuated in that one direction.

Reverse jumper probes at the motor connector terminals and window should now move in opposite direction. If window does not move or grunt, replace the motor.

If window moved completely open or closed, reverse the jumper probes and cycle window to the opposite position to verify full operation.

If motor grunts and does not move, verify that crank system is not binding.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove D-pillar trim panel. (Refer to 23 - BODY/INTERIOR/LEFT D-PILLAR TRIM PANEL - REMOVAL) or (Refer to 23 - BODY/INTERIOR/RIGHT D-PILLAR TRIM PANEL - REMOVAL).

(3) Disconnect wire connector from power vent motor.

(4) Using a flat bladed tool, carefully lift the circular actuator link tab. Remove link from window ball socket.

(5) Remove bolts holding power vent motor to D-pillar (Fig. 1).

(6) Remove power vent motor.

INSTALLATION

(1) Obtain new vent window motor.

(2) Snap the actuator link socket onto the quarter window ball socket. Using a soft rubber mallet, push the circular link tab flush with link surface.

(3) Install bolts holding power vent motor to D-pillar.

(4) Reconnect wire connector to power vent motor.

(5) Reconnect the battery negative cable.

(6) Cycle quarter window open/close to verify function.

(7) Install D-pillar trim panel.

VENT WINDOW MOTOR (Continued)

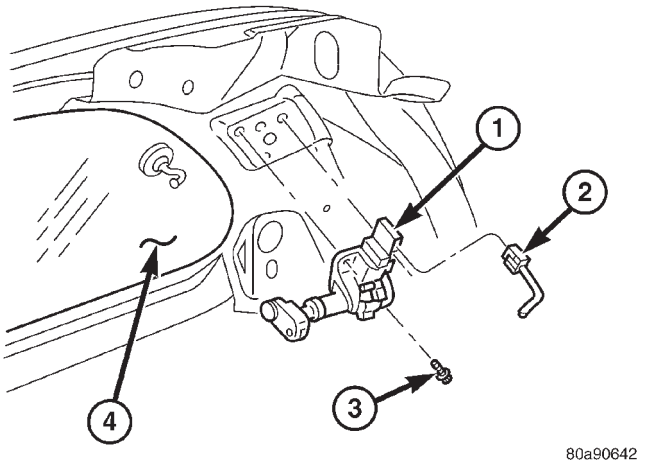

Fig. 1 VENT WINDOW MOTOR

2 - WIRE HARNESS CONNECTOR
3 - BOLT
4 - VENT WINDOW

WINDOW MOTOR

REMOVAL

The window motor is incorporated into the window regulator assembly. If the window motor requires replacement, the window regulator must be replaced. (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL).

WINDOW SWITCH

DIAGNOSIS AND TESTING - WINDOW SWITCH

(1) Remove the desired switch to be tested from the door trim panel. Driver's side (master) or passenger side. (Refer to 8 - ELECTRICAL/POWER WINDOWS/POWER WINDOW SWITCH - REMOVAL).

(2) Using an ohmmeter, Test driver door switch for continuity as described in (Fig. 2).

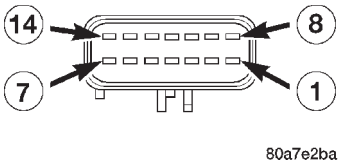

Fig. 2 Power Window Master Switch Connector

POWER WINDOW MASTER SWITCH TEST

SWITCH POSITION	CONTINUITY BETWEEN

LEFT VENT CLOSE	9 and 3
RIGHT VENT OPEN	9 and 1
RIGHT VENT CLOSE	11 and 5

* MUST TEST WITH B+ ON PIN 9 AND GROUND ON PIN 13 FOR CONTINUITY BETWEEN PINS 11 AND 6

(3) If the result are not OK, replace the driver side window lift switch.

(4) Test passenger door switch for continuity as described in (Fig. 3).

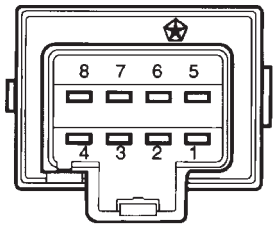

Fig. 3 Passenger Door Power Window Switch

WINDOW SWITCH (Continued)

PASSENGER WINDOW SWITCH TEST

SWITCH POSITION	CONTINUITY BETWEEN
OFF	3 AND 8
OFF	2 AND 5
UP	1 AND 8
DOWN	1 AND 5

(5) If the results are not OK, replace the switch.

The power window master switch has a Auto-Down feature. The switch is equipped with two detent positions when actuating the power window OPEN. The first detent position allows the window to roll down and stop when the switch is released. The second detent position actuates an integral express roll down relay that rolls the window down after the switch is released. When the express down circuit senses stall current (window has reached end of down travel), the switch will turn current off to the motor. The AUTO feature can be cancelled by actuating the switch UP or DOWN while window is in motion. If the electronic circuit in the switch fails to detect a stall current, the auto down circuit will time out within 9 to 13 seconds.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick, start at the bottom of the switch and bezel assembly and pry up to remove the switch and bezel assembly from the door trim panel (Fig. 4).

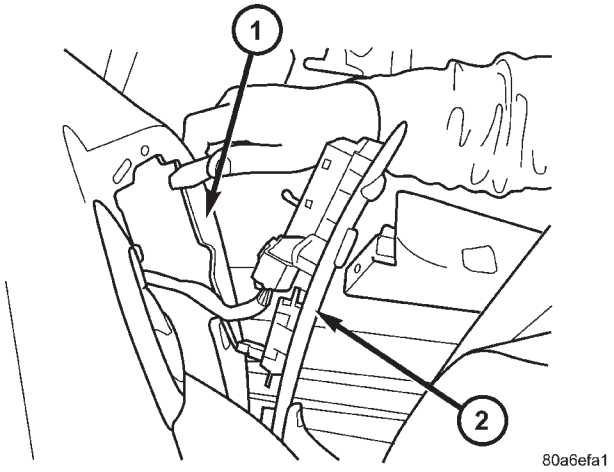

Fig. 4 POWER WINDOW SWITCH

1 - DOOR TRIM PANEL
2 - POWER WINDOW SWITCH AND BEZEL ASSEMBLY

(3) Unlatch the locking tab on the harness side connector of the switch.

(4) Disconnect wire harness connectors from switch.

INSTALLATION

(1) Reconnect wire harness connector to switch.

(2) Insert switch into door trim panel and press into place.

(3) Reconnect battery negative cable.

RESTRAINTS

DESCRIPTION

This vehicle is equipped with a Frontal Impact Airbag System, which utilizes the driver/passenger airbags and seatbelt pretensioners. This system is designed to protect occupants in the event of a front impact collision. These airbags and seatbelt pretensioners are all serviceable parts. If these pyrotechnics are deployed or defective, they must be replaced, as well as the Occupant Restraint Controller (ORC) must be diagnosed following procedures outlined in the service/diagnostic manuals.

Vehicles equipped with the Side Impact Airbag System, the seat back assembly must be replaced, as well as the Side Impact Airbag Control Module (SIACM) must be diagnosed following procedures outlined in the service/diagnostic manuals.

OPERATION

The Occupant Restraint Controller (ORC) controls the driver/passenger airbags and seatbelt pretensioners. If the ORC determines the impact is severe enough, the driver/passenger airbags and seatbelt pretensioners will inflate. Once a deployment occurs, these devices, and all damaged parts must be replaced, as well as the ORC must be diagnosed following procedures outlined in the service/diagnostic manuals.

The Side Impact Airbag Control Module (SIACM), the seat back assemblies and all damaged parts must be replaced, as well as the SIACM must be diagnosed following procedures outlined in the service/diagnostic manuals.

WARNING

WARNING: THIS SYSTEM IS A SENSITIVE, COMPLEX ELECTRO–MECHANICAL UNIT. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE BEFORE BEGINNING AIRBAG SYSTEM COMPONENT REMOVAL OR INSTALLATION PROCEDURES. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.
ALLOW SYSTEM CAPACITOR TO DISCHARGE FOR TWO MINUTES BEFORE REMOVING AIRBAG COMPONENTS.
DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A SOLID SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED AND COULD RESULT IN PERSONAL INJURY. WHEN CARRYING OR HANDLING AN UNDEPLOYED AIRBAG MODULE, THE TRIM SIDE OF THE AIRBAG SHOULD BE POINTING AWAY FROM THE BODY TO MINIMIZE POSSIBILITY OF INJURY IF ACCIDENTAL DEPLOYMENT OCCURS.
REPLACE AIRBAG SYSTEM COMPONENTS WITH MOPAR® REPLACEMENT PARTS. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION.
WEAR SAFETY GLASSES, RUBBER GLOVES, AND LONG SLEEVED CLOTHING WHEN CLEANING POWDER RESIDUE FROM VEHICLE AFTER AIRBAG DEPLOYMENT. SODIUM HYDROXIDE POWDER RESIDUE EMITTED FROM A DEPLOYED AIRBAG CAN CAUSE SKIN IRRITATION. FLUSH AFFECTED AREA WITH COOL WATER IF IRRITATION IS EXPERIENCED. IF NASAL OR THROAT IRRITATION IS EXPERIENCED, EXIT THE VEHICLE FOR FRESH AIR UNTIL THE IRRITATION CEASES. IF IRRITATION CONTINUES, SEE A PHYSICIAN.
DO NOT USE A REPLACEMENT AIRBAG THAT IS NOT IN THE ORIGINAL PACKAGING, IMPROPER DEPLOYMENT AND PERSONAL INJURY CAN RESULT.
THE FACTORY INSTALLED FASTENERS, SCREWS AND BOLTS USED TO FASTEN AIRBAG COMPONENTS HAVE A SPECIAL COATING AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. DO NOT USE SUBSTITUTE FASTENERS, USE ONLY ORIGINAL EQUIPMENT FASTENERS LISTED IN THE PARTS CATALOG WHEN FASTENER REPLACEMENT IS REQUIRED.

CAUTION:
Deployed and Nondeployed Air Bags may or may not have live pyrotechnic material within the air bag inflator. Do not dispose of Driver and Passenger Airbags unless you are sure of complete deployment. Please refer to the Hazardous Substance Control System for Proper Disposal. Dispose of deployed air bags in a manner consistent with state, provincial, local, and federal regulations.

DIAGNOSIS AND TESTING - AIRBAG SYSTEM

(1) Connect a DRB lll® scan tool to the Data Link Connector (DLC), located at left side of the steering column and at the lower edge of the lower instrument panel.

(2) Turn the ignition key to ON position. Exit vehicle with scan tool. Use the latest version of the proper cartridge.

(3) After checking that no one is inside the vehicle, connect the battery negative terminal.

(4) Using the DRB lll® scan tool, read and record active diagnostic code data.

(5) Read and record any stored diagnostic codes.

(6) Refer to the proper Body Diagnostic Procedures manual if any diagnostic codes are found in Step 4 or Step 5.

(7) Erase stored diagnostic codes if there are no active diagnostic codes. If problems remain, diagnostic codes will not erase. Refer to the Proper Body Diagnostic Procedures Manual to diagnose the problem. **If airbag warning lamp either fails to light, or goes on and stays on, there is a system malfunction. Refer to the proper Body Diagnostic Procedures manual to diagnose the problem.**

CLOCK SPRING

DESCRIPTION

The clock spring is screwed to a plastic mounting platform on the steering column behind the steering wheel. The clock spring is used to maintain a continuous electrical circuit between the wiring harness and the drivers airbag.

OPERATION

This assembly consists of a flat ribbon like electrically conductive tape which winds and unwinds with the steering wheel rotation. The clock spring cannot be repaired. If the clock spring is faulty, damaged, or if the airbag has been deployed, the clock spring must be replaced.

STANDARD PROCEDURE - CLOCK SPRING CENTERING

If the rotating tape (wire coil) in the clock spring is not positioned properly with the steering wheel and the front wheels, the clock spring may fail. The following procedure MUST BE USED to center the clock spring if it is not known to be properly positioned, or if the front wheels were moved from the straight ahead position.

(1) Adjust the steering wheel so that the tires are in a straight ahead position.

(2) Remove Driver Airbag from steering wheel.

(3) Disconnect wire connectors from back of airbag.

(4) Remove steering wheel.

(5) Rotate the clock spring rotor clockwise until the rotor stops. Do not apply excessive force.

(6) From the end of travel, rotate the rotor two turns counterclockwise until the wires end up at the top.

(7) Install steering wheel and airbag.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

REMOVAL

(1) Position steering wheel and front wheels straight ahead.

(2) Release hood latch and open hood. Disconnect and isolate the battery negative cable.

(3) Remove driver airbag from steering wheel.

(4) Disconnect wire connectors from back of driver airbag.

(5) Disconnect the 2–way connector from remote radio control harness and the 4-way connector from the speed control/horn harness.

(6) Remove steering wheel.

(7) Remove steering column shrouds.

(8) Disconnect 4-way and 6-way connectors between the clock spring and the instrument panel wiring harness.

(9) Remove clock spring from housing assembly by removing the two retaining screws retaining the clock spring.

INSTALLATION

(1) Position the clock spring into the housing. Install the two retaining screws to clock spring.

(2) Connect the 4-way and 6-way harness between the clock spring and the instrument panel.

(3) Install the steering wheel. Refer to Steering, Column, Steering Wheel, Installation.

(4) Connect the harness connector to the driver airbag.

(5) Connect the remote radio control harness and the speed control/horn harness.

(6) Install the driver airbag into the steering wheel.

(7) Install the steering column upper and lower shrouds.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

DRIVER AIRBAG

DESCRIPTION

The Driver Airbag is located in the center of the steering wheel. The most visible part of the airbag is the cover/horn switch.

OPERATION

The Driver Airbag cover contains the horn switch, inflator device, and a fabric bag. The airbag cover/horn switch is serviced separately from the inflator and bag components.

DRIVER AIRBAG (Continued)

When the front airbag system is deployed, the following **MUST** be replaced:

- Complete Steering Column Assembly.
- Lower Steering Column Coupler.
- Steering Wheel.
- Clock Spring.
- Driver Airbag
- Passenger Airbag
- Upper Instrument Panel with Pad.

CARE OF UNDEPLOYED AIRBAGS

Airbags must be stored in their original special container until used for service. At no time should a source of electricity be permitted near the inflator on the back of an airbag. When carrying or handling an undeployed airbag, the trim side of the airbag should be pointing away from the body to minimize possibility of injury if accidental deployment occurs. Do not place undeployed airbag face down on a solid surface, the airbag will propel into the air if accidental deployment occurs.

STANDARD PROCEDURE - CLEAN UP

Roll or fold the driver airbag towards the steering wheel and then tape the bag to the steering wheel.

Use a vacuum cleaner to remove any residual powder from the vehicle interior. Work from the outside in to avoid kneeling or sitting in a contaminated area. Vacuum the heater and A/C outlets as well. If HVAC was in RECIRC mode at time of airbag deployment, operate HVAC blower on low speed/heat and vacuum powder residue expelled from the heat outlets. Multiple vacuum cleaning may be necessary to decontaminate the interior of the vehicle.

REMOVAL

DEPLOYED AIRBAG

The Driver Airbag and Driver Airbag Cover/Horn Pad are serviced separately from each other.

(1) Clean powder residue from interior of vehicle, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - STANDARD PROCEDURE) Cleanup.

(2) Remove two screws attaching Driver Airbag to steering wheel.

(3) Remove the driver airbag from steering wheel.

(4) Disconnect wire connectors from Airbag and Clock Spring.

(5) Adjust the steering wheel so that the tires are in a straight ahead position. Remove steering wheel, (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL)

(6) Disconnect the 2-way and 4-way connectors between the clock spring and the instrument panel wiring harness.

(7) Remove upper and lower steering column shrouds.

(8) Remove clock spring from the housing assembly by depressing the 2 tabs on the clock spring.

UNDEPLOYED AIRBAG

(1) Remove screws attaching airbag/horn switch to steering wheel.

(2) Remove Driver Airbag from steering wheel.

(3) Disconnect wire connectors from driver airbag and clock spring.

INSTALLATION

DEPLOYED AIRBAG

(1) Perform cleanup procedure.(Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - STANDARD PROCEDURE)

(2) Install a new steering column assembly and lower steering column coupler. Refer to Steering, Column, Installation.

(3) Install the clock spring.

(4) Install the driver airbag and the two screws retaining the airbag. Tighten screws to 10 N·m (90 in. lbs.)

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

UNDEPLOYED AIRBAG

(1) Position a new airbag into the airbag cavity.

(2) Install the two screws retaining the airbag. Tighten screws to 10 N·m (90 in. lbs.)

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

DRIVER AIRBAG TRIM COVER

REMOVAL

The horn switch is integral to the driver airbag trim cover. If either component is faulty or damaged, the entire driver airbag trim cover and horn switch unit must be replaced.

(1) Disconnect and isolate the battery negative cable.

WARNING: WAIT TWO MINUTES FOR THE AIRBAG SYSTEM RESERVE CAPACITOR TO DISCHARGE.

DRIVER AIRBAG TRIM COVER (Continued)

(2) Remove the driver airbag from the steering wheel (Refer to 8 - ELECTRICAL/RESTRAINTS/ DRIVER AIRBAG - REMOVAL).

(3) Remove the plastic wire retainer that captures the horn switch feed pigtail wire between the upper left inflator stud and the inflator on the back of the driver airbag housing.

(4) Remove the four nuts that secure the upper and lower trim cover retainers to the studs on the back of the driver airbag housing.

(5) Remove the upper and lower trim cover retainers from the airbag housing studs.

(6) Remove the horn switch ground pigtail wire eyelet terminal from the upper right airbag housing stud.

(7) Disengage the six trim cover locking blocks from the lip around the outside edge of the driver airbag housing and remove the housing from the cover.

INSTALLATION

(1) Install the housing into the cover. Engage the six trim cover locking blocks to the lip around the outside edge of the driver airbag housing.

(2) Install the horn switch ground pigtail wire eyelet terminal to the upper right airbag housing stud.

(3) Install the upper and lower trim cover retainers to the airbag housing studs.

(4) Install the four nuts that secure the upper and lower trim cover retainers to the studs on the back of the driver airbag housing.

(5) Install the plastic wire retainer that captures the horn switch feed pigtail wire between the upper left inflator stud and the inflator on the back of the driver airbag housing.

(6) Install the driver airbag onto the steering wheel (Refer to 8 - ELECTRICAL/RESTRAINTS/ DRIVER AIRBAG - INSTALLATION).

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. FIRST (Refer to 8 - ELECTRICAL/RESTRAINTS/DIAGNOSIS AND TESTING - AIRBAG SYSTEM).

OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

The front driver and passenger airbag system is designed to reduce the risk of fatality or serious injury, caused by a frontal impact of the vehicle.

The Occupant Restraint Controller (ORC) contains the impact sensor and energy reserve capacitor. It is mounted on a bracket, under the instrument panel, just forward of the storage bin. The ORC monitors the system to determine the system readiness. The ORC contains on-board diagnostics and will light the AIRBAG warning lamp in the message center when a problem occurs.

OPERATION

The impact sensor provides verification of the direction and severity of the impact. One impact sensor is used. It is located inside the Occupant Restraint Controller (ORC). The impact sensor is an accelerometer that senses deceleration. The deceleration pulses are sent to a microprocessor which contains a decision algorithm. When an impact is severe enough to require airbag protection, the ORC microprocessor sends a signal that completes the electrical circuit to the driver and passenger airbags. The impact sensor is calibrated for the specific vehicle and reacts to the severity and direction of an impact.

REMOVAL

NOTE: Diagnose the ORC using the service/diagnostic manual.

(1) Disconnect and isolate the battery negative cable.

(2) Remove storage bin from instrument panel. Refer to Body, Instrument Panel, Storage Bin, Removal.

(3) Remove three bolts holding ORC to floor bracket.

(4) Disconnect the wire connector from ORC.

(5) Remove the ORC assembly from vehicle.

INSTALLATION

WARNING: DO NOT INSTALL ORC IF MOUNTING LOCATION IS DEFORMED OR DAMAGED.

CAUTION: Use correct screws when installing the ORC.

(1) Install the ORC assembly into vehicle.

(2) Connect the wire connector to the ORC.

(3) Install three bolts holding ORC to floor bracket. Torque bolts to 7.3 - 9.6 N·m (65 to 85 in. lbs.)

(4) Install the storage bin onto the instrument panel. Refer to Body, Instrument Panel, Storage Bin, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

PASSENGER AIRBAG

DESCRIPTION

WARNING: NEVER DISASSEMBLE THE PASSENGER AIRBAG, THE PASSENGER AIRBAG HAS NO SERVICEABLE PARTS.

The Passenger Airbag is located beneath the instrument panel and pad assembly. The airbag is mounted to the back side of the instrument panel reinforcement.

The instrument panel top pad is the most visible part of the passenger airbag system. Located under the instrument panel top pad are the airbag door, the passenger airbag cushion and the airbag cushion supporting components.

The passenger airbag includes a magnesium housing within which the cushion and inflator are mounted and sealed.

Following a passenger airbag deployment, the passenger airbag and the instrument panel must be replaced. The passenger airbag cannot be repaired, and must be replaced if deployed or damaged in any way.

OPERATION

The passenger airbag is equipped with two inflators, each with three levels of pressure output. The inflators seal the hole in the airbag cushion so it can discharge the gas it produces directly into the cushion when supplied with the proper electrical signal. Following an airbag deployment, the airbag cushion quickly deflates by venting this gas through the cushion material towards the instrument panel.

The passenger airbag is secured with screws to the instrument panel beneath the instrument panel top pad and above the glove box opening. The instrument panel top pad above the glove box opening conceals the airbag door and a predetermined hinge line beneath its decorative cover. Upon airbag deployment, the top pad will bend at the hinge line and the door will fold back out of the way onto the top of the instrument panel.

When the front airbag system is deployed, the following **MUST** be replaced:

- Complete Steering Column Assembly.
- Lower Steering Column Coupler.
- Steering Wheel.
- Clock Spring.
- Driver Airbag.
- Passenger Airbag.
- Upper Instrument Panel with Pad.

CARE OF UNDEPLOYED AIRBAGS

Airbags must be stored in their original special container until used for service. At no time should a source of electricity be permitted near the inflator on the back of an airbag. When carrying or handling an undeployed airbag, the trim side of the airbag should be pointing away from the body to minimize possibility of injury if accidental deployment occurs. Do not place undeployed airbag face down on a solid surface, the airbag will propel into the air if accidental deployment occurs.

STANDARD PROCEDURE - CLEAN UP

Roll or fold the passenger airbag towards the instrument panel surface and close the door over the folded bag. Then tape the door shut.

Use a vacuum cleaner to remove any residual powder from the vehicle interior. Work from the outside in to avoid kneeling or sitting in a contaminated area. Vacuum the heater and A/C outlets as well. If HVAC was in RECIRC mode at time of airbag deployment, operate HVAC blower on low speed/heat and vacuum powder residue expelled from the heat outlets. Multiple vacuum cleaning may be necessary to decontaminate the interior of the vehicle.

REMOVAL

DEPLOYED AIRBAG

(1) Clean powder residue from interior of vehicle. Refer to Electrical, Restraints, Passenger Airbag, Standard Procedure - Passenger Airbag Clean Up.

(2) Remove instrument panel. Refer to Body, Instrument Panel, Removal.

(3) Remove all reusable components from the upper instrument panel and transfer to the new instrument panel.

UNDEPLOYED AIRBAG

(1) Remove instrument panel. Refer to Body, Instrument Panel, Removal.

(2) De-trim the instrument panel enough to gain access to the passenger airbag fasteners.

(3) Disconnect yellow wire connector from passenger airbag.

(4) Remove three bolts to the passenger airbag.

(5) Remove airbag from instrument panel through rear of instrument panel.

INSTALLATION

DEPLOYED AIRBAG

Transfer all reusable components to the new instrument panel.

(1) Install new Passenger Airbag into instrument panel.

PASSENGER AIRBAG (Continued)

(2) Install airbag attaching bolts to the instrument panel.
(3) Connect yellow wire connector from passenger airbag.
(4) Install Instrument panel. Refer to Body, Instrument Panel, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

UNDEPLOYED AIRBAG

(1) Install Passenger Airbag into instrument panel.
(2) Install airbag attaching bolts to the instrument panel.
(3) Connect yellow wire connector from passenger airbag.
(4) Install Instrument panel. Refer to Body, Instrument Panel, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

SEAT AIRBAG

DESCRIPTION

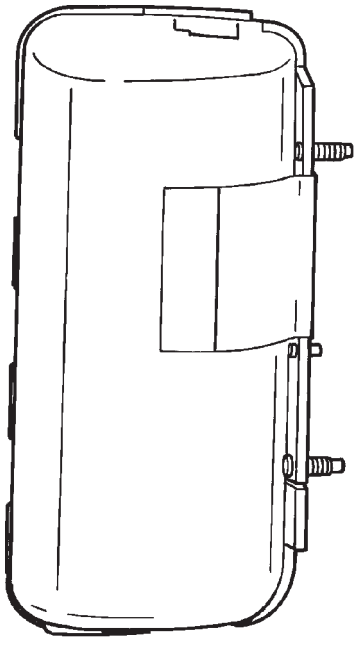

Fig. 1 SEAT AIRBAG - TYPICAL

The side impact airbag system Seat Airbags are located in the outboard side of the front seat backs. One in each front seat. The seat airbag inflator assembly is within the airbag housing (Fig. 1). Each airbag is mounted to the seat back frame. If deployed or defective, the entire seat back assembly must be replaced.

OPERATION

Only the Side Impact Airbag Control Module (SIACM) can deploy the side airbags. When supplied with the proper electrical signal, the seat airbag inflator will produce a gas and discharge the bag directly between the occupant and the side of the vehicle, protecting the occupant. Upon deployment, the seat back trim cover will tear open and allow the side airbag to fully inflate and quickly deflate.

SEAT BELT OUTBOARD FRONT

REMOVAL

Inspect the condition of the shoulder belt and lap belt. Replace any belt that is cut, frayed, torn, or damaged in any way. Also, replace the shoulder belt if the retractor is either damaged or inoperative.
(1) Remove shoulder harness height adjuster knob by pulling it straight away from adjuster.
(2) Remove cover from seat belt turning loop.
(3) Remove bolt attaching turning loop to shoulder belt height adjuster (Fig. 2).
(4) Remove turning loop from B-pillar.
(5) Remove lower B-pillar trim cover or quarter trim panel.
(6) Remove bolt attaching seat belt retractor to B-pillar (Fig. 2).
(7) Lift retractor upward and disengage arrow head retainer attaching retractor to B-pillar.
(8) Remove seat belt from vehicle.

INSTALLATION

Inspect the condition of the shoulder belt and lap belt. Replace any belt that is cut, frayed, torn, or damaged in any way. Also, replace the shoulder belt if the retractor is either damaged or inoperative.
(1) Place seat belt into position.
(2) Lower retractor into position B-pillar.
(3) Install bolt attaching seat belt retractor to B-pillar. Tighten all seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(4) Install turning loop onto B-pillar.
(5) Install lower B-pillar trim cover or quarter trim panel.
(6) Install bolt attaching turning loop to shoulder belt height adjuster. Tighten all seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(7) Press cover onto the seat belt turning loop.

SEAT BELT OUTBOARD FRONT (Continued)

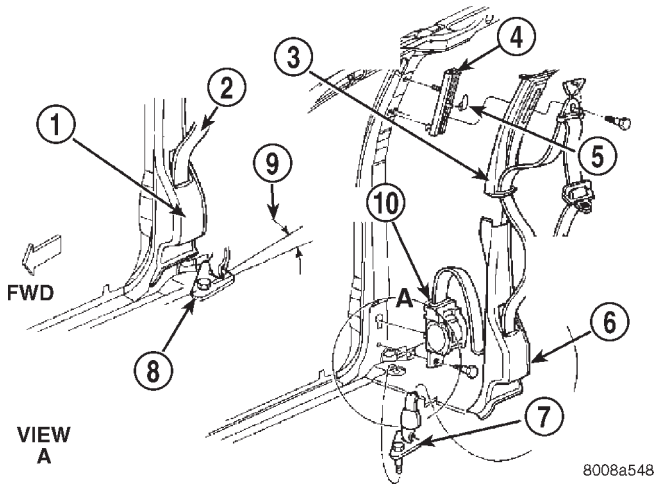

Fig. 2 SEAT BELT - OUTBOARD FRONT

1 - B-PILLAR TRIM LOWER

5 - KNOB
6 - B-PILLAR TRIM LOWER
7 - FLOOR ANCHOR
8 - FLOOR ANCHOR
9 - 30° OUTBOARD
10 - RETRACTOR

(8) Install shoulder harness height adjuster knob by pushing onto the adjuster.

SEAT BELT FIRST ROW ANCHOR BRACKET - LWB

REMOVAL

(1) Remove lower quarter trim panel.
(2) Remove bolt attaching first row seat belt anchor bracket to floor.
(3) Remove bracket from vehicle.

INSTALLATION

(1) Position bracket to vehicle.
(2) Install bolt attaching first row seat belt anchor bracket to floor.
(3) Install lower quarter trim panel.

NOTE: The tightening specification for all seat belt anchor bolts is 39 N·m (29 ft. lbs.) torque.

SEAT BELT LEFT FIRST ROW OUTBOARD - SWB THREE DOOR

REMOVAL

(1) Remove first and second row seats. Refer to Owner's manual for proper procedures.
(2) Remove shoulder harness height adjuster knob by pulling it straight away from adjuster.
(3) Slide floor anchor cover from over the anchor bolt.
(4) Remove floor anchor bolt (Fig. 3).
(5) Remove anchor from floor.
(6) Open clam shell cover from over seat belt turning loop.
(7) Remove bolt attaching turning loop to shoulder belt height adjuster.
(8) Remove turning loop from C-pillar.
(9) Remove B-pillar upper trim cover.
(10) Remove C-pillar upper trim cover.
(11) Remove lower quarter trim panel.
(12) Route seat belt webbing and turning loop through access hole in lower quarter trim panel.
(13) Remove bolt attaching seat belt retractor to quarter panel.
(14) Lift retractor upward and disengage arrow head retainer attaching retractor to quarter panel (Fig. 3).
(15) Remove seat belt from vehicle.

INSTALLATION

(1) Install seat belt into position.
(2) Lower retractor into position to quarter panel.
(3) Install bolt attaching seat belt retractor to quarter panel. Tighten all seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(4) Install lower quarter trim panel.
(5) Install C-pillar upper trim cover.
(6) Route seat belt webbing and turning loop through access hole in lower quarter trim panel.
(7) Install B-pillar upper trim cover.
(8) Install turning loop onto C-pillar. Tighten all seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(9) Press clam shell cover over seat belt turning loop.
(10) Install anchor to floor.
(11) Slide floor anchor cover over the anchor bolt.
(12) Install shoulder harness height adjuster knob by pushing it onto adjuster.

2 - KNOB
3 - RETRACTOR
4 - LOWER ANCHOR
5 - QUARTER TRIM

(13) Install first and second row seats.

SEAT BELT FIRST ROW OUTBOARD - SWB FOUR DOOR

REMOVAL

(1) Remove first and second row seats. Refer to Owner's manual for proper procedures.

(2) Remove shoulder harness height adjuster knob by pulling it straight away from adjuster.

(3) Slide floor anchor cover from over the anchor bolt.

(4) Remove floor anchor bolt (Fig. 4).

(5) Remove anchor from floor.

(6) Open clam shell cover from over seat belt turning loop.

(7) Remove bolt attaching turning loop to shoulder belt height adjuster (Fig. 4).

(8) Remove turning loop from C-pillar.

(9) Remove lower quarter trim panel.

(10) Route seat belt webbing and turning loop through access hole in lower quarter trim panel.

(11) Remove bolt attaching seat belt retractor to quarter panel (Fig. 4).

(12) Lift retractor upward and disengage arrow head retainer holding retractor to quarter panel.

(13) Remove seat belt from vehicle.

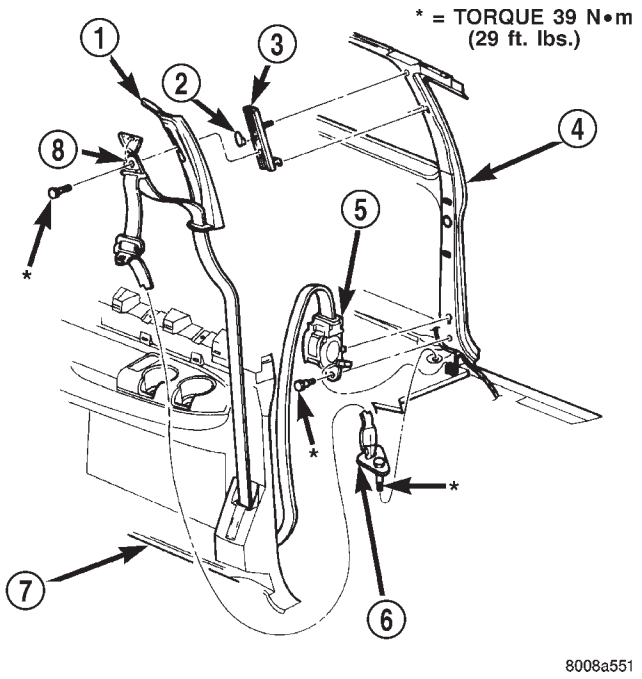

Fig. 4 SEAT BELT FIRST ROW OUTBOARD - SWB FOUR DOOR

2 - KNOB
3 - HEIGHT ADJUSTER
4 - C-PILLAR
5 - RETRACTOR
6 - FLOOR ANCHOR
7 - QUARTER TRIM PANEL
8 - TURNING LOOP

INSTALLATION

(1) Install seat belt into position.

(2) Lower retractor into position to quarter panel.

(3) Install bolt attaching seat belt retractor to quarter panel. Tighten seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.

(4) Route seat belt webbing and turning loop through access hole in lower quarter trim panel.

(5) Install lower quarter trim panel.

(6) Install turning loop in position on C-pillar. Tighten seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.

(7) Install bolt attaching turning loop to shoulder belt height adjuster. Tighten seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.

(8) Close clam shell cover over seat belt turning loop.

(9) Place anchor in position on floor.

SEAT BELT FIRST ROW OUTBOARD - SWB FOUR DOOR (Continued)

(10) Install floor anchor bolt. Tighten seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(11) Slide floor anchor cover over the anchor bolt.
(12) Install shoulder harness height adjuster knob by pushing knob on the adjuster.

SEAT BELT FIRST ROW OUTBOARD - LWB FOUR DOOR

REMOVAL

(1) Remove first and second row seats. Refer to Owner's manual for proper procedures.
(2) Remove shoulder harness height adjuster knob by pulling it straight away from adjuster.
(3) Slide floor anchor cover from over the anchor bolt.
(4) Remove floor anchor bolt.
(5) Remove anchor from floor.
(6) Open clam shell cover from over seat belt turning loop.
(7) Remove bolt attaching turning loop to shoulder belt height adjuster.
(8) Remove turning loop from C-pillar.
(9) Remove lower quarter trim panel.
(10) Route seat belt webbing and turning loop through access hole in lower quarter trim panel.
(11) Remove bolt attaching seat belt retractor to quarter panel.
(12) Lift retractor upward and disengage arrow head retainer attaching retractor to quarter panel.
(13) Remove seat belt from vehicle.

INSTALLATION

(1) Position seat belt to vehicle.
(2) Install arrow head retainer to quarter panel and push downward to seat retainer.
(3) Install bolt attaching seat belt retractor to quarter panel.
(4) Route seat belt webbing and turning loop through access hole in lower quarter trim panel.
(5) Install lower quarter trim panel.
(6) Position turning loop to C-pillar.
(7) Install bolt attaching turning loop to shoulder belt height adjuster.
(8) Close clam shell cover from over seat belt turning loop.
(9) Position anchor to floor.
(10) Install floor anchor bolt.
(11) Slide floor anchor cover over the anchor bolt.
(12) Install shoulder harness height adjuster knob by pushing it straight onto adjuster.
(13) Install first and second row seats. Refer to Owner's manual for proper procedures.

NOTE: The tightening specification for all seat belt anchor bolts is 39 N·m (29 ft. lbs.) torque.

SEAT BELT SECOND RIGHT ROW OUTBOARD - LWB

REMOVAL

(1) Remove second row seat from vehicle. Refer to Owner's Manual for proper procedures.
(2) Slide lower anchor cover from over the anchor shoulder-nut.
(3) Remove lower anchor shoulder-nut (Fig. 5).
(4) Remove lower anchor from wheelhouse.
(5) Fold upper turning loop extension cover downward to gain access to anchor bolt.
(6) Remove bolt attaching turning loop to extension bracket above quarter glass (Fig. 5).
(7) Remove turning loop from extension bracket.
(8) Remove D-pillar trim panel.
(9) Remove quarter trim bolster.
(10) Route seat belt webbing and turning loop through access hole in quarter trim.
(11) Remove bolt attaching retractor to inner quarter panel (Fig. 5).
(12) Remove screw attaching retractor to inner quarter panel.
(13) Remove second row seat belt retractor from vehicle.

INSTALLATION

(1) Position second row seat belt retractor in vehicle.
(2) Install screw attaching retractor to inner quarter panel.
(3) Install bolt attaching retractor to inner quarter panel. Tightening specifications for all seat belt bolts is 39 N·m (29 ft. lbs.) torque.
(4) Route seat belt webbing and turning loop through access hole in quarter trim.
(5) Install quarter trim bolster.
(6) Install D-pillar trim panel.
(7) Position turning loop to extension bracket.
(8) Install bolt attaching turning loop to extension bracket above quarter glass. Tightening specifications for all seat belt bolts is 39 N·m (29 ft. lbs.) torque.
(9) Install upper turning loop extension cover.
(10) Position lower anchor to wheelhouse.
(11) Install lower anchor shoulder-nut. Tightening shoulder nut to 39 N·m (29 ft. lbs.) torque.
(12) Install lower anchor cover over the anchor shoulder-nut.

SEAT BELT SECOND RIGHT ROW OUTBOARD - LWB (Continued)

(13) Install second row seat to vehicle. Refer to Owner's Manual for proper procedures.

SEAT BELT SECOND RIGHT ROW OUTBOARD - LBW WITH REAR HVAC

REMOVAL

(1) Remove second row seat from vehicle. Refer to Owner's Manual for proper procedures.

(2) Slide lower anchor cover from over the anchor shoulder-nut.

(3) Remove lower anchor shoulder-nut.

(4) Remove lower anchor from wheelhouse.

(5) Fold upper turning loop extension cover downward to gain access to anchor bolt.

(6) Remove bolt attaching turning loop to extension bracket above quarter glass.

(7) Remove turning loop from extension bracket.

(8) Remove D-pillar trim panel.

(9) Remove quarter trim bolster.

(10) Remove quarter trim panel as necessary to gain access to HVAC unit.

(11) Route seat belt webbing and turning loop through access hole in quarter trim.

(12) Loosen HVAC unit enough to gain access to seat belt retractor fasteners.

(a) Remove bracket around HVAC unit (Fig. 6).

(b) Remove air duct (Fig. 7).

(c) Remove fasteners attaching HVAC unit to inner quarter panel (Fig. 8).

(d) Remove screws attaching upper evaporator housing to lower evaporator housing.

(e) Remove coolant line retaining bracket hold down bolt.

(13) Remove bolts attaching seat belt guide loop to inner quarter panel.

(14) Pull outward on HVAC unit and remove bolt attaching retractor to inner quarter panel.

(15) Remove screw attaching retractor to inner quarter panel.

(16) Remove second row seat belt retractor from vehicle.

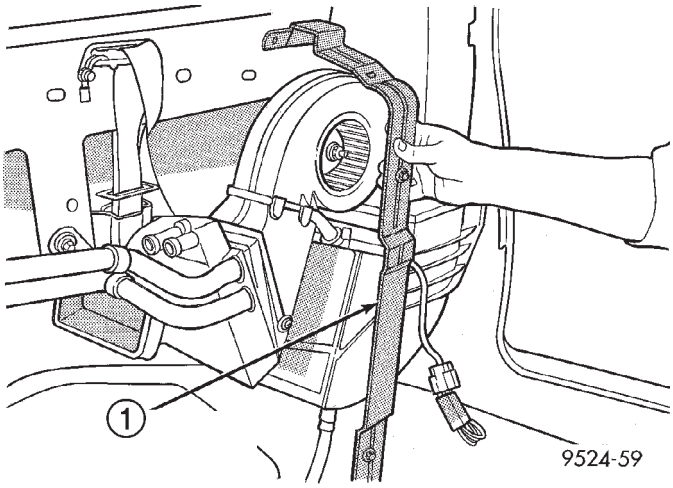

Fig. 6 TRIM PANEL MOUNTING BRACKET

1 - TRIM PANEL MOUNTING BRACKET

INSTALLATION

(1) Position second row seat belt retractor to vehicle.

(2) Install screw attaching retractor to inner quarter panel.

(3) Pull outward on HVAC unit and install bolt attaching retractor to inner quarter panel. Tightening specifications for all seat belt bolts is 39 N·m (29 ft. lbs.) torque.

(4) Install bolts attaching seat belt guide loop to inner quarter panel.

(5) Install coolant line retaining bracket hold down bolt.

3 - REAR EVAPORATOR UPPER HOUSING

(6) Install screws attaching upper evaporator housing to lower evaporator housing.

(7) Install fasteners attaching HVAC unit to inner quarter panel.

(8) Install air duct.

(9) Install bracket around HVAC unit.

(10) Route seat belt webbing and turning loop through access hole in quarter trim.

(11) Install quarter trim panel as necessary to gain access to HVAC unit.

(12) Install quarter trim bolster.

(13) Install D-pillar trim panel.

(14) Position turning loop to extension bracket.

(15) Install bolt attaching turning loop to extension bracket above quarter glass. Tightening seat belt bolt to 39 N·m (29 ft. lbs.) torque.

(16) Pull upper turning loop extension cover upward over anchor bolt.

(17) Install lower anchor shoulder-nut. Tightening seat belt bolt to 39 N·m (29 ft. lbs.) torque.

(18) Slide lower anchor cover over anchor shoulder-nut.

(19) Install second row seat from vehicle. Refer to Owner's Manual for proper procedures.

SEAT BELT SECOND ROW OUTBOARD - SWB

REMOVAL

(1) Remove second row seat from vehicle. Refer to Owner's Manual for proper procedures.

(2) Slide lower anchor cover from over the anchor shoulder-nut.

(3) Remove lower anchor shoulder-nut.

(4) Remove lower anchor from wheelhouse (Fig. 9).

(5) Remove D-pillar trim panel.

(6) Route seat belt webbing and turning loop through access hole in quarter trim.

(7) Remove bolts attaching seat belt guide loop to inner quarter panel.

(8) Remove anchor bolt attaching retractor to inner quarter panel.

(9) Remove second row seat belt retractor from vehicle (Fig. 9).

INSTALLATION

(1) Place second row seat belt retractor into position.

(2) Install anchor bolt attaching retractor to inner quarter panel. Tighten all seat belts to 39 N·m (29 ft. lbs.) torque.

(3) Install bolts attaching seat belt guide loop to inner quarter panel.

(4) Route seat belt webbing and turning loop through access hole in quarter trim.

(5) Install D-pillar trim panel.

(6) Install lower anchor to the wheelhouse.

(7) Install lower anchor shoulder-nut. Tighten all seat belts to 39 N·m (29 ft. lbs.) torque.

(8) Slide lower anchor cover over the anchor shoulder-nut.

(9) Install second row seat into position. Refer to Owner's Manual for proper procedures.

SEAT BELT BUCKLE - FRONT INBOARD

REMOVAL

(1) Remove screws attaching front inboard side cover to seat cushion frame.
(2) Remove side cover from vehicle.
(3) Remove bolt attaching seat belt buckle to front seat track (Fig. 10).
(4) Remove buckle from vehicle.

INSTALLATION

(1) Place buckle into position.
(2) Install bolt attaching seat belt buckle to front seat track. Tighten seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(3) Install side cover into position.
(4) Install screws attaching front inboard side cover to seat cushion frame.

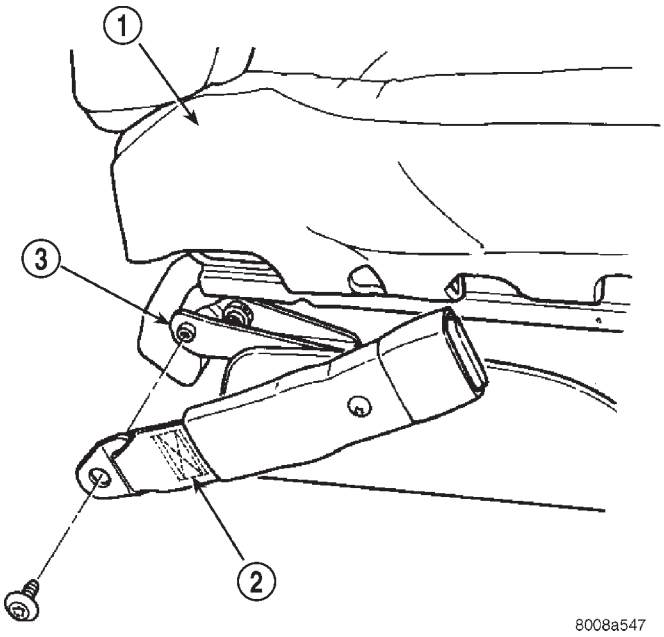

Fig. 10 SEAT BELT BUCKLE - FRONT INBOARD

1 - SEAT CUSHION
2 - SEAT BELT BUCKLE
3 - SEAT TRACK

SEAT BELT BUCKLE FIRST ROW QUAD BUCKET

REMOVAL

(1) Remove seat from vehicle.
(2) Remove screws attaching inboard side cover to seat cushion.
(3) Remove side cover from seat.
(4) Remove bolts attaching recliner bracket to seat cushion.
(5) Remove recliner bracket from seat.
(6) Remove bolt attaching seat belt buckle to seat track (Fig. 10).
(7) Remove buckle from vehicle.

INSTALLATION

(1) Place buckle into position.
(2) Install bolt attaching seat belt buckle to seat track. Tighten all seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(3) Install recliner bracket onto the seat.
(4) Install bolts attaching recliner bracket to seat cushion.
(5) Install side cover from seat.
(6) Install screws attaching inboard side cover to seat cushion.
(7) Install seat into position. Tighten all seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.

SEAT BELT BUCKLE FIRST ROW - TWO PASSENGER BENCH

REMOVAL

(1) Remove seat from vehicle.
(2) Remove bolt attaching inboard seat belt buckle to seat frame (Fig. 11).
(3) Remove belt from seat.

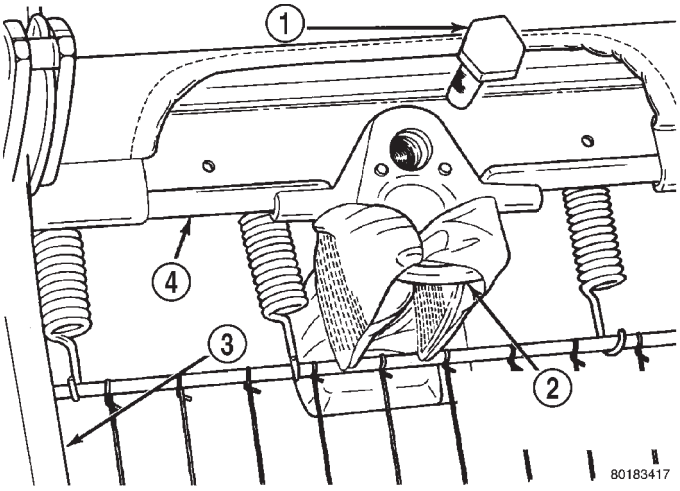

Fig. 11 SEAT BELT BUCKLE FIRST ROW - TWO PASSENGER BENCH

1 - ANCHOR BOLT
2 - TWO (2) PASS REAR SEAT BELT BUCKLE
3 - RISER
4 - REAR FRAME

INSTALLATION

(1) Place seat belt into position to the seat.
(2) Install bolt attaching inboard seat belt buckle to seat frame. Tighten all seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(3) Install seat into position.

SEAT BELT BUCKLE SECOND ROW - THREE PASSENGER BENCH

REMOVAL

(1) Remove bolt attaching seat belt buckle to seat rear frame rail (Fig. 12).
(2) Remove seat belt buckle from seat.

INSTALLATION

(1) Place seat belt buckle in position on seat.

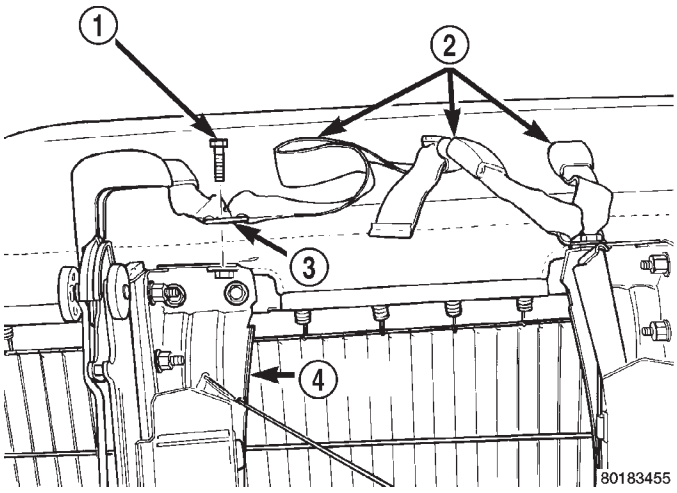

Fig. 12 SEAT BELT BUCKLE SECOND ROW - THREE PASSENGER BENCH

1 - ANCHOR BOLT
2 - SEAT BELTS
3 - ANCHOR
4 - RISER

(2) Install bolt to attach seat belt buckle to seat rear frame rail. Tighten all seat belt bolts to 39 N·m (29 ft. lbs.) torque.

SEAT BELT TENSIONER

DESCRIPTION

The seat belt system incorporates Seat Belt Tensioners. The tensioner is designed to hold the occupant in their respective seat by retracting the seat belt up to four inches. They are integral to the front seat belt buckles and cannot be serviced. If found defective they must be replaced. After an airbag deployment, the tensioner must be replaced.

OPERATION

At the onset of an impact event, each tensioner uses a pyrotechnic device which is triggered simultaneously with the airbags to rapidly retract the seat belts. With the slack removed, the occupant's forward motion in an impact will be reduced as will the likelihood of contacting interior components. After an impact that deploys the airbags, the seat belt tensioner assembly must be replaced.

The Occupant Restraint Controller (ORC) monitors the seat belt tensioner circuit resistance and reports active and stored Diagnostic Trouble Codes (DTC's) if any problem is found.

SEAT BELT TENSIONER (Continued)

Once a vehicle has been in an accident, the tensioner must be replaced along with any deployed airbags and broken or damaged parts. Refer to the proper Body Diagnostic Procedures manual for diagnosis and testing.

WARNING: WHEN THE FRONT AIRBAG IS DEPLOYED, THE TENSIONER WILL HAVE DEPLOYED ALSO AND SHOULD BE REPLACED.

SHOULDER BELT HEIGHT ADJUSTER

REMOVAL

(1) Remove B or C-pillar trim cover.
(2) Remove screws attaching shoulder belt height adjuster to pillar.
(3) Remove height adjuster from vehicle (Fig. 13).

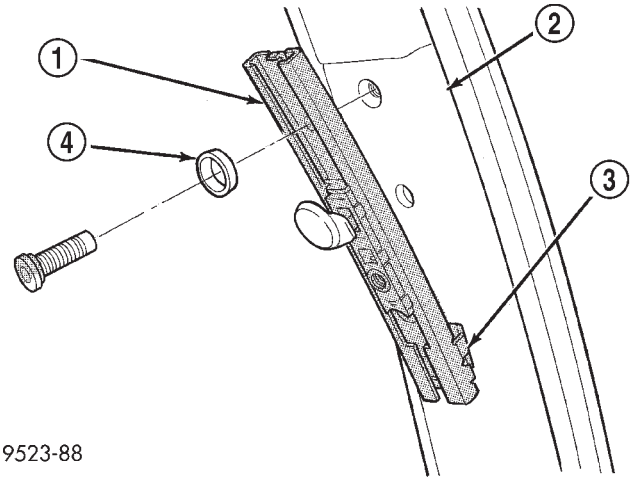

Fig. 13 SHOULDER BELT HEIGHT ADJUSTER

1 - SHOULDER HARNESS HEIGHT ADJUSTER
2 - PILLAR
3 - HOOK
4 - BUSHING

INSTALLATION

(1) Place height adjuster into position.
(2) Install screws attaching shoulder belt height adjuster to pillar. Tighten seat belt anchor bolts to 39 N·m (29 ft. lbs.) torque.
(3) Install B or C-pillar trim cover.

SHOULDER BELT HEIGHT ADJUSTER KNOB

REMOVAL

(1) Disengage clips attaching clam shell cover to seat belt turning loop and open cover.
(2) Using a trim tool, pry knob from shoulder belt height adjuster (Fig. 14).

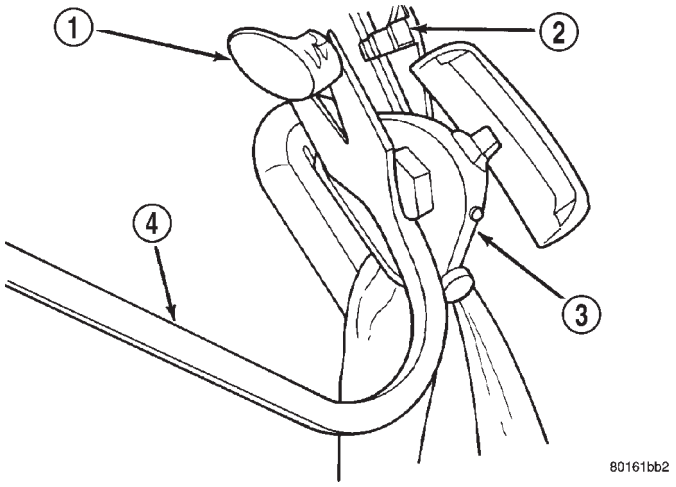

Fig. 14 SHOULDER BELT HEIGHT ADJUSTER KNOB

1 - KNOB
2 - HEIGHT ADJUSTER
3 - SEAT BELT TURNING LOOP
4 - SNAP-ON TRIM TOOL A179A

INSTALLATION

(1) Place shoulder belt height adjuster knob in position on height adjuster.
(2) Push knob on until retainers engage.

SIDE IMPACT AIRBAG CONTROL MODULE

DESCRIPTION

The side airbag system is a safety devise designed to reduce the risk of fatality or serious injury, caused by a side impact of the vehicle.

Vehicles equipped with side impact airbags use two Side Impact Airbag Control Modules (SIACM). One is located on each respective side body B-pillar. Each contains an impact sensor that senses a side impact occurrence. The SIACM communicates with the ORC via the PCI bus in order to notify the driver of any potential side airbag system problem.

OPERATION

The impact sensor provides verification of the direction and severity of the side impact. The right side SIACM controls the right seat airbag. The left side SIACM controls the left seat airbag. In the event of a side impact the appropriate SIACM will send an electronic signal to its airbag, deploying the airbag. The SIACM communicates with the Occupant Restraint Controller (ORC) via the PCI bus circuit.

The accelerometer pulses are sent to a microprocessor, which contains a decision algorithm. When an impact is severe enough to require airbag protection, the SIACM microprocessor sends a signal to deploy the side airbag that completes the electrical circuits to the right or left side airbag. The sensor is calibrated for the specific vehicle and reacts to the severity and direction of the impact.

REMOVAL

NOTE: Diagnose the SIACM using the service/diagnostic manual.

(1) Disconnect and isolate the battery negative cable terminal.

(2) Remove the lower B-pillar trim from the appropriate side of the vehicle. Refer to Body, Interior, B-Pillar Lower Trim, Removal.

(3) Remove the three SIACM retaining screws and remove the module from the vehicle.

(4) Disconnect the SIACM electrical connector.

INSTALLATION

WARNING: DO NOT INSTALL THE SIACM IF THE MOUNTING LOCATION IS DEFORMED OR DAMAGED.

(1) Connect the SIACM electrical connector.

(2) Place the module in the slot on their respective B-pillar. Install the three SIACM retaining screws. Torque screws to 5.7 - 7.9 N·m (50 - 70 lbs.)

CAUTION: Use the correct screws when installing the SIACM.

(3) Install the lower B-pillar trim on the appropriate side of the vehicle. Refer to Body, Interior, B-Pillar Lower Trim, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

SPEED CONTROL

DESCRIPTION

The speed control system is electronically controlled and vacuum operated. The electronic control is integrated into the Powertrain Control Module. The controls are located on the steering wheel. The ON/OFF, and SET buttons are located on the left side of the airbag module. The RESUME/ACCEL, CANCEL and COAST buttons are located on the right side of the airbag module (Fig. 1).

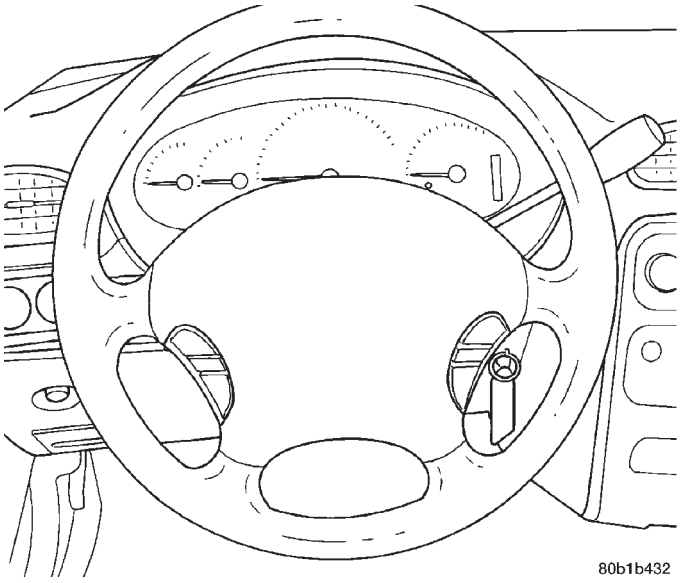

Fig. 1 SPEED CONTROL SWITCHES - Typical

The system is designed to operate at speeds above 30 mph (48 km/h).

WARNING: THE USE OF SPEED CONTROL IS NOT RECOMMENDED WHEN DRIVING CONDITIONS DO NOT PERMIT MAINTAINING A CONSTANT SPEED, SUCH AS IN HEAVY TRAFFIC OR ON ROADS THAT ARE WINDING, ICY, SNOW COVERED, OR SLIPPERY.

OPERATION

OPERATION

When speed control is activated by depressing the ON switch, the PCM allows a set speed to be stored in RAM for speed control. To store a set speed, depress and release the SET switch while the vehicle is moving at a speed between 25 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral. The speed control can be disengaged manually by:

- Stepping on the brake pedal
- Depressing the OFF switch
- Depressing the CANCEL switch.
- Depressing the clutch pedal
- Operating in 1st or 2nd gear (autostick, if equipped)

SPEED CONTROL (Continued)

NOTE: Turning the system off by depressing the OFF switch or turning off the ignition switch will erase the set speed stored in the PCM.

For added safety, the speed control system is programmed to disengage for any of the following conditions:

- An indication of Park or Neutral
- A rapid increase rpm (indicates that the clutch has been disengaged)
- Excessive engine rpm (indicates that the transmission may be in a low gear)
- The speed signal increases at a rate of 10 mph per second (indicates that the co-efficient of friction between the road surface and tires is extremely low)
- The speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate)
- If the actual speed is greater than 20 mph over the set speed.
- Autostick shifts into 1st or 2nd gear (autostick, if equipped)

Once the speed control has been disengaged, depressing the RESUME switch when speed is greater than 20 mph allows the vehicle to resume control to the target speed that was stored in the PCM.

While the speed control is engaged, the driver can increase the vehicle speed by depressing the ACCEL switch. The new target speed is stored in the PCM when the ACCEL switch is released. The PCM also has a ″tap-up″ feature in which target speed increases by 2 mph for each momentary switch activation of the ACCEL switch. The PCM also provides a means to decelerate to a new lower target speed without disengaging speed control. Depress and hold the COAST switch until the desired speed is reached, then release the switch.

The PCM also has a “Tap Down” feature in which target speed decreases at 1 mph for each momentary switch activation of the coast switch.

OPERATION - INTERACTIVE SPEED CONTROL (4 Speed EATX Only)

Interactive means that communication between the PCM and the TCM is taking place. Interactive speed control avoids unnecessary shifting for smoother, quieter operation and when downshifts are required, makes the shifts smoother.

CLIMBING A GRADE

DESCRIPTION

When climbing a grade the interactive speed control tries to maintain the set speed by increasing the throttle opening, while inhibiting/delaying downshifts.

OPERATION

If opening the throttle alone cannot maintain the set speed and the vehicle speed drops more than three mph below the set speed, the transmission will downshift to third gear. If the vehicle continues to lose speed, by more than 6 mph, the transmission will downshift again to maintain the set speed. After the vehicle encounters a less-steep grade, or has crested the grade (reduced the load on the powertrain) and can maintain the set speed at a reduced throttle position, the transmission will upshift, as appropriate, until the set speed can be maintained in Overdrive.

GRADE HUNTING

DESCRIPTION

All vehicles equipped with a four speed automatic transmission have a grade hunting feature for the 2nd to 3rd gear upshift and the 3rd to Overdrive upshift.

OPERATION

The TCM identifies the powertrain loading conditions and selects the proper gear to maintain the current vehicle speed. Under moderate loading conditions the transaxle will stay in 3rd gear until the top of the grade is reached or the powertrain loading is reduced.

If powertrain loading is severe, the transaxle may shift into 2nd gear and remain there until powertrain loading is reduced, then a 2nd to 3rd gear upshift will be scheduled. Grade hunting features always operate regardless of whether or not the interactive speed control is engaged. **If the interactive speed control is not engaged and powertrain loading is not reduced, the driver may have to completely lift off of the throttle before an upshift will occur**. If the driver does lift off the throttle to induce an upshift under these conditions, vehicle speed will reduce and the Overdrive to 3rd and 3rd to 2nd gear downshifts will reoccur when the throttle is reapplied. If grade hunting is repeatedly induced by the driver, transaxle damage may result.

AUTOMATIC SPEED CONTROL OVERSPEED REDUCTION

DESCRIPTION

Transmission control software includes an automatic speed control overspeed reduction feature. This maintains vehicle speed at the selected set point when descending a grade.

SPEED CONTROL (Continued)

OPERATION

The Transmission Control Module (TCM) first senses that the speed control is set. If the set speed is exceeded by more than 4 mph (6.5 km/hr) and the throttle is closed, the TCM causes the transaxle to downshift to THIRD gear. After downshifting, the automatic speed control resumes normal operation. To ensure that an upshift is appropriate after the set speed is reached, the TCM waits until the speed control system opens the throttle at least 6 degrees before upshifting to OVERDRIVE again.

If the driver applies the brakes, canceling automatic speed control operation with the transaxle still in THIRD gear, the TCM maintains this gear until the driver opens the throttle at least 6 degrees to avoid an inappropriate upshift. The upshift is also delayed for 2.5 seconds after reaching the 6 degrees throttle opening in anticipation that the driver might open the throttle enough to require THIRD gear. This will avoid unnecessary and disturbing transmission cycling. If the automatic speed control RESUME feature is used after braking, the upshift is delayed until the set speed is achieved to reduce cycling and provide better response.

DIAGNOSIS AND TESTING - ROAD TEST

Perform a vehicle road test to verify reports of speed control system malfunction. The road test should include attention to the speedometer. Speedometer operation should be smooth and without flutter at all speeds.

Flutter in the speedometer indicates a problem which might cause surging in the speed control system. The cause of any speedometer problems should be corrected before proceeding. Refer to the Instrument Cluster for speedometer diagnosis.

If a road test verifies an inoperative system, and the speedometer operates properly, check for:

- A Diagnostic Trouble Code (DTC). If a DTC exists, conduct tests per the Powertrain Diagnostic Procedures manual.
- A misadjusted brake (stop) lamp switch. This could also cause an intermittent problem.
- Loose or corroded electrical connections at the servo. Corrosion should be removed from electrical terminals and a light coating of Mopar Multipurpose Grease, or equivalent, applied.
- Leaking vacuum reservoir.
- Loose or leaking vacuum hoses or connections.
- Defective one-way vacuum check valve.
- Secure attachment at both ends of the speed control servo cable.
- Smooth operation of throttle linkage and throttle body air valve.
- Conduct electrical test at PCM.
- Failed speed control servo. Do the servo vacuum test.

CAUTION: When test probing for voltage or continuity at electrical connectors, care must be taken not to damage connector, terminals or seals. If these components are damaged, intermittent or complete system failure may occur.

SPECIFICATIONS - TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.

Servo Mounting Bracket Bolts	14	10.3	123.9
Servo Mounting Nuts	6.7		60

CABLE

DESCRIPTION

The speed control servo cable is connected between the speed control vacuum servo diaphragm and the throttle body control linkage.

OPERATION

This cable causes the throttle control linkage to open or close the throttle valve in response to movement of the vacuum servo diaphragm.

REMOVAL

(1) Disconnect the negative battery cable.
(2) Remove speed control cable from throttle cam by sliding clasp out hole used for throttle cable.
(3) Compress the retaining tabs on the cable and slide cable out of bracket.
(4) Disconnect electrical connectors and vacuum hose from servo.
(5) Remove two nuts attaching speed control cable and mounting bracket to servo.
(6) Pull cable away from servo to expose retaining clip and remove clip attaching cable to servo.
(7) Remove speed control cable.

INSTALLATION

(1) Slide cable into throttle cable bracket and engage retaining tabs.
(2) Rotate the throttle cam forward to the wide open position and install speed control cable clasp.
(3) Rotate the throttle cam forward to the wide open position and install throttle cable clasp.
(4) Install retaining clip that attaches cable to servo.
(5) Insert servo studs through holes in the mounting bracket and speed control cable.
(6) Install nuts, tighten to 6.7 N·m (60 in. lbs.).
(7) Connect vacuum hose to servo.
(8) Connect electrical connector.
(9) Install servo and bracket and tighten nuts and bolt.
(10) Connect negative battery cable.

SERVO

DESCRIPTION

The servo unit consists of a solenoid valve body, and a vacuum chamber. The solenoid valve body contains three solenoids:

- Vacuum
- Vent
- Dump

The vacuum chamber contains a diaphragm with a cable attached to control the throttle linkage.

OPERATION

The PCM controls the solenoid valve body. The solenoid valve body controls the application and release of vacuum to the diaphragm of the vacuum servo. The servo unit cannot be repaired and is serviced only as a complete assembly.

Power is supplied to the servo by the PCM through the brake switch. The PCM controls the ground path for the vacuum and vent solenoids.

The dump solenoid is energized anytime it receives power. If power to the dump solenoid is interrupted, the solenoid dumps vacuum in the servo. This provides a safety backup to the vent and vacuum solenoids.

The vacuum and vent solenoids must be grounded by the PCM to operate. When the PCM grounds the vacuum servo solenoid, the solenoid allows vacuum to enter the servo and pull open the throttle plate using the cable. When the PCM breaks the ground, the solenoid closes and no more vacuum is allowed to enter the servo. The PCM also operates the vent solenoid via ground. The vent solenoid opens and closes a passage to bleed or hold vacuum in the servo as required.

The PCM cycles the vacuum and vent solenoids to maintain the set speed, or to accelerate and decelerate the vehicle. To increase throttle opening, the PCM grounds the vacuum and vent solenoids. To decrease throttle opening, the PCM removes the grounds from the vacuum and vent solenoids.

REMOVAL

(1) Release hood latch and open hood.
(2) Disconnect the negative battery cable.
(3) Disconnect the throttle and speed control cable ends from throttle body (Fig. 2).

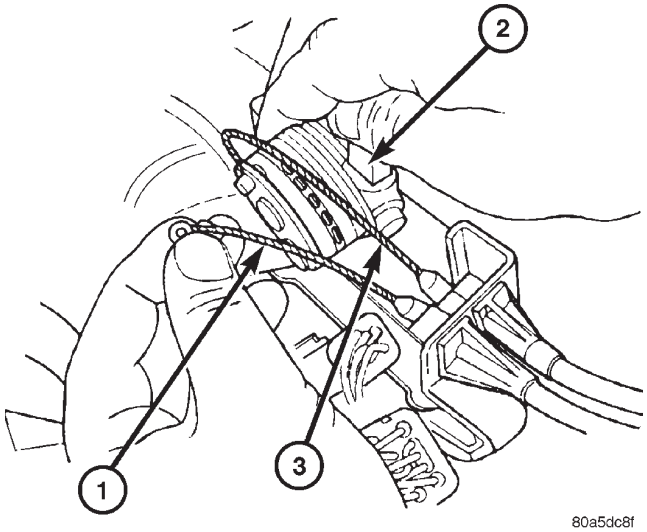

Fig. 2 Speed Control Cable End

1 - SPEED CONTROL VACUUM HOSE
2 - THROTTLE BODY
3 - SPEED CONTROL CABLE

SERVO (Continued)

(4) Depress lock tabs holding speed control and throttle cable casing to cable mount bracket.

(5) Disconnect vacuum line from speed control servo that leads to the battery tray/vacuum reservoir.

(6) Remove battery tray/vacuum reservoir, refer to the Battery section for more information (Fig. 3).

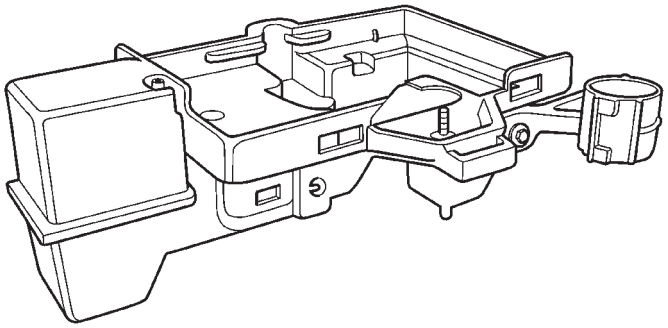

Fig. 3 BATTERY TRAY/VACUUM RESERVOIR

(7) Remove speed control servo and bracket (Fig. 4).

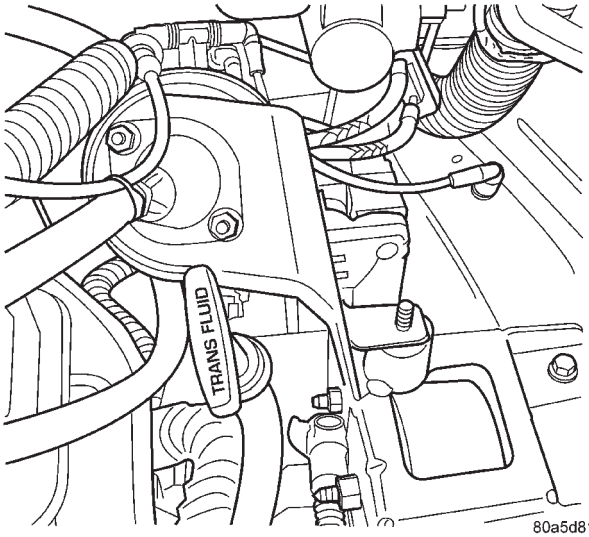

Fig. 4 SPEED CONTROL SERVO

(8) Disconnect wire connector from speed control servo.

(9) Remove speed control servo.

INSTALLATION

Transfer speed control cable to replacement speed control servo.

(1) Install retaining clip to cable at servo.

(2) Install 2 nuts at cable to servo and servo bracket, tighten to 7 N·m (60 ins. lbs.).

(3) Connect electrical connector to servo.

(4) Connect vacuum line to speed control servo that leads to the battery tray/vacuum reservoir.

(5) Install speed control servo and bracket.

(6) Install battery tray/vacuum reservoir, refer to the Battery section for more information.

(7) Install speed control and throttle cable casing to cable mount bracket.

(8) Connect the throttle and speed control cable ends to throttle body.

(9) Connect the negative battery cable.

SWITCH

DESCRIPTION

There are two separate switch pods that operate the speed control system and are located on the steering wheel.

OPERATION

The speed control system has five separate resistive switches that provide a single multiplexed (MUX) voltage inputs to the PCM.The switch names are: ON, OFF, SET, COAST, RESUME, ACCEL, TAP-UP, COAST, and CANCEL. Based on conditions when the buttons are pushed (and released), the five voltages ranges provided to the PCM result in the following functions: ON, OFF, SET, COAST, RESUME, ACCEL, TAP-UP, TAP-DOWN, COAST, and CANCEL. Refer to the Speed Control Section for more information

Also the PCM receives an input from the brake switch to sense whether the brake pedal has been depressed. When the PCM receives the brake depressed input, it turns off power to the speed control servo and disengages speed control. Also the power to the servo is supplied through the brake switch, which opens the circuit when the brake pedal is depressed.

The individual switches cannot be repaired. If one switch fails, the entire switch module must be replaced.

REMOVAL

The speed control switches are mounted in the steering wheel and wired through the clock spring device under the airbag module.

WARNING: IF REMOVAL OF AIRBAG MODULE IS NECESSARY, REFER TO THE RESTRAINT SYSTEMS SECTION FOR MORE INFORMATION.

(1) Remove the negative battery cable.

SWITCH (Continued)

(2) Turn off ignition.
(3) Remove the air bag, refer to the restraint section for more information.
(4) Remove the screw from bottom of the switch.
(5) Remove switch from steering wheel.
(6) Disconnect two-way electrical connector.
(7) Repeat for the other switch.

INSTALLATION

The speed control switches are mounted in the steering wheel and wired through the clock spring device under the airbag module.

WARNING: IF REMOVAL OF AIRBAG MODULE IS NECESSARY, REFER TO THE RESTRAINT SYSTEMS SECTION FOR MORE INFORMATION.

(1) Connect two-way electrical connector.
(2) Install switch.
(3) Install screw for the switch.
(4) Repeat for the other switch.
(5) Install the air bag, refer to the restraint section for more information.
(6) Install the negative battery cable.

VACUUM RESERVOIR

DESCRIPTION

The vacuum reservoir is located in the engine compartment. It is made of plastic.

OPERATION

The reservoir stores engine vacuum. Manifold vacuum is supplied from the brake booster check valve. The speed control vacuum supply hose has a check valve at the source (brake booster) to maintain the highest available vacuum level in the servo, reservoir and vacuum hoses. When engine vacuum drops, as in climbing a grade while driving, the reservoir supplies the vacuum needed to maintain proper speed control operation. The vacuum reservoir cannot be repaired and must be replaced if faulty.

REMOVAL

(1) Release hood latch and open hood.
(2) Disconnect the negative battery cable.
(3) Disconnect the vacuum line to the battery tray/vacuum reservoir.
(4) Remove battery tray/vacuum reservoir, refer to the Battery section for more information.

INSTALLATION

(1) Install battery tray/vacuum reservoir, refer to the Battery section for more information.
(2) Connect vacuum line that leads to the battery tray/vacuum reservoir.
(3) Connect the negative battery cable.

VEHICLE THEFT SECURITY

DESCRIPTION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is designed to protect against whole vehicle theft. The system monitors vehicle doors, hood, liftgate, and ignition action for unauthorized operation. The alarm activates:

- Sounding of the horn
- Flashing of the park and tail lamps
- Flashing of the headlamps
- An engine kill feature (without SKIS)

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is available as a factory-installed option on this vehicle. It is designed to provide passive protection against unauthorized vehicle use by disabling the engine, after two (2) seconds of running, whenever an invalid key is used to start the vehicle. The SKIS is active whenever the ignition is on and does not require any customer intervention. The primary components of the system are the Sentry Key Immobilizer Module (SKIM), Sentry Key (ignition key w/ a transponder molded into the head), indicator light, Body Control Module (BCM), and the Powertrain Control Module (PCM). The SKIM is mounted to the steering column with the molded, integral antenna mounted on the ignition housing. The indicator light, is located in the message center.

OPERATION

VEHICLE THEFT SECURITY SYSTEM

Upon failure of proper SKIM communication to the PCM, the PCM will shut off fuel after two seconds of run time. The engine will not re-crank on the key cycle that the failure occurred, a full key down sequence must be performed for the engine to crank again. After six consecutive fuel shut-offs, the engine will no longer crank on subsequent key cycles. The failure must be corrected and a valid communication process between the SKIM and the PCM must occur for the engine to crank and start again.

The electronics for the VTSS are part of the Body Control Module (BCM). The system is armed when the vehicle is locked using the:

- Power door lock switches (with any door ajar)
- Remote Keyless Entry transmitter.
- Door Cylinder Lock Switches.

For vehicles equipped with SKIS, the doors do not have to be locked to enable the fuel shut off feature.

After the vehicle is locked and the last door is closed, the set LED indicator in the top cover will flash quickly for 16 seconds, indicating that arming is in progress. If no monitored systems are activated during this period, the system will arm. The LED will extinguish unless the liftgate is open. If the liftgate is open, the LED will flash at a slower rate.

This indicates that the system is armed. If fault is detected on any key cylinder input, the indicator LED will remain solid during the arming process, although the system will still arm. If the indicator LED does not illuminate at all upon door closing it indicates that the system is not arming.

VEHICLE THEFT SECURITY (Continued)

Passive disarming occurs upon normal vehicle entry by unlocking either door with the ignition key/ remote transmitter. This disarming will also halt the alarm once it has been activated.

A tamper alert exists to notify the driver that the VTSS had been activated. This alert consists of 3 horn pulses when the vehicle is disarmed.

NOTE: The VTSS will not arm by pushing down the door lock mechanism. This will manually override the system.

For Door Cylinder Lock Switch Removal and Installation, refer to Electrical, Power Locks, Door Cylinder Lock Switch.

If the VTSS is triggered, the horn will pulse, headlamps/marker lamps will flash, and the VTSS warning lamp will flash. If BCM determines the threat to be false and the VTSS is not triggered again, the system will shut down and rearm itself after three minutes. If a trigger is still active, the alarm will continue for an additional 15 minutes without the horn. The VTSS monitoring portion of the system is split into two sections. The engine compartment section and the passenger compartment section. If a malfunction occurs in the engine compartment section, the passenger compartment section would still arm and function normally.

NOTE: If hood is not secure during the arming sequence, the lamp will stay lit and not flash. The system will arm with hood not secured (hood ajar switch closed) and the liftgate open (liftgate ajar switch closed). System will not arm if passenger compartment is not secure (all switches closed)

ARMING THE VTSS - METHOD A

(1) With the key removed from the ignition lock and any door open (excluding liftgate), actuate one of the following:

- Power door lock button to LOCK,
- Key fob LOCK button
- Door lock key cylinder to locked position.

(2) Close all opened doors. Liftgate can remain open.

(3) After the last door is closed, an arming time-out period of sixteen seconds will start, then the VTSS will become armed.

ARMING THE VTSS - METHOD B

Actuating the key fob transmitter LOCK button, key locking the front doors with the doors closed and the ignition locked will begin the arming time-out period. If method A, 16 second time-out sequence was in process when method B was actuated, the 16 second time-out will restart from the time of the second actuation.

If the security lamp does not illuminate at all upon final door closure, it indicates that the system is not arming.

The current VTSS status armed or disarmed shall be maintained in memory to prevent battery disconnects from disarming the system.

TRIGGERING THE VTSS

After the VTSS is armed, the following actions will trigger the alarm:

- Opening any door (excluding liftgate).
- Opening the hood
- Turning the ignition to the ACC, or UNLOCK position.

NOTE: When the VTSS is ARMED, the interior power door lock switch “UNLOCK” will be disabled until the vehicle is disarmed.

CAUTION: The VTSS indicator LED will trigger and engine will continue to run if the vehicle is equipped with SKIS and the proper key is used to start the vehicle. This condition will occur if the VTSS has been triggered. If valid key is used, VTSS will disarm

SENTRY KEY IMMOBILIZER SYSTEM

The SKIS includes keys from the factory which are pre-programmed. Each SKIM will recognize a maximum of eight Sentry Keys. If the customer would like to own additional keys other than those provided with the vehicle, they can be purchased from any authorized dealer. These keys must be programmed to the SKIM on the vehicle in order for the system to recognize them as valid keys. This can be done by the dealer with a DRB III® scan tool or by a customer if this feature is available in their market and they have two (2) valid keys already available to them. Refer to the Service Procedures portion of this system for additional details. The SKIS performs a self-test each time the ignition switch is turned to the ON position and will store Diagnostic Trouble Codes (DTC’s) if a system malfunction is detected. The SKIS can be diagnosed and any stored DTC’s can be retrieved using a DRB III® scan tool as described in the appropriate Body Diagnostic Procedures manual.

VEHICLE THEFT SECURITY (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SENTRY KEY IMMOBILIZER SYSTEM

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS, WARNINGS, BEFORE ATTEMPTING COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: The following tests may not prove conclusive in the diagnosis of this system. The most reliable, efficient, and accurate means to diagnose the Sentry Key Immobilizer System involves the use of a DRB III® scan tool. Refer to the proper Body Diagnostic Procedures Manual.

The Sentry Key Immobilizer System (SKIS) and the Programmable Communication Interface (PCI) bus network should be diagnosed using a DRB III® scan tool. The DRB III® will allow confirmation that the PCI bus is functional, that the Sentry Key Immobilizer Module (SKIM) is placing the proper messages on the PCI bus, and that the Powertrain Control Module (PCM) is receiving the PCI bus messages. Refer to the proper Body Diagnostic Procedures manual, and Wiring Diagrams for complete circuit descriptions and diagrams.

(1) Check the fuses in the Integrated Power Module (IPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Disconnect and isolate the battery negative remote cable from the remote terminal. Unplug the wire harness connector at the SKIM. Check for continuity between the ground circuit cavity of the SKIM wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the SKIM wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the fuse in the IPM as required.

(4) Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the SKIM wire harness connector. If OK, use a DRB III® scan tool and the proper Body Diagnostic Procedures manual to complete the diagnosis of the SKIS. If not OK, repair the open circuit to the fuse in the IPM as required.

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds. Using a DRB III® scan tool. Refer to the proper Body Diagnostic Procedures Manual for test procedures.

HOOD AJAR SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Using a small flat blade screwdriver, pry trigger switch from the bracket on the left fender well.

(3) Disconnect the hood ajar switch from the wire connector and remove from vehicle.

INSTALLATION

(1) Connect the hood ajar switch to the wire conector.

(2) Press the hood ajar switch into position on the bracket located on the left inner fender well.

(3) Reconnect the battery negative cable.

(4) Close the hood and check for proper operation.

TRANSPONDER KEY

DESCRIPTION

The Sentry Key Immobilizer System (SKIS) uses a transponder chip that is integral to each ignition key (Fig. 1) to communicate with the Sentry Key Immobilizer Module (SKIM). Ignition keys are supplied with the vehicle when it is shipped from the factory. The transponder chip is undermolded within the head of the key. This undermold is hidden beneath an overmolded rubber cap.

OPERATION

Each Sentry Key has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the SKIM has a unique ″Secret Key″ code programmed into it by the manufacturer as well. When a Sentry Key is programmed into the memory of the SKIM, the SKIM stores the transponder identification code from the Sentry Key, and the Sentry Key learns the ″Secret Key″ code from the SKIM. Once the Sentry Key learns the ″Secret Key″ code of the SKIM, it is also permanently programmed into the transponder's memory. Therefore, blank keys for the SKIS must be programmed by the

TRANSPONDER KEY (Continued)

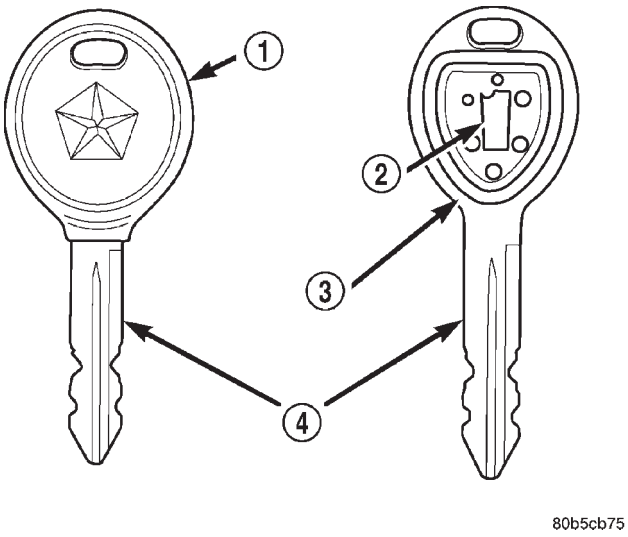

Fig. 1 TRANSPONDER KEY - TYPICAL

1 - MOLDED CAP
2 - TRANSPONDER
3 - MOLDED CAP REMOVED
4 - SENTRY KEY

SKIM in addition to being cut to match the mechanical coding of the ignition lock cylinder. Refer to Electrical, Vehicle Theft Security, Transponder Key, Standard Procedure - Transponder Programming.

The Sentry Key's transponder is within the range of the SKIM's transceiver antenna ring when it is inserted into the ignition lock cylinder. When the ignition switch is turned to the ON position, the SKIM communicates with the Sentry Key via a radio frequency (RF) signal. The SKIM determines if a valid key is present based on the information it receives from the Sentry Key. If a valid key is detected, that fact is communicated to the PCM via the PCI bus and the vehicle is allowed to continue running. If an invalid key is received by the PCM or no status at all is communicated, the vehicle will stall after two (2) seconds of running. The indicator light will be flashing at this point. The Sentry Key's transponder can not be repaired. If it is faulty or damaged, it must be replaced.

Common communication problems:

- Two transponder keys too close together.
- Speed Pass too close to transponder key.

Solid indicator that there is a system failure.

- Loss of PCM communication.
- Failed antenna circuit.

STANDARD PROCEDURE - TRANSPONDER PROGRAMMING

USING A DRB III® SCAN TOOL

All Sentry Keys included with the vehicle are pre-programmed to work with the Sentry Key Immobilizer System (SKIS) when it is shipped from the factory. The Sentry Key Immobilizer Module (SKIM) can be programmed to recognize up to a total of eight Sentry Keys. When programming a blank Sentry Key transponder, the key must first be cut to match the ignition lock cylinder of the vehicle for which it will be used. The vehicle's four digit PIN code will be required to complete this task since you will need it to enter the Secured Access Mode in the SKIM. The following steps must be completed using a DRB III® scan tool:

(1) Insert the blank key into the ignition and turn it to the RUN position.

(2) Using a DRB III® scan tool, select ″Theft Alarm,″ ″SKIM,″ ″Miscellaneous,″ and then ″Program New Key.″

(3) Enter the four digit PIN code using the DRB III® scan tool. When programming is completed, the SKIM will exit Secured Access Mode and the DRB III® scan tool will display the results of your attempt to program the key. One of five distinct results may be displayed. All five are listed below:

- ″**Programming Successful**″ is displayed if the Sentry Key programming is successful.
- ″**Learned Key in Ignition**″ is displayed if the key in the ignition has already been programmed into that vehicle's SKIM.
- ″**Eight Keys Already Learned (At The Maximum) Programming Not Done**″ is displayed if eight keys have already been programmed into the SKIM. In this case, if a new key needs to be added due to a lost or defective key, the ″Erase All Keys″ command (which requires entering the Secured Access Mode) has to be performed. Following the ″Erase All Keys″ command, all keys that will be used to operate the vehicle **MUST** be reprogrammed to the SKIM.
- ″**Programming Not Attempted**″ is displayed after an ″Erase All Keys″ function is executed.
- ″**Programming Key Failed**″ is displayed if further diagnosis is required.

To learn additional keys, turn the ignition OFF, remove the learned key, insert the next new blank key, and repeat the steps from the beginning.

"CUSTOMER LEARN" MODE

This feature is only available on domestic vehicles or those which have a U.S. country code designator. This procedure requires access to at least two valid Sentry Keys. If two valid Sentry Keys are not avail-

TRANSPONDER KEY (Continued)

able, Sentry Key programming will require the use of a DRB III® scan tool.

The steps required to program Sentry Keys with two valid Sentry Keys follows:

(1) Obtain the blank Sentry Key(s) that need to be programmed. Cut the keys to match the ignition lock cylinder mechanical key codes.

(2) Insert one of the two valid Sentry Keys into the ignition switch and turn the ignition switch to the ON position.

(3) After the ignition switch has been in the ON position for longer than three seconds, but no more than fifteen seconds, cycle the ignition switch back to the OFF position. Replace the first valid Sentry Key in the ignition lock cylinder with the second valid Sentry Key and turn the ignition switch back to the ON position. The second valid Sentry Key must be inserted within 15 seconds of removing the first valid Sentry key.

(4) About ten seconds after the completion of Step 3, the indicator light will start to flash and a single audible chime tone will sound to indicate that the system has entered the ″Customer Learn″ programming mode.

(5) Within sixty seconds of entering the ″Customer Learn″ programming mode, turn the ignition switch to the OFF position, replace the valid Sentry Key with a blank Sentry Key transponder, and turn the ignition switch back to the ON position.

(6) About ten seconds after the completion of Step 5, a single audible chime tone will sound and the indicator light will stop flashing and stay on solid for three seconds and then turn off to indicate that the blank Sentry Key has been successfully programmed. The SKIS will immediately exit the ″Customer Learn″ programming mode and the vehicle may be started using the newly programmed Sentry Key.

These steps must be completed in their entirety for each additional Sentry Key to be programmed. If any of the above steps are not completed in the given sequence, or within the allotted time, the SKIS will exit the ″Customer Learn″ programming mode and the programming will be unsuccessful. The SKIS will also automatically exit the ″Customer Learn″ programming mode if:

- It sees a non-blank Sentry Key when it should see a blank.
- If it has already programmed eight (8) valid Sentry Keys.
- If the ignition switch is turned to the OFF position for more than about fifty (50) seconds.

NOTE: If you attempt to start the vehicle while in “Customer Learn” mode (LED flashing), the vehicle will behave as though an invalid key is being used (i.e. the engine will stall after two (2) seconds of running). No faults will be logged.

NOTE: Once a Sentry Key has been programmed to a particular vehicle, it cannot be used on any other vehicle.

VTSS/SKIS INDICATOR LAMP

DESCRIPTION

The Sentry Key Immobilizer System (SKIS) uses an indicator light to convey information on the status of the system to the customer. This light is shared with the Vehicle Theft Security System (VTSS). The light is located in the Message Center. The indicator light is controlled by the Body Control Module (BCM) based upon messages it receives from the Sentry Key Immobilizer Module (SKIM) on the PCI bus.

OPERATION

The BCM performs a four second bulb check, regardless of SKIM messages. After the bulb check, the lamp is controlled according to SKIM messages. Then, the SKIM sends messages to the BCM to operate the light based upon the results of the SKIS self tests. The light may be actuated in two possible ways, flashing or on solid. If the light comes on and stays on solid after a power-up test, this indicates that the SKIM has detected a system malfunction. If the SKIM detects an invalid key when the ignition switch is moved to the ON position, it sends a message on the PCI bus to the BCM, to flash the light. The SKIM can also send a message to flash the light and generate a single audible chime at the same time. These two events occurring simultaneously indicate that the SKIS has been placed into the ″Customer Learn″ mode. Refer to Electrical, Vehicle Theft Security, Transponder Key, Standard Procedure - Transponder Programming for more information on the ″Customer Learn″ mode. If the light comes on and stays on after the power-up test, diagnosis of the SKIS should be performed using a DRB III® scan tool and the appropriate Body Diagnostic Procedures manual. The light is not a serviceable component.

WIPERS/WASHERS

DESCRIPTION

FRONT WIPER/WASHER SYSTEM

The windshield wipers can be operated with the windshield wiper switch when the ignition switch is in the RUN or ACCESSORY positions. The windshield wiper system is protected by a 30 amp fuse (9) located in the Power Distribution Center (PDC) part of the Integrated Power Module (IPM) in the engine compartment. The wiper/washer switch is integral to the multi-function switch. It is a resistive MUX switch that sends inputs to the BCM to operate the wiper/washer system.

REAR WIPER/WASHER SYSTEM

The rear windshield wiper and washers can be operated when the ignition switch is in the RUN or ACCESSORY positions.

OPERATION

FRONT WIPER/WASHER SYSTEM

The windshield washer circuit is protected by a 15 amp Cartridge Fuse located in the IPM. The wiper motor has permanent magnetic fields. The speeds are determined by current flow to the appropriate set of brushes inside the motor. The current flow is controlled by the multi-function switch. The high speed/low speed relays are located in the IPM. The speed sensitive intermittent wiper is controlled by the Body Control Module (BCM). The intermittent mode, with the vehicle traveling greater than 10.4 mph, has a range of 0.5 to 18 seconds. With the vehicle traveling less than 10.4 mph, the time delay doubles to a range of 1 to 36 seconds. The wiper arms will park at the base of the windshield just above the cowl cover after the wiper switch is turned OFF.

The windshield wiper motor and linkage is located in an integral wiper unit at the rear of the engine compartment. The wiper unit must be removed to gain access to the wiper motor.

REAR WIPER/WASHER SYSTEM

When continuous rear wiper operation is required, the BCM will provide ignition ON voltage to the rear wiper motor. When the wiper switch is turned OFF, the BCM provides circuit ground to operate the motor until the wipe cycle is complete and the wiper arm returns to the base of the rear window.

When intermittent rear wiper mode is selected, the wiper motor will cycle every 7 seconds. The intermittent delay time is also adjusted based upon vehicle speed. With the vehicle traveling greater than 50 mph, the cycle changes to every 5 seconds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FRONT WIPER SYSTEM

The windshield wiper system operates in several modes:

- Low and high speed normal wipe
- Speed sensitive intermittent wipe
- Wipe after wash
- Park (switch OFF)

The windshield wiper circuits are continuously monitored and controlled by the Body Control Module (BCM). If a problem occurs in the electronic components, wiring, switch (except integral motor park switch) and wiper motor a Diagnostic Trouble Code (DTC) will be stored in the BCM memory. DTC's can be retrieved using a DRB III® scan tool. Refer to the proper Body Diagnostic Procedures manual for DTC descriptions and retrieval information.

The windshield wiper park switch and circuit is monitored by the BCM. The park switch and circuit can be tested using the Wiper System Diagnosis table.

DIAGNOSIS AND TESTING - FRONT WIPER/WASHER SWITCH

(1) Remove the multi-function switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - REMOVAL).

(2) Using an ohmmeter check resistance readings between switch pins. Refer to the WIPER/WASHER SWITCH RESISTANCE table.

WIPER/WASHER SWITCH RESISTANCE

SWITCH POSITION	RESISTANCE BETWEEN
OFF	4 AND 3 = OPEN CIRCUIT
DELAY POSITION	
1ST	3 AND 4 = 3.3K Ω ± 5%
2ND	3 AND 4 = 1.7K Ω ± 5%
3RD	3 AND 4 = 1K Ω ± 5%
4TH	3 AND 4 = 620 Ω ± 5%
5TH	3 AND 4 = 620 Ω ± 5%
LOW	3 AND 4 = 430 Ω ± 5%
HIGH	3 AND 4 = 240 Ω ± 5%
WASH	1 AND 3 = 5.9K Ω ± 5%

WIPERS/WASHERS (Continued)

DIAGNOSIS AND TESTING - FAILED PARK SWITCH

If the wiper park switch has failed, the windshield wipers will operate as follows:

- **SWITCH OFF** - Wipers stop in current location regardless of the park signal.
- **INTERMITTENT MODE** - Wipers operate continuously or at low speed for one or more extra wipes.
- **LOW SPEED** - Wipers operate at low speed.
- **HIGH SPEED** - Wipers operate at high speed.
- **WIPE AFTER WASH** - Wipers operate at low speed in any mode setting. Wipers operate only while the wash button is depressed with switch in the OFF mode and wipers stop in mid-cycle when button is released.

The windshield wiper park switch and circuit is monitored by the BCM. The park switch and circuit can be tested using the WIPER SYSTEM DIAGNOSIS table.

WIPER SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER BLADES DO NOT PARK PROPERLY	1. WIPER ARMS IMPROPERLY PARKED.	1. REMOVE WIPER ARMS AND REPARK. REFER TO WIPER ARM REMOVAL AND INSTALLATION.
	2. WIPER ARMS ARE LOOSE ON PIVOT SHAFT.	2. REMOVE WIPER ARM AND REPARK. REFER TO WIPER ARM REMOVAL AND INSTALLATION.
	3. MOTOR CRANK LOOSE AT OUTPUT SHAFT.	3. REMOVE WIPER ARM, RUN WIPER MOTOR TO PARK POSITION AND REMOVE THE MODULE. WITHOUT ROTATING THE MOTOR OUTPUT SHAFT, REMOVE THE CRANK AND CLEAN ANY FOREIGN MATTER FROM THE MOTOR SHAFT. INSTALL THE MOTOR CRANK IN ITS ORIGINAL POSITION.
	4. STRIPPED WIPER ARM HEAD.	4. REPLACE WIPER ARM.
MOTOR STOPS IN ANY POSITION WHEN THE SWITCH IS TURNED OFF	OPEN PARK CIRCUIT.	CHECK PARK SWITCH BY DISCONNECTING THE WIRE CONNECTOR AND APPLY BATTERY VOLTAGE TO PIN 4. PLACE A JUMPER WIRE FROM PIN 2 TO PIN 3 AND THEN TO AN EXTERNAL GROUND. REPLACE MOTOR IF MOTOR DOES NOT PARK.
MOTOR WILL NOT STOP WHEN THE SWITCH IS TURNED OFF	1. FAULTY SWITCH.	1. CHECK SWITCH IN LOW, HIGH AND INTERMITTENT POSITION.
	2. LACK OF DYNAMIC BRAKE ON WET GLASS.	2. ENSURE PARK SWITCH HAS CLEAN GROUND.
WIPER BLADES SLAP AGAINST COWL SCREEN OR WINDOW MOLDINGS.	WIPER ARMS ARE PARKED INCORRECTLY.	PARK WIPER ARMS. REFER TO WIPER ARM ADJUSTMENT.
BLADES CHATTER	1. FOREIGN SUBSTANCE SUCH AS POLISH ON GLASS OR BLADES.	1. CLEAN GLASS AND BLADE ELEMENT WITH NON-ABRASIVE CLEANER.
	2. ARMS TWISTED, BLADE AT WRONG ANGLE ON GLASS.	2. REPLACE ARM.

WIPERS/WASHERS (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. BLADE STRUCTURE BENT.	3. REPLACE BLADE.
	4. BLADE ELEMENT HAS PERMANENT SET.	4. REPLACE BLADE.
WIPER KNOCK AT REVERSAL	1. LINKAGE BUSHINGS WORN.	1. REPLACE WORN LINK. REFER TO WIPER LINKAGE REMOVAL AND INSTALLATION.
	2. ARMATURE ENDPLAY IN MOTOR.	2. REPLACE WIPER MOTOR. REFER TO WIPER MOTOR REMOVAL AND INSTALLATION.
WIPER MOTOR WILL NOT RUN	1. BLOWN FUSE.	1. REPLACE FUSE, AND RUN SYSTEM.
	2. NEW FUSE BLOWS.	2. CHECK FOR SHORT IN WIRING OR SWITCH.
	3. NEW FUSE BLOWS.	3. REPLACE FUSE, REMOVE MOTOR CONNECTOR, TURN SWITCH ON, FUSE DOES NOT BLOW, REPLACE MOTOR.
	4. NO VOLTAGE AT MOTOR.	4. CHECK SWITCH AND WIRING HARNESS. REFER TO WIRING DIAGRAMS.
	5. POOR GROUND.	5. REPAIR GROUND WIRE CONNECTION AS NECESSARY.

WIPERS/WASHERS (Continued)

DIAGNOSIS AND TESTING - REAR WIPER SYSTEM

The rear window wiper system operates in several modes:

- Continuous wipe
- Intermittent wipe
- Wash
- Wipe after wash

The windshield wiper circuits are continuously monitored and controlled by the Body Control Module (BCM). If a problem occurs in the electronic components, wiring, switch (except integral motor park switch) and wiper motor a Diagnostic Trouble Code (DTC) will be stored in the BCM memory. The DTC(s) can be retrieved using a DRB III® scan tool.

DIAGNOSIS AND TESTING - WASHER SYSTEM

WASHER SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
WASHER MOTOR	1. IPM FUSE #33 BLOWN OR DEFECTIVE.	1. CHECK FUSE #33 IN THE IPM. REPLACE IF NOT OK.
	2. IPM FUSE #33 LOOSE.	2. PROPERLY INSTALL IPM FUSE #33 IN SOCKET.
BLOWN FUSE WHEN IGNITION SWITCH IS IN THE RUN OR ACCESSORY POSITION.	1. SHORT IN IPM BETWEEN FUSE #33 AND PIN 11 OR PIN 1.	1. REFER TO IPM DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
	2. SHORT IN MOTOR POWER CIRCUIT.	2. SHORT OR DEFECTIVE CIRCUIT BETWEEN IPM PIN 11 AND WASHER MOTOR CONNECTOR POSITIVE TERMINAL 2. IF NOT OK, REPAIR CIRCUIT.
	3. SHORT IN WASHER PUMP MOTOR.	3. REPLACE WASHER PUMP MOTOR.
WASHER MOTOR RUNS WHEN IGNITION SWITCH IN RUN OR ACCESSORY POSITION.	1. SHORT IN IPM BETWEEN WASHER PUMP MOTOR LSD AND PIN 20.	1. REFER TO IPM DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
	2. DEFECTIVE FRONT WASHER LSD IN IPM.	2. REFER TO IPM DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
	3. SHORT IN MOTOR GROUND CIRCUIT.	3. SHORT OR DEFECTIVE CIRCUIT BETWEEN IPM PIN 20 AND MOTOR CONNECTOR NEGATIVE TERMINAL 1. IF NOT OK, REPAIR CIRCUIT.

WIPERS/WASHERS (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
WASHER SYSTEM WILL NOT FLOW WASHER FLUID.	1. NO WASHER FLUID IN RESERVOIR.	1. FILL WASHER RESERVOIR.
	2. IPM FUSE #33 BLOWN.	2. SHORT OR DEFECTIVE CIRCUIT BETWEEN IPM PIN 11 AND WASHER PUMP MOTOR CONNECTOR POSITIVE TERMINAL 2. INTERNAL SHORT IN IPM. IF NOT OK, REPAIR CIRCUIT OR REFER TO IPM DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
	3. WASHER HOSE NOT FLOWING WASHER FLUID.	3. ASSURE WASHER HOSE IS NOT PINCHED, LOOSE, BROKEN OR DISCONNECTED. IF NOT OK, PROPERLY ROUTE OR REPAIR WASHER HOSE.
	4. MOTOR CONNECTOR LOOSE.	4. PROPERLY SEAT AND LOCK CONNECTOR TO MOTOR.
	5. MOTOR CONNECTOR TERMINALS BENT.	5. REPAIR TERMINALS AND PROPERLY SEAT CONNECTOR TO MOTOR.
	6. OPEN CIRCUIT TO OR FROM WASHER SELECT SWITCH.	6. OPEN OR DEFECTIVE CIRCUIT BETWEEN IPM BODY CONTROLLER PIN 27 AND WASHER SELECT SWITCH PIN 4, OR OPEN OR DEFECTIVE CIRCUIT BETWEEN IPM BODY CONTROLLER PIN 22 AND WASHER SELECT SWITCH PIN 2. IF NOT OK, REPAIR CIRCUIT.
	7. OPEN OR DEFECTIVE WASHER SELECT SWITCH.	7. (Refer to 8 - ELECTRICAL/LAMPS/ LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING).
	8. OPEN POWER CIRCUIT TO MOTOR.	8. OPEN OR DEFECTIVE CIRCUIT BETWEEN IPM CONNECTOR TERMINAL 11 AND WASHER MOTOR CONNECTOR POSITIVE TERMINAL 2. INTERNAL OPEN IN IPM. IF NOT OK, REPAIR CIRCUIT OR REFER TO IPM DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
	9. OPEN OR DEFECTIVE MOTOR GROUND CIRCUIT.	9. OPEN OR DEFECTIVE CIRCUIT BETWEEN IPM CONNECTOR TERMINAL 20 AND WASHER MOTOR CONNECTOR NEGATIVE TERMINAL 1. INTERNAL OPEN IN IPM. IF NOT OK, REPAIR CIRCUIT OR REFER TO IPM DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
	10. OPEN CIRCUIT IN MOTOR.	10. CHECK FOR OPEN CIRCUIT IN MOTOR BETWEEN POSITIVE TERMINAL 2 AND NEGATIVE TERMINAL 1. IF NOT OK, REPLACE WASHER MOTOR.
	11. SEIZED MOTOR BEARINGS.	11. APPLY DIRECT BATTERY VOLTAGE TO MOTOR TERMINALS. IF MOTOR DOES NOT RUN, REPLACE MOTOR.

WIPERS/WASHERS (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
COWL GRILLE NOZZLE WILL NOT FLOW.	1. FROZEN NOZZLE.	1. MOVE VEHICLE INTO HEATED AREA TO ALLOW TIME TO THAW NOZZLE. ASSURE WASHER FLUID IS PROPERLY BLENDED FOR AMBIENT OUTSIDE TEMPERATURES.
	2. NOZZLE HOSE NOT FLOWING.	2. ASSURE NOZZLE HOSE IS NOT PINCHED, LOOSE, BROKEN, OR DISCONNECTED. IF NOT OK, PROPERLY ROUTE OR REPAIR NOZZLE HOSE.
	3. NOZZLE HOSE PLUGGED BY CONTAMINATION.	3. CLEAN NOZZLE HOSE OF CONTAMINATION. DETERMINE SOURCE OF CONTAMINATION. INSPECT RESERVOIR FOR EXCESSIVE CONTAMINATION. CLEAN SYSTEM AS REQUIRED.
	4. NOZZLE PLUGGED BY CONTAMINATION.	4. CLEAN NOZZLE OF CONTAMINATION OR REPLACE NOZZLE. DETERMINE SOURCE OF CONTAMINATION. INSPECT RESERVOIR FOR EXCESSIVE CONTAMINATION. CLEAN SYSTEM AS REQUIRED.
	5. DEFECTIVE WASHER HOSE CHECK VALVE.	5. REPLACE COWL GRILLE PANEL WASHER HOSE/CHECK VALVE ASSEMBLY.
WASHER FLUID OUTPUT IS LOW.	1. PARTIALLY PINCHED HOSE.	1. ASSURE WASHER HOSE IS NOT PARTIALLY PINCHED. IF NOT OK, PROPERLY ROUTE HOSE.
	2. REVERSE POLARITY TO PUMP.	2. CHECK FOR CROSSED CIRCUIT TO PUMP. IF NOT OK, REPAIR CIRCUIT.
	3. WORN OUT WASHER PUMP.	3. REPLACE WASHER PUMP.
COWL GRILLE NOZZLE STREAM OVERSHOOTS WINDSHIELD.	1. NOZZLE NOT SEATED IN COWL GRILLE.	1. ASSURE NOZZLE IS SNAPPED IN PLACE.
	2. NOZZLE JET(S) OUT OF ADJUSTMENT.	2. ADJUST NOZZLE JET(S) USING A SAFETY PIN.
WIPER WILL NOT CYCLE WHEN WASHER SELECT SWITCH IS DEPRESSED.	1. DEFECTIVE IPM.	1. REFER TO IPM DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
	2. DEFECTIVE IPM/BODY CONTROLLER.	2. REFER TO IPM/BODY CONTROLLER DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
WASHER OPERATES INTERMITTENTLY.	1. INTERMITTENT MOTOR GROUND.	INTERMITTENT GROUND BETWEEN MOTOR CONNECTOR TERMINAL 1 AND IPM PIN 20.
	2. INTERMITTENT OPEN IN WASHER SELECT SWITCH.	2. (Refer to 8 - ELECTRICAL/LAMPS/ LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING).
	3. DEFECTIVE WASHER MOTOR.	3. REPLACE WASHER MOTOR.

WIPERS/WASHERS (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
LOW WASHER FLUID LEVEL INDICATOR INOPERATIVE.	1. LOOSE FLUID LEVEL SENSOR CONNECTOR.	1. PROPERLY SEAT CONNECTOR TO LOW FLUID LEVEL SENSOR AND LOCK.
	2. OPEN POWER CIRCUIT TO FLUID LEVEL SENSOR.	2. OPEN OR DEFECTIVE CIRCUIT BETWEEN IPM CONNECTOR TERMINAL 7 AND THE LOW FLUID LEVEL SENSOR CONNECTOR TERMINAL 2. IF NOT OK, REPAIR CIRCUIT.
	3. OPEN GROUND CIRCUIT.	3. OPEN OR DEFECTIVE CIRCUIT BETWEEN FLUID LEVEL SENSOR CONNECTOR TERMINAL 1 AND FLOOR GROUND 1.
	4. DEFECTIVE IPM.	4. REFER TO IPM DIAGNOSTIC PROCEDURES IN WIRING DIAGRAMS.
	5. FLUID LEVEL SENSOR SWITCH OPEN OR DEFECTIVE.	5. APPLY OHMMETER TO THE SWITCH TERMINALS TO CHECK FOR COMPLETE CIRCUIT. CYCLE SWITCH FLOAT BACK AND FORTH BY FILLING AND DEPLETING RESERVOIR OF WASHER FLUID TO CHECK FOR PROPER SWITCH FUNCTION. IF NOT OK, REPLACE LOW FLUID LEVEL SENSOR SWITCH.
LEAKING WASHER FLUID.	1. PUMP OR SENSOR GROMMET DEFECTIVE.	1. PROPERLY SEAT PUMP OR SENSOR IN GROMMET. IF NOT OK, REPLACE PUMP OR SENSOR GROMMET.
	2. LEAKING WASHER PUMP.	2. REPLACE WASHER PUMP.
	3. LEAKING FLUID LEVEL SENSOR.	3. REPLACE FLUID LEVEL SENSOR.
	4. LEAKING OR DEFECTIVE RESERVOIR BODY.	4. REPLACE RESERVOIR BODY.

FRONT WASHER PUMP MOTOR

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Disconnect the washer hose at the in-line connector forward of the cowl grille so that the in-line connector remains with the washer hose from the fresh air plenum.

(4) Disconnect the washer hose from the hose clip located on the front fender side shield.

(5) Remove the filler tube screw.

(6) Hoist and support vehicle on hoist or jack stands.

(7) Remove the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - REMOVAL).

(8) Disconnect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - REMOVAL).

(9) Drain washer fluid from the reservoir and into a suitable clean container. This can be done by disconnecting the windshield washer hose from the front (outboard) washer pump and allowing the washer fluid to drain into a container through a temporary jumper hose connected to the front washer pump.

(10) Disconnect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the release position, then, depress the black tab and pull the connector off the pump or sensor.

(11) Remove the two reservoir mounting screws.

(12) Disconnect the reservoir from the body mount by raising the reservoir upward slightly and then down so that the reservoir filler neck and front washer hose pull through the opening in the front fender side shield.

(13) Remove pump from reservoir by pulling pump upper retention tab away from reservoir cavity and then lifting pump up from mounting grommet. Do not damage reservoir/pump sealing surface or puncture reservoir during removal.

(14) Remove pump grommet and discard.

INSTALLATION

(1) Use new grommet when installing a new pump assembly.

(2) Assure pump upper retention tab is pressed into reservoir slot and that pump is rotated flat against the reservoir and that pump connector is facing up in the fully seated position. Assure the pump is aligned to and fully seated in the reservoir cavity.

(3) Push filler neck and front washer hose through the opening in the front fender side shield. Connect the reservoir to the body mount by lowering the reservoir down.

(4) Install the two reservoir mounting screws. Torque screws to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(5) Connect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the closed or locked position.

(6) Assure that washer hose is properly routed to prevent pinching and possible inoperative washers.

(7) Connect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - INSTALLATION).

(8) Install the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - INSTALLATION).

(9) lower vehicle from hoist or jack stands.

(10) Install the filler tube screw. Torque screw to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(11) Connect the washer hose to the hose clip located on the front fender side shield.

(12) Connect the washer hose at the in-line connector forward of the cowl grille.

(13) Install the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(14) Connect the battery negative cable.

(15) Verify system operation.

FRONT WIPER ARMS

STANDARD PROCEDURE - FRONT WIPER ARM ALIGNMENT

(1) Verify wiper blade element condition and wiper arm spring tension. Run wipers in low speed mode while applying water to the windshield. Observe the wiper blade that is chattering or skipping across the windshield. If the wiper element is not rolling over when the wiper direction reverses, align the wiper arm. The extension bar portion of the wiper arm must be twisted in the proper direction to allow the wiper element to roll over when the direction reverses.

(2) Place two small adjustable wrenches placed 50 mm (2 in.) apart on the wiper arm extension rod.

(3) Twist the extension rod slightly in the opposite direction that the element is laying on the windshield while holding the wrench closest to the pivot stationary.

FRONT WIPER ARMS (Continued)

(4) Repeat Step 1, and align as necessary until wiper stops chattering and wipes the windshield clear.

REMOVAL

CAUTION: The driver side wiper arm must be parked above the passenger side. Failure to do so will result in damage to the arms, blades or system.

(1) Lift the arm cap upward.
(2) Remove the nut holding wiper arm to the wiper pivot.
(3) Using a suitable two jaw puller, separate the wiper arm from the wiper pivot (Fig. 1).

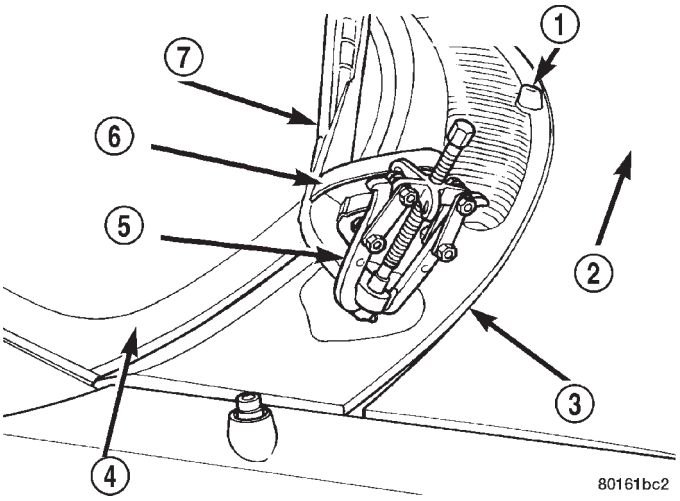

Fig. 1 WIPER ARM REMOVAL

1 - WASHER NOZZLE
2 - HOOD
3 - COWL COVER
4 - WINDSHIELD
5 - TWO JAW PULLER
6 - ARM CAP
7 - WINDSHIELD WIPER ARM

INSTALLATION

(1) Verify that the wiper motor and linkage are in the park position.
(2) Place the wiper arm in position over the wiper pivot (Fig. 2).
(3) Install the nut to hold the wiper arm to the wiper pivot. Torque nut to 35 N·m (26 ft. lbs.).

CAUTION: It is important to torque the wiper arm nut properly to insure that the wiper arm head does not strip and damage the arm, blade, and pivot of both wiper arms.

(4) Push the arm cap cover down.

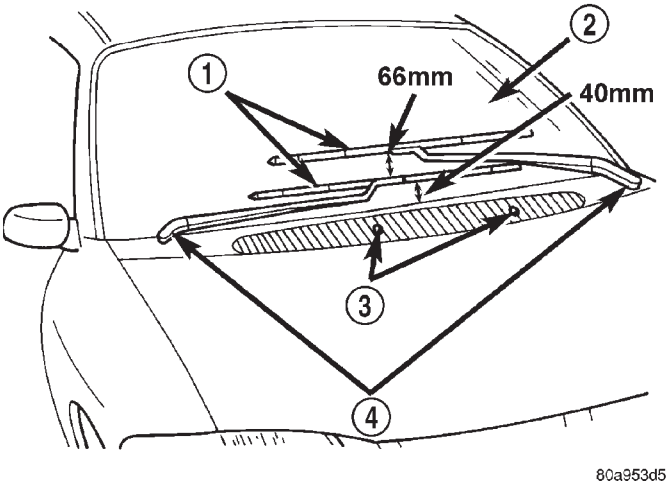

Fig. 2 WIPER ARM ADJUSTMENT

1 - WIPER BLADES
2 - WINDSHIELD
3 - WASHER NOZZLES
4 - WIPER ARMS

FRONT WIPER MOTOR

REMOVAL

(1) Remove the front wiper motor from vehicle (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/ WIPER MODULE - REMOVAL).
(2) Remove four backwall bolts and four brace nuts.
(3) Remove wiper linkage from wiper module.
(4) Disconnect wire connectors from back of wiper motor.
(5) Remove wiper linkage from motor crank. DO NOT remove crank from motor.
(6) Remove bolts holding wiper motor and remove motor.

INSTALLATION

(1) Place wiper module on a suitable work surface.
(2) Install wiper linkage into wiper unit.
(3) Connect wire connectors to wiper motor.
(4) Place the wiper module into engine compartment and connect wiper module wire connector to engine wire harness (Fig. 10).
(5) Install the four backwall bolts and four brace nuts to wiper module.
(6) Operate wiper motor and verify that the wiper motor parks when wiper switch is turned OFF.

HEADLAMP WASHERS - EXPORT

DESCRIPTION

The headlamp washers (Fig. 3) work in conjunction with the windshield washers. The headlamp washers are enabled with the headlamps ON and the windshield washers activated. With the windshield washers activated, the headlamp washers will spray twice for a predetermined amount of time.

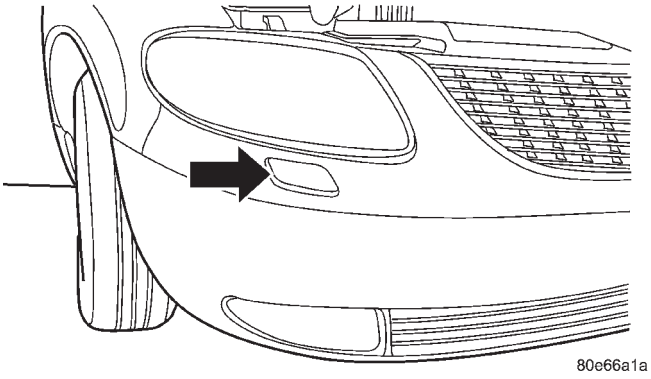

Fig. 3 HEADLAMP WASHER LOCATION

OPERATION

The headlamp washer system utilizes a separate high pressure pump that is attached to the windshield washer reservoir. The headlamp washer pump feeds nozzles that are mounted in the front fascia of the vehicle. The nozzle bodies have a telescopic action that will extend the nozzles in front of the headlamp assembly. These nozzles spray the headlamps when the system is activated.

To activate the headlamp washers, turn ON the headlamps and them press the windshield washer control knob (Fig. 4). The switch sends an input to the Body Control Module (BCM), and then the BCM will signal the windshield washers to operate and direct two timed high pressure sprays onto the headlamp lens. When the criteria is met to activate the headlamp washers (headlamps ON and windshield washer control depressed), the headlamp washers will spray its two timed pulses every fourth request from the washer control.

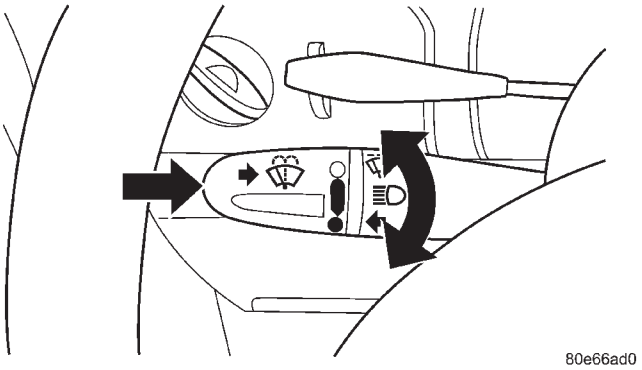

Fig. 4 WINDSHIELD WASHER CONTROL

DIAGNOSIS AND TESTING - HEADLAMP WASHERS - EXPORT

The headlamp washer pump pick-up is located above the low washer fluid level sensor. First of all check the fluid level in the reservoir.

(1) Check fuse #30 for continuity. If no continuity, go to Step 3.

(2) If the headlamp washers do not pop up when a headlamp wash is requested, disconnect the headlamp washer hose. To disconnect the headlamp washer hose, push down on the latch at any connector with slight force and pull apart. When reattaching, push till you hear a snap. With a regulated 20 psi of air pressure, apply it to the washer hose. The headlamp washers should pop up out of the front fascia. If not, check for leaks/connections in the hose.

WARNING: IF MORE THAN 20 PSI IS APPLIED TO THE WASHER HOSE, WASHER FLUID MAY SPRAY OUT OF THE HEADLAMP WASHER. WEAR SAFETY GLASSES AND DO NOT HAVE AIMING DIRECTLY TOWARD FACE.

(3) If the hose and washer spray assembly are OK, check the washer pump for ground and 12v power during a washer request. If defective, repair circuit as necessary.

HEADLAMP WASHERS - EXPORT (Continued)

HEADLAMP WASHER TEST

CONDITION	POSSIBLE CAUSE	CORRECTION
HEADLAMP WASHER SYSTEM WILL NOT FLOW WASHER FLUID.	1. NO WASHER FLUID IN RESERVOIR.	1. FILL RESERVOIR.
	2. JUNCTION BLOCK FUSE #5 BLOWN.	2. SHORT CIRCUIT BETWEEN JUNCTION BLOCK FUSE #5 AND WIPER SWITCH TERMINAL #1. SHORT IN WIPER SWITCH. IF NOT OK, REPAIR CIRCUIT OR REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES.
	3. HEADLAMP WASHER HOSE NOT FLOWING FLUID.	3. ASSURE WASHER HOSE IS NOT PINCHED, LOOSE, BROKEN, OR DISCONNECTED. IF NOT OK, PROPERLY ROUTE OR REPAIR WASHER HOSE.
	4. MOTOR CONNECTOR LOOSE.	4. PROPERLY SEAT CONNECTOR TO MOTOR.
	5. MOTOR CONNECTOR TERMINALS BENT.	5. REPAIR TERMINALS AND PROPERLY SEAT CONNECTOR TO MOTOR.
	6. OPEN POWER CIRCUIT TO SWITCH.	6. OPEN OR DEFECTIVE CIRCUIT BETWEEN JUNCTION BLOCK FUSE #5 AND WASHER SWITCH CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT.
	7. OPEN OR DEFECTIVE WIPER/WASHER SWITCH.	7. CONNECT AN OHMMETER ACROSS WIPER/WASHER SWITCH TERMINAL #1 AND #2 AND DEPRESS WASHER BUTTON AND CHECK FOR CONTINUITY. IF NOT OK, REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES.
	8. OPEN POWER CIRCUIT TO MOTOR.	8. OPEN OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND MOTOR CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT.
	9. OPEN OR DEFECTIVE MOTOR GROUND CIRCUIT.	9. OPEN OR DEFECTIVE CIRCUIT BETWEEN WASHER MOTOR CONNECTOR GROUND TERMINAL #2 AND LEFT HEADLAMP GROUND #5 OR ENGINE GROUND #1 OR 2.
	10. OPEN CIRCUIT IN HEADLAMP WASHER MOTOR.	10. CHECK FOR AN OPEN CIRCUIT ON MOTOR BETWEEN POWER TERMINAL #1 AND GROUND TERMINAL #2. IF NOT OK, REPLACE WASHER MOTOR.
	11. SEIZED MOTOR BEARINGS.	11. APPLY DIRECT BATTERY VOLTAGE TO MOTOR TERMINALS. IF MOTOR DOES NOT RUN, REPLACE MOTOR.
	12. DEFECTIVE HEADLAMP WASHER RELAY.	12. REPLACE THE HEADLAMP WASHER RELAY.
ONE HEADLAMP WASHER NOZZLE WILL NOT FLOW WASHER FLUID.	1. HEADLAMP WASHER HOSE NOT FLOWING FLUID.	1. REPAIR OR REPLACE THE HEADLAMP WASHER HOSE.
	2. PLUGGED HEADLAMP WASHER NOZZLE.	2. REPLACE HEADLAMP WASHER NOZZLE.

HEADLAMP WASHERS - EXPORT (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Hoist vehicle or support on jack stands.
(3) Disconnect the hose from the nozzle inlet. To disconnect the headlamp washer hose, push down on the latch with slight force and pull apart.
(4) Apply a regulated 20 psi of compressed air to the inlet, so as to fully extend the telescopic unit.

WARNING: IF MORE THAN 20 PSI IS APPLIED TO THE WASHER INLET, WASHER FLUID MAY SPRAY OUT OF THE HEADLAMP WASHER. WEAR SAFETY GLASSES AND DO NOT HAVE AIMING DIRECTLY TOWARD FACE.

(5) Unsnap cover from telescopic assembly.
(6) Disconnect air supply from washer inlet to fully retract the telescopic unit.
(7) Remove two screws holding the nozzle assembly to the front fascia.
(8) Remove the nozzle assembly from behind fascia.

INSTALLATION

(1) Place the nozzle assembly in behind the fascia.
(2) Install the two screws holding the nozzle assembly to the front fascia.
(3) Snap cover onto telescopic assembly.

WARNING: IF MORE THAN 20 PSI IS APPLIED TO THE WASHER INLET, WASHER FLUID MAY SPRAY OUT OF THE HEADLAMP WASHER. WEAR SAFETY GLASSES AND DO NOT HAVE AIMING DIRECTLY TOWARD FACE.

On the new washer unit, there is a white tab with pull ring holding the telescopic unit up approximately an inch. This is to ease the installation process. Once cover is snapped on, you may either pull up on the unit to remove the tab, or apply regulated compressed air.
(4) Apply a regulated 20 psi of compressed air the inlet, so as to fully extend the telescopic unit.
(5) With unit extended, pull white tab out from the bottom of the telescopic unit and discard.
(6) Remove the air supply from the washer unit.
(7) Connect the washer hose to the telescopic unit. Press firmly until snap is heard.
(8) Remove vehicle from hoist or jack stands.
(9) Connect the battery negative cable.
(10) Verify vehicle and system operation.

HEADLAMP WASHER HOSE - EXPORT

REMOVAL

The headlamp washer hose is a special high pressure hose with specific fittings, and must be replaced as a unit.
(1) Disconnect and isolate the battery negative cable.
(2) Hoist vehicle or support on jack stands.
(3) Remove parts as necessary to replace high pressure headlamp washer hose. When disconnecting hose, press down firmly on latch at headlamp washer pump motor and telescopic washer assembly and pull apart.

INSTALLATION

The headlamp washer hose is a special high pressure hose with specific fittings, and must be replaced as a unit.
(1) Install the new high pressure headlamp washer hose assembly. Push fitting on until a snap is heard.
(2) Install the parts that were removed to replace high pressure headlamp washer hose.
(3) Remove vehicle from hoist or jack stands.
(4) Connect the battery negative cable.
(5) Verify vehicle and system operation.

HEADLAMP WASHER PUMP MOTOR - EXPORT

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
(3) Disconnect the washer hose at the in-line connector forward of the cowl grille so that the in-line connector remains with the washer hose from the fresh air plenum.
(4) Disconnect the washer hose from the hose clip located on the front fender side shield.
(5) Remove the filler tube screw.
(6) Hoist and support vehicle on hoist or jack stands.
(7) Remove the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - REMOVAL).
(8) Disconnect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - REMOVAL).

HEADLAMP WASHER PUMP MOTOR - EXPORT (Continued)

(9) Drain washer fluid from the reservoir and into a suitable clean container. This can be done by disconnecting the windshield washer hose from the front (outboard) washer pump and allowing the washer fluid to drain into a container through a temporary jumper hose connected to the front washer pump.

(10) Disconnect the rear washer pump hose from washer pump.

(11) Disconnect the high pressure headlamp washer pump hose by pressing down firmly on latch and pulling hose off.

(12) Disconnect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the release position, then, depress the black tab and pull the connector off the pump or sensor.

(13) Remove the two reservoir mounting screws.

(14) Disconnect the reservoir from the body mount by raising the reservoir upward slightly and then down so that the reservoir filler neck and front washer hose pull through the opening in the front fender side shield.

(15) Remove pump from reservoir by pulling pump up and away from reservoir cavity and out of mounting grommet. Do not damage reservoir/pump sealing surface or puncture reservoir during removal.

(16) Remove pump grommet and discard.

INSTALLATION

(1) Use new grommet when installing a new pump assembly.

(2) Assure pump upper retention tab is pressed into reservoir slot and assure the pump is aligned to and fully seated in the reservoir cavity.

(3) Push filler neck and front washer hose through the opening in the front fender side shield. Connect the reservoir to the body mount by lowering the reservoir down.

(4) Install the two reservoir mounting screws. Torque screws to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(5) Connect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the closed or locked position.

(6) Connect front and rear washer pump hoses and assure that they are properly routed to prevent pinching and possible inoperative washers.

(7) Connect the high pressure headlamp washer hose by firmly pushing hose onto inlet until a snap is heard.

(8) Connect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - INSTALLATION).

(9) Install the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - INSTALLATION).

(10) lower vehicle from hoist or jack stands.

(11) Install the filler tube screw. Torque screw to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(12) Connect the washer hose to the hose clip located on the front fender side shield.

(13) Connect the washer hose at the in-line connector forward of the cowl grille.

(14) Install the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(15) Connect the battery negative cable.

(16) Verify vehicle and system operation.

REAR WASHER PUMP MOTOR

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Disconnect the washer hose at the in-line connector forward of the cowl grille so that the in-line connector remains with the washer hose from the fresh air plenum.

(4) Disconnect the washer hose from the hose clip located on the front fender side shield.

(5) Remove the filler tube screw.

(6) Hoist and support vehicle on hoist or jack stands.

(7) Remove the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - REMOVAL).

(8) Disconnect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - REMOVAL).

(9) Drain washer fluid from the reservoir and into a suitable clean container. This can be done by disconnecting the windshield washer hose from the front (outboard) washer pump and allowing the washer fluid to drain into a container through a temporary jumper hose connected to the front washer pump.

(10) Disconnect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the release position, then, depress the black tab and pull the connector off the pump or sensor.

(11) Remove the two reservoir mounting screws.

REAR WASHER PUMP MOTOR (Continued)

(12) Disconnect the reservoir from the body mount by raising the reservoir upward slightly and then down so that the reservoir filler neck and front washer hose pull through the opening in the front fender side shield.

(13) Remove pump from reservoir by pulling pump upper retention tab away from reservoir cavity and then lifting pump up from mounting grommet. Do not damage reservoir/pump sealing surface or puncture reservoir during removal.

(14) Remove pump grommet and discard.

INSTALLATION

(1) Use new grommet when installing a new pump assembly.

(2) Assure pump upper retention tab is pressed into reservoir slot and that pump is rotated flat against the reservoir and that pump connector is facing up in the fully seated position. Assure the pump is aligned to and fully seated in the reservoir cavity.

(3) Push filler neck and front washer hose through the opening in the front fender side shield. Connect the reservoir to the body mount by lowering the reservoir down.

(4) Install the two reservoir mounting screws. Torque screws to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(5) Connect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the closed or locked position.

(6) Assure that washer hose is properly routed to prevent pinching and possible inoperative washers.

(7) Connect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - INSTALLATION).

(8) Install the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - INSTALLATION).

(9) lower vehicle from hoist or jack stands.

(10) Install the filler tube screw. Torque screw to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(11) Connect the washer hose to the hose clip located on the front fender side shield.

(12) Connect the washer hose at the in-line connector forward of the cowl grille.

(13) Install the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(14) Connect the battery negative cable.

(15) Verify system operation.

REAR WIPER ARM

REMOVAL

(1) Lift and hold wiper blade away from rear window.

(2) Lift lock holding wiper arm to wiper pivot upward.

(3) Allow wiper arm to rest against lock.

(4) Pull wiper from pivot by rocking back and forth (Fig. 5).

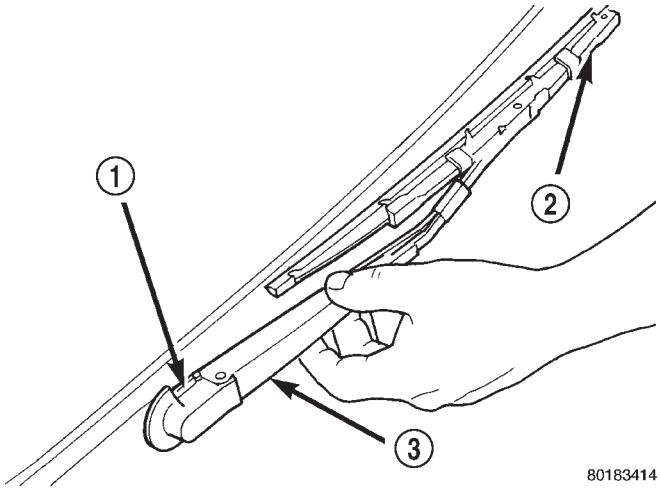

Fig. 5 REAR WIPER ARM

1 - LOCK
2 - WIPER BLADE
3 - REAR WIPER ARM

INSTALLATION

(1) Position arm on pivot.

(2) Pull up on arm and release lock

(3) Allow wiper arm to rest on rear window.

REAR WIPER MOTOR

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove rear wiper arm. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/REAR WIPER ARM - REMOVAL) in this section.

(3) Open liftgate.

(4) Remove liftgate trim panel. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/ TRIM PANEL - REMOVAL).

(5) Disconnect wire connector from rear wiper motor.

(6) Remove screws holding rear wiper motor to liftgate (Fig. 6).

(7) Remove wiper motor from liftgate.

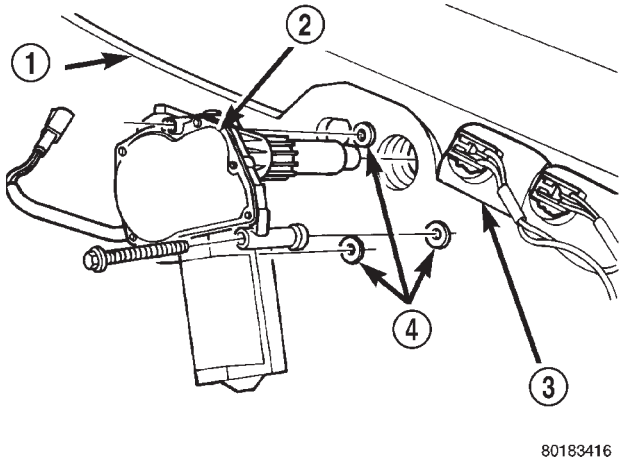

Fig. 6 REAR WINDOW WIPER MOTOR

1 - REAR WINDOW
2 - REAR WIPER MOTOR
3 - CHMSL
4 - WELL NUTS

INSTALLATION

(1) Position the wiper motor in the liftgate.

(2) Install the retaining screws.

(3) Connect the wire harness connector.

(4) Install the liftgate trim panel. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/ TRIM PANEL - INSTALLATION).

(5) Connect wire connector to rear wiper motor.

(6) Install the screws holding rear wiper motor to liftgate (Fig. 6).

(7) Install the wiper motor to the liftgate (Fig. 6).

(8) Close the liftgate.

(9) Install the wiper arm. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/REAR WIPER ARM - INSTALLATION) in this section.

(10) Connect the battery negative cable.

REAR WIPER/WASHER SWITCH

DESCRIPTION

The rear window wiper/washer switches are located on the center bezel with the hazard and heated seat switches (Fig. 7). They are not serviceable separately from the hazard and heated seat switches. If defective, the entire switch assembly must be replaced.

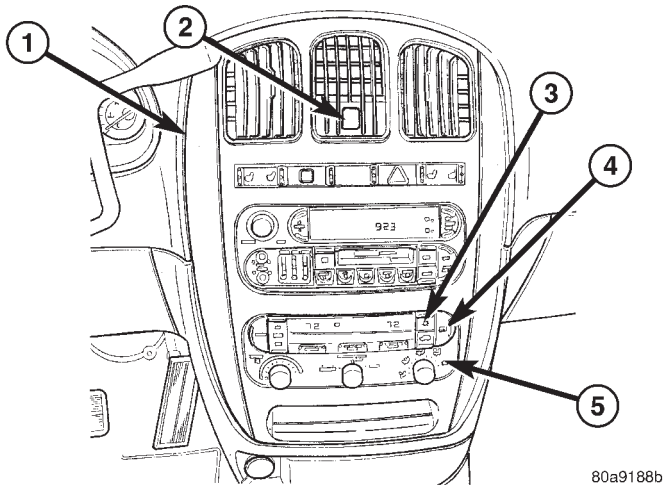

Fig. 7 HVAC CONTROL PANEL

1 - TRIM BEZEL
2 - IN CAR TEMPERATURE SENSOR
3 - A/C REQUEST SWITCH
4 - REAR WINDOW DEFOGGER/HEATED MIRRORS SWITCH COMBO
5 - FRONT WINDOW DEFROSTER MODE SELECTOR

OPERATION

Refer to the vehicle Owner's Manual for operating instructions for the rear window wiper and washer.

WASHER FLUID LEVEL SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Disconnect the washer hose at the in-line connector forward of the cowl grille so that the in-line connector remains with the washer hose from the fresh air plenum.

(4) Disconnect the washer hose from the hose clip located on the front fender side shield.

(5) Remove the filler tube screw.

WASHER FLUID LEVEL SWITCH (Continued)

(6) Hoist and support vehicle on hoist or jack stands.

(7) Remove the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - REMOVAL).

(8) Disconnect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - REMOVAL).

(9) Drain washer fluid from the reservoir and into a suitable clean container. This can be done by disconnecting the windshield washer hose from the front (outboard) washer pump and allowing the washer fluid to drain into a container through a temporary jumper hose connected to the front washer pump.

(10) Disconnect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the release position, then, depress the black tab and pull the connector off the pump or sensor.

(11) Remove the two reservoir mounting screws.

(12) Disconnect the reservoir from the body mount by raising the reservoir upward slightly and then down so that the reservoir filler neck and front washer hose pull through the opening in the front fender side shield.

(13) Remove the sensor from reservoir by using a side foot to gently pry the sensor from the body of the reservoir. Do not damage the reservoir/sensor sealing surface or puncture reservoir during removal.

CAUTION: To avoid damage to the sensor, assure the reservoir is in an upright position before removing the sensor from the reservoir. Do not rotate the sensor during removal.

INSTALLATION

(1) Use a new grommet when installing a new sensor assembly.

(2) Assure that the flat of the sensor is aligned under the ridge of the reservoir and that the sensor connector is facing down in the fully seated position. This will allow for proper operation of the sensor float switch.

(3) Push filler neck and front washer hose through the opening in the front fender side shield. Connect the reservoir to the body mount by lowering the reservoir down.

(4) Install the two reservoir mounting screws. Torque screws to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(5) Connect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the closed or locked position.

(6) Assure that washer hose is properly routed to prevent pinching and possible inoperative washers.

(7) Connect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - INSTALLATION).

(8) Install the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - INSTALLATION).

(9) lower vehicle from hoist or jack stands.

(10) Install the filler tube screw. Torque screw to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(11) Connect the washer hose to the hose clip located on the front fender side shield.

(12) Connect the washer hose at the in-line connector forward of the cowl grille.

(13) Install the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(14) Connect the battery negative cable.

(15) Verify system operation.

WASHER HOSES

REMOVAL

(1) Remove washer reservoir from vehicle (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL).

(2) Disconnect washer hose front the reservoir cavity.

(3) Disconnect the washer hose from the reservoir pump.

(4) Remove parts as necessary to replace washer hose (engine compartment, interior components, etc.).

INSTALLATION

(1) Install parts as necessary to after replacing washer hose (engine compartment, interior components, etc.).

(2) Connect the washer hose to the reservoir pump.

(3) Connect washer hose to the reservoir cavity.

(4) Install the washer reservoir into vehicle (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION).

WASHER RESERVOIR

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Disconnect the washer hose at the in-line connector forward of the cowl grille so that the in-line connector remains with the washer hose from the fresh air plenum.

(4) Disconnect the washer hose from the hose clip located on the front fender side shield.

(5) Remove the filler tube screw.

(6) Hoist and support vehicle on hoist or jack stands.

(7) Remove the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - REMOVAL).

(8) Disconnect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - REMOVAL).

(9) Drain washer fluid from the reservoir and into a suitable clean container. This can be done by disconnecting the windshield washer hose from the front (outboard) washer pump and allowing the washer fluid to drain into a container through a temporary jumper hose connected to the front washer pump.

(10) Disconnect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the release position, then, depress the black tab and pull the connector off the pump or sensor.

(11) Remove the two reservoir mounting screws.

(12) Disconnect the reservoir from the body mount by raising the reservoir upward slightly and then down so that the reservoir filler neck and front washer hose pull through the opening in the front fender side shield.

INSTALLATION

(1) Push filler neck and front washer hose through the opening in the front fender side shield. Connect the reservoir to the body mount by lowering the reservoir down.

(2) Install the two reservoir mounting screws. Torque screws to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(3) Connect the electrical body harness connectors to the washer pump motors and the fluid level sensor. Slide the red lock on the connector to the closed or locked position.

(4) Assure that washer is properly routed to prevent pinching and possible inoperative washers.

(5) Connect the left right front wheelhouse splash shield and move aside (Refer to 23 - BODY/EXTERIOR/WHEELHOUSE SPLASH SHIELD - INSTALLATION).

(6) Install the right front wheel and tire assembly (Refer to 22 - TIRES/WHEELS - INSTALLATION).

(7) lower vehicle from hoist or jack stands.

(8) Install the filler tube screw. Torque screw to 8.5 - 11.3 N·m (75 - 100 in. lbs.).

(9) Connect the washer hose to the hose clip located on the front fender side shield.

(10) Connect the washer hose at the in-line connector forward of the cowl grille.

(11) Install the engine fresh air housing inside the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(12) Connect the battery negative cable.

(13) Verify system operation.

WIPER BLADES

REMOVAL

(1) Lift the wiper arm away from the glass.

(2) Disengage the release tab holding the wiper blade to the wiper arm and remove the wiper blade from the wiper arm (Fig. 8) and (Fig. 9).

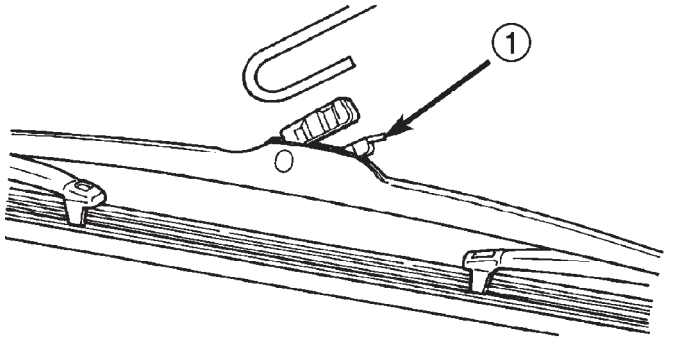

Fig. 8 WINDSHIELD WIPER BLADE

1 - RELEASE TAB

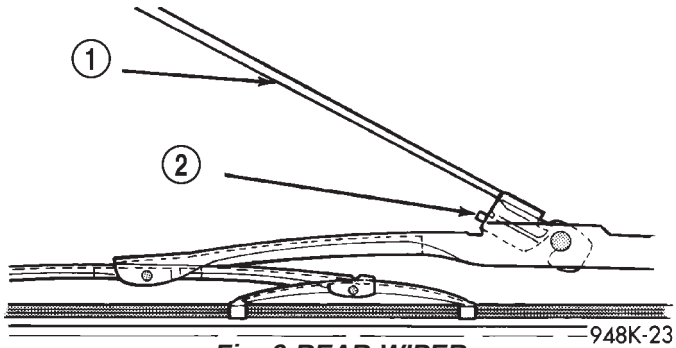

Fig. 9 REAR WIPER

1 - WIPER ARM
2 - BLADE LATCH

WIPER BLADES (Continued)

CLEANING

Wiper blades exposed to the weather for a long period of time tend to lose their wiping effectiveness. Periodic cleaning of the wiper blade is recommended to remove the accumulation of salt and road grime. The wiper blades, arms and windshield should be cleaned with a sponge or cloth and a mild detergent or nonabrasive cleaner. If the wiper blades continue to streak or smear, they should be replaced. The wiper blade should run smoothly across the windshield in both directions. The wiper blade should slightly roll over center when the blade reverses direction. A wiper blade insert that has lost flexibility or a wiper arm that has lost spring tension, will cause the blade to skip or chatter across the windshield. If the wiper blades are new and the wiper arm spring tension is OK and a chattering sound is emitted from the wiper(s), the wiper blade is not rolling over center. If this condition exists, (refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - ADJUSTMENTS).

INSTALLATION

(1) Position the blade onto the arm.
(2) Engage the blade to the retainer by pulling up on the blade until the tabs snap into position (Fig. 8).

WIPER LINKAGE

REMOVAL

(1) Remove the front windshield wiper unit from vehicle (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).
(2) Place the wiper unit on a suitable work surface.
(3) Remove nuts holding the cowl cover brackets to the wiper unit.
(4) Remove cowl cover brackets from the wiper unit.
(5) Remove nuts holding linkage to the wiper unit.
(6) Remove the wiper linkage from the wiper unit.
(7) Disconnect the wire connectors from back of the wiper motor.

INSTALLATION

(1) Connect the wire harness connector.
(2) Install the linkage on the wiper unit.
(3) Install the nut holding the linkage to the wiper unit.
(4) Install the cowl cover brackets to the wiper nut.
(5) Install the front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).
(6) Install the cowl cover.
(7) Install the wiper arms and blades.

WIPER MODULE

REMOVAL

(1) Release the hood latch and open hood.
(2) Disconnect and isolate the battery negative cable.
(3) Remove the wiper arms.
(4) Remove the cowl cover (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).
(5) Disconnect the positive lock on the wiper module wire connector (Fig. 10).

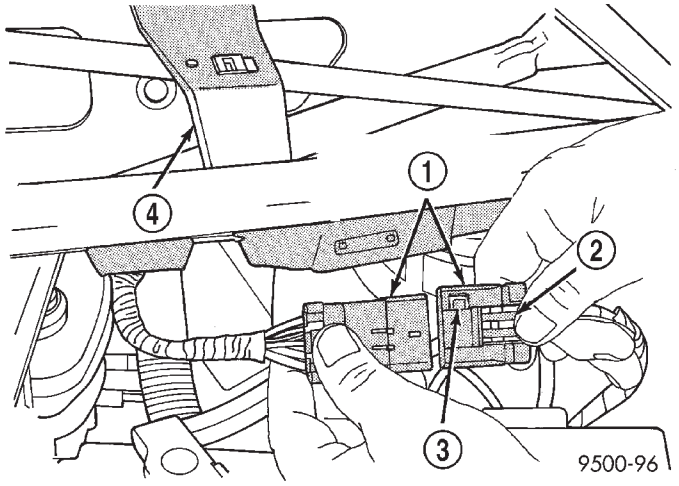

Fig. 10 WIPER MODULE WIRE CONNECTOR

1 - WIPER SYSTEM WIRE CONNECTOR
2 - LOCK TAB
3 - POSITIVE LOCK
4 - WIPER MODULE

(6) Disconnect the wiper module wire connector from the engine compartment wire harness.
(7) Disconnect the windshield washer hose from coupling outside the module.
(8) Disconnect the drain tubes from nipples on bottom of the wiper module.
(9) Remove nuts holding wiper module to lower windshield fence.
(10) Remove bolts holding the wiper module to the dash panel (Fig. 11).
(11) Lift wiper module from weld-studs on lower windshield fence.

CAUTION: Do not allow wiper module to rest on brake master cylinder reservoir, damage to brake system can result.

(12) Remove wiper module.

WIPER MODULE (Continued)

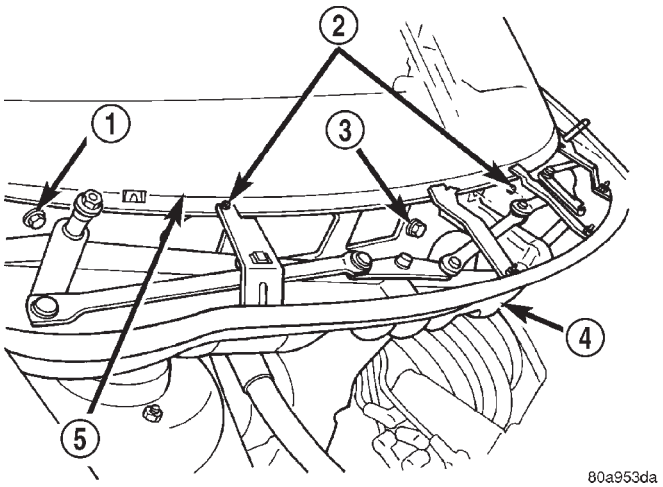

Fig. 11 WIPER MODULE

1 - BOLT
2 - NUTS
3 - BOLT
4 - WIPER MODULE
5 - WINDSHIELD

INSTALLATION

(1) Position the wiper module into the cowl.
(2) Install the bolts that secure the wiper module to the dash (Fig. 11).
(3) Install the nuts that retain the wiper module.
(4) Connect the drain tubes to the nipples on the wiper module.
(5) Connect the windshield washer tube.
(6) Connect the wire harness connector to the wiper module (Fig. 11).
(7) Connect the positive lock on the wiper module wire connector (Fig. 10).

CAUTION: Do not allow wiper module to rest on brake master cylinder reservoir, damage to brake system can result.

(8) Install the cowl cover (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).
(9) Install the wiper arms and blades.
(10) Connect the battery negative cable.
(11) Close the hood.

WIRING DIAGRAM INFORMATION

DESCRIPTION

DESCRIPTION - HOW TO USE WIRING DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicles wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

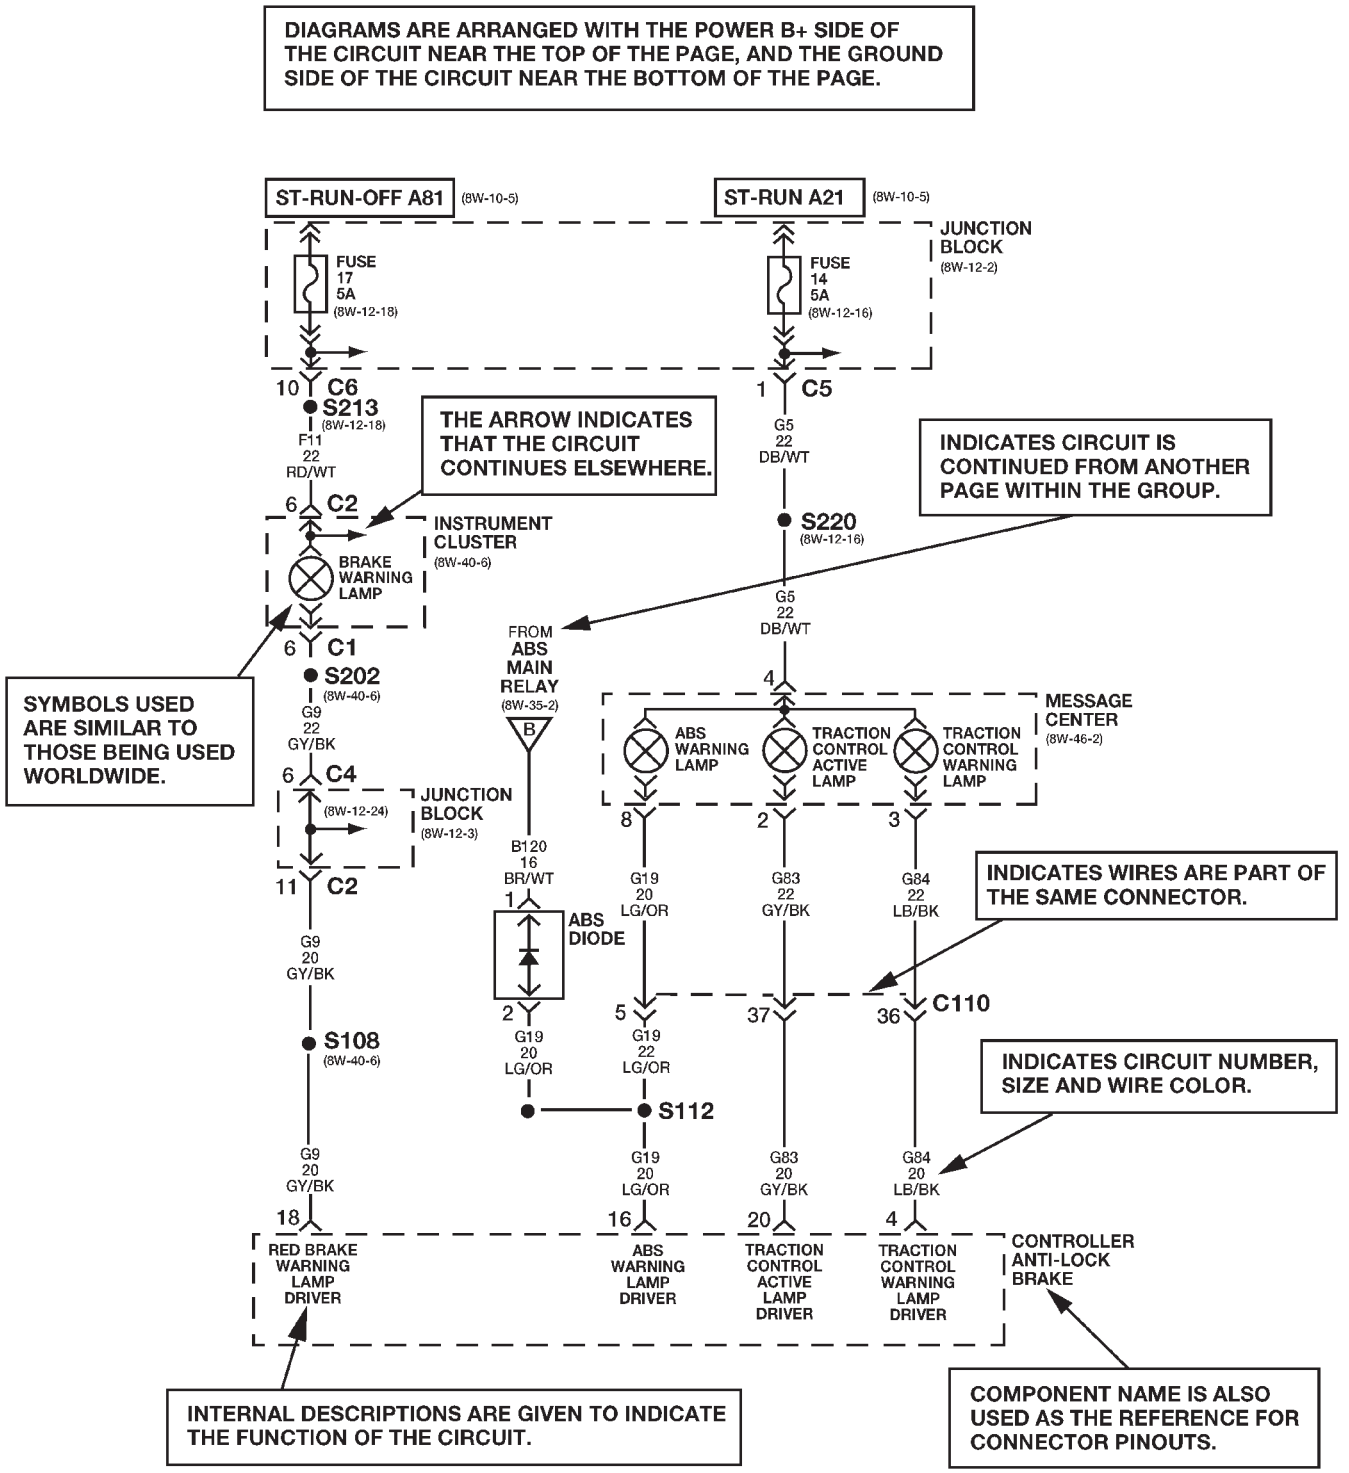
Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

WIRING DIAGRAM INFORMATION (Continued)



The System shown here is an EXAMPLE ONLY. It does not represent the actual circuit shown in the WIRING DIAGRAM SECTION.

DOHC . . . . . Double Over Head Cam Engine
Built-Up-Export . . . . . Vehicles Built For Sale In Markets Other Than North America
Except Built-Up-Export . . Vehicles Built For Sale In North America

DESCRIPTION - CIRCUIT INFORMATION

Each wire shown in the diagrams contains a code which identifies the main circuit, part of the main circuit, gage of wire, and color (Fig. 4).

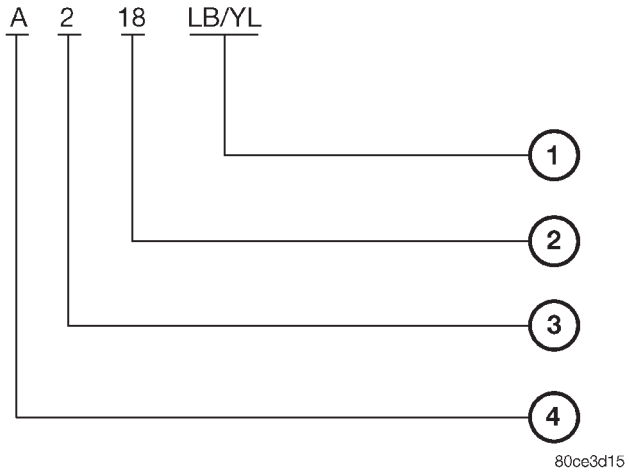

Fig. 4 WIRE CODE IDENTIFICATION

1 - COLOR OF WIRE (LIGHT BLUE WITH YELLOW TRACER
2 - GAGE OF WIRE (18 GAGE)
3 - PART OF MAIN CIRCUIT (VARIES DEPENDING ON EQUIPMENT)
4 - MAIN CIRCUIT IDENTIFICATION

WIRE COLOR CODE CHART

COLOR CODE	COLOR
BL	BLUE
BK	BLACK
BR	BROWN
DB	DARK BLUE
DG	DARK GREEN
GY	GRAY
LB	LIGHT BLUE
LG	LIGHT GREEN
OR	ORANGE
PK	PINK
RD	RED
TN	TAN
VT	VIOLET
WT	WHITE
YL	YELLOW
*	WITH TRACER

WIRING DIAGRAM INFORMATION (Continued)

DESCRIPTION - CIRCUIT FUNCTIONS

All circuits in the diagrams use an alpha/numeric code to identify the wire and it's function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)
H	OPEN
I	NOT USED
J	OPEN
K	POWERTRAIN CONTROL MODULE
L	EXTERIOR LIGHTING
M	INTERIOR LIGHTING
N	NOT USED
O	NOT USED
P	POWER OPTION (BATTERY FEED)
Q	POWER OPTIONS (IGNITION FEED)
R	PASSIVE RESTRAINT
S	SUSPENSION/STEERING
T	TRANSMISSION/TRANSAXLE/ TRANSFER CASE
U	OPEN
V	SPEED CONTROL, WIPER/ WASHER
W	OPEN
X	AUDIO SYSTEMS
Y	OPEN
Z	GROUNDS

DESCRIPTION - SECTION IDENTIFICATION AND INFORMATION

The wiring diagrams are grouped into individual sections. If a component is most likely found in a particular group, it will be shown complete (all wires, connectors, and pins) within that group. For example, the Auto Shutdown Relay is most likely to be found in Group 30, so it is shown there complete. It can, however, be shown partially in another group if it contains some associated wiring.

Splice diagrams in Section 8W-70 show the entire splice and provide references to other sections the splices serves. Section 8W-70 only contains splice diagrams that are not shown in their entirety somewhere else in the wiring diagrams.

Section 8W-80 shows each connector and the circuits involved with that connector. The connectors are identified using the name/number on the diagram pages.

WIRING SECTION CHART

GROUP	TOPIC
8W-01 thru 8W-09	General information and Diagram Overview
8W-10 thru 8W-19	Main Sources of Power and Vehicle Grounding
8W-20 thru 8W-29	Starting and Charging
8W-30 thru 8W-39	Powertrain/Drivetrain Systems
8W-40 thru 8W-49	Body Electrical items and A/C
8W-50 thru 8W-59	Exterior Lighting, Wipers and Trailer Tow
8W-60 thru 8W-69	Power Accessories
8W-70	Splice Information
8W-80	Connector Pin Outs
8W-91	Connector, Ground and Splice Locations

WIRING DIAGRAM INFORMATION (Continued)

DESCRIPTION - CONNECTOR, GROUND AND SPLICE INFORMATION

CAUTION: Not all connectors are serviced. Some connectors are serviced only with a harness. A typical example might be the Supplemental Restraint System connectors. Always check parts availability before attempting a repair.

IDENTIFICATION

In-line connectors are identified by a number, as follows:

- In-line connectors located in the engine compartment are C100 series numbers
- In-line connectors located in the Instrument Panel area are C200 series numbers.
- In-line connectors located in the body are C300 series numbers.
- Jumper harness connectors are C400 series numbers.
- Grounds and ground connectors are identified with a "G" and follow the same series numbering as the in-line connectors.
- Splices are identified with an "S" and follow the same series numbering as the in-line connectors.
- Component connectors are identified by the component name instead of a number. Multiple connectors on a component use a C1, C2, etc. identifier.

LOCATIONS

Section 8W-91 contains connector/ground/splice location illustrations. The illustrations contain the connector name (or number)/ground number/splice number and component identification. Connector/ground/splice location charts in section 8W-91 reference the figure numbers of the illustrations.

The abbreviation T/O is used in the component location section to indicate a point in which the wiring harness branches out to a component. The abbreviation N/S means Not Shown in the illustrations

WARNING

WARNINGS - GENERAL

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.

WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.

WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.

WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.

WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.

WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.

WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.

WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.

WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND AVOID LOOSE CLOTHING.

DIAGNOSIS AND TESTING - WIRING HARNESS

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.

- Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

WIRING DIAGRAM INFORMATION (Continued)

• Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

• Probing Tools - These tools are used for probing terminals in connectors (Fig. 5). Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

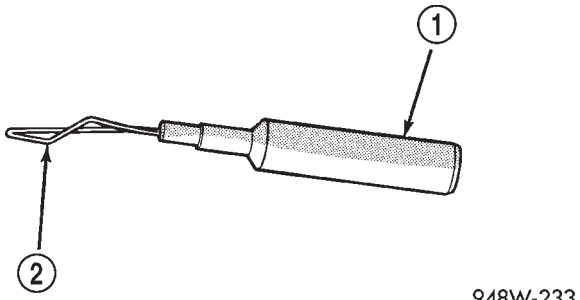

Fig. 5 PROBING TOOL

1 - SPECIAL TOOL 6801
2 - PROBING END

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

(1) Verify the problem.

(2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.

(3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.

(4) Isolate the problem area.

(5) Repair the problem area.

(6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

STANDARD PROCEDURE

STANDARD PROCEDURE - ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

All ESD sensitive components are solid state and a symbol (Fig. 6) is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.

(1) Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.

(2) Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.

(3) When using a voltmeter, be sure to connect the ground lead first.

(4) Do not remove the part form it's protective packing until it is time to install the part.

(5) Before removing the part from it's pakage, ground the pakage to a known good ground on the vehicle.

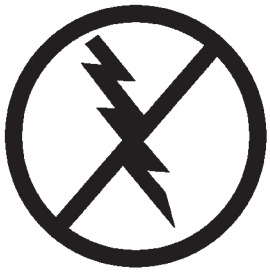

Fig. 6 ELECTROSTATIC DISCHARGE SYMBOL

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING OF VOLTAGE POTENTIAL

(1) Connect the ground lead of a voltmeter to a known good ground (Fig. 7).

(2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

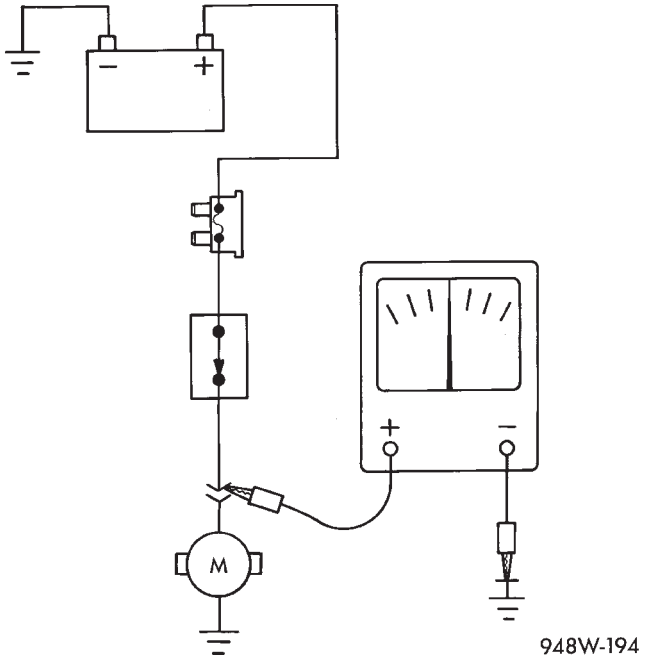

Fig. 7 TESTING FOR VOLTAGE POTENTIAL

STANDARD PROCEDURE - TESTING FOR CONTINUITY

(1) Remove the fuse for the circuit being checked or, disconnect the battery.

(2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 8).

(3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

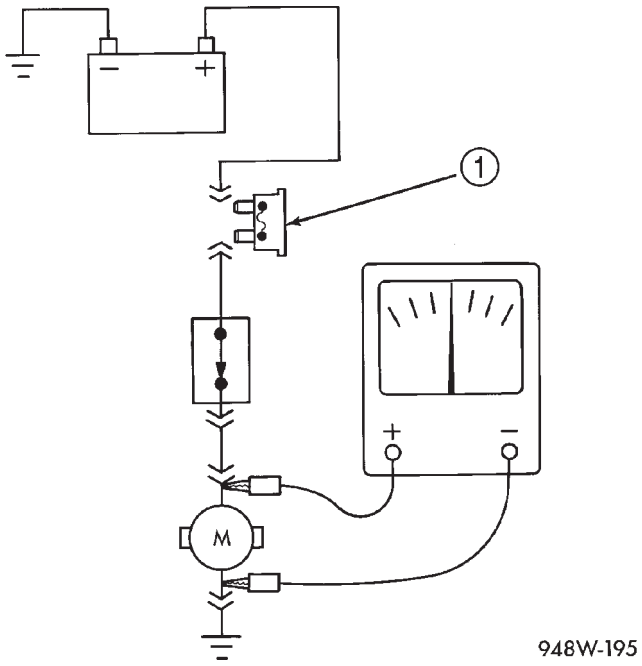

Fig. 8 TESTING FOR CONTINUITY

1 - FUSE REMOVED FROM CIRCUIT

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND

(1) Remove the fuse and disconnect all items involved with the fuse.

(2) Connect a test light or a voltmeter across the terminals of the fuse.

(3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.

(4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

(1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
(2) Replace the blown fuse.
(3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
(4) Start connecting or energizing the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP

(1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 9).
(2) Connect the other lead of the voltmeter to the other side of the switch, component or circuit.
(3) Operate the item.
(4) The voltmeter will show the difference in voltage between the two points.

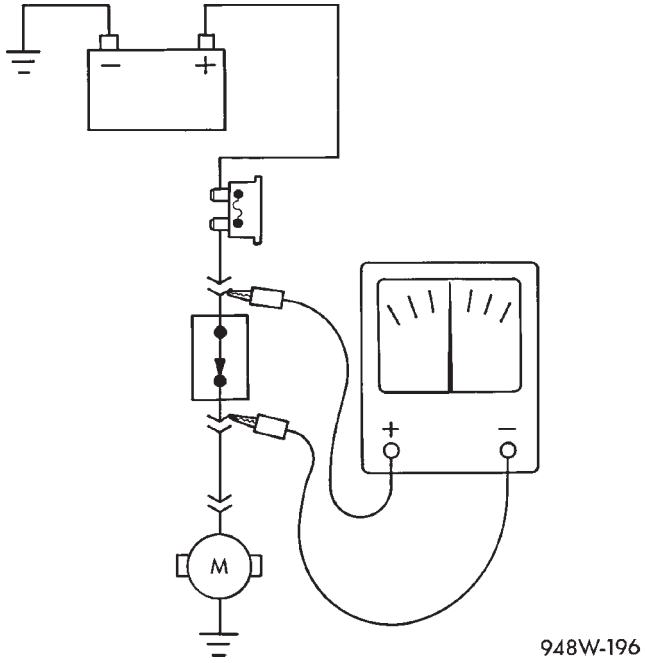

Fig. 9 TESTING FOR VOLTAGE DROP

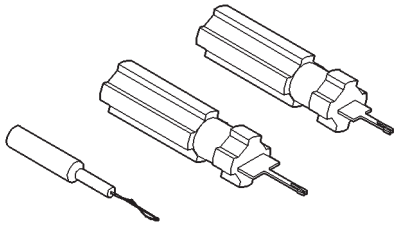
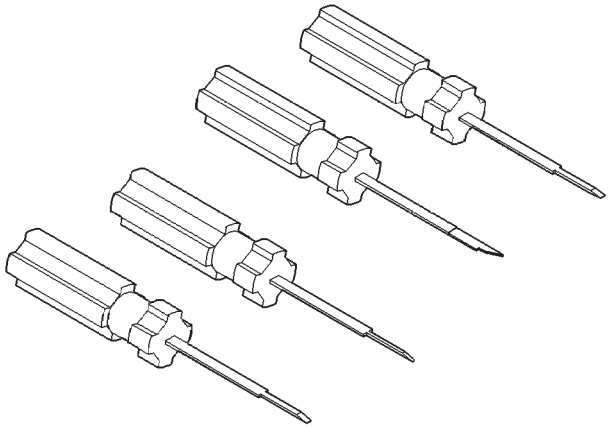
SPECIAL TOOLS

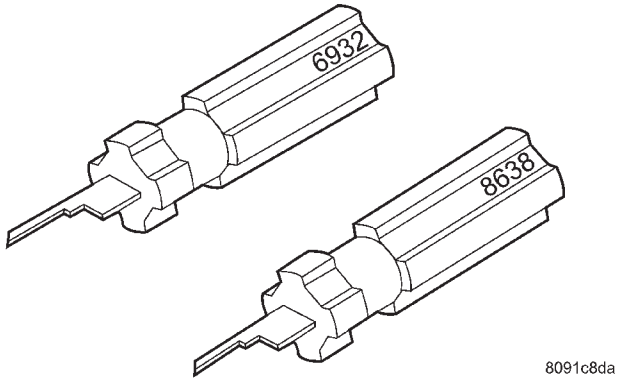
WIRING/TERMINAL



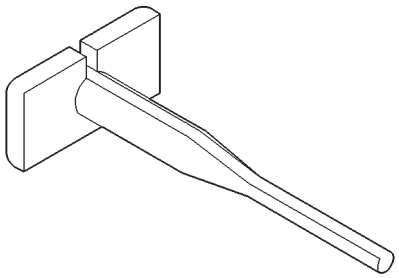
PROBING TOOL PACKAGE 6807



TERMINAL PICK TOOL SET 6680



TERMINAL REMOVING TOOLS 6932 AND 8638



TERMINAL REMOVING TOOL 6934

CONNECTOR

REMOVAL

(1) Disconnect battery.
(2) Release Connector Lock (Fig. 10).
(3) Disconnect the connector being repaired from its mating half/component.
(4) Remove the dress cover (if applicable) (Fig. 10).

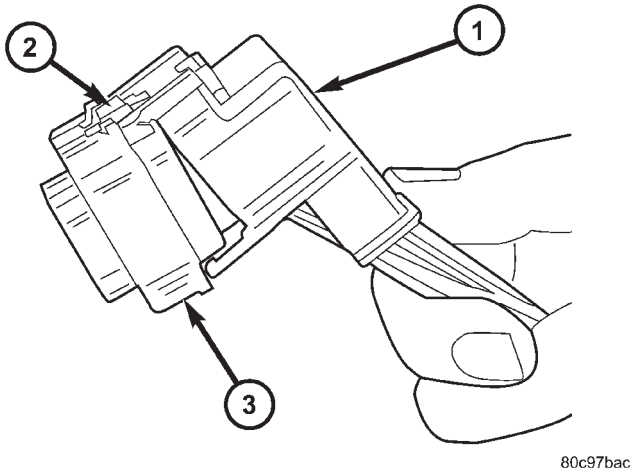


Fig. 10 REMOVAL OF DRESS COVER

1 - DRESS COVER
2 - CONNECTOR LOCK
3 - CONNECTOR

(5) Release the Secondary Terminal Lock, if required (Fig. 11).
(6) Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector (Fig. 12).

INSTALLATION

(1) Insert the removed terminal in the same cavity on the repair connector.
(2) Repeat steps for each terminal in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.
(3) When the connector is re-assembled, the secondary terminal lock must be placed in the locked position to prevent terminal push out.
(4) Replace dress cover (if applicable).
(5) Connect connector to its mating half/component.
(6) Connect battery and test all affected systems.

DIODE

REMOVAL

(1) Disconnect the battery.
(2) Locate the diode in the harness, and remove the protective covering.
(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 13).

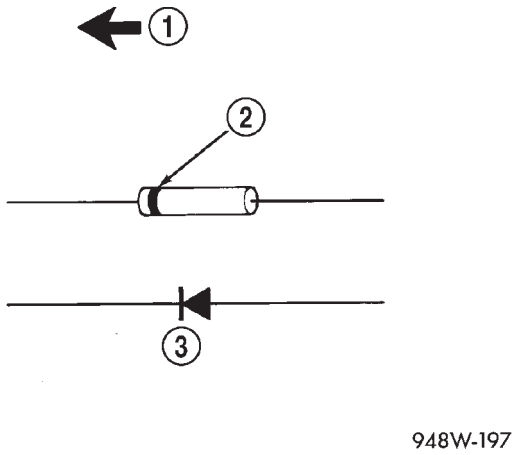

Fig. 13 DIODE IDENTIFICATION

1 - CURRENT FLOW
2 - BAND AROUND DIODE INDICATES CURRENT FLOW
3 - DIODE AS SHOWN IN THE DIAGRAMS

INSTALLATION

(1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.
(2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 13).
(3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**
(4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.
(5) Re-connect the battery and test affected systems.

TERMINAL

REMOVAL

(1) Follow steps for removing terminals described in the connector removal section.
(2) Cut the wire 6 inches from the back of the connector.

INSTALLATION

(1) Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.
(2) Cut the repair wire to the proper length and remove one–half (1/2) inch of insulation.
(3) Splice the repair wire to the wire harness (see wire splicing procedure).
(4) Insert the repaired wire into the connector.
(5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
(6) Re-tape the wire harness starting at 1–1/2 inches behind the connector and 2 inches past the repair.
(7) Connect battery and test all affected systems.

WIRE

STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

(1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.

(2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.

(3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 14).

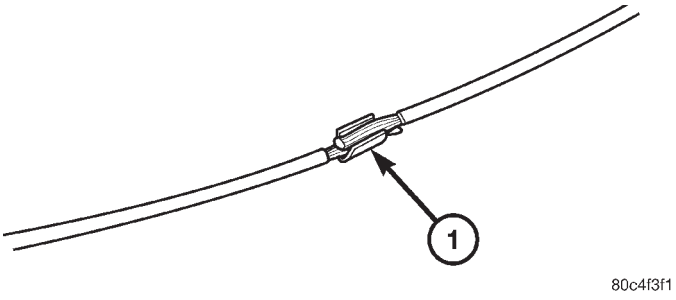

Fig. 14 SPLICE BAND

1 - SPLICE BAND

(4) Using crimping tool, Mopar p/n 05019912AA, crimp the splice clip and wires together (Fig. 15).

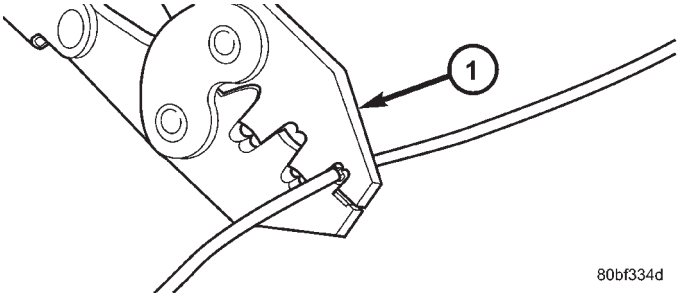

Fig. 15 CRIMPING TOOL

1 - CRIMPING TOOL

(5) Solder the connection together using rosin core type solder only (Fig. 16).

CAUTION: DO NOT USE ACID CORE SOLDER.

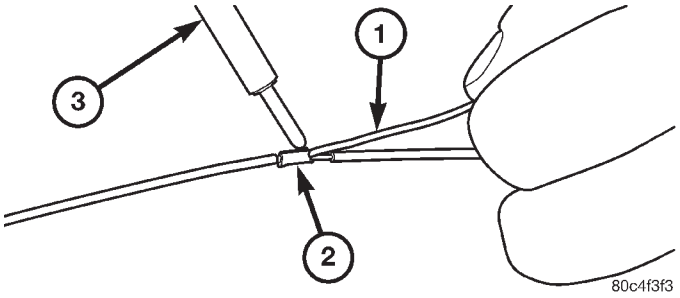

Fig. 16 SOLDER SPLICE

1 - SOLDER
2 - SPLICE BAND
3 - SOLDERING IRON

(6) Center the heat shrink tubing over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant comes out of both ends of the tubing (Fig. 17).

8W-45 BODY CONTROL MODULE

Component	Page
A/C- Heater Control	8W-45-16, 19
Auto Temp Control	8W-45-16, 19
Automatic Day/Night Mirror	8W-45-11
Body Control Module	8W-45-2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 15, 16, 17, 18, 19, 20
Center Dome Lamp	8W-45-9, 13
Clockspring	8W-45-17
Controller Antilock Brake	8W-45-13
Diagnostic Junction Port	8W-45-12
Driver Door Courtesy Lamp	8W-45-15
Driver Door Lock Switch	8W-45-12, 15
Driver Heated Seat Module	8W-45-11
Floor Console Lamp	8W-45-13
Front Cigar Lighter	8W-45-17
Front Control Module	8W-45-3
Front Reading Lamps/Switch	8W-45-8, 13
Fuel Pump Module	8W-45-15
Fuse 14	8W-45-3
Fuse 19	8W-45-2
Fuse 20	8W-45-2
Fuse 24	8W-45-2
G301	8W-45-5, 6, 8
Glove Box Lamp	8W-45-19
Halo Lamp	8W-45-19
Headlamp Switch	8W-45-11, 16, 20
Hood Ajar Switch	8W-45-12
Ignition Switch	8W-45-3
Instrument Cluster	8W-45-16, 18, 19
Instrument Panel Switch Bank	8W-45-10, 11, 17, 19
Integrated Power Module	8W-45-2, 3, 5, 6, 13
Left B-Pillar Switch	8W-45-9
Left Cylinder Lock Switch	8W-45-10
Left Front Door Lock Motor/Ajar Switch	8W-45-4, 7
Left Liftgate Flood Lamp	8W-45-12
Left Mid Reading Lamp	8W-45-9, 14
Left Power Mirror	8W-45-20
Left Rear Lamp Assembly	8W-45-5, 6
Left Rear Reading Lamp	8W-45-9, 14
Left Remote Radio Switch	8W-45-17
Left Repeater Lamp	8W-45-20
Left Sliding Door Control Module	8W-45-8, 10
Left Sliding Door Lock Motor	8W-45-7
Left Sliding Door Lock Motor/Ajar Switch	8W-45-7, 8
Left Stop/Turn Signal Relay	8W-45-5
Left Visor/Vanity Lamp	8W-45-13
License Lamp	8W-45-8
Liftgate Ajar Switch	8W-45-12
Liftgate Cinch/Release Motor	8W-45-12
Liftgate Cylinder Lock Switch	8W-45-9
Memory Set Switch	8W-45-4
Message Center	8W-45-18
Multi- Function Switch	8W-45-16
Name Brand Speaker Relay	8W-45-3
Overhead Console	8W-45-4, 11
Passenger Door Courtesy Lamp	8W-45-15
Passenger Door Lock Switch	8W-45-12, 15
Passenger Folding Mirror Relay	8W-45-20
Passenger Heated Seat Module	8W-45-11
Power Folding Mirror Switch	8W-45-20
Power Liftgate Module	8W-45-8
Power Mirror Switch	8W-45-16
Radio	8W-45-17
Rear Auto Temp Control Switch	8W-45-10, 19
Rear Blower Rear Control Switch	8W-45-10
Rear Dome Lamp	8W-45-9
Rear Wiper Motor	8W-45-8
Remote Keyless Entry Module	8W-45-4, 16
Right B-Pillar Switch	8W-45-9
Right Combination Relay	8W-45-5
Right Cylinder Lock Switch	8W-45-10
Right Front Door Lock Motor/Ajar Switch	8W-45-7, 9
Right Liftgate Flood Lamp	8W-45-12
Right Mid Reading Lamp	8W-45-9, 14
Right Power Mirror	8W-45-20
Right Rear Lamp Assembly	8W-45-5, 6
Right Rear Reading Lamp	8W-45-9, 14
Right Remote Radio Switch	8W-45-17
Right Repeater Lamp	8W-45-20
Right Sliding Door Control Module	8W-45-8, 10
Right Sliding Door Lock Motor	8W-45-7
Right Sliding Door Lock Motor/Ajar Switch	8W-45-7, 8
Right Visor/Vanity Lamp	8W-45-13
Thatcham Alarm Module	8W-45-10
Traction Control Switch	8W-45-17
