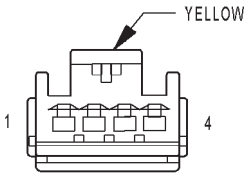
CLOCKSPRING C1

CLOCKSPRING C1 - WHITE 6 WAY

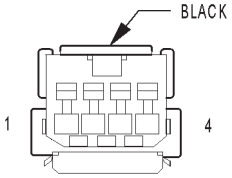
CAV	CIRCUIT	FUNCTION
1	X920 20GY/OR	RADIO CONTROL MUX RETURN
2	X20 20GY/WT	RADIO CONTROL MUX
3	X3 20DG/VT	HORN SWITCH SENSE
4	V37 20VT	SPEED CONTROL SWITCH SIGNAL
5	K900 20DB/DG	SPEED CONTROL SWITCH GROUND
6	-	-



CLOCKSPRING C2

CLOCKSPRING C2 - YELLOW 4 WAY

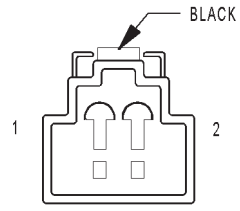
CAV	CIRCUIT	FUNCTION
1	R61 18LG/PK	DRIVER SQUIB 2 LINE 1
2	R63 18LG/WT	DRIVER SQUIB 2 LINE 2
3	R43 18LG/BR	DRIVER SQUIB 1 LINE 1
4	R45 18LG/OR	DRIVER SQUIB 1 LINE 2



CLOCKSPRING C3

CLOCKSPRING C3 - BLACK 4 WAY

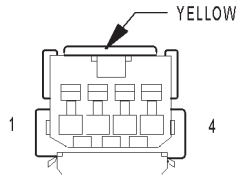
CAV	CIRCUIT	FUNCTION
1	-	-
2	Z23 20BK/VT	RIGHT SPEED CONTROL SWITCH GROUND
2	Z23 20BK/VT	LEFT SPEED CONTROL SWITCH GROUND
3	V37 20DG/VT (EXCEPT BUILT-UP-EXPORT)	SPEED CONTROL SWITCH SIGNAL
3	V37 20DG/VT (EXCEPT BUILT-UP-EXPORT)	SPEED CONTROL SWITCH SIGNAL
3	V37 20VT/TN (BUILT-UP-EXPORT)	SPEED CONTROL SWITCH SIGNAL
3	V37 20VT/TN (BUILT-UP-EXPORT)	SPEED CONTROL SWITCH SIGNAL
4	X3 20DG/VT	HORN SWITCH SENSE



CLOCKSPRING C4

CLOCKSPRING C4 - BLACK 2 WAY

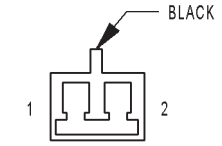
CAV	CIRCUIT	FUNCTION
1	X20 20RD/BK	RADIO CONTROL MUX
2	X920 20RD/DB	RADIO CONTROL MUX RETURN



CLOCKSPRING C5

CLOCKSPRING C5 - YELLOW 4 WAY

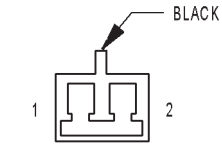
CAV	CIRCUIT	FUNCTION
1	R45 18OR/LB	DRIVER SQUIB 1 LINE 2
2	R43 18BK/LB	DRIVER SQUIB 1 LINE 1
3	R63 18TN/LB	DRIVER SQUIB 2 LINE 2
4	R61 18OR/LB	DRIVER SQUIB 2 LINE 1



CLUTCH PEDAL INTERLOCK SWITCH (MTX)

CLUTCH PEDAL INTERLOCK SWITCH (MTX) - BLACK 2 WAY

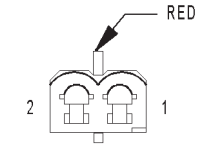
CAV	CIRCUIT	FUNCTION
1	T141 20YL/OR	IGNITION SWITCH OUTPUT (START)
2	T751 20YL	IGNITION SWITCH OUTPUT (START)



CLUTCH PEDAL INTERLOCK SWITCH JUMPER (ATX)

CLUTCH PEDAL INTERLOCK SWITCH JUMPER (ATX) - BLACK 2 WAY

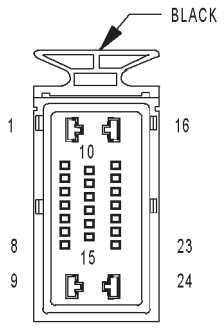
CAV	CIRCUIT	FUNCTION
1	T141 20YL/OR	IGNITION SWITCH OUTPUT (START)
2	T751 20YL	IGNITION SWITCH OUTPUT (START)



CLUTCH PEDAL UPSTOP SWITCH (DIESEL)

CLUTCH PEDAL UPSTOP SWITCH (DIESEL) - RED 2 WAY

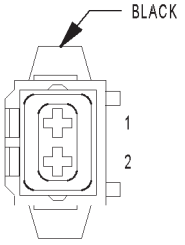
CAV	CIRCUIT	FUNCTION
1	K119 20DB/LG	CLUTCH PEDAL UPSTOP SWITCH SENSE
2	Z150 20BK/LG	GROUND



CONTROLLER ANTILOCK BRAKE

CONTROLLER ANTILOCK BRAKE - BLACK 24 WAY

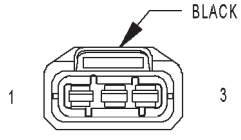
CAV	CIRCUIT	FUNCTION
1	Z107 12BK/DG	GROUND
2	B1 18DG/OR	RIGHT REAR WHEEL SPEED SENSOR SIGNAL
3	B2 18DG/LB	RIGHT REAR WHEEL SPEED SENSOR 12 VOLT SUPPLY
4	-	-
5	D25 18WT/VT	PCI BUS
6	B6 18DG/WT	RIGHT FRONT WHEEL SPEED SENSOR SIGNAL
7	B7 18DG/VT	RIGHT FRONT WHEEL SPEED SENSOR 12 VOLT SUPPLY
8	-	-
9	A111 12DG/RD	FUSED B(+)
10	F500 18DG/PK	FUSED IGNITION SWITCH OUTPUT (RUN)
11	-	-
12	-	-
13	-	-
14	-	-
15	-	-
16	Z127 12BK/DG	GROUND
17	-	-
18	L50 18WT/TN	BRAKE LAMP SWITCH OUTPUT
19	B3 18DG/YL	LEFT REAR WHEEL SPEED SENSOR SIGNAL
20	B4 18DG/GY	LEFT REAR WHEEL SPEED SENSOR 12 VOLT SUPPLY
21	-	-
22	B8 18DG/TN	LEFT FRONT WHEEL SPEED SENSOR SIGNAL
23	B9 18DG/WT (3.3L/3.8L)	LEFT FRONT WHEEL SPEED SENSOR 12 VOLT SUPPLY
23	B9 18DG/LG (EXCEPT 3.3L/3.8L)	LEFT FRONT WHEEL SPEED SENSOR 12 VOLT SUPPLY
24	A107 12TN/RD	FUSED B(+)



CRANK CASE VENTILATION HEATER (DIESEL)

CRANK CASE VENTILATION HEATER (DIESEL) - BLACK 2 WAY

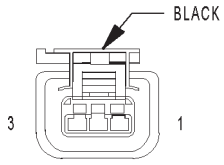
CAV	CIRCUIT	FUNCTION
1	Z153 18BK/GY	GROUND
2	N1 18DB/OR	FUEL HEATER RELAY OUTPUT



CRANKSHAFT POSITION SENSOR (DIESEL)

CRANKSHAFT POSITION SENSOR (DIESEL) - BLACK 3 WAY

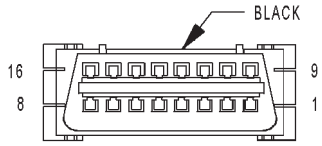
CAV	CIRCUIT	FUNCTION
1	K24 20BR/LB	CRANKSHAFT POSITION SENSOR SIGNAL NO. 2
2	K3 20BR/OR	CRANKSHAFT POSITION SENSOR SIGNAL NO. 1
3	Z122 18WT	GROUND (DRAIN)



CRANKSHAFT POSITION SENSOR (GAS)

CRANKSHAFT POSITION SENSOR (GAS) - BLACK 3 WAY

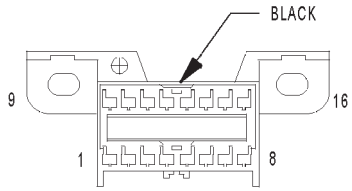
CAV	CIRCUIT	FUNCTION
1	F888 18BR/PK	8 VOLT SUPPLY
2	K900 18DB/DG	SENSOR GROUND
3	K24 18BR/LB	CRANKSHAFT POSITION SENSOR SIGNAL



DATA LINK CONNECTOR

DATA LINK CONNECTOR - BLACK 16 WAY

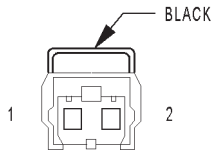
CAV	CIRCUIT	FUNCTION
1	-	-
2	D25 20WT/VT	PCI BUS
3	-	-
4	Z11 18BK/LG	GROUND
5	Z111 18BK/WT (EXCEPT BUILT-UP-EXPORT)	GROUND
5	Z111 20BK/WT (BUILT-UP-EXPORT)	GROUND
6	D20 20WT/LG (GAS)	SCI RECEIVE
7	D21 20WT/BR (EXCEPT BUILT-UP-EXPORT)	SCI TRANSMIT
7	D21 20WT/DG (BUILT- UP-EXPORT)	SCI TRANSMIT
8	-	-
9	D23 20WT/BR	FLASH PROGRAM ENABLE
10	-	-
11	-	-
12	-	-
13	-	-
14	D16 20WT/OR (GAS)	SCI RECEIVE
15	-	-
16	A105 20DB/RD	FUSED B(+)



DIAGNOSTIC JUNCTION PORT

DIAGNOSTIC JUNCTION PORT - BLACK 16 WAY

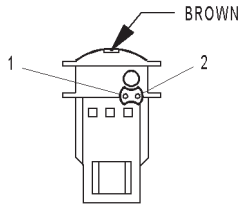
CAV	CIRCUIT	FUNCTION
1	D25 20WT/VT	PCI BUS (PCM/SKIM/ECM/THATCHAM)
2	D25 20WT/VT	PCI BUS (HVAC)
3	D25 20WT/VT	PCI BUS (RADIO)
4	D25 20WT/VT	PCI BUS (ORC)
5	D25 20WT/VT	PCI BUS (CLUSTER)
6	D25 20WT/VT	PCI BUS (BCM)
7	D25 20WT/VT	PCI BUS (DLC)
8	D25 20WT/VT	PCI BUS (OVERHEAD CONSOLE)
9	D25 20WT/VT	PCI BUS (FCM/TCM/CAB)
10	D25 20WT/VT	PCI BUS (LSIACM)
11	D25 20WT/VT (MEMORY)	PCI BUS (MEMORY)
12	D25 20WT/VT	PCI BUS (PWR DOOR LT/RT/LIFTGATE)
13	D25 20WT/VT	PCI BUS (RSIACM)
14	-	-
15	-	-
16	-	-



DOSING PUMP (DIESEL)

DOSING PUMP (DIESEL) - BLACK 2 WAY

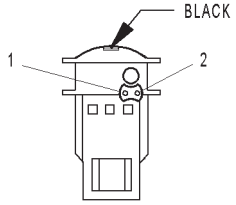
CAV	CIRCUIT	FUNCTION
1	18RD	DOSING PUMP CONTROL
2	Z149 18BK/DB	GROUND



DRIVER AIRBAG C1

DRIVER AIRBAG C1 - BROWN 2 WAY

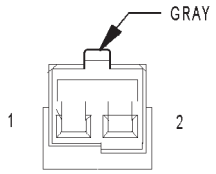
CAV	CIRCUIT	FUNCTION
1	R43 18BK/LB	DRIVER SQUIB 1 LINE 1
2	R45 18OR/LB	DRIVER SQUIB 1 LINE 2



DRIVER AIRBAG C2

DRIVER AIRBAG C2 - BLACK 2 WAY

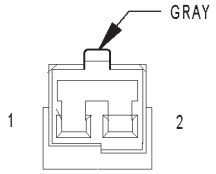
CAV	CIRCUIT	FUNCTION
1	R61 18OR/LB	DRIVER SQUIB 2 LINE 1
2	R63 18TN/LB	DRIVER SQUIB 2 LINE 2



DRIVER BLEND DOOR ACTUATOR (ATC)

DRIVER BLEND DOOR ACTUATOR (ATC) - GRAY 2 WAY

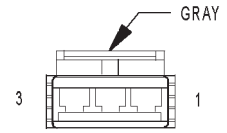
CAV	CIRCUIT	FUNCTION
1	C61 20DB/LG	DRIVER BLEND DOOR DRIVER (A)
2	C161 20LB/WT	DRIVER BLEND DOOR DRIVER (B)



DRIVER BLEND DOOR ACTUATOR (MTC)

DRIVER BLEND DOOR ACTUATOR (MTC) - GRAY 2 WAY

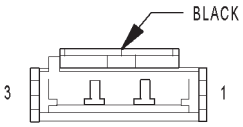
CAV	CIRCUIT	FUNCTION
1	C61 20LB/WT (LHD)	DRIVER BLEND DOOR DRIVER (A)
1	C34 20DB/LB (RHD)	COMMON DOOR DRIVER (B)
2	C61 20LB/WT(RHD)	DRIVER BLEND DOOR DRIVER (A)
2	C34 20DB/LB (LHD)	COMMON DOOR DRIVER (B)



DRIVER DOOR COURTESY LAMP

DRIVER DOOR COURTESY LAMP - GRAY 3 WAY

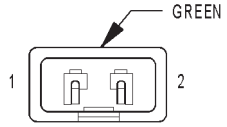
CAV	CIRCUIT	FUNCTION
1	Z322 20BK/BR (RHD)	GROUND
1	Z321 20BK/BR (LHD)	GROUND
2	-	-
3	M21 20YL/BR	COURTESY LAMPS DRIVER



DRIVER DOOR LOCK SWITCH

DRIVER DOOR LOCK SWITCH - BLACK 3 WAY

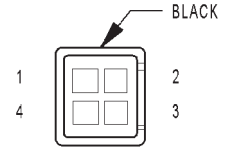
CAV	CIRCUIT	FUNCTION
1	F304 16WT/PK (EXCEPT POWER WINDOWS)	FUSED ACCESSORY RELAY OUTPUT
1	F304 16WT/PK (POWER WINDOWS)	FUSED WINDOW CIRCUIT BREAKER OUTPUT
2	G160 20VT/LG (RHD)	RIGHT DOOR LOCK SWITCH MUX
2	G161 20VT/DG (LHD)	LEFT DOOR LOCK SWITCH MUX
3	Z460 20BK/LG (RHD)	GROUND
3	Z461 20BK/DG (LHD)	GROUND



DRIVER HEATED SEAT BACK

DRIVER HEATED SEAT BACK - GREEN 2 WAY

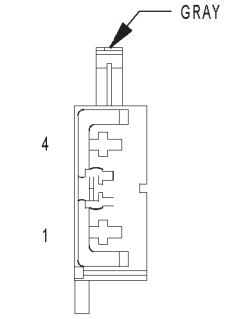
CAV	CIRCUIT	FUNCTION
1	S2 18BK (RHD)	DRIVER SEAT BACK HEATER GROUND
1	S2 18DG (LHD)	DRIVER SEAT BACK HEATER GROUND
2	S1 18RD (RHD)	DRIVER SEAT BACK HEATER B(+) DRIVER
2	S1 18DB (LHD)	DRIVER SEAT BACK HEATER B(+) DRIVER



DRIVER HEATED SEAT CUSHION

DRIVER HEATED SEAT CUSHION - BLACK 4 WAY

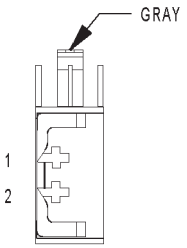
CAV	CIRCUIT	FUNCTION
1	P87 16RD	DRIVER SEAT CUSHION HEATER GROUND
2	P89 20GR	SEAT SENSOR 5 VOLT SUPPLY
3	Z848 18BK/OR	DRIVER SEAT TEMP SENSOR INPUT
4	P88 16GR	DRIVER SEAT CUSHION HEATER B(+) DRIVER



DRIVER HEATED SEAT MODULE C1

DRIVER HEATED SEAT MODULE C1 - GRAY 4 WAY

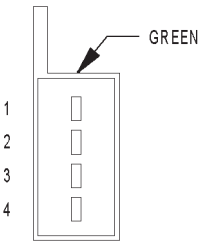
CAV	CIRCUIT	FUNCTION
1	Z849 18BK	GROUND
2	P7 20LG/DG	DRIVER HEATED SEAT SWITCH MUX
3	F503 20WT/PK	FUSED IGNITION SWITCH OUTPUT (RUN)
4	A210 14OR/RD	FUSED B(+)



DRIVER HEATED SEAT MODULE C2

DRIVER HEATED SEAT MODULE C2 - GRAY 2 WAY

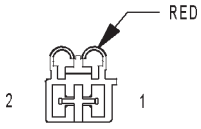
CAV	CIRCUIT	FUNCTION
1	S2 18DG (LHD)	DRIVER SEAT BACK HEATER GROUND
1	S2 18BK (RHD)	DRIVER SEAT BACK HEATER GROUND
2	S1 18DB (LHD)	DRIVER SEAT BACK HEATER B(+) DRIVER
2	S1 18RD (RHD)	DRIVER SEAT BACK HEATER B(+) DRIVER



DRIVER HEATED SEAT MODULE C3

DRIVER HEATED SEAT MODULE C3 - GREEN 4 WAY

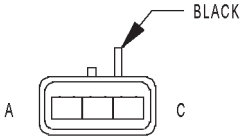
CAV	CIRCUIT	FUNCTION
1	P87 16RD	DRIVER SEAT CUSHION HEATER GROUND
2	P89 20GR	SEAT SENSOR 5 VOLT SUPPLY
3	Z848 18BK/OR	DRIVER SEAT TEMP SENSOR INPUT
4	P88 16GR	DRIVER SEAT CUSHION HEATER B(+) DRIVER



DRIVER POWER SEAT FRONT RISER MOTOR

DRIVER POWER SEAT FRONT RISER MOTOR - RED 2 WAY

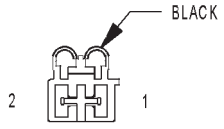
CAV	CIRCUIT	FUNCTION
1	P119 14LG/DG (MEMORY)	SEAT FRONT UP DRIVER
1	P19 14LG/LB	DRIVER FRONT UP SWITCH SENSE
2	P121 14LG/DB (MEMORY)	SEAT FRONT DOWN DRIVER
2	P21 14LG/TN	DRIVER FRONT DOWN SWITCH SENSE



DRIVER POWER SEAT FRONT RISER POSITION SENSOR

DRIVER POWER SEAT FRONT RISER POSITION SENSOR - BLACK 3 WAY

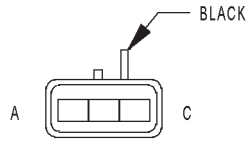
CAV	CIRCUIT	FUNCTION
A	P28 20LG/BR	SEAT POSITION SENSOR GROUND
B	P26 20LG	FRONT RISER POSITION SIGNAL
C	P29 20LG/WT	SEAT SENSOR 5 VOLT SUPPLY



DRIVER POWER SEAT HORIZONTAL MOTOR

DRIVER POWER SEAT HORIZONTAL MOTOR - BLACK 2 WAY

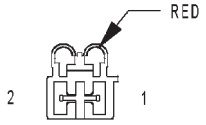
CAV	CIRCUIT	FUNCTION
1	P17 14LG/DG	DRIVER SEAT HORIZONTAL REARWARD SWITCH SENSE
1	P117 14LG/LB (LHD) (MEMORY)	SEAT HORIZONTAL REARWARD DRIVER
1	P115 14LG (RHD) (MEMORY)	SEAT HORIZONTAL FORWARD DRIVER
2	P15 14LG/WT	DRIVER SEAT HORIZONTAL FORWARD SWITCH SENSE
2	P115 14LG (LHD) (MEMORY)	SEAT HORIZONTAL FORWARD DRIVER
2	P117 14LG/LB (RHD) (MEMORY)	SEAT HORIZONTAL REARWARD DRIVER



DRIVER POWER SEAT HORIZONTAL POSITION SENSOR

DRIVER POWER SEAT HORIZONTAL POSITION SENSOR - BLACK 3 WAY

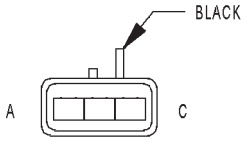
CAV	CIRCUIT	FUNCTION
A	P29 20LG/WT	SEAT SENSOR 5 VOLT SUPPLY
B	P25 20LG/VT	SEAT HORIZONTAL POSITION SIGNAL
C	P28 20LG/BR	SEAT POSITION SENSOR GROUND



DRIVER POWER SEAT REAR RISER MOTOR

DRIVER POWER SEAT REAR RISER MOTOR - RED 2 WAY

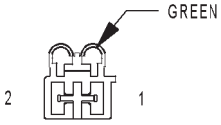
CAV	CIRCUIT	FUNCTION
1	P11 14LG/YL	DRIVER SEAT REAR UP SWITCH SENSE
1	P111 14LG/YL (MEMORY)	SEAT REAR UP DRIVER
2	P13 14LG/OR	DRIVER SEAT REAR DOWN SWITCH SENSE
2	P113 14LG/WT (MEMORY)	SEAT REAR DOWN DRIVER



DRIVER POWER SEAT REAR RISER POSITION SENSOR

DRIVER POWER SEAT REAR RISER POSITION SENSOR - BLACK 3 WAY

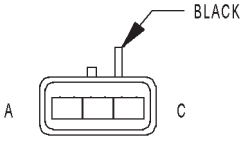
CAV	CIRCUIT	FUNCTION
A	P28 20LG/BR	SEAT POSITION SENSOR GROUND
B	P27 20LG/LB	REAR RISER POSITION SIGNAL
C	P29 20LG/WT	SEAT SENSOR 5 VOLT SUPPLY



DRIVER POWER SEAT RECLINER MOTOR

DRIVER POWER SEAT RECLINER MOTOR - GREEN 2 WAY

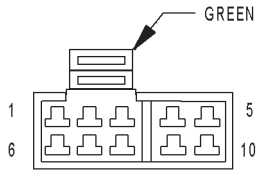
CAV	CIRCUIT	FUNCTION
1	P41 14LG/GY	DRIVER SEAT RECLINER DOWN SWITCH SENSE
1	P141 14LG/BR (MEMORY)	SEAT RECLINER DOWN DRIVER
2	P43 14LG/VT	DRIVER SEAT RECLINER UP SWITCH SENSE
2	P143 14LG/GY (MEMORY)	SEAT RECLINER UP DRIVER



DRIVER POWER SEAT RECLINER POSITION SENSOR

DRIVER POWER SEAT RECLINER POSITION SENSOR - BLACK 3 WAY

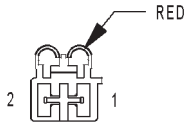
CAV	CIRCUIT	FUNCTION
A	P29 20LG/WT	SEAT SENSOR 5 VOLT SUPPLY
B	P47 20LG/LB	RECLINER POSITION SIGNAL
C	P28 20LG/BR	SEAT POSITION SENSOR GROUND



DRIVER POWER SEAT SWITCH

DRIVER POWER SEAT SWITCH - GREEN 10 WAY

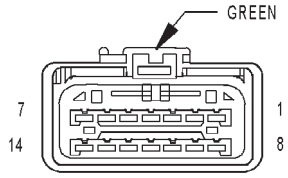
CAV	CIRCUIT	FUNCTION
1	Z849 20BK/OR (MEMORY)	GROUND
1	Z849 14BK/OR	GROUND
2	P43 14LG/VT	DRIVER SEAT RECLINER UP SWITCH SENSE
2	P43 14LG/VT (MEMORY)	RECLINER UP SWITCH SENSE
3	P17 14LG/DG	DRIVER SEAT HORIZONTAL REARWARD SWITCH SENSE
3	P17 20LG/DG (MEMORY)	SEAT HORIZONTAL REARWARD SWITCH SENSE
4	P41 14LG/GY	DRIVER SEAT RECLINER DOWN SWITCH SENSE
4	P41 14LG/GY (MEMORY)	RECLINER DOWN SWITCH SENSE
5	A210 14OR/RD	FUSED SEAT SWITCH DRIVER
5	P9 20LG/OR (MEMORY)	SEAT SWITCH B(+) SUPPLY
6	P15 14LG/WT	DRIVER SEAT HORIZONTAL FORWARD SWITCH SENSE
6	P15 20LG/WT (MEMORY)	SEAT HORIZONTAL FORWARD SWITCH SENSE
7	P19 14LG/LB	DRIVER FRONT UP SWITCH SENSE
7	P19 20LG/LB (MEMORY)	SEAT FRONT UP SWITCH SENSE
8	P11 14LG/YL	DRIVER SEAT REAR UP SWITCH SENSE
8	P11 20LG/YL (MEMORY)	SEAT REAR UP SWITCH SENSE
9	P13 20LG/OR (MEMORY)	SEAT REAR DOWN SWITCH SENSE
9	P13 14LG/OR	DRIVER SEAT REAR DOWN SWITCH SENSE
10	P21 14LG/TN	DRIVER FRONT DOWN SWITCH SENSE
10	P21 20LG/TN (MEMORY)	SEAT FRONT DOWN SWITCH SENSE



DRIVER POWER WINDOW MOTOR

DRIVER POWER WINDOW MOTOR - RED 2 WAY

CAV	CIRCUIT	FUNCTION
1	Q11 16OR/LG	MASTER WINDOW SWITCH DRIVER UP
2	Q21 16OR/WT	MASTER WINDOW SWITCH DRIVER DOWN



DRIVER POWER WINDOW SWITCH (EXCEPT LOWLINE)

DRIVER POWER WINDOW SWITCH (EXCEPT LOWLINE) - GREEN 14 WAY

CAV	CIRCUIT	FUNCTION
1	Q24 16OR/DG	PASSENGER SIDE REAR WINDOW OPEN
2	Q16 12OR/TN	MASTER WINDOW SWITCH PASSENGER UP
3	Q13 16OR/DB	DRIVER SIDE REAR WINDOW CLOSE
4	Q26 12OR/GY	MASTER WINDOW SWITCH PASSENGER DOWN
5	Q14 16OR/GY	PASSENGER SIDE REAR WINDOW CLOSE
6	Q11 16OR/LG	MASTER WINDOW SWITCH DRIVER UP
7	Q23 16OR/LB	DRIVER SIDE REAR WINDOW OPEN
8	Q21 16OR/WT	MASTER WINDOW SWITCH DRIVER DOWN
9	F304 12WT/PK	FUSED WINDOW CIRCUIT BREAKER OUTPUT

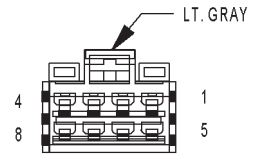
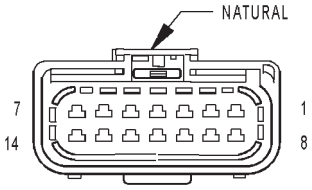
11	F304 12WT/PK	FUSED WINDOW CIRCUIT BREAKER OUTPUT
12	-	-
13	Z421 12BK/BR	GROUND
14	F304 16WT/PK	FUSED WINDOW CIRCUIT BREAKER OUTPUT



DRIVER POWER WINDOW SWITCH (LOWLINE)

DRIVER POWER WINDOW SWITCH (LOWLINE) - LT. GRAY 8 WAY

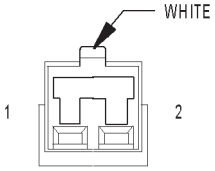
CAV	CIRCUIT	FUNCTION
1	F304 12WT/PK	FUSED WINDOW CIRCUIT BREAKER OUTPUT
2	Z421 12BK/BR	GROUND
3	Z421 12BK/BR	GROUND
4	-	-
5	Q21 16OR/WT	MASTER WINDOW SWITCH DRIVER DOWN
6	F304 12WT/PK	FUSED WINDOW CIRCUIT BREAKER OUTPUT
7	Z421 20BK/BR	GROUND
8	Q11 16OR/LG	MASTER WINDOW SWITCH DRIVER UP



DRIVER POWER WINDOW SWITCH (RHD)

DRIVER POWER WINDOW SWITCH (RHD) - NATURAL 14 WAY

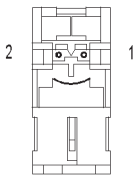
CAV	CIRCUIT	FUNCTION
1	Q23 16OR/LB	DRIVER SIDE REAR WINDOW OPEN
2	Q11 16OR/LG	MASTER WINDOW SWITCH DRIVER UP
3	Q14 16OR/GY	PASSENGER SIDE REAR WINDOW CLOSE
4	Q26 12OR/GY	MASTER WINDOW SWITCH PASSENGER DOWN
5	Q13 16OR/DB	DRIVER SIDE REAR WINDOW CLOSE
6	Q16 12OR/TN	MASTER WINDOW SWITCH PASSENGER UP
7	Q24 16OR/DG	PASSENGER SIDE REAR WINDOW OPEN
8	F304 16WT/PK	FUSED WINDOW CIRCUIT BREAKER OUTPUT
9	Z421 12BK/BR	GROUND
10	-	-
11	F304 12WT/PK	FUSED WINDOW CIRCUIT BREAKER OUTPUT
12	-	-
13	F304 12WT/PK	FUSED WINDOW CIRCUIT BREAKER OUTPUT
14	Q21 16OR/WT	MASTER WINDOW SWITCH DRIVER DOWN



DRIVER SEAT BELT SWITCH

DRIVER SEAT BELT SWITCH - WHITE 2 WAY

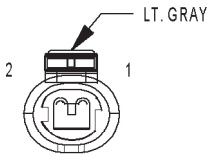
CAV	CIRCUIT	FUNCTION
1	R59 18LG/TN	DRIVER SEAT BELT SWITCH LINE 1
2	R57 18LG/GY	DRIVER SEAT BELT SWITCH LINE 2



DRIVER SEAT BELT TENSIONER

DRIVER SEAT BELT TENSIONER - 2 WAY

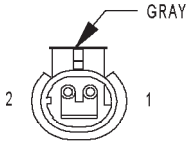
CAV	CIRCUIT	FUNCTION
1	R53 18LG/YL	DRIVER SEAT BELT TENSIONER LINE 2
2	R55 18LG/DG	DRIVER SEAT BELT TENSIONER LINE 1



EGR SOLENOID (DIESEL)

EGR SOLENOID (DIESEL) - LT. GRAY 2 WAY

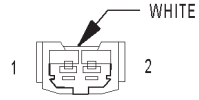
CAV	CIRCUIT	FUNCTION
1	K35 20GY/YL	EGR SOLENOID CONTROL
2	K342 16BR/WT	ECM/PCM RELAY OUTPUT



EGR SOLENOID (GAS)

EGR SOLENOID (GAS) - GRAY 2 WAY

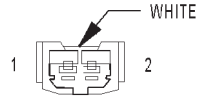
CAV	CIRCUIT	FUNCTION
1	K35 18DB/VT	EGR SOLENOID CONTROL
2	F202 18PK/GY	FUSED IGNITION SWITCH OUTPUT (RUN-START)



ELECTRIC WIPER DE-ICER C1

ELECTRIC WIPER DE-ICER C1 - WHITE 2 WAY

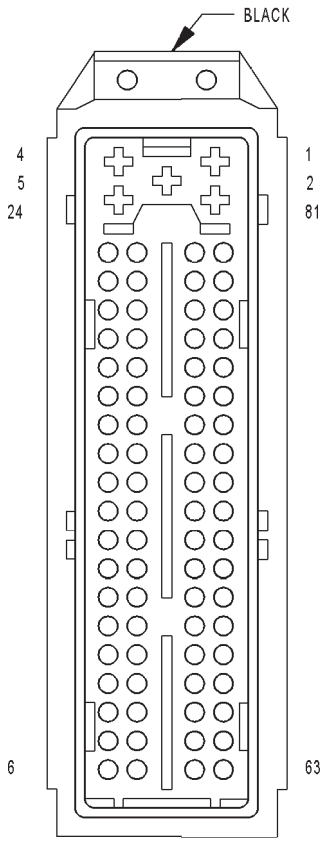
CAV	CIRCUIT	FUNCTION
1	F302 18GY/PK	FUSED ACCESSORY RELAY OUTPUT
2	-	-



ELECTRIC WIPER DE-ICER C2

ELECTRIC WIPER DE-ICER C2 - WHITE 2 WAY

CAV	CIRCUIT	FUNCTION
1	C900 18LB/VT	WIPER DE-ICER DRIVER
2	-	-



ENGINE CONTROL MODULE C1 (DIESEL)

ENGINE CONTROL MODULE C1 (DIESEL) - BLACK 81 WAY

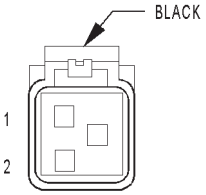
FUEL INJECTOR NO. 5 (3.3L/3.8L)

FUEL INJECTOR NO. 5 (3.3L/3.8L) - BLACK 2 WAY

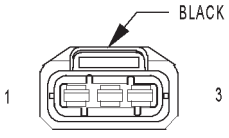
CAV	CIRCUIT	FUNCTION
1	K342 16BR/WT	AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K38 16BR/OR	FUEL INJECTOR NO. 5 DRIVER



FUEL INJECTOR NO. 6 (3.3L/3.8L)

FUEL INJECTOR NO. 6 (3.3L/3.8L) - BLACK 2 WAY

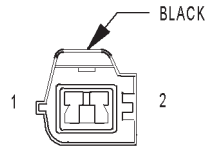
CAV	CIRCUIT	FUNCTION
1	K342 16BR/WT	AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K58 16BR/VT	FUEL INJECTOR NO. 6 DRIVER



FUEL PRESSURE SENSOR (DIESEL)

FUEL PRESSURE SENSOR (DIESEL) - BLACK 3 WAY

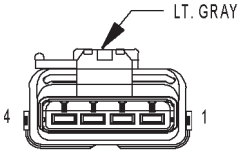
CAV	CIRCUIT	FUNCTION
1	K80 20DB/TN	FUEL PRESSURE SENSOR GROUND
2	K78 20GY	FUEL PRESSURE SENSOR SIGNAL
3	K9 20LB	FUEL PRESSURE SENSOR 5 VOLT SUPPLY



FUEL PRESSURE SOLENOID (DIESEL)

FUEL PRESSURE SOLENOID (DIESEL) - BLACK 2 WAY

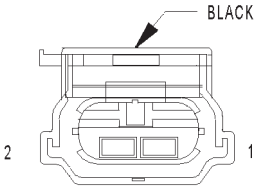
CAV	CIRCUIT	FUNCTION
1	K342 16BR/WT	ECM/PCM RELAY OUTPUT
2	K87 16BR	FUEL PRESSURE SOLENOID CONTROL



FUEL PUMP MODULE

FUEL PUMP MODULE - LT. GRAY 4 WAY

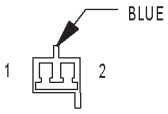
CAV	CIRCUIT	FUNCTION
1	Z201 16BK/OR (GAS)	GROUND
2	Z201 18BK/OR (RHD/DIESEL)	GROUND
2	Z201 20BK/DB (LHD/DIESEL) (GAS)	GROUND
3	N4 18DB/WT	FUEL LEVEL SENSOR SIGNAL
4	N1 16DB/OR (GAS)	FUEL PUMP RELAY OUTPUT



GENERATOR

GENERATOR - BLACK 2 WAY

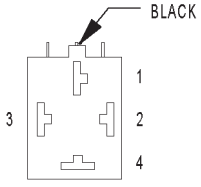
CAV	CIRCUIT	FUNCTION
1	K342 16BR/WT (DIESEL)	ECM/PCM RELAY OUTPUT
1	K342 16BR/WT (GAS)	AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K20 14BR/GY (DIESEL)	GENERATOR FIELD CONTROL
2	K20 18BR/GY (GAS)	GENERATOR FIELD CONTROL



GLOVE BOX LAMP

GLOVE BOX LAMP - BLUE 2 WAY

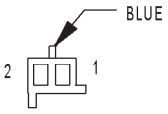
CAV	CIRCUIT	FUNCTION
1	M28 20YL/TN	GLOVE BOX LAMP DRIVER
2	Z328 20BK/TN	GROUND



GLOW PLUG RELAY (DIESEL)

GLOW PLUG RELAY (DIESEL) - BLACK 4 WAY

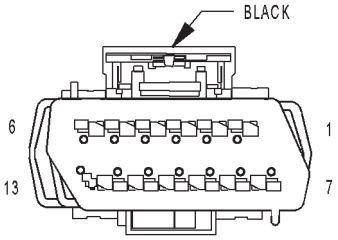
CAV	CIRCUIT	FUNCTION
1	A202 10RD/WT	FUSED B(+)
2	K152 20DB/WT	GLOW PLUG RELAY CONTROL
3	K342 16BR/WT	ECM/PCM RELAY OUTPUT
4	K154 10BR/OR	GLOW PLUG RELAY OUTPUT



HALO LAMP

HALO LAMP - BLUE 2 WAY

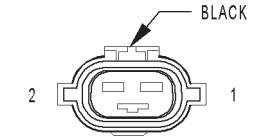
CAV	CIRCUIT	FUNCTION
1	Z326 20BK/OR	GROUND
2	M26 20YL/DB	HALO LAMP DRIVER



HEADLAMP SWITCH

HEADLAMP SWITCH - BLACK 13 WAY

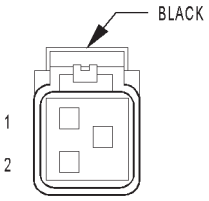
CAV	CIRCUIT	FUNCTION
1	Z403 20BK/YL (BUILT-UP-EXPORT)	GROUND
2	L78 20WT/OR (BUILT-UP-EXPORT)	FUSED PARK LAMP RELAY OUTPUT
3	-	-
4	Z407 18BK/OR	GROUND
5	L36 20WT/DB (BUILT-UP-EXPORT)	REAR FOG LAMP INDICATOR DRIVER
6	L900 20WT/YL	HEADLAMP SWITCH MUX RETURN
7	L13 20WT/YL (BUILT-UP-EXPORT)	HEADLAMP ADJUST SIGNAL
8	E19 20OR/BR	PANEL LAMPS DRIVER (HEADLAMP SWITCH)
9	-	-
10	L39 20WT/OR (HIGH LINE)	FRONT FOG LAMP INDICATOR DRIVER
11	L307 20WT/BR	HEADLAMP SWITCH MUX
12	E2 20OR/BR	PANEL LAMPS DIMMER SIGNAL
13	-	-



HEADLAMP WASHER PUMP MOTOR (BUILT-UP-EXPORT)

HEADLAMP WASHER PUMP MOTOR (BUILT-UP-EXPORT) - BLACK 2 WAY

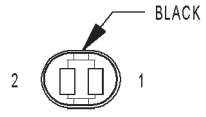
CAV	CIRCUIT	FUNCTION
1	V53 12BR/OR	HEADLAMP WASHER RELAY OUTPUT
2	Z243 12BK/OR	GROUND



HIGH NOTE HORN

HIGH NOTE HORN - BLACK 2 WAY

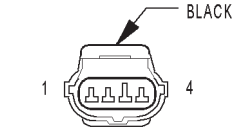
CAV	CIRCUIT	FUNCTION
1	Z299 18BK/OR	GROUND
2	X2 18DG/OR	HORN RELAY OUTPUT



HOOD AJAR SWITCH

HOOD AJAR SWITCH - BLACK 2 WAY

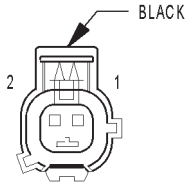
CAV	CIRCUIT	FUNCTION
1	G70 20VT/LB	HOOD AJAR SWITCH SENSE
2	Z470 20BK/LB	GROUND



IDLE AIR CONTROL MOTOR (2.4L)

IDLE AIR CONTROL MOTOR (2.4L) - BLACK 4 WAY

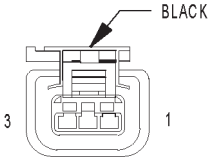
CAV	CIRCUIT	FUNCTION
1	K59 18BR/DG	IDLE AIR CONTROL NO. 4 DRIVER
2	K40 18BR/LG	IDLE AIR CONTROL NO. 3 DRIVER
3	K60 18VT/LG	IDLE AIR CONTROL NO. 2 DRIVER
4	K39 18VT/DG	IDLE AIR CONTROL NO. 1 DRIVER



IDLE AIR CONTROL MOTOR (3.3L/3.8L)

IDLE AIR CONTROL MOTOR (3.3L/3.8L) - BLACK 2 WAY

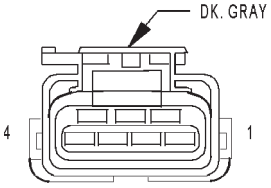
CAV	CIRCUIT	FUNCTION
1	K39 18VT/DG	IDLE AIR CONTROL NO. 1 DRIVER
2	K60 18VT/LG	IDLE AIR CONTROL NO. 2 DRIVER



IGNITION COIL (2.4L)

IGNITION COIL (2.4L) - BLACK 3 WAY

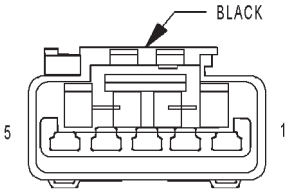
CAV	CIRCUIT	FUNCTION
1	K17 16DB/TN	IGNITION COIL NO. 2 DRIVER
2	K342 16BR/WT	AUTOMATIC SHUT DOWN RELAY OUTPUT
3	K19 16DB/DG	IGNITION COIL NO. 1 DRIVER



IGNITION COIL (3.3L/3.8L)

IGNITION COIL (3.3L/3.8L) - DK. GRAY 4 WAY

CAV	CIRCUIT	FUNCTION
1	K18 16DB/OR	IGNITION COIL NO. 3 DRIVER
2	K342 16BR/WT	AUTOMATIC SHUT DOWN RELAY OUTPUT
3	K19 16DB/DG	IGNITION COIL NO. 1 DRIVER
4	K17 16DB/TN	IGNITION COIL NO. 2 DRIVER



IGNITION SWITCH

IGNITION SWITCH - BLACK 5 WAY

CAV	CIRCUIT	FUNCTION
1	G900 20VT/OR	IGNITION SWITCH SENSE RETURN
2	G20 20VT/BR	IGNITION SWITCH SENSE
3	F20 20PK/WT (LHD)	FUSED IGNITION SWITCH OUTPUT (RUN-START)

CONNECTOR/GROUND/SPLICE LOCATION
DESCRIPTION 1

CONNECTOR/GROUND/SPLICE LOCATION

DESCRIPTION

This section provides illustrations identifying connector, ground, and splice locations in the vehicle. Connector, ground, and splice indexes are provided. Use the wiring diagrams in each section for connector, ground, and splice identification. Refer to the appropriate index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

CONNECTORS

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.
A/C Compressor Clutch	LTGY	Top of A/C Compressor	9, 10, 11, 13, 14
A/C-Heater Control C1 (MTC)	BK/RD	Rear of Control	15, 18, 20
A/C-Heater Control C2 (MTC)	BK/BL	Rear of Control	15, 18, 20
A/C Pressure Transducer	GY	At Throttle Body	9, 11, 12, 13
Accelerator Pedal Position Sensor (Diesel)	BK	At Accelerator Pedal	36
Airbag Control Module	YL/RD	Right Side of Instrument Panel	15, 19, 20
Ambient Temperature Sensor	BK	On Radiator Closure Panel	1
ATC Remote Sensor		Above ATC Control	N/S
Automatic Day/Night Mirror	BK	At Mirror	N/S
Autostick Switch	BK	Rear of Switch	16, 17, 18
Auto Temperature Control C1 (ATC)	WT	Rear of Control	N/S
Auto Temperature Control C2 (ATC)	BK	Rear of Control	N/S
Auto Temperature Control C3 (ATC)		Rear of Control	N/S
Back-Up Lamp Switch	BK	On Transmission	12
Battery Temperature Sensor (Diesel)	BK	At Battery	N/S
Blower Motor Resistor C1 (MTC)	BK	Right Side of HVAC	N/S
Blower Motor Resistor C2 (MTC)		Right Side of HVAC	N/S
Body Control Module C1	BK	Under Left Instrument Panel	35, 36
Body Control Module C2	BK/GN	Under Left Instrument Panel	35, 36
Body Control Module C3	BK/WT	Under Left Instrument Panel	35, 36
Body Control Module C4	BK/GY	Under Left Instrument Panel	15, 16, 25
Body Control Module C5	BK	Under Left Instrument Panel	15, 16, 25

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.
Boost Pressure Sensor (Diesel)	BK	Top Left of Engine	N/S
Brake Fuid Level Switch	BK	On Master Cylinder	6
Brake Lamp Switch	BK	At Top Of Brake Pedal	35, 36
Brake Transmission Shift Interlock Solenoid (EATX)	BK	Near Steering Column	15, 16, 17, 26
C100	BK	Left Fender Shield	5
C101	LTGY	Left Fender Shield	5
C102 (2.4L)	BK	Top Front of Engine	10
C102 (3.3/3.8L)	BK	At Fuel Rail	13
C103 (Diesel)	BK	Left Side Engine Compartment	N/S
C106 (BUX)	BK	Near Left Headlamp Leveling Motor	N/S
C107 (BUX)	BK	Near Right Headlamp Leveling Motor	N/S
C200	GY	Left Side Instrument Panel	15, 16, 25, 35, 36
C201	YL	Left Side Instrument Panel	15, 16, 25, 35, 36
C202	GY	Right Side Instrument Panel A/C Heatrer Unit	15, 19, 24
C203 (United Kingdom)	WT	Right Side of Instrument Panel	N/S
C300 (LHD)	BK	Left Front Door Lower	N/S
C300 (RHD)	BK	Right Front Door Lower	
C301	LTGY	Left Front Door Upper	N/S
C302	LTGY	Right Front Door Upper	8, 33, 37
C303 (LHD)	BK	Right Front Door Lower	8, 37
C303 (RHD)	BK	Left Front Door Lower	33, 37
C304	YL	Left Wire Track Seat to Body	27
C305	GY	Left Wire Track Seat to Body	27
C306	YL	Right Wire Track Seat to Body	28
C307	GY	Right Wire Track Seat to Body	28
C308	BL	Left Rear Sliding Door	34
C309	GN	Right Rear Sliding Door	27, 28, 33
C310	BK	At Front Console	N/S
C311	GY	Rear A/C Switch	N/S
C312	GY	At Dome Lamp	28, 33
C313	BK	At Rear Console	N/S
C314	BK	Left Side Liftgate	42
C315	BK	Right Side Liftgate	42
C316	BK	Wire Track to Sliding Door	N/S
C317	BK	Right Sliding Door	27
C318 (Trailer Tow)	BK	Left Quarter	N/S
C319 (Except Built-up Export)		Left Side Liftgate	N/S
C320	DKGY	Driver Power Seat on Seat Harness	N/S
C321	DKGY	Under Passenger Seat	N/S
C322	BK	On Seat Harness to Body	27
C324	BK	Left Sliding Door	N/S

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.
C325	BK	Right Sliding Door	27
C326	YL	At Driver Side Airbag	N/S
C327	YL	At Passenger Side Airbag	N/S
C329 (Diesel)	BK	Left Rear Engine Compartment	N/S
C330 (Diesel)	LTGY	Left Rear Engine Compartment	N/S
C331 (Diesel)	BK	Left Rear Engine Compartment	N/S
Cabin Heater Assist C1 (Diesel)	BK	Top of Engine	11, 12
Cabin Heater Assist C2 (Diesel)	BK	Top of Engine	11, 12
Camshaft Position Sensor (Gas)	BK	Rear of Cylinder Head Right Side of Engine	N/S
Camshaft Position Sensor (Diesel)	BK	Rear of Cylinder Head	11, 12
CD Changer		Behind CD Changer	N/S
Center Dome Lamp	GY	At Lamp	N/S
Center High Mounted Stop Lamp	BK	At Lamp	42
Clockspring - C1	WT	Steering Column	15, 16, 17, 18, 26
Clockspring - C2	YL	Steering Column	15, 16, 17, 18, 26
Clockspring - C3	BK	Steering Column	N/S
Clockspring - C4	BK	Steering Column	N/S
Clockspring - C5	YL	Steering Column	N/S
Clutch Pedal Interlock Switch (Diesel)	RD	At Switch/Driver Side	36
Clutch Pedal Upstop Switch (Diesel)	BK	At Switch/Driver Side	36
Controller Anti-Lock Brake	BK	Right Side of Engine Compartment	9, 10, 12, 13, 14
Crank Case Ventilation Heater (Diesel)	BK	Top of Cylinder Head	11
Crankshaft Position Sensor (Diesel)	BK	Rear of Engine	12
Crankshaft Position Sensor (Gas)	BK	Rear of Engine	9, 13
Data Link Connector	WT	Lower Instrument Panel Near Steering Column	35, 36
Diagnostic Junction Port	BK	Lower Instrument Panel Near Steering Column	35, 36
Dosing Pump	BK	Top of Engine	N/S
Driver Airbag C1	BN	Steering Column	N/S
Driver Airbag C2	BK	Steering Column	N/S
Driver Blend Actuator (ATC)	GY	On HVAC	N/S
Driver Blend Actuator (MTC)	GY	On HVAC	N/S
Driver Door Courtesy Lamp	GY	At Lamp	N/S
Driver Door Lock Switch	BK	At Switch	N/S
Driver Heated Seat Back	GN	At Seat	N/S
Driver Heated Seat Cushion	BK	At Seat	N/S
Driver Heated Seat Module C1	GY	Driver Heated Seat	N/S
Driver Heated Seat Module C2	GY	Driver Heated Seat Back	N/S
Driver Heated Seat Module C3	GN	At Seat	N/S

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.
Driver Power Seat Front Riser Motor	RD	At Seat	N/S
Driver Power Seat Horizontal Motor	BK	At Seat	N/S
Driver Power Seat Rear Riser Motor	RD	At Seat	N/S
Driver Power Seat Recliner Motor	GN	At Seat	N/S
Driver Power Seat Switch	GN	At Switch	N/S
Driver Power Window Motor	RD	At Motor	N/S
Driver Power Window Switch	GN	At Switch	N/S
Driver Power Window Switch (RHD)	NAT	At Switch	N/S
Driver Seatbelt Switch	WT	At Switch on Seat Harness	N/S
Driver Seatbelt Tensioner		On Seat Harness	N/S
EGR Solenoid (Diesel)	BK	Above Transmission Right Side of Engine	N/S
EGR Solenoid	GY	Above Transmission Right Side of Engine	9, 10, 11, 13
Electric Wiper De-Icer-C1	WT	Right Side Instrument Panel	15, 1923
Electric Wiper De-Icer-C2	WT	Left Side Instrument Panel	15, 16, 22
Engine Control Module C1 (Diesel)	BK	Right Side of Engine	11
Engine Control Module C2 (Diesel)	BK	Right Side of Engine	11
Engine Coolant Temperature Sensor (Gas)	BK	On Cylinder Block	N/S
Engine Coolant Temperature Sensor (Diesel)	BL	On Cylinder Block	11
Engine Oil Pressure Sensor (Diesel)	BK	Rear of Engine	12
Engine Oil Pressure Switch (Gas)	LTGN	On Cylinder Block	9
Engine Oil Temperature Sensor (Diesel)	BK	Rear of Engine	12
EVAP/Purge Solenoid	BK	Right Motor Mount	9, 13
Evaporator Temperature Sensor	BK	Right Side of HVAC	N/S
Floor Console Lamp	BK	At Lamp	N/S
Floor Console Power Outlet	RD	At Front Console	N/S
Front Blower Module C1 (ATC)	BK	On HVAC	N/S
Front Blower Module C2 (ATC)	BK	On HVAC	N/S
Front Cigar Lighter	RD/NAT	Rear of Lighter	15, 18, 20
Front Reading Lamps/Switch	BK	At Switch	N/S
Front Washer Pump Motor	BK	Right Fender Well	3
Fuel Heater (Diesel)	BK	Left Rear Engine Compartment	N/S
Fuel Injector No.1	BK	At Fuel Injector	N/S
Fuel Injector No.1 (Diesel)	BK	At Fuel Injector	11
Fuel Injector No.2	BK	At Fuel Injector	N/S
Fuel Injector No.2 (Diesel)	BK	At Fuel Injector	11

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.

POWER DISTRIBUTION SYSTEM

DESCRIPTION

This group covers the various standard and optional power distribution components used on this model. The power distribution system for this vehicle consists of the following components:

- Integrated Power Module (IPM)
- Front Control Module (FCM)
- Power Outlets

Refer to Wiring Diagrams for complete circuit schematics.

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Bus bars
- Cartridge fuses
- Circuit splice blocks
- Flashers
- Fusible links
- Relays

Following are general descriptions of the major components in the power distribution system. See the owner's manual in the vehicle glove box for more information on the features and use of all of the power distribution system components.

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized distribution points for the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the vehicle technician to use when conducting diagnosis and repair of faulty circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate many accessories that the vehicle owner may choose to have installed in the aftermarket.

ACCESSORY RELAY

DESCRIPTION

The accessory relay is an electromechanical device that switches fused battery current to the accessory powered vehicle circuits when the ignition switch is turned to the Accessory or On positions. The delay feature will maintain power to the accessories for 45 seconds after the ignition is shut off or until a door is opened. This allows sufficient time to close windows and park the windshield wipers. The accessory relay is located in the Integrated Power Module (IPM) in the engine compartment.

The accessory relay is a International Standards Organization (ISO) relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The accessory relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor or diode is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

DIAGNOSIS AND TESTING

DIAGNOSIS & TESTING - ACCESSORY RELAY

The accessory relay (Fig. 1) is located in the Integrated Power Module (IPM), in the engine compartment. For complete circuit diagrams, refer to **Wiring Diagrams**.

(1) Remove the accessory relay from the IPM. Refer to **Accessory Relay** in the Removal and Installation section of this group for the procedure.

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, perform the Relay Circuit Test that follows. If not OK, replace the faulty relay.

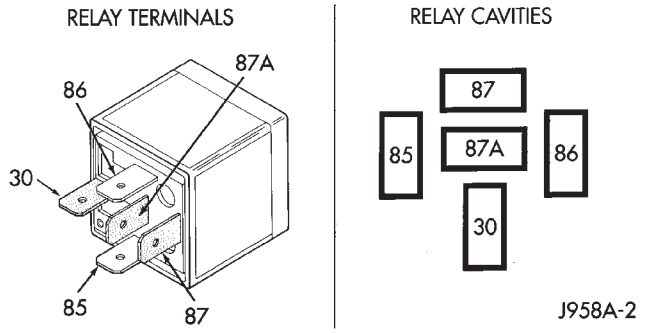

Fig. 1 Accessory Relay

DIAGNOSIS & TESTING - RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) of the IPM is connected to battery voltage and should be hot at all times. Check for battery voltage at the fused B(+) circuit cavity in the IPM receptacle for the accessory relay. If OK, go to Step 2. If not OK, repair the fused B(+) circuit to the IPM fuse as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the fused B(+) fuse in the IPM that feeds the accessories when the relay is energized by the ignition switch. There should be continuity between the IPM cavity for relay terminal 87 and the fused B(+) fuse in the IPM at all times. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the IPM fuse as required.

ACCESSORY RELAY (Continued)

(4) The coil ground terminal (85) is connected to the electromagnet in the relay. It receives battery feed to energize the accessory relay when the ignition switch is in the Accessory or On positions. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (acc/run) circuit cavity for relay terminal 85 in the IPM receptacle for the accessory relay. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (acc/run) circuit to the ignition switch as required.

(5) The coil battery terminal (86) is connected to the electromagnet in the relay. The IPM cavity for this terminal should have continuity to ground at all times. If not OK, repair the open ground circuit to ground as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the Integrated Power Module (IPM) cover from the IPM.

(3) Remove the accessory relay from the IPM. Refer to the IPM cover for relay location.

INSTALLATION

(1) Position the accessory relay in the proper receptacle in the Integrated Power Module (IPM).

(2) Push in firmly on the accessory relay until the terminals are fully seated in the terminal cavities in the IPM receptacle.

(3) Install the IPM cover.

(4) Reconnect the battery negative cable.

INTEGRATED POWER MODULE

DESCRIPTION

The Integrated Power Module (IPM) is a combination of the Power Distribution Center (PDC) and the Front Control Module (FCM). The IPM is located in the engine compartment, next to the battery on this model (Fig. 2). The power distribution center mates directly with the Front Control Module (FCM) to form the IPM Fuse and Relay Center. The power distribution center (PDC) is a printed circuit board based module that contains fuses and relays, while the front control module contains the electronics controlling the IPM and other functions. This IPM connects directly to the battery positive via a four pin connector. The ground connection is via two other connectors. The IPM provides the primary means of voltage distribution and protection for the entire vehicle.

The molded plastic IPM housing includes a base and cover. The IPM cover is easily opened or removed for service access by squeezing the two marked cover latches and has a fuse and relay layout map integral to the inside surface of the cover. This IPM housing base and cover are secured in place by an IPM mounting bracket. This mounting bracket is designed to allow the IPM to rotate counter-clockwise once the locking tab is disengaged. The IPM mounting bracket is secured in place by bolts threaded into the left front wheel house.

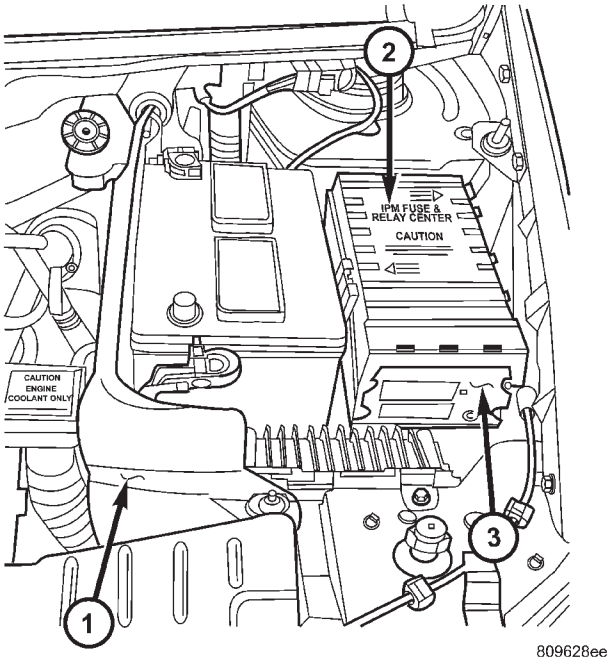

Fig. 2 BATTERY THERMAL GUARD

1 - BATTERY THERMAL GUARD
2 - INTEGRATED POWER MODULE
3 - FRONT CONTROL MODULE

Replaceable components of the IPM assembly are broken down into the following components: the Power Distribution Center (PDC) (without fuses or relays), the IPM cover, the Front Control Module (FCM), the IPM mounting bracket, IPM bracket retaining clips and the IPM assembly which includes the power distribution center, the cover and FCM. **Refer to the Front Control Module in the Electronic Control Module section** of this service manual for information on the FCM.

OPERATION

All of the current from the battery and the generator output enters the Integrated Power Module (IPM) via a four- pin connector on the bottom of the module. The IPM cover is unlatched and opened or removed to access the fuses or relays. Internal connections of all of the power distribution center circuits is accomplished by a combination of bus bars and a printed circuit board. Refer to the Wiring sec-

INTEGRATED POWER MODULE (Continued)

tion of the service manual for complete IPM circuit schematics.

REMOVAL

(1) Disconnect the negative and positive battery cables.

(2) Remove the battery thermal guard from the vehicle. Refer to the Battery section for the procedure.

(3) Remove the battery from the vehicle. Refer to the Battery section for the procedure.

(4) Using a flat-bladed screwdriver, twist the Integrated Power Module (IPM) bracket retaining latch outward to free the intelligent power module from its mounting bracket (Fig. 3).

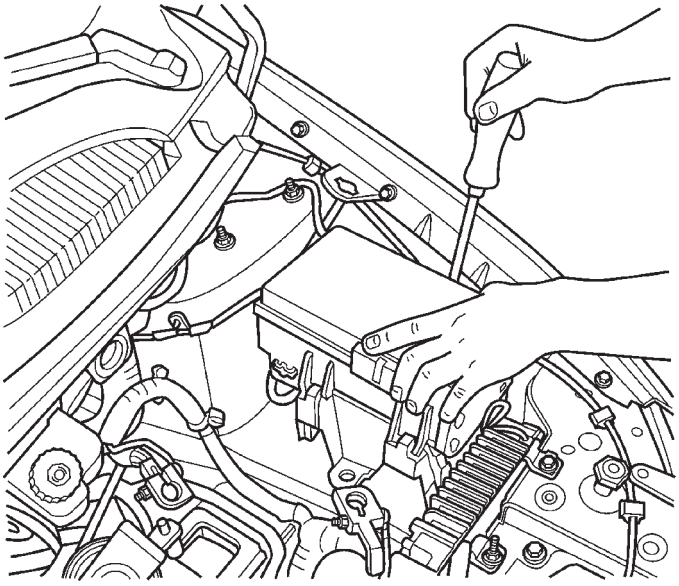

Fig. 3 RELEASING INTEGRATED POWER MODULE FROM ITS MOUNTING BRACKET

(5) Rotate the IPM counter-clockwise to access and disconnect the various electrical connectors (Fig. 4).

(6) Free the IPM from its mounting bracket by removing the IPM bracket clips from the hinge. A screwdriver slipped up from under the hinge will free the clips.

INSTALLATION

(1) Snap the left side of the Integrated Power Module (IPM) housing in its mounting bracket and connect the various electrical connectors. Care must be taken that the Connector Positive Assurance (CPA) on the five-pin B+ connector is positively engaged to prevent generating a Diagnostic Trouble Code (DTC).

NOTE: IPM electrical connectors are color coded to ease location reference.

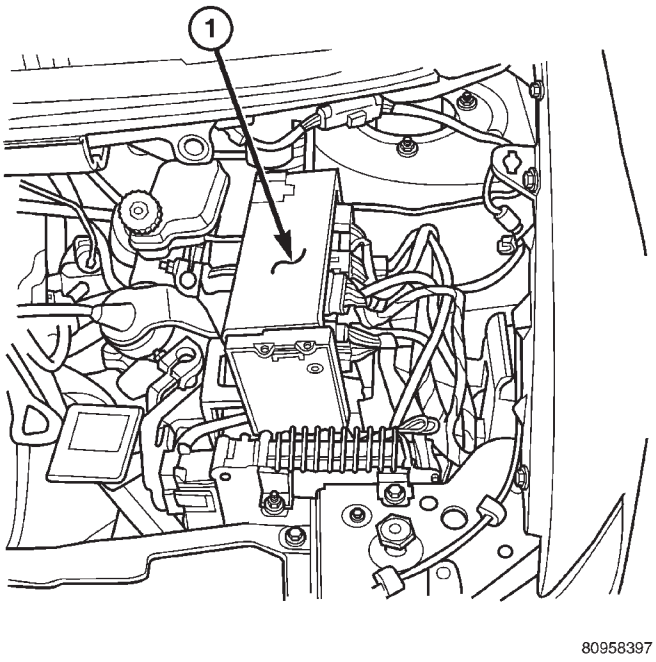

Fig. 4 DISCONNECTING IPM

1 - INTEGRATED POWER MODULE FUSE & RELAY CENTER

(2) Being certain no wires are stressed or pinched, rotate the IPM clock-wise until secured in mounting bracket. An audible click may be heard.

(3) Install the battery in the vehicle. Refer to the Battery section for the procedure.

(4) Install the battery thermal guard in the vehicle. Refer to the Battery section for the procedure.

(5) Connect the negative and positive battery cables.

(6) Using a diagnostic scan tool, check for any stored diagnostic trouble codes and correct, check that all vehicle options are operational before returning the vehicle to service.

IOD FUSE

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is removed from its normal cavity in the Integrated Power Module (IPM) when the vehicle is shipped from the factory. Dealer personnel are to remove the IOD fuse from the storage location and install it into the IPM fuse cavity marked IOD as part of the preparation procedures performed just prior to new vehicle delivery.

The IPM has a molded plastic cover that can be removed to provide service access to all of the fuses and relays in the IPM. An integral latch and hinges are molded into the IPM cover for easy removal. A fuse layout map is integral to the underside of the IPM cover to ensure proper fuse and relay identifica-

IOD FUSE (Continued)

tion. The IOD fuse is a 15 ampere blade-type cartridge fuse and, when removed, it is stored in a fuse cavity adjacent to the washer fuse within the IPM.

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock. The only reason the IOD fuse is removed is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is removed from the IPM fuse cavity when the vehicle is shipped from the assembly plant. Dealer personnel must install the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that removing the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged. Refer to **Battery System** for additional service information.

REMOVAL

(1) Turn the ignition switch to the Off position.

(2) Unlatch and open the cover of the intelligent power module.

(3) Remove the IOD fuse from fuse location marked **IOD** of the Integrated Power Module (IPM).

(4) Store the removed IOD fuse by installing it in the unused fuse storage marked **SPARE** of the IPM.

(5) Close and latch the IPM.

INSTALLATION

(1) Be certain the ignition switch is in the Off position.

(2) Unlatch and open the cover of the Integrated Power Module (IPM).

(3) Remove the stored 15 amp IOD fuse from fuse storage marked **SPARE** of the IPM.

(4) Use a thumb to press the IOD fuse firmly down into IPM fuse cavity marked **IOD**.

(5) Close and latch the IPM cover.

POWER OUTLET

DESCRIPTION

Accessory power outlets are standard equipment on this model. Two power outlets are installed in the instrument panel center lower bezel, which is located near the bottom of the instrument panel center stack area. Two additional power outlets are also incorporated into the vehicle, one on the left rear C-pillar trim and the other in the center console, if equipped. The power outlets bases are secured by a snap fit in the appropriate bezels. A hinged plug flips closed to conceal and protect the power outlet base when the power outlet is not being used.

The power outlet receptacle unit and the power outlet plugs are each available for service replacement.

OPERATION

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet on the instrument panel marked with a battery receives battery voltage from a fuse in the Integrated Power Module (IPM) at all times. The other power outlet on the instrument panel marked with a key receives battery voltage only when the key is in the on position.

The power outlet located in the center console receives battery voltage all the time when positioned between the **front seats** and key-on voltage when positioned between the **rear seats**. The power outlet located on the C-pillar receives battery voltage only when the key is in the on position.

DIAGNOSIS AND TESTING

DIAGNOSIS & TESTING - POWER OUTLET

For complete circuit diagrams, refer to **Cigar Lighter/Power Outlet** in Wiring Diagrams.

POWER OUTLET (Continued)

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused B(+) fuse in the Integrated Power Module (IPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the IPM. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the IPM fuse as required.

(3) Open the power outlet door. Check for continuity between the inside circumference of the power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Check for battery voltage at the insulated contact located at the back of the power outlet receptacle. If not OK, go to Step 5.

(5) Disconnect and isolate the battery negative cable. Remove the appropriate bezel. Check for continuity between the ground circuit cavity of the power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the power outlet wire harness connector. If OK, replace the faulty power outlet receptacle. If not OK, repair the open fused B(+) circuit to the IPM fuse as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Look inside and note position of the retaining bosses (Fig. 5).

(3) Using external snap ring pliers with 90 degree tips. Insert pliers with tips against bosses and squeeze forcing bosses out of base.

(4) Pull out the base through mounting ring by gently rocking pliers. A tool can be made to do the same. Refer to (Fig. 6).

(5) Disconnect the base wires.

(6) Set base aside. Remove light ring and disconnect wire.

INSTALLATION

(1) Position the mounting ring on the instrument panel and feed the wires through the ring. Index the cap and the mounting ring with the index tab at the 9 o'clock position to the key in the instrument panel. Install the ring.

(2) Connect the wires to the base. Orientate the base alignment rib at the 11 o'clock position to mate the groove in the mounting ring to the base.

(3) Push the base into the bezel until it locks in place.

(4) Check operation of outlet or element and install the 12 volt outlet cap.

ENGINE 2.4L

DESCRIPTION

The 2.4 Liter (148 cu. in.) in-line four cylinder engine is a double over head camshaft with hydraulic lash adjusters and four valve per cylinder design. The engine is free-wheeling; meaning it has provisions for piston-to-valve clearance. However valve-to-valve interference can occur, if camshafts are rotated independently.

The cylinders are numbered from front of the engine to the rear. The firing order is 1–3–4–2.

The engine identification number is located on the rear of the cylinder block (Fig. 1).

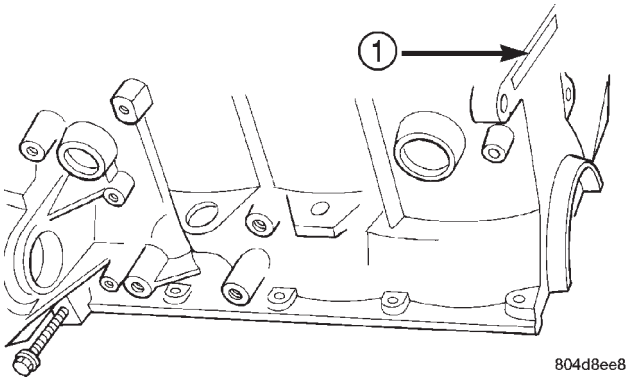

Fig. 1 Engine Identification

1 - ENGINE IDENTIFICATION LOCATION

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Hydraulic Lash Adjuster Noise Diagnosis
- Engine Oil Leak Inspection

ENGINE 2.4L (Continued)

DIAGNOSIS AND TESTING - ENGINE
DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING)
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - SPECIFICATIONS)
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing belt/chain.
ENGINE STALLS OR IDLES ROUGH	1. Idle speed too low.	1. Test minimum air flow. (Refer to Appropriate Diagnostic Information)
	2. Incorrect fuel mixture.	2. (Refer to Appropriate Diagnostic Information)
	3. Intake manifold leakage.	3. Inspect intake manifold, manifold gasket, and vacuum hoses.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)

ENGINE 2.4L (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head gasket.	5. Replace cylinder head gasket.
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Install new parts, as necessary.
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Contamination in fuel system.	4. Clean system and replace fuel filter.

ENGINE 2.4L (Continued)

DIAGNOSIS AND TESTING - ENGINE
DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES	1. High or low oil level in crankcase.	1. Check and correct engine oil level.
	2. Thin or diluted oil.	2. Change oil to correct viscosity.
	3. Thick oil	3. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	4. Low oil pressure.	4. Check and correct engine oil pressure problem.
	5. Dirt in hydraulic lifters/lash adjusters.	5. Replace hydraulic lifters/lash adjusters.
	6. Worn rocker arms.	6. Inspect oil supply to rocker arms.
	7. Worn hydraulic lifters/lash adjusters.	7. Replace hydraulic lifters/lash adjusters.
	8. Worn valve guides.	8. Replace cylinder head assembly.
	9. Excessive runout of valve seats on valve faces.	9. Grind valve seats and valves.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Connecting rod journal out-of-round.	6. Replace crankshaft or grind surface.
	7. Misaligned connecting rods.	7. Replace bent connecting rods.

ENGINE 2.4L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Excessive end play.	6. Check thrust bearing for wear on flanges.
	7. Crankshaft journal out-of-round or worn.	7. Replace crankshaft or grind journals.
	8. Loose flywheel or torque converter.	8. Tighten to correct torque.
OIL PRESSURE DROP	1. Low oil level.	1. Check engine oil level.
	2. Faulty oil pressure sensor/switch.	2. Replace oil pressure sensor/ switch.
	3. Low oil pressure.	3. Check oil pressure sensor/switch and main bearing oil clearance.
	4. Clogged oil filter.	4. Install new oil filter.
	5. Worn parts in oil pump.	5. Replace worn parts or pump.
	6. Thin or diluted oil.	6. Change oil to correct viscosity.
	7. Oil pump relief valve stuck.	7. Remove valve and inspect, clean, or replace.
	8. Oil pump suction tube loose.	8. Remove oil pan and install new tube or clean, if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Excessive bearing clearance.	10. Measure bearings for correct clearance.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket(s).
	2. Loose fastener, broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Misaligned or deteriorated cup or threaded plug.	3. Replace as necessary.

ENGINE 2.4L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Replace cylinder head assembly.
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

DIAGNOSIS AND TESTING - ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

(5) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:

- Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
- Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
- Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
- If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.

(4) If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

(7) After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Check engine oil level and add oil if necessary.

(2) Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

(3) Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.

(4) Remove the Auto Shutdown (ASD) relay from the PDC.

(5) Be sure throttle blade is fully open during the compression check.

(6) Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

(7) Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.

(8) Repeat the previous step for all remaining cylinders.

(9) Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.

(10) If one or more cylinders have abnormally low compression pressures, repeat the compression test.

(11) If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

ENGINE 2.4L (Continued)

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 2).

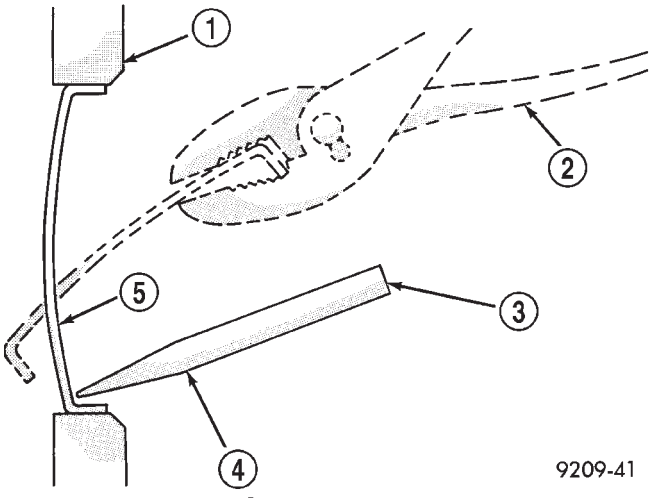

Fig. 2 Core Hole Plug Removal

1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

STANDARD PROCEDURE - REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

STANDARD PROCEDURE - HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

(1) Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.

(2) Remove negative battery cable.

(3) Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.

(4) With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.

(5) Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

(6) Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)

(7) Repair engine or components as necessary to prevent this problem from re-occurring.

ENGINE 2.4L (Continued)

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

(8) Install new spark plugs.
(9) Drain engine oil and remove oil filter.
(10) Install a new oil filter.
(11) Fill engine with specified amount of approved oil.
(12) Connect negative battery cable.
(13) Start engine and check for any leaks.

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bedplate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 3)

ENGINE 2.4L (Continued)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:
- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 3)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 3)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

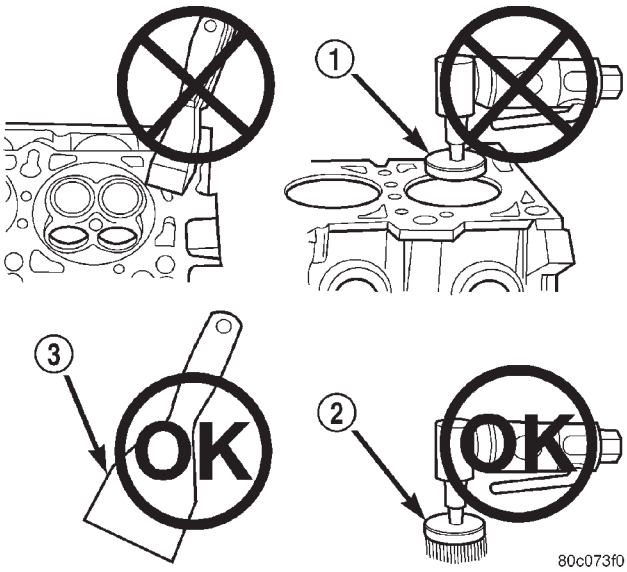

Fig. 3 Proper Tool Usage For Surface Preparation

1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER

STANDARD PROCEDURE - MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

(1) Remove oil film from surface to be checked. Plastigage is soluble in oil.

(2) Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes (Fig. 4). (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap bolts of the bearing being checked to the proper specifications.

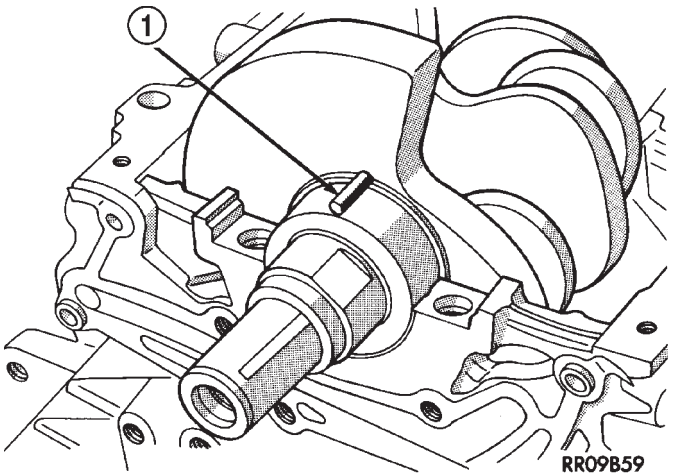

Fig. 4 Plastigage Placed in Lower Shell—Typical

1 - PLASTIGAGE

(3) Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

(4) Install the proper crankshaft bearings to achieve the specified bearing clearances.

REMOVAL - ENGINE ASSEMBLY

(1) Perform fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Disconnect battery negative cable.

(3) Remove air cleaner housing and inlet tube.

(4) Disconnect the fuel line from fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)

(5) Disconnect all vacuum hoses.

(6) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(7) Remove radiator fans. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

(8) Remove radiator upper and lower hoses.

ENGINE 2.4L (Continued)

NOTE: When the transaxle cooler lines are removed from the rolled-groove type fittings at the transaxle, damage to the inner wall of the hose will occur. To prevent prevent potential leakage, the cooler hoses must be cut off flush at the transaxle fitting, and a service cooler hose splice kit must be installed upon reassembly.

(9) Using a blade or suitable hose cutter, cut transaxle oil cooler lines off flush with fittings. Plug cooler lines and fittings to prevent debris from entering transaxle or cooler circuit. A service splice kit will be installed upon reassembly.

(10) Disconnect transmission shift linkage and electrical connectors.

(11) Disconnect throttle body linkage.

(12) Disconnect engine wiring harness.

(13) Disconnect heater hoses from heater (Fig. 5).

(14) Discharge air conditioning system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE)

(15) Hoist vehicle and remove front wheels and tires.

(16) Remove accessory drive belt splash shield.

(17) Remove accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(18) Remove axle shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

(19) Drain engine oil and remove oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE)

(20) Remove crossmember cradle plate (Fig. 6).

(21) Disconnect exhaust pipe from manifold (Fig. 7).

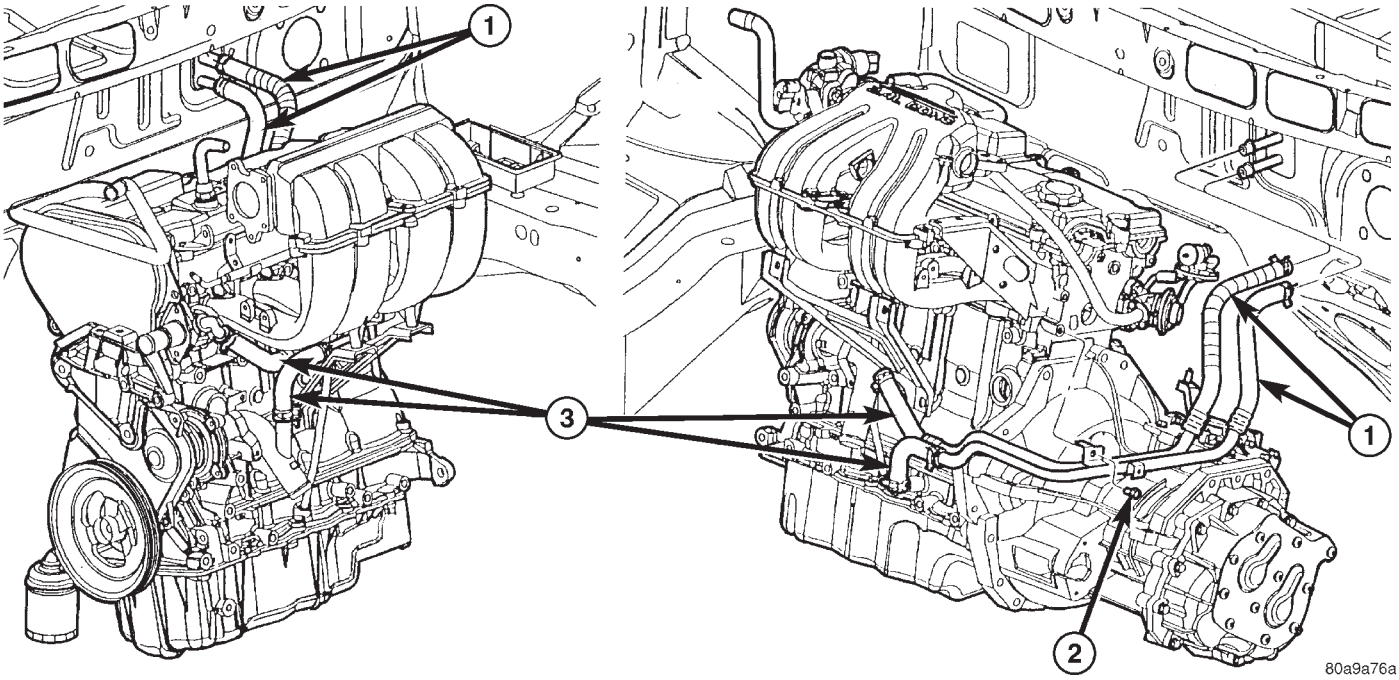

Fig. 5 HEATER HOSES - 2.4L

1 - HEATER HOSES TO HEATER
2 - BOLT - HEATER TUBE SUPPORT
3 - HEATER HOSE TO ENGINE - SUPPLY AND RETURN

ENGINE 2.4L (Continued)

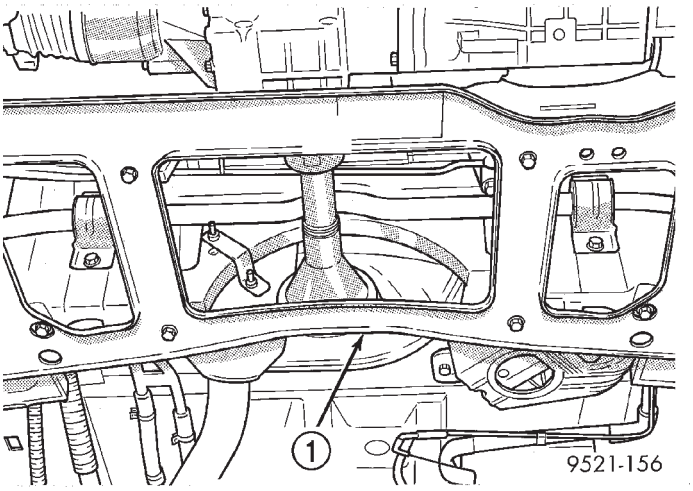

Fig. 6 Crossmember Cradle Plate

1 - CRADLE PLATE

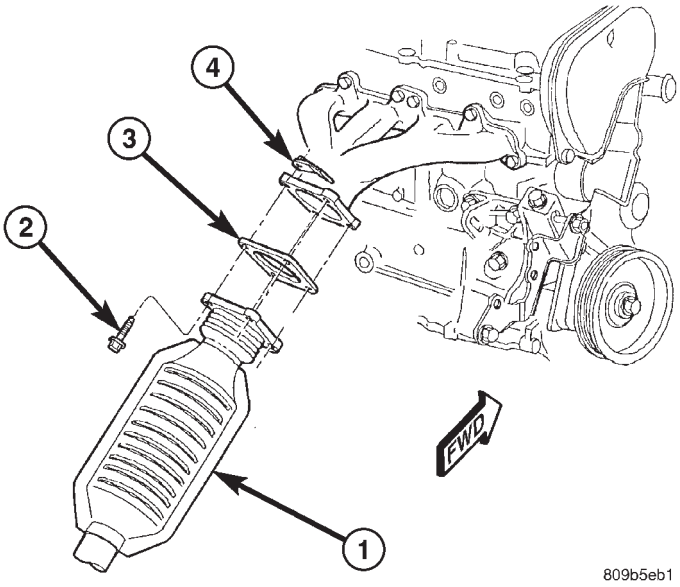

Fig. 7 Catalytic Converter to Exhaust Manifold

1 - CATALYTIC CONVERTER
2 - BOLT
3 - GASKET
4 - FLAG NUT

(22) Remove engine front mount and bracket from engine. (Refer to 9 - ENGINE/ENGINE MOUNTING/ FRONT MOUNT - REMOVAL)

(23) Remove structural collar. (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL)

(24) Remove rear engine mount bracket. (Refer to 9 - ENGINE/ENGINE MOUNTING/REAR MOUNT - REMOVAL)

(25) Mark flex plate to torque converter and remove torque converter bolts.

(26) Pinch-off power steering supply hose at pump. Remove hose from pump.

(27) Remove and set aside the power steering pump and bracket. Do not disconnect pressure line.

(28) Lower vehicle.

(29) Remove A/C lines at compressor and cap openings.

(30) Remove engine ground straps (strap at engine right mount and at starter).

(31) Raise vehicle enough to allow engine dolly Special Tool 6135, cradle Special Tool 6710 with Posts Special Tool 6848 to be installed under vehicle (Fig. 8).

(32) Loosen cradle posts to allow movement for proper positioning. Locate two rear posts (right side of engine) into the holes on the engine bedplate. Locate the two front posts (left side of engine) on the oil pan rails (Fig. 8). Lower vehicle and position cradle mounts until the engine is resting on mounts. Tighten mounts to cradle frame. This will keep mounts from moving when removing or installing engine and transmission.

(33) Install safety straps around the engine to cradle. Tighten straps and lock.

(34) Lower vehicle so the weight of **ONLY THE ENGINE AND TRANSMISSION** are on the cradle.

(35) Remove engine and transmission mount bolts.

(36) Raise vehicle slowly. It may be necessary to move the engine/transmission assembly with the dolly to allow for removal around the body.

ENGINE 2.4L (Continued)

INSTALLATION - ENGINE ASSEMBLY

(1) Position engine and transmission assembly under vehicle and slowly lower the vehicle over the engine and transmission.

(2) Align engine and transmission mounts to attaching points. Install mounting bolts at the right (Fig. 9) and left mounts (Fig. 10).

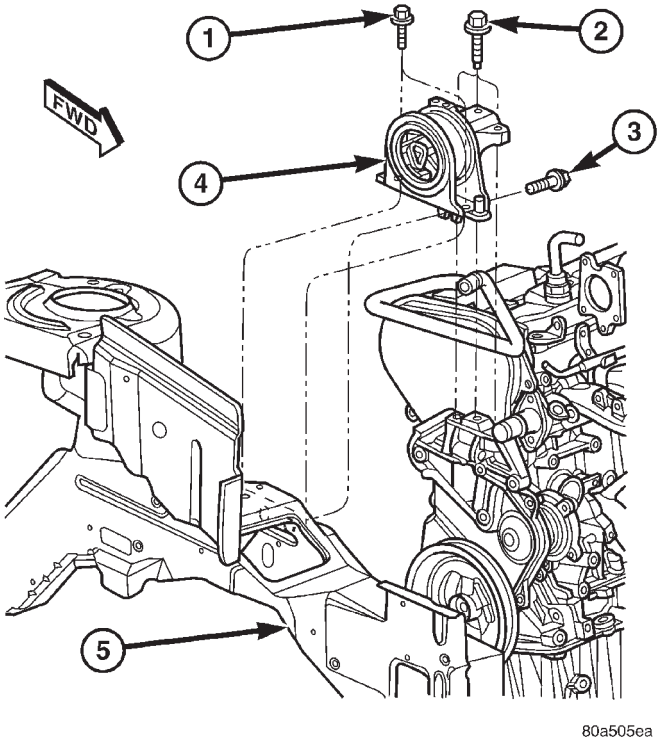

Fig. 9 RIGHT MOUNT TO RAIL AND ENGINE

1 - BOLT - MOUNT TO RAIL 68 N·m (50 ft. lbs.)
2 - BOLT - MOUNT TO ENGINE 54 N·m (40 ft. lbs.)
3 - BOLT - MOUNT TO RAIL (HORIZONTAL) 68 N·m (50 ft. lbs.)
4 - RIGHT ENGINE MOUNT
5 - RIGHT FRAME RAIL

(3) Remove safety straps.

(4) Slowly raise vehicle enough to remove the engine dolly and cradle Special Tools 6135 and 6710.

(5) Install rear mount bracket and rear mount through bolt. (Refer to 9 - ENGINE/ENGINE MOUNTING/REAR MOUNT - INSTALLATION)

(6) Install the flex plate to torque converter bolts.

(7) Install structural collar. (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION)

(8) Install front mount bracket and front mount through bolt. (Refer to 9 - ENGINE/ENGINE MOUNTING/FRONT MOUNT - INSTALLATION)

(9) Connect exhaust system to manifold (Fig. 7).

(10) Install crossmember cradle plate (Fig. 6).

(11) Install new oil filter.

(12) Install power steering pump and bracket.

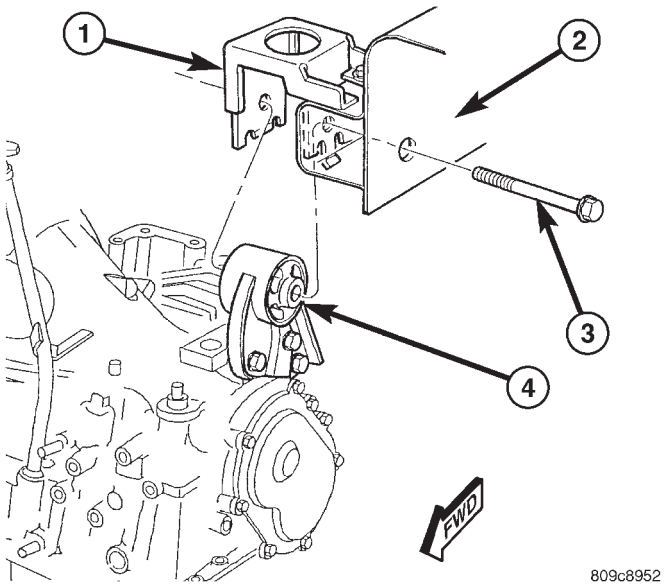

Fig. 10 LEFT MOUNT TO FRAME BRACKET

1 - FRAME BRACKET
2 - FRAME RAIL - LEFT
3 - BOLT
4 - TRANSAXLE MOUNT

(13) Connect power steering supply line to pump and remove pinch-off pliers.

(14) Connect A/C compressor hoses to compressor.

(15) Install accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(16) Install axle shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

(17) Install accessory drive belt splash shield.

(18) Install front wheels and tires.

(19) Remove plugs from transmission cooler hoses and install transaxle oil cooler line service splice kit. Refer to instructions included with kit.

(20) Connect the transaxle shift linkage and electrical connectors.

(21) Connect heater hoses (Fig. 5).

(22) Install ground straps.

(23) Connect all engine and throttle body electrical connections.

(24) Connect all vacuum lines.

(25) Connect the throttle cables.

(26) Connect the fuel line. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)

(27) Connect radiator lower and upper hoses.

(28) Install radiator fans. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(29) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(30) Connect battery cables.

(31) Install air cleaner and inlet hose.

ENGINE 2.4L (Continued)

(32) Fill engine crankcase with proper oil to correct level.

(33) Start engine and run until operating temperature is reached.

(34) Adjust transmission linkage, if necessary.

SPECIFICATIONS

SPECIFICATIONS - 2.4L ENGINE

DESCRIPTION	SPECIFICATION
General Specification	
Type	In-Line OHV, DOHC
Number of Cylinders	4
Displacement	2.4 Liters (148 cu. in.)
Bore	87.5 mm (3.445 in.)
Stroke	101.0 mm (3.976 in.)
Compression Ratio	9.4:1
Firing Order	1-3-4-2
Compression Pressure	690 kPa (Minimum) (100 psi Minimum)
Max. Variation Between Cylinders	25%
Cylinder Block	
Cylinder Bore Diameter	87.4924–87.5076 mm (3.4446–3.4452 in.)
Out-of-Round (Max.)	0.051 mm (0.002 in.)
Taper (Max.)	0.051 mm (0.002 in.)
Pistons	
Piston Diameter	87.463–87.481 mm (3.4434–3.4441 in.)
Clearance @ 14 mm (9/16 in.) from bottom of skirt	0.024–0.057 mm (0.0009–0.0022 in.)
Weight	346–356 grams (12.20–12.56 oz.)
Land Clearance (Diametrical)	0.614–0.664 mm (0.024–0.026 in.)
Piston Length	66.25 mm (2.608 in.)
Piston Ring Groove Depth No. 1	4.640–4.784 mm (0.182–0.188 in.)
Piston Ring Groove Depth No. 2	4.575–4.719 mm (0.180–0.185 in.)
Piston Ring Groove Depth No. 3	4.097–4.236 mm (0.161–0.166 in.)
Piston Pins	
Clearance in Piston	0.005–0.018 mm (0.0002–0.0008 in.)
Clearance in Connecting Rod	Interference
Diameter	21.998–22.003 mm (0.8660–0.8662 in.)
End Play	None
Length	72.75–73.25 mm (2.864–2.883 in.)
Piston Rings	
Ring Gap—Top Compression Ring	0.25–0.51 mm (0.0098–0.020 in.)
Wear Limit	0.8 mm (0.031 in.)
Ring Gap—2nd Compression Ring	0.23–0.48 mm (0.009–0.018 in.)
Wear Limit	0.8 mm (0.031 in.)
Ring Gap—Oil Control Steel Rails	0.25–0.64 mm (0.0098–0.025 in.)
Wear Limit	1.0 mm (0.039 in.)
Ring Side Clearance—Compression Rings	0.030–0.080 mm (0.0011–0.0031 in.)
Wear Limit	0.10 mm (0.004 in.)
Ring Side Clearance—Oil Ring Pack	0.012–0.178 mm (0.0004–0.0070 in.)
Ring Width—Compression Rings	1.47–1.50 mm (0.057–0.059 in.)
Ring Width—Oil Ring Pack	2.72–2.88 mm (0.107–0.1133 in.)
Connecting Rod	
Bearing Clearance	0.025–0.071 mm (0.0009–0.0027 in.)

—Exhaust	110.89–111.69 mm (4.365–4.397 in.)
Valve Stem Diameter	
—Intake	5.934–5.952 mm (0.2337–0.2344 in.)
—Exhaust	5.906–5.924 mm (0.2326–0.2333 in.)
Valve Margin	
Intake	1.2–1.7 mm (0.047–0.066 in.)
Service Limit	0.95 mm (1/32 in.)
Exhaust	0.985–1.315 mm (0.038–0.051 in.)
Service Limit	1.05 mm (3/64 in.)
Valve Stem Tip Height	
Intake	48.04 mm (1.891 in.)
Exhaust	47.99 mm (1.889 in.)
Valve Stem to Guide Clearance	
Intake	0.048–0.066 mm (0.0018–0.0025 in.)
Max. Allowable	0.076 mm (0.003 in.)
Service Limit	0.25 mm (0.010 in.)
Exhaust	0.0736–0.094 mm (0.0029–0.0037 in.)
Max. Allowable	0.101 mm (0.004 in.)
Service Limit	0.25 mm (0.010 in.)
Valve Springs	
Free Length (Approx.)	48.4 mm (1.905 in.)
Nominal Force (Valve Closed)	338 N @ 38.0 mm (75.98 lbs. @ 1.496 in.)
Nominal Force (Valve Open)	607 N @ 29.75 mm (136 lbs. @ 1.172 in.)
Installed Height	38.00 mm (1.496 in.)
Number of Coils	7.82
Wire Diameter	3.86 mm (1.496 in.)
Oil Pump	
Clearance Over Rotors (Max.)	0.10 mm (0.004 in.)
Cover Out-of-Flat (Max.)	0.025 mm (0.001 in.)
Inner Rotor Thickness (Min.)	9.40 mm (0.370 in.)
Outer Rotor Thickness (Min.)	9.40 mm (0.370 in.)
Outer Rotor Clearance (Max.)	0.039 mm (0.015 in.)
Outer Rotor Diameter (Min.)	79.95 mm (3.148 in.)
Tip Clearance Between Rotors (Max.)	0.20 mm (0.008 in.)
Oil Pressure	
At Curb Idle Speed*	25 kPa (4 psi)
At 3000 rpm	170–550 kPa (25–80 psi)
CAUTION: *If pressure is ZERO at curb idle, DO NOT run engine at 3000 rpm.

AIR CLEANER ELEMENT

REMOVAL

(1) Unsnap 2 clips.
(2) Lift cover and pull toward the engine and remove cover tabs from air box.
(3) Lift cover and remove the element (Fig. 11).

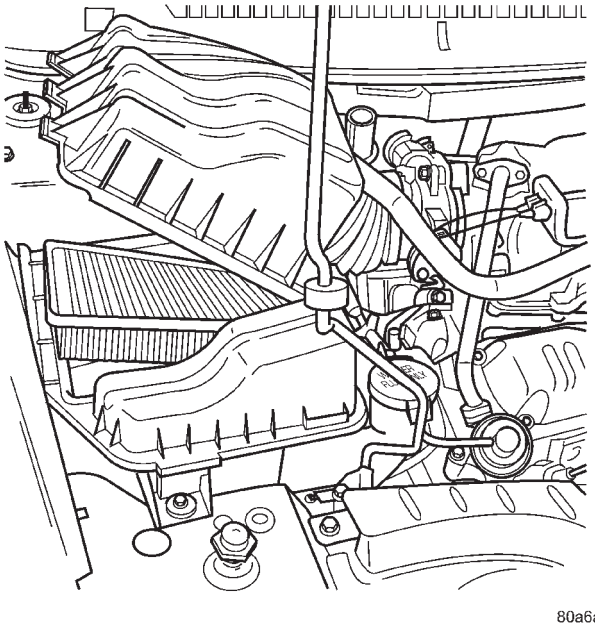

Fig. 11 AIR BOX COVER

INSTALLATION

(1) Install the air filter element into air box (Fig. 11).
(2) Move cover so that the tabs insert into the air box.
(3) Push cover down and snap the 2 clips.

AIR CLEANER HOUSING

REMOVAL

(1) Disconnect the negative battery cable.
(2) Disconnect the inlet air temperature sensor (Fig. 12).
(3) Remove the inlet hose to throttle body (Fig. 11).
(4) Remove the bolt for air box at upper radiator cross member.
(5) Pull air box up and off over the single locating pin.
(6) Remove air box from vehicle

INSTALLATION

(1) Install air box into vehicle and onto the locating pin.

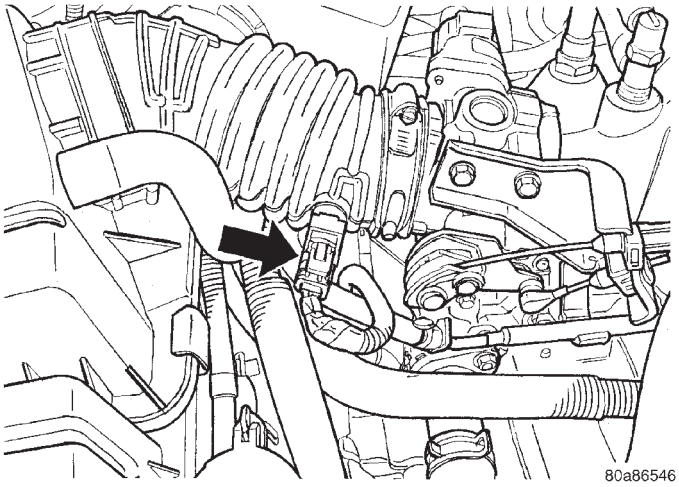

Fig. 12 IAT SENSOR 2.4L

(2) Install bolt to hold air box to the upper radiator cross member.
(3) Install the inlet hose to the throttle body.
(4) Connect the inlet air temperature sensor (Fig. 12).
(5) Connect the negative battery cable.

CYLINDER HEAD

DESCRIPTION

The cross flow designed, aluminum cylinder head contains dual over-head camshafts with four valves per cylinder (Fig. 13). The valves are arranged in two in-line banks. The intake valves face toward the front of the vehicle. The exhaust valves face the dash panel. The cylinder head incorporates powdered metal valve guides and seats. The cylinder head is sealed to the block using a multi-layer steel head gasket and retaining bolts.

Integral oil galleries provide lubrication passages to the hydraulic lash adjusters, camshafts, and valve mechanisms.

OPERATION

The cylinder head closes the combustion chamber, allowing the pistons to compress the fuel/air mixture for ignition. The valves are actuated by the lobe profiles on the camshaft to open and close at specified duration to either allow clean air in the combustion chamber or the exhaust gases out; depending on the stroke of the engine.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

CYLINDER HEAD (Continued)

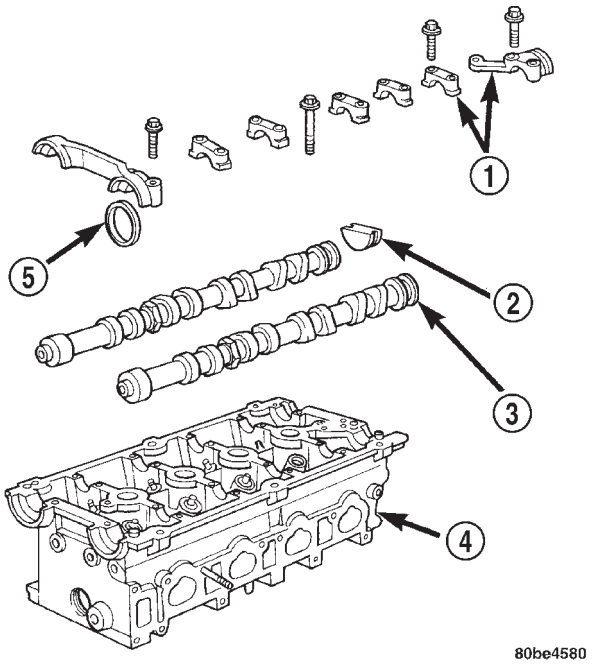

Fig. 13 Cylinder Head and Camshafts

1 - CAMSHAFT BEARING CAPS
2 - PLUG
3 - CAMSHAFT
4 - CYLINDER HEAD
5 - CAMSHAFT OIL SEAL

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL - CYLINDER HEAD

(1) Perform fuel system pressure release procedure **before attempting any repairs.** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - SPECIFICATIONS)

(2) Disconnect battery negative cable.

(3) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(4) Remove air filter housing and inlet tube.

(5) Remove upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

(6) Remove heater tube support bracket from cylinder head.

(7) Disconnect radiator upper and heater supply hoses from intake manifold water outlet connections.

(8) Remove accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(9) Raise vehicle and remove exhaust pipe from manifold.

(10) Remove power steering pump reservoir and line support bracket from lower intake manifold and set aside. Do not disconnect lines.

(11) Remove ignition coil and wires from engine.

(12) Disconnect cam sensor and fuel injector wiring connectors.

CYLINDER HEAD (Continued)

(13) Remove timing belt and camshaft sprockets. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(14) Remove timing belt idler pulley and rear timing belt cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(15) Remove cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(16) Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

NOTE: Identify rocker arm position to ensure correct re-installation in original position, if reused.

(17) Remove rocker arms. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL)

(18) Remove cylinder head bolts in REVERSE sequence of tightening (Fig. 19).

(19) Remove cylinder head from engine block.

(20) Inspect and clean cylinder head. (Refer to 9 - ENGINE/CYLINDER HEAD - INSPECTION) (Refer to 9 - ENGINE/CYLINDER HEAD - CLEANING)

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

(1) Cylinder head must be flat within 0.1 mm (0.004 in.) (Fig. 14).

(2) Inspect camshaft bearing journals for scoring.

(3) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(4) Using a small hole gauge and a micrometer, measure valve guides in 3 places top, middle and bottom (Fig. 15). (Refer to 9 - ENGINE - SPECIFICATIONS) Replace guides if they are not within specification.

(5) Check valve guide height (Fig. 16).

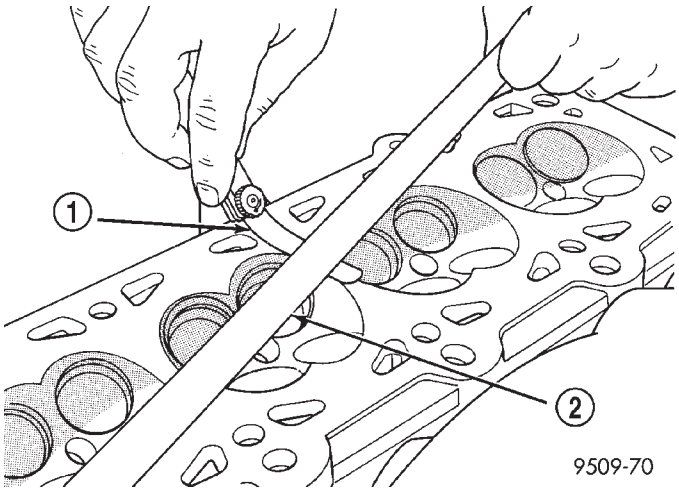

Fig. 14 Checking Cylinder Head Flatness

2 - STRAIGHT EDGE

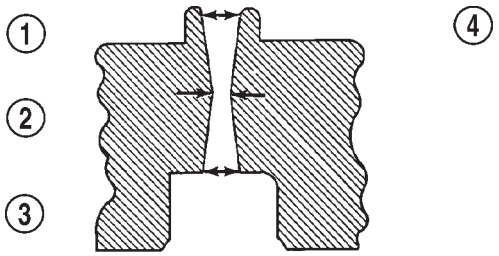

Fig. 15 Checking Wear on Valve Guide—Typical

1 - TOP
2 - MIDDLE
3 - BOTTOM
4 - CUT AWAY VIEW OF VALVE GUIDE MEASUREMENT LOCATIONS

INSTALLATION - CYLINDER HEAD

NOTE: The Cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolts must be replaced (Fig. 17).

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced.

(1) Before installing the bolts, the threads should be coated with engine oil.

(2) Position cylinder head gasket on engine block (Fig. 18).

(3) Install cylinder head on engine block.

(4) Tighten the cylinder head bolts in the sequence shown in (Fig. 19). Using the 4 step torque turn method, tighten according to the following values:

- First All to 34 N·m (25 ft. lbs.)

CYLINDER HEAD (Continued)

- Third All to 68 N·m (50 ft. lbs.)

CAUTION: Do not use a torque wrench for the following step.

- Fourth Turn an additional 1/4 Turn,

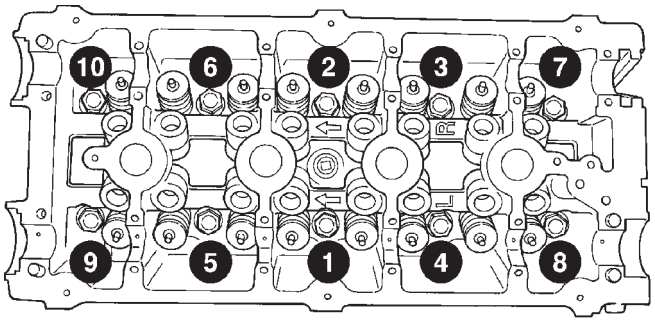

Fig. 19 Cylinder Head Tightening Sequence

(5) Install rocker arms. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION)

(6) Install camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

(7) Install cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

(8) Install timing belt rear cover and timing belt idler pulley. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(9) Install timing belt and camshaft sprockets. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

(10) Connect cam sensor and fuel injectors wiring connectors.

(11) Install ignition coil and wires. Connect ignition coil wiring connector.

(12) Install power steering pump reservoir and line support bracket to cylinder head.

(13) Raise vehicle and install the exhaust pipe to the manifold.

(14) Install accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(15) Install heater tube support bracket to cylinder head.

(16) Connect radiator upper and heater hoses to intake manifold water outlet connections.

(17) Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(18) Using new gaskets, install EGR tube and tighten fasteners to 11 N·m (95 in. lbs.).

CYLINDER HEAD (Continued)

(19) Install air inlet tube and housing.

(20) Connect all vacuum lines, electrical wiring, ground straps and fuel line.

(21) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(22) Connect battery negative cable.

CAMSHAFT OIL SEAL(S)

REMOVAL

(1) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(2) Hold each camshaft sprocket with Special Tool 6847 while removing center bolt (Fig. 20).

(3) Remove camshaft sprockets.

(4) Remove rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(5) Remove camshaft seal using Special Tool C-4679A (Fig. 21).

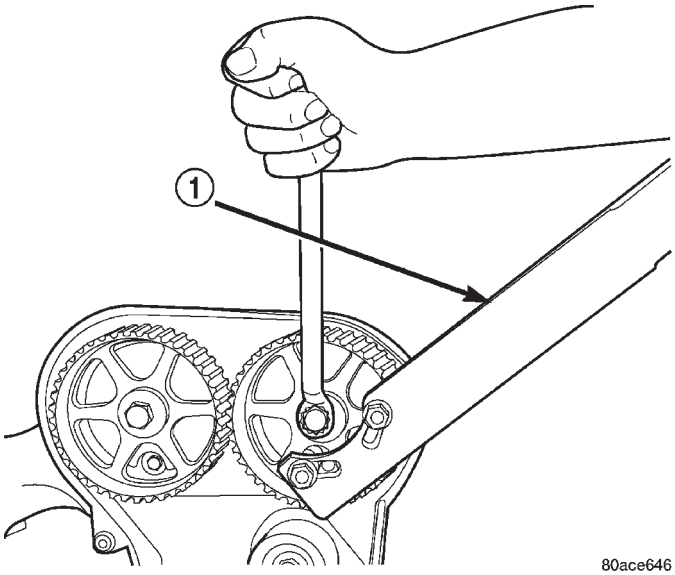

Fig. 20 Camshaft Sprocket - Removal/Installation

1 - SPECIAL TOOL 6847

CAUTION: Do not nick shaft seal surface or seal bore.

INSTALLATION

(1) Shaft seal surface must be free of varnish, dirt or nicks. Polish with 400 grit paper if necessary.

(2) Install camshaft seals into cylinder head using Special Tool MD-998306 until flush with head (Fig. 22).

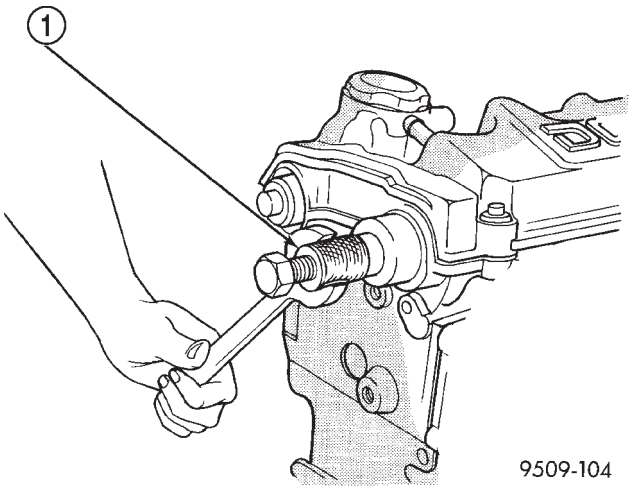

Fig. 21 Camshaft Oil Seal - Removal With C-4679A

1 - SPECIAL TOOL C-4679

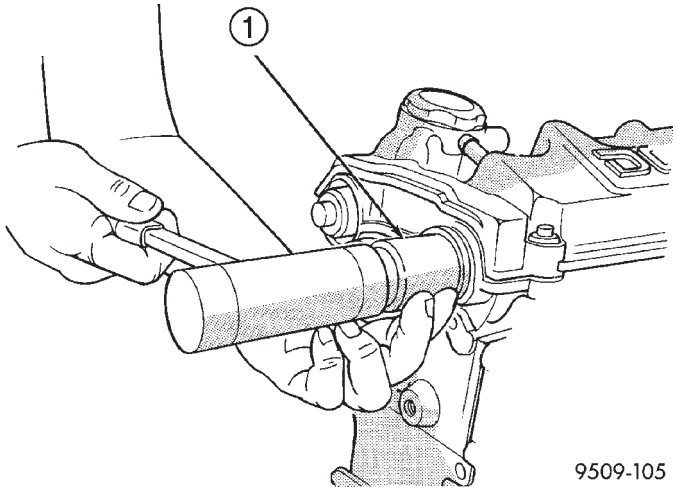

Fig. 22 Camshaft Seal - Installation

1 - SPECIAL TOOL MD-998306

(3) Install timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(4) Install camshaft sprockets. Hold each sprocket with Special Tool 6847 and tighten center bolt to 101 N·m (75 ft. lbs.) (Fig. 20).

(5) Install timing belt and front covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

CAMSHAFT(S)

DESCRIPTION

Both camshafts have six bearing journal surfaces and two cam lobes per cylinder (Fig. 23). Flanges at the rear journals control camshaft end play. Provision for a cam position sensor is located on the intake camshaft on the rear of the cylinder head. A hydrodynamic oil seal is used for oil control at the front of the camshaft.

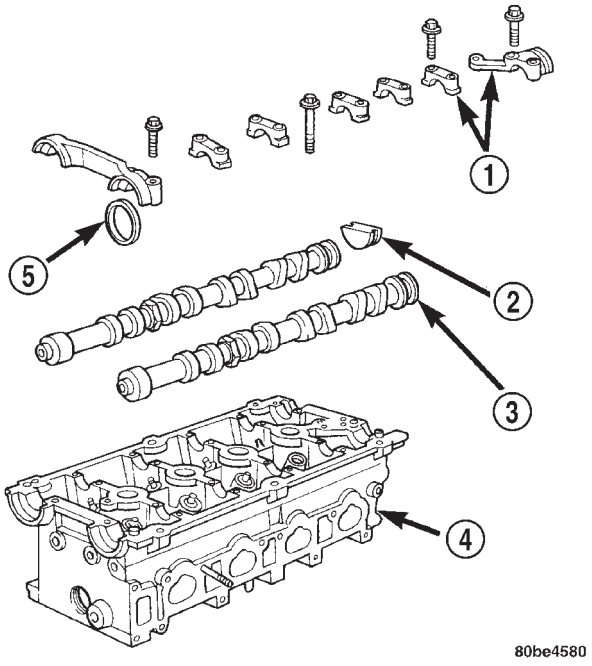

Fig. 23 Camshafts

1 - CAMSHAFT BEARING CAPS
2 - PLUG
3 - CAMSHAFT
4 - CYLINDER HEAD
5 - CAMSHAFT OIL SEAL

OPERATION

The camshaft is driven by the crankshaft via drive sprockets and belt. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE - MEASURING CAMSHAFT END PLAY

(1) Oil camshaft journals and install camshaft **WITHOUT** rocker arms. Install rear cam caps and tighten screws to specified torque.

(2) Using a suitable tool, move camshaft as far rearward as it will go.

(3) Zero dial indicator (Fig. 24).

(4) Move camshaft as far forward as it will go.

(5) Record reading on dial indicator. For end play specification, (Refer to 9 - ENGINE - SPECIFICATIONS).

(6) If end play is excessive, check cylinder head and camshaft for wear; replace as necessary.

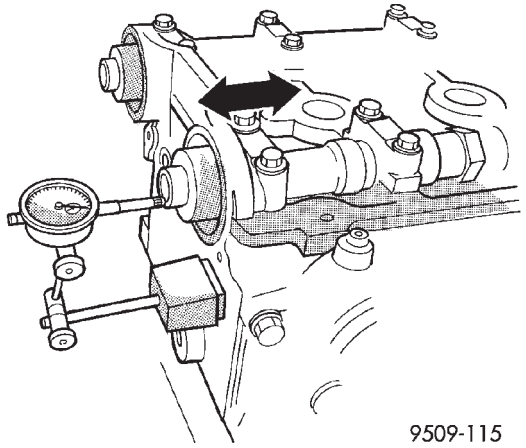

Fig. 24 Camshaft End Play - Typical

REMOVAL

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).

(2) Remove camshaft position sensor and camshaft target magnet (Refer to 8 - ELECTRICAL/IGNITION CONTROL/CAMSHAFT POSITION SENSOR - REMOVAL).

(3) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(4) Remove camshaft sprockets and timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(5) Bearing caps are identified for location. Remove the outside bearing caps first (Fig. 25).

(6) Loosen the camshaft bearing cap attaching fasteners in sequence shown (Fig. 26) one camshaft at a time.

CAUTION: Camshafts are not interchangeable. The intake cam number 6 thrust bearing face spacing is wider.

(7) Identify the camshafts before removing from the head. The camshafts are not interchangeable.

(8) Remove camshafts from cylinder head.

NOTE: If removing rocker arms, identify for reinstallation in the original position.

CLEANING

Clean camshaft with a suitable solvent.

CAMSHAFT(S) (Continued)

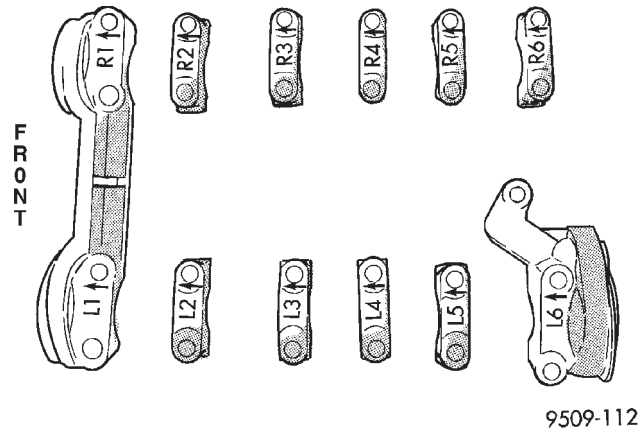

Fig. 25 Camshaft Bearing Cap Identification

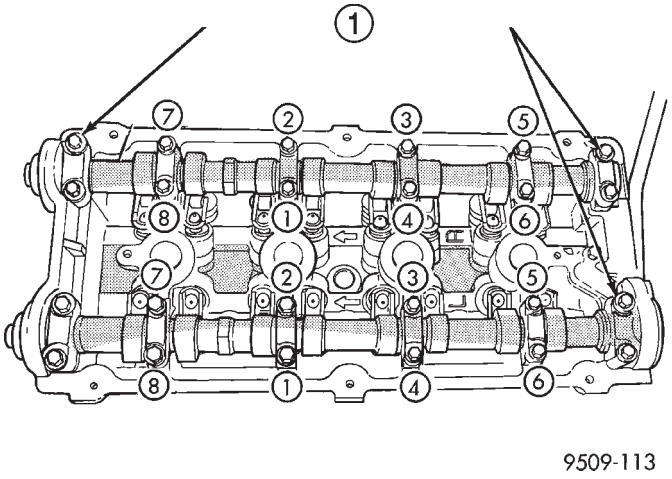

Fig. 26 Camshaft Bearing Cap - Removal

1 - REMOVE OUTSIDE BEARING CAPS FIRST

INSPECTION

(1) Inspect camshaft bearing journals for damage and binding (Fig. 27). If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

(2) Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the rocker arms.

(3) Measure the lobe actual wear (unworn area - wear zone = actual wear) (Fig. 27) and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

INSTALLATION

CAUTION: Ensure that NONE of the pistons are at top dead center when installing the camshafts.

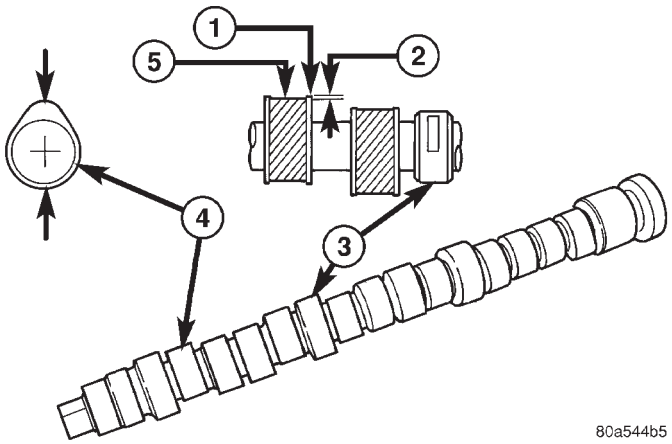

Fig. 27 Checking Camshaft(s) for Wear

1 - UNWORN AREA
2 - ACTUAL WEAR
3 - BEARING JOURNAL
4 - LOBE
5 - WEAR ZONE

(1) Lubricate all camshaft bearing journals, rocker arms and camshaft lobes.

(2) Install all rocker arms in original positions, if reused.

(3) Position camshafts on cylinder head bearing journals. Install right and left camshaft bearing caps No. 2 – 5 and right No. 6. Tighten M6 fasteners to 12 N·m (105 in. lbs.) in sequence shown in (Fig. 28).

(4) Apply Mopar® Gasket Maker to No. 1 and No. 6 bearing caps (Fig. 29). Install bearing caps and tighten M8 fasteners to 28 N·m (250 in. lbs.).

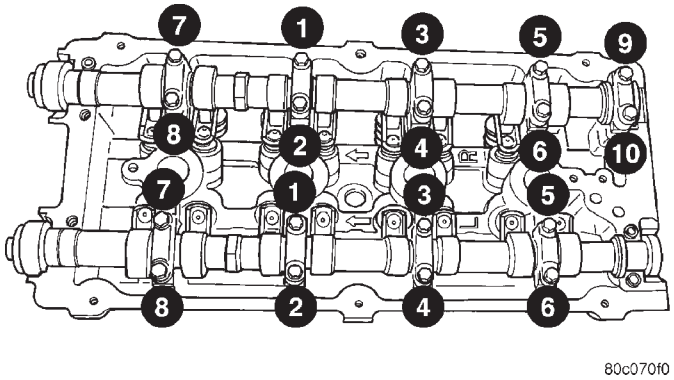

Fig. 28 Camshaft Bearing Cap Tightening Sequence

NOTE: Bearing end caps must be installed before seals can be installed.

(5) Install camshaft oil seals (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT OIL SEAL(S) - INSTALLATION).

(6) Install camshaft target magnet and camshaft position sensor.

CAMSHAFT(S) (Continued)

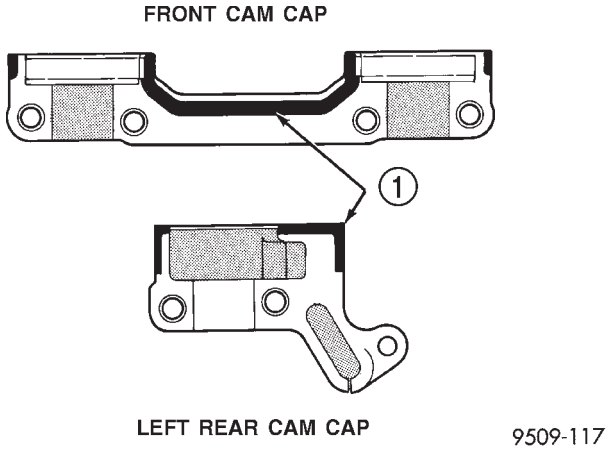

Fig. 29 Camshaft Bearing Cap Sealing

1 - 1.5 mm (.060 in.) DIAMETER BEAD OF MOPAR GASKET MAKER

(7) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

(8) Install timing belt rear cover and camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT COVER(S) - INSTALLATION).

(9) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

CYLINDER HEAD COVER

REMOVAL

(1) Remove upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

(2) Remove upper manifold support bracket.

(3) Remove ignition coil and spark plug wires.

(4) Disconnect PCV and make-up air hoses from cylinder head cover.

(5) Remove cylinder head cover bolts.

(6) Remove cylinder head cover from cylinder head.

CLEANING

Clean cylinder head and cover mating surfaces using a suitable solvent.

INSPECTION

Inspect cover rails for flatness.

INSTALLATION

NOTE: Replace spark plug well seals and bolt assemblies when installing a new cylinder head cover gasket.

(1) Install new cylinder head cover gaskets and spark plug well seals (Fig. 30).

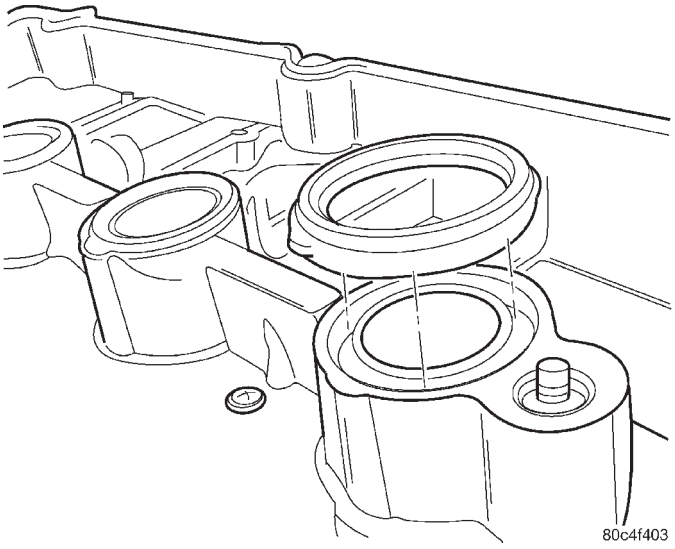

Fig. 30 Spark Plug Well Seals

(2) Replace cylinder head cover bolt assemblies.

CAUTION: Do not allow oil or solvents to contact the timing belt as they can deteriorate the rubber and cause tooth skipping.

(3) Apply Mopar® Engine RTV GEN II at the camshaft cap corners and at the top edges of the 1/2 round seal (Fig. 31).

(4) Install cylinder head cover assembly to cylinder head. Install all bolts, ensuring the single (1) stud used to attach the upper intake manifold support bracket is located in the #8 location as shown in torque sequence diagram (Fig. 32). Tighten bolts in sequence shown in (Fig. 32). Using a 3 step torque method as follows:

(a) Tighten all bolts to 4.5 N·m (40 in. lbs.).

(b) Tighten all bolts to 9.0 N·m (80 in. lbs.).

(c) Tighten all bolts to 12 N·m (105 in. lbs.).

(5) Install ignition coil and spark plug wires. Tighten fasteners to 12 N·m (105 in. lbs.).

(6) If the PCV valve was removed, apply Mopar® Thread Sealant with Teflon to threads and install valve to cylinder head cover. Tighten PCV valve to 8 N·m (70 in. lbs.).

(7) Connect PCV and make-up air hoses to cylinder head cover.

(8) Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

CYLINDER HEAD COVER (Continued)

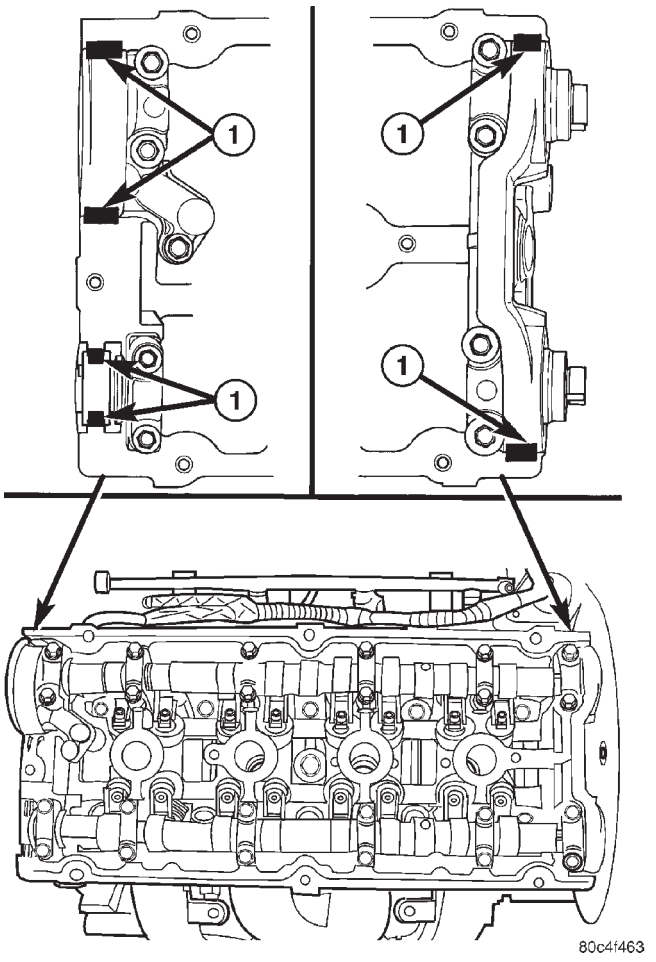

Fig. 31 Sealer Locations

1 – SEALER LOCATION

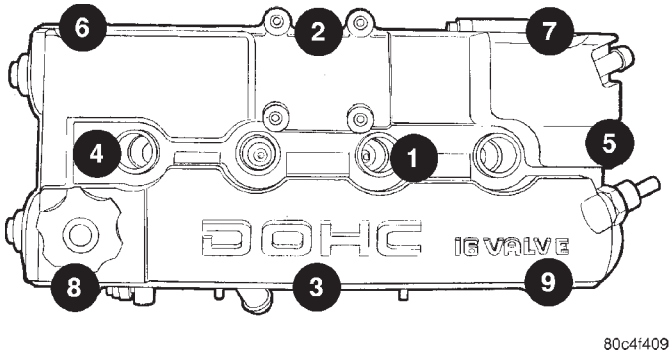

Fig. 32 Cylinder Head Cover Tightening Sequence (Typical Cover Shown)

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel. They have chrome plated stems to prevent scuffing. Viton rubber valve stem seals are integral with the spring seats. The valves have three-bead lock keepers to retain springs and to promote valve rotation.

CLEANING

(1) Clean all valves thoroughly and discard burned, warped and cracked valves.

VALVE SPRINGS & SEALS

REMOVAL

REMOVAL - CYLINDER HEAD ON

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

(3) Rotate crankshaft until piston is at TDC on compression.

(4) With air hose attached to adapter tool installed in spark plug hole, apply 90-120 psi air pressure.

(5) Using Special Tool MD-998772-A with adapter 6779 (Fig. 33), compress valve springs and remove valve locks.

(6) Remove valve spring(s).

(7) Remove valve stem seal(s) by a using valve stem seal tool (Fig. 35).

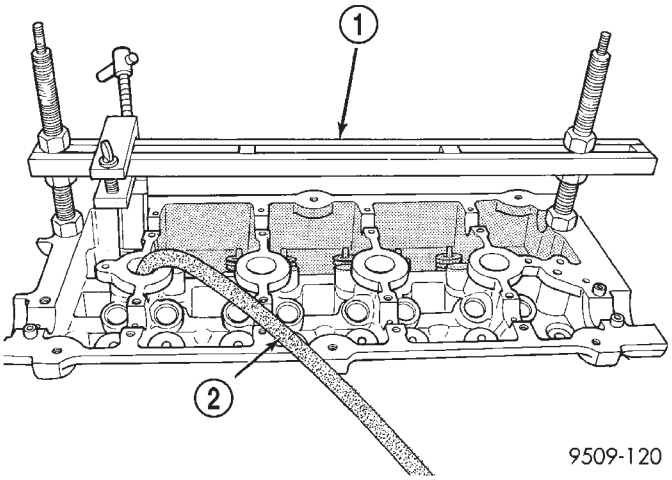

Fig. 33 Valve Spring - Removal/Installation

1 - VALVE SPRING COMPRESSOR MD 998772A
2 - AIR HOSE

VALVE SPRINGS & SEALS (Continued)

REMOVAL - CYLINDER HEAD OFF

(1) With cylinder head removed from cylinder block, compress valve springs using a universal valve spring compressor.

(2) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(3) Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves, locks and retainers to insure installation in original location.

(4) Inspect the valves. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSPECTION)

INSPECTION

(1) Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested for correct tension. Discard the springs that do not meet specifications. The following specifications apply to both intake and exhaust valves springs:

- Valve Closed Nominal Tension—76 lbs. @ 38.0 mm (1.50 in.)
- Valve Open Nominal Tension—136 lbs. @ 29.75 mm (1.17 in.)

(2) Inspect each valve spring for squareness with a steel square and surface plate, test springs from both ends. If the spring is more than 1.5 mm (1/16 inch) out of square, install a new spring.

INSTALLATION

INSTALLATION - CYLINDER HEAD ON

(1) Install valve seal/valve spring seat assembly (Fig. 34). Push the assembly down to seat it onto the valve guide.

(2) Install valve spring and retainer, use Special Tool MD-998772-A with adapter 6779 to compress valve springs only enough to install locks (Fig. 33). Correct alignment of tool is necessary to avoid nicking valve stems.

(3) Remove air hose and install spark plugs.

(4) Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

(5) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

INSTALLATION - CYLINDER HEAD OFF

(1) Coat valve stems with clean engine oil and insert in cylinder head.

(2) Install new valve stem seals on all valves using a valve stem seal tool (Fig. 35). The valve stem seals should be pushed firmly and squarely over valve guide.

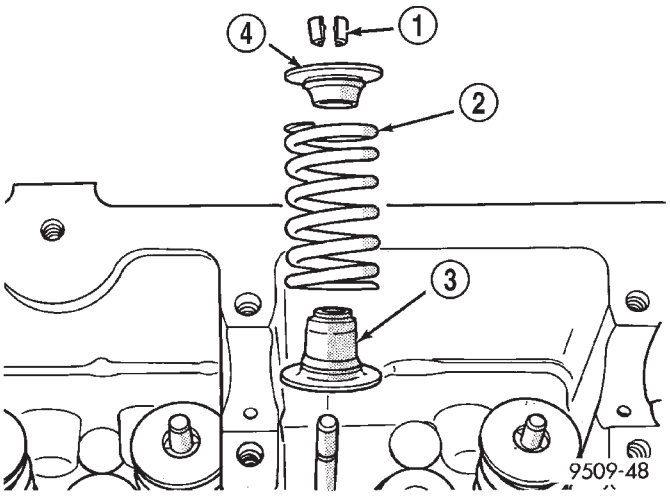

Fig. 34 Valve Stem Seal/Valve Spring Seat

1 - VALVE RETAINING LOCKS
2 - VALVE SPRING
3 - VALVE SEAL AND VALVE SPRING SEAT ASSEMBLY
4 - VALVE SPRING RETAINER

CAUTION: When oversize valves are used, the corresponding oversize valve seal must also be used. Excessive guide wear may result if oversize seals are not used with oversize valves.

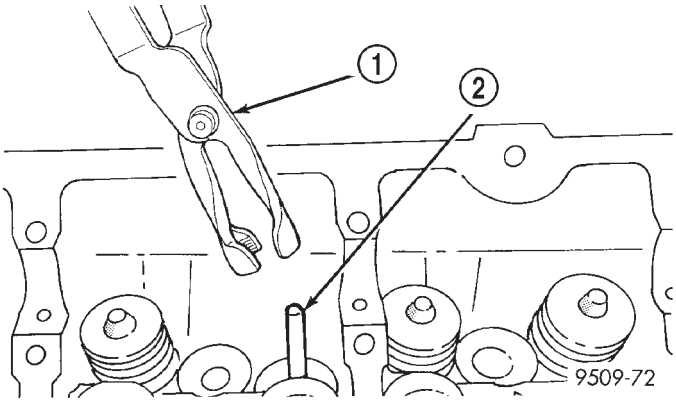

Fig. 35 Valve Stem Oil Seal Tool

1 - VALVE SEAL TOOL
2 - VALVE STEM

(3) Install valve springs and retainers. Compress valve springs only enough to install locks, taking care not to misalign the direction of compression. Nicked valve stems may result from misalignment of the valve spring compressor.

CAUTION: When depressing the valve spring retainers with valve spring compressor the locks can become dislocated. Ensure both locks are in the correct location after removing tool.

VALVE SPRINGS & SEALS (Continued)

(4) Check the valve spring installed height B after refacing the valve and seat (Fig. 36). Make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.525 in.), install a 0.762 mm (0.030 in.) spacer under the valve spring seat to bring spring height back within specification.

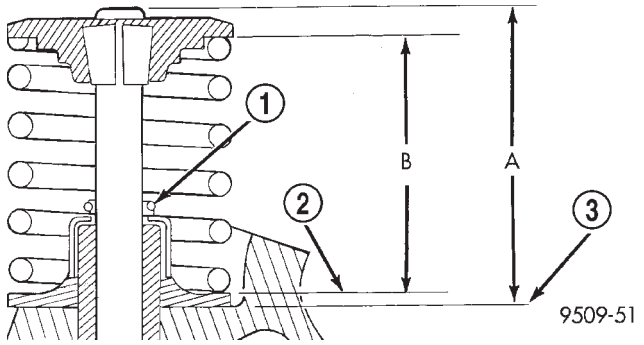

Fig. 36 Checking Spring Installed Height and Valve Tip Height Dimensions

1 - GARTER SPRING
2 - VALVE SPRING SEAT
3 - CYLINDER HEAD SURFACE

HYDRAULIC LASH ADJUSTERS

DIAGNOSIS AND TESTING - HYDRAULIC LASH ADJUSTER NOISE DIAGNOSIS

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

(3) During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor (integral to the head gasket) in the vertical oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Faulty lash adjuster.

a. Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

b. Remove suspected lash adjusters, and replace as necessary.

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

(1) Remove cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(2) Remove rocker arm. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL)

(3) Remove hydraulic lash adjuster (Fig. 37).

(4) Repeat removal procedure for each hydraulic lash adjuster.

(5) If reusing, mark each hydraulic lash adjuster for reassembly in original position. Lash adjusters are serviced as an assembly.

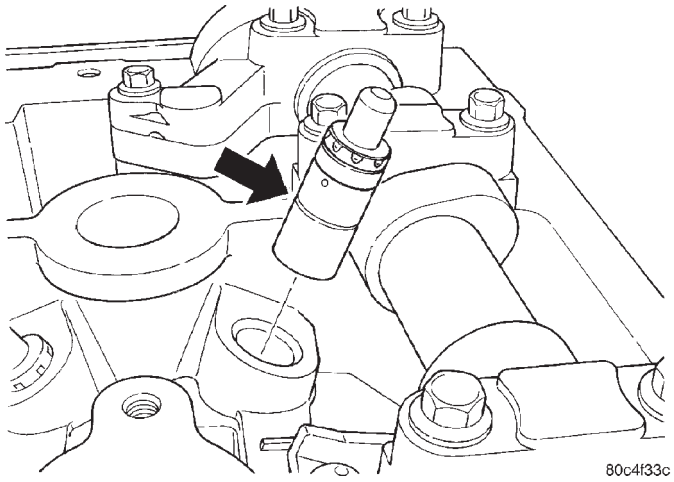

Fig. 37 Hydraulic Lash Adjuster

INSTALLATION

(1) Install hydraulic lash adjuster (Fig. 37). Ensure the lash adjusters are at least partially full of engine oil. This is indicated by little or no plunger travel when the lifter is depressed.

(2) Install rocker arm. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION)

(3) Repeat installation procedure for each hydraulic lash adjuster.

(4) Install cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

ROCKER ARMS

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

(1) Remove cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
(2) Remove spark plugs.
(3) Rotate engine until the camshaft lobe, on the follower being removed, is positioned on its base circle (heel). Also, the piston should be a minimum of 6.3 mm (0.25 in) below TDC position.

CAUTION: If cam follower assemblies are to be reused, always mark position for reassembly in their original positions.

(4) Using Special Tools 8215A and 8436 slowly depress valve assembly until rocker arm can be removed (Fig. 38).
(5) Repeat removal procedure for each rocker arm.

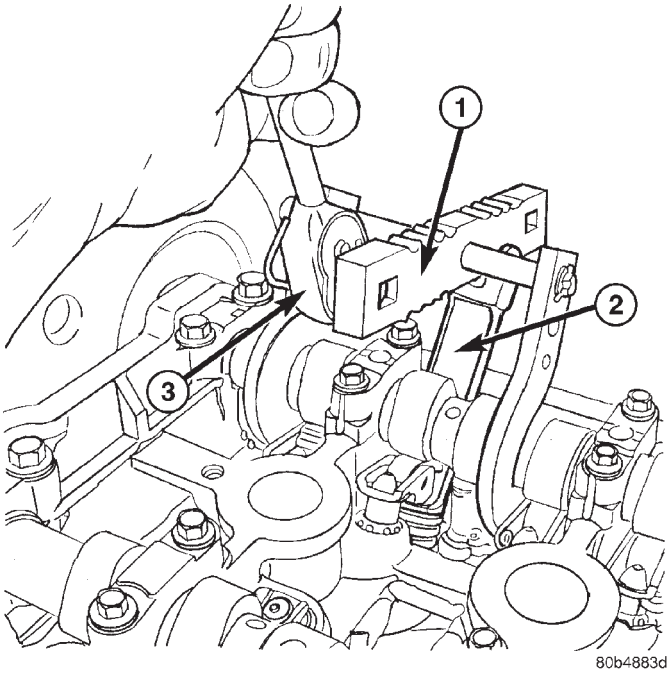

Fig. 38 Rocker Arm - Removal/Installation

1 - SPECIAL TOOL 8215A
2 - SPECIAL TOOL 8436
3 - 3/8″ DRIVE RACHET

INSPECTION

Inspect the rocker arm for wear or damage (Fig. 39). Replace as necessary.

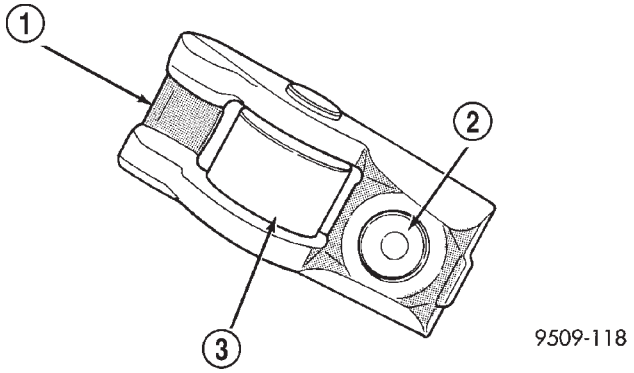

Fig. 39 Rocker Arm

1 - TIP
2 - LASH ADJUSTER POCKET
3 - ROLLER

INSTALLATION

(1) Lubricate rocker arm with clean engine oil.
(2) Using Special Tools 8215A and 8436 slowly depress valve assembly until rocker arm can be installed on the hydraulic lifter and valve stem (Fig. 38).
(3) Repeat installation procedure for each rocker arm.
(4) Install spark plugs.
(5) Install cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

ENGINE BLOCK

DESCRIPTION

The cast iron cylinder block is a two-piece assembly, consisting of the cylinder block and bedplate (Fig. 40). The bedplate incorporates the main bearing caps and bolts to the cylinder block. This design offers a much stronger lower end and increased cylinder block rigidity. The rear oil seal retainer is integral with the block. The bedplate and block are serviced as an assembly.

ENGINE BLOCK (Continued)

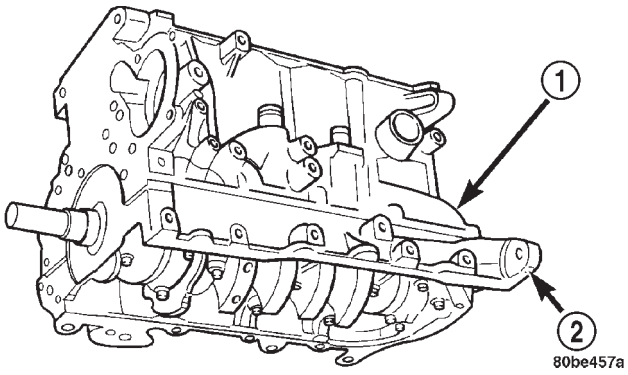

Fig. 40 Cylinder Block and Bedplate

1 - CYLINDER BLOCK
2 - BEDPLATE

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON TO CYLINDER BORE FITTING

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin about 14 mm (9/16 inch.) from the bottom of the skirt as shown in (Fig. 42). Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line shown in (Fig. 41). Refer to for Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS). Correct piston to bore clearance must be established in order to assure quiet and economical operation.

NOTE: Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

STANDARD PROCEDURE - CYLINDER BORE HONING

(1) Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

(2) Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

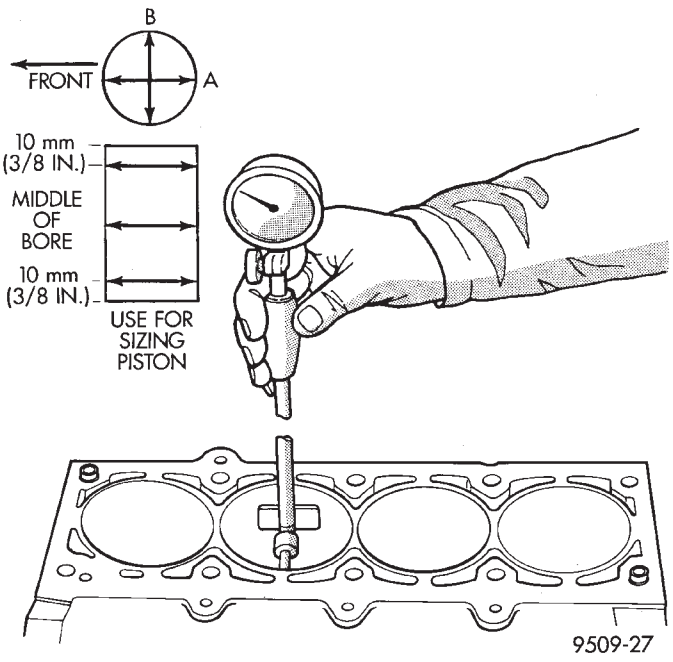

Fig. 41 Checking Cylinder Bore

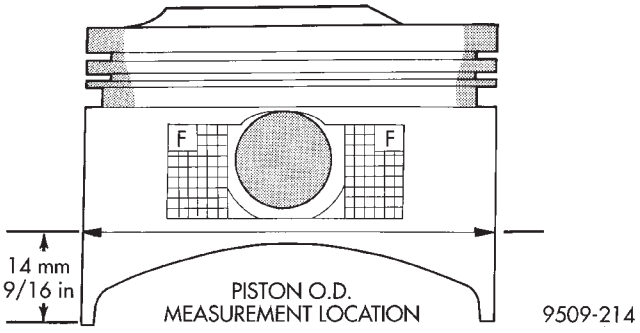

Fig. 42 Piston Measurement

(3) Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40-60 degrees, the cross hatch angle is most satisfactory for proper seating of rings (Fig. 43).

(4) A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

ENGINE BLOCK (Continued)

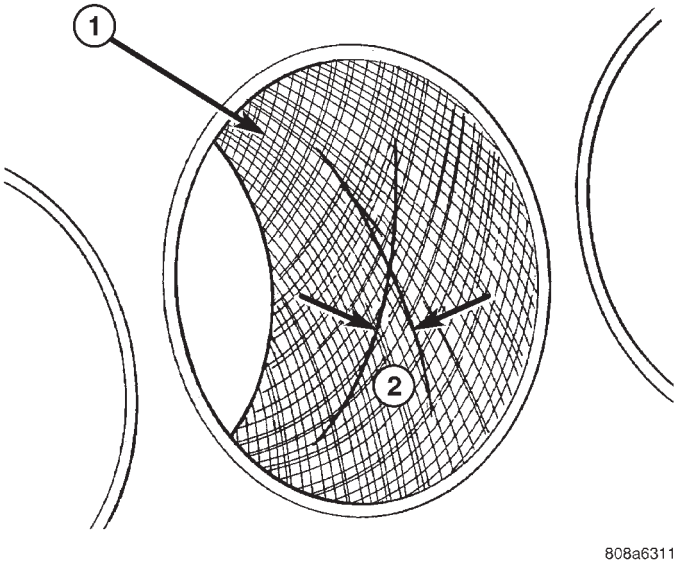

Fig. 43 Cylinder Bore Cross-Hatch Pattern

1 - CROSS-HATCH PATTERN
2 - 40°–60°

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

(1) Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

(2) If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).

(3) Examine block and cylinder bores for cracks or fractures.

(4) Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Fig. 44) (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

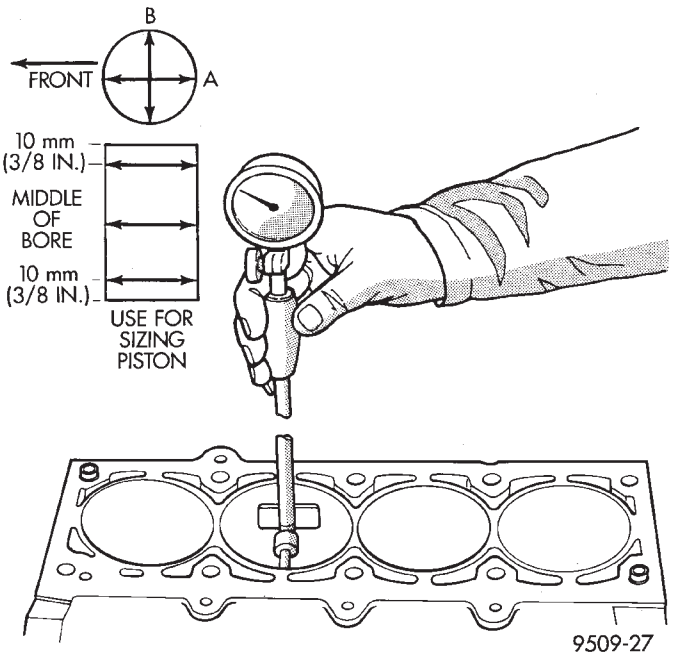

Fig. 44 Checking Cylinder Bore Size

Measure the cylinder bore at three levels in directions A and B (Fig. 44). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CONNECTING ROD BEARINGS

STANDARD PROCEDURE

CONNECTING ROD - FITTING

(1) For measuring connecting rod bearing clearance procedure and use of Plastigage(Refer to 9 - ENGINE - STANDARD PROCEDURE). For bearing clearance refer to Engine Specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

NOTE: The rod bearing bolts should not be reused.

(2) Before installing the **NEW** bolts the threads should be oiled with clean engine oil.

(3) Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.

CONNECTING ROD BEARINGS (Continued)

(4) Tighten the bolts to 27 N·m PLUS 1/4 turn (20 ft. lbs. PLUS 1/4 turn) **Do not use a torque wrench for last step.**

(5) Using a feeler gauge, check connecting rod side clearance (Fig. 45). Refer to clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

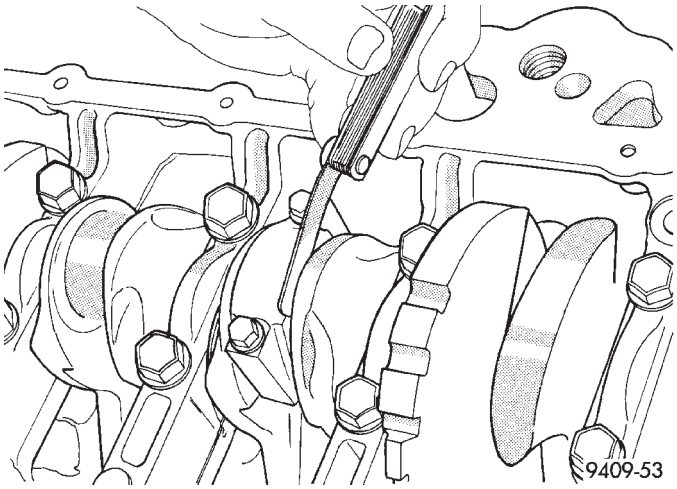

Fig. 45 Connecting Rod Side Clearance

CRANKSHAFT

DESCRIPTION

The crankshaft is made of nodular cast iron and includes five main bearing journals and four connecting rod journals (Fig. 46). The number three journal is the location for the thrust bearing. The mains and connecting rod journals have undercut fillet radiuses that are rolled for added strength. To optimize bearing loading, eight counterweights are used.

OPERATION

The crankshaft transfers force generated by combustion within the cylinder to the flywheel or flexplate.

STANDARD PROCEDURE - CRANKSHAFT END PLAY

(1) Using Dial Indicator C-3339 and Mounting Post L-4438, attach to front of engine, locating probe perpendicular on nose of crankshaft (Fig. 47).

(2) Move crankshaft all the way to the rear of its travel.

(3) Zero the dial indicator.

(4) Move crankshaft all the way to the front and read the dial indicator. Refer to Engine Specifications.

REMOVAL

NOTE: Crankshaft can not be removed when engine is in vehicle.

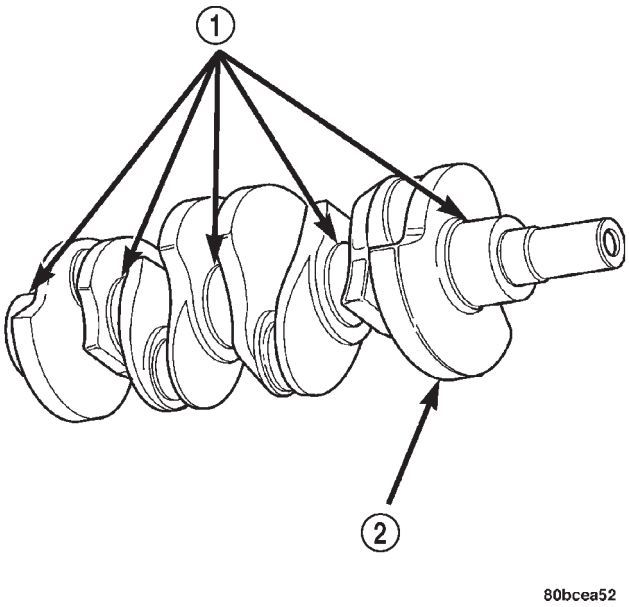

Fig. 46 Crankshaft - Typical

1 - MAIN BEARING JOURNALS
2 - COUNTER BALANCE WEIGHTS

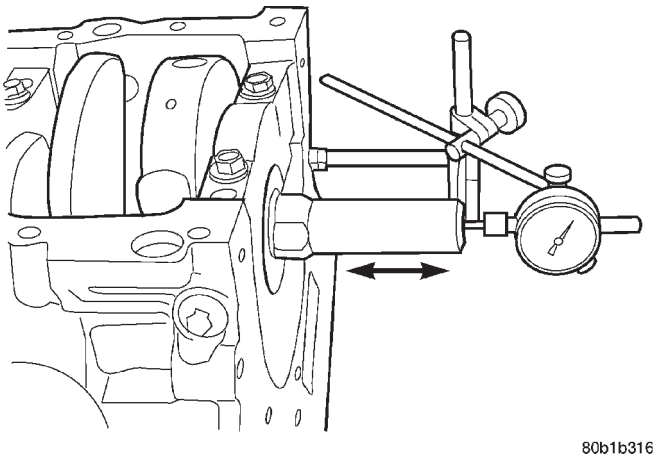

Fig. 47 CHECKING CRANKSHAFT END PLAY

(1) Remove engine assembly from vehicle. (Refer to 9 - ENGINE - REMOVAL)

(2) Separate engine from transaxle.

(3) Remove flex plate and crankshaft rear oil seal.

(4) Mount engine on a repair stand.

(5) Drain engine oil and remove oil filter.

(6) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(7) Remove engine mount support bracket.

(8) Remove the crankshaft damper and timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(9) Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

CRANKSHAFT (Continued)

(10) Remove the crankshaft sprocket and oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL)

(11) Remove balance shafts and housing assembly. (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - REMOVAL)

NOTE: If piston/connecting rod replacement is necessary, remove cylinder head.

(12) Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(13) Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.

(14) Remove all bedplate bolts from the engine block (Fig. 48).

(15) Using a mallet gently tap the bedplate loose from the engine block dowel pins.

CAUTION: Do not pry up on one side of the bedplate. Damage may occur to cylinder block to bedplate alignment and thrust bearing.

(16) Bedplate should be removed evenly from the cylinder block dowel pins to prevent damage to the dowel pins and thrust bearing.

(17) Lift out crankshaft from cylinder block. Do not damage the main bearings or journals when removing the crankshaft.

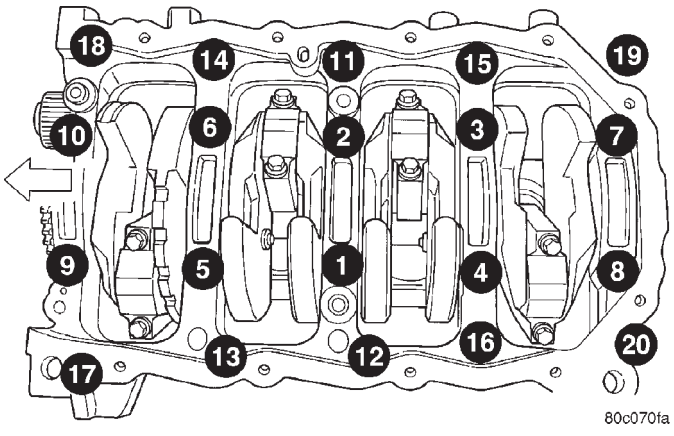

Fig. 48 Bedplate Bolt Tightenening Sequence

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring (Fig. 49). Limits of taper or out of round on any crankshaft journals should within specitifications. (Refer to 9 - ENGINE - SPECIFICATIONS) Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

CAUTION: With the nodular cast iron crankshafts, it is important that the final paper or cloth polish be in the same direction as normal rotation in the engine.

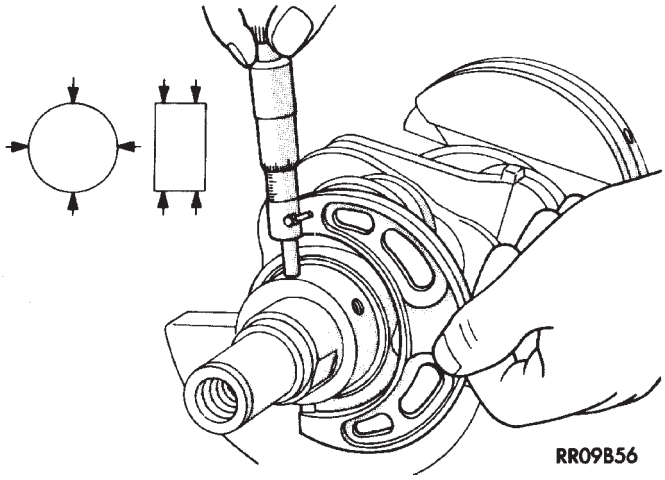

Fig. 49 Crankshaft Journal Measurements

INSTALLATION

(1) Install the main bearing upper shells with the lubrication groove in the cylinder block (Fig. 50).

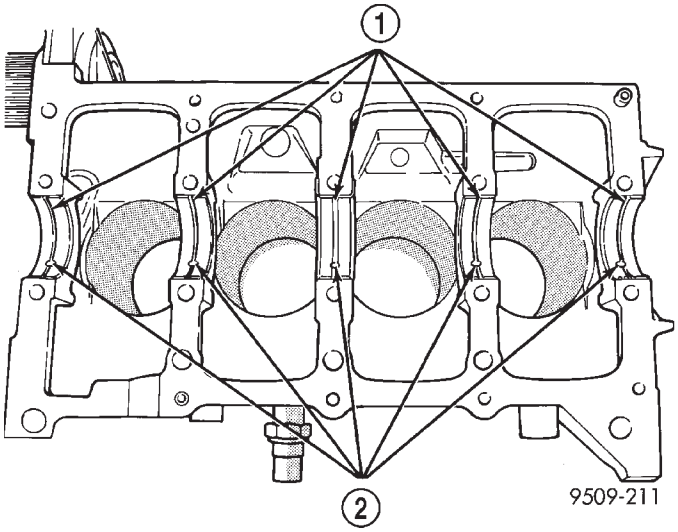

Fig. 50 Installing Main Bearing Upper Shell

1 - LUBRICATION GROOVES
2 - OIL HOLES

CRANKSHAFT (Continued)

(2) Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.

CAUTION: Do not get oil on the bedplate mating surface. It will affect the sealer ability to seal the bedplate to cylinder block.

(3) Oil the bearings and journals. Install crankshaft.

CAUTION: Use only the specified anaerobic sealer on the bedplate or damage may occur to the engine.

(4) Apply 1.5 to 2.0 mm (0.059 to 0.078 in.) bead of Mopar® Bed Plate Sealant to cylinder block as shown in (Fig. 51).

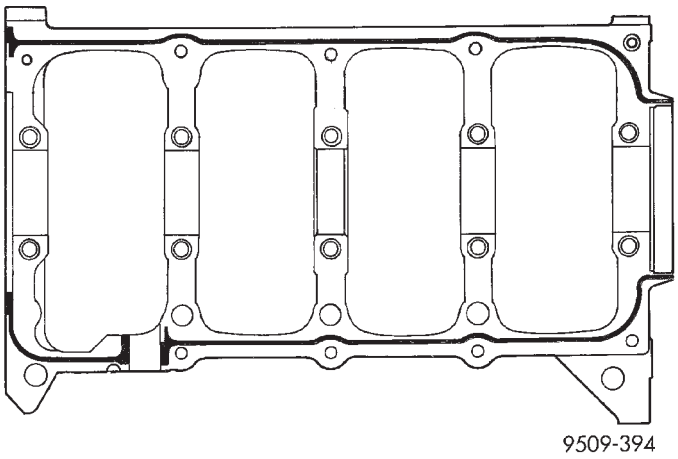

Fig. 51 Bedplate Sealing

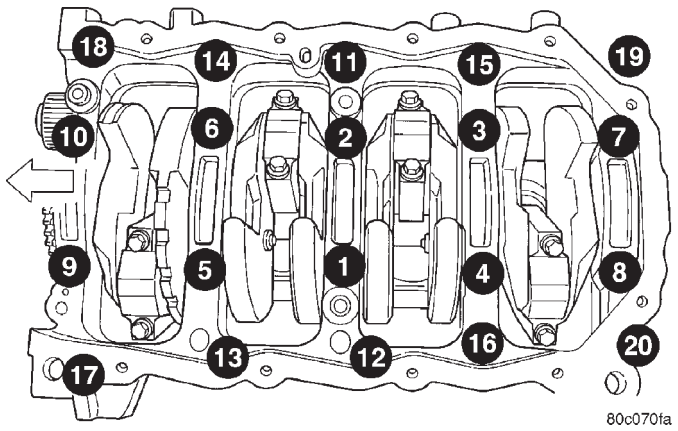

Fig. 52 Bedplate Bolt Torque Sequence

(5) Install lower main bearings into main bearing cap/bedplate. Make certain the bearing tabs are seated into the bedplate slots. Install the main bearing/bedplate into engine block.

(6) Before installing the bolts the threads should be oiled with clean engine oil, wipe off any excess oil.

(7) Install main bearing bedplate to engine block bolts 11, 17, and 20 finger tight. Tighten these bolts down together until the bedplate contacts the cylinder block.

(8) To ensure correct thrust bearing alignment, perform the following steps:

- Step 1: Rotate crankshaft until number 4 piston is at TDC.
- Step 2: Move crankshaft rearward to limits of travel.
- Step 3: Then, move crankshaft forward to limits of travel.
- Step 4: Wedge an appropriate tool between the rear of the cylinder block **(NOT BED PLATE)** and the rear crankshaft counterweight. This will hold the crankshaft in it's furthest forward position.
- Step 5: Install and tighten bolts (1–10) in sequence shown in (Fig. 52) to 41 N·m (30 ft. lbs.).
- Step 6: Remove wedge tool used to hold crankshaft.

(9) Tighten bolts (1–10) again to 41 N·m (30 ft. lbs.) in sequence shown in (Fig. 52).

CAUTION: Do Not use a torque wrench for the following step.

(10) Turn bolts (1–10) an additional 1/4 turn in sequence shown in (Fig. 52).

(11) Install main bearing bedplate to engine block bolts (11–20), and torque each bolt to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 52).

(12) Tighten bolts (11–20) again to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 52).

(13) After the main bearing bedplate is installed, check the crankshaft turning torque. The turning torque should not exceed 5.6 N·m (50 in. lbs.).

(14) Install connecting rod bearings and caps. **Do Not Reuse Connecting Rod Bolts.** Torque connecting rod bolts to 27 N·m (20 ft. lbs.) plus 1/4 turn.

(15) Install balance shafts and housing assembly. (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - INSTALLATION)

(16) Install the oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION)

(17) Install cylinder head if it was removed (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(18) Install the timing belt rear cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(19) Install crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(20) Install the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

CRANKSHAFT (Continued)

(21) Install the timing belt front covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(22) Install engine mount support bracket.

(23) Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

(24) Install the oil filter.

(25) Install crankshaft rear oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)

(26) Install flex plate. Apply Mopar® Lock & Seal Adhesive to bolt threads and tighten to 95 N·m (70 ft. lbs.).

(27) Attach transaxle to engine. Tighten attaching bolts to 101 N·m (75 ft. lbs.).

(28) Install the engine assembly. (Refer to 9 - ENGINE - INSTALLATION)

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE - MAIN BEARING - FITTING

For crankshaft specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

CRANKSHAFT MAIN BEARINGS

The crankshaft is supported in five main bearings. All upper and lower bearing shells in the crankcase have oil grooves. Crankshaft end play is controlled by a flanged bearing on the number three main bearing journal (Fig. 53).

Upper and lower Number 3 bearing halves are flanged to carry the crankshaft thrust loads and are NOT interchangeable with any other bearing halves in the engine (Fig. 53). All bearing cap bolts removed during service procedures are to be cleaned and oiled before installation. Bearing shells are available in standard and the following undersized: 0.025 mm (0.001 in.) and 0.250 mm (0.010 in.). Never install an undersize bearing that will reduce clearance below specifications. Replace or machine the crankshaft as necessary to obtain proper bearing clearances.

MAIN BEARING INSTALLATION

(1) Install the main bearing shells with the lubrication groove in the cylinder block (Fig. 54).

(2) Make certain oil holes in block line up with oil holes in bearings. Bearing tabs must seat in the block tab slots.

CAUTION: Do not get oil on the bedplate mating surface. It will may effect the sealer ability to seal the bedplate to cylinder block.

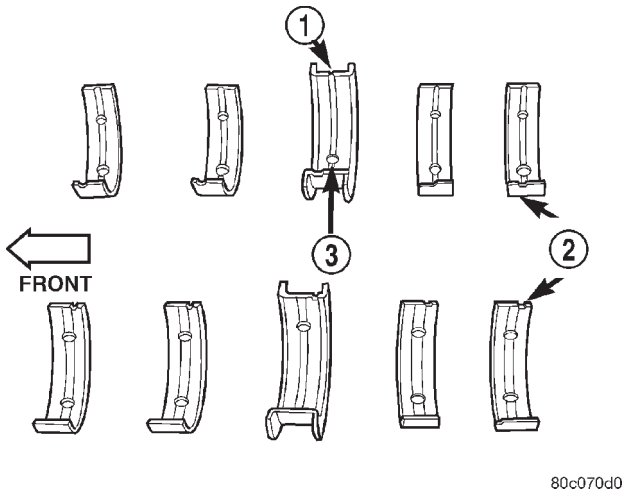

Fig. 53 Main Bearing Identification

1 - OIL GROOVE
2 - MAIN BEARINGS
3 - OIL HOLE

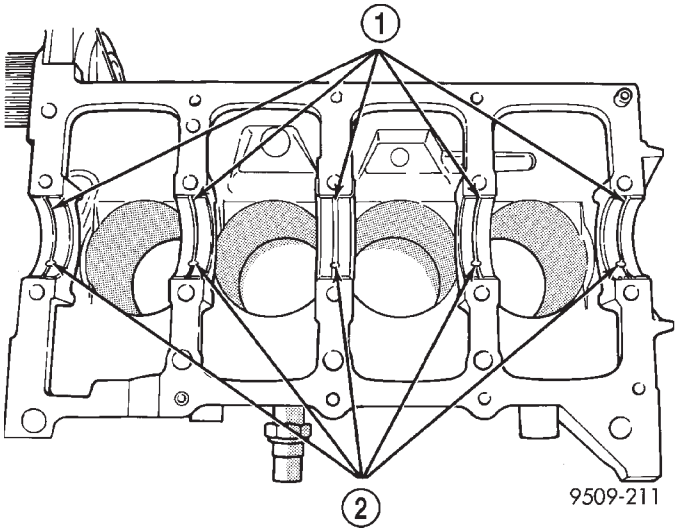

Fig. 54 Installing Main Bearing Upper Shell

1 - LUBRICATION GROOVES
2 - OIL HOLES

(3) Oil the bearings and journals and install crankshaft.

CAUTION: Use only the specified anaerobic sealer on the bedplate or damage may occur to the engine. Ensure that both cylinder block and bedplate surfaces are clean.

(4) Apply 1.5 to 2.0 mm (0.059 to 0.078 in.) bead of anaerobic sealer Mopar® Bed Plate Sealant to cylinder block as shown in (Fig. 55).

(5) Install lower main bearings into main bearing cap/bedplate. Make certain the bearing tabs are seated into the bedplate slots.

CRANKSHAFT MAIN BEARINGS (Continued)

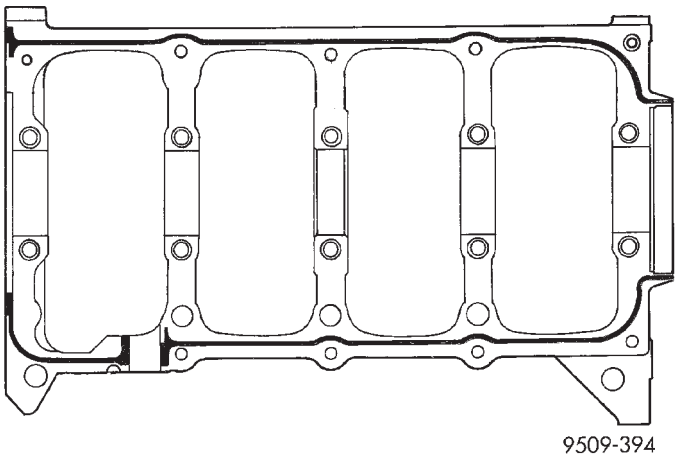

Fig. 55 Main Bearing Caps/Bedplate Sealing

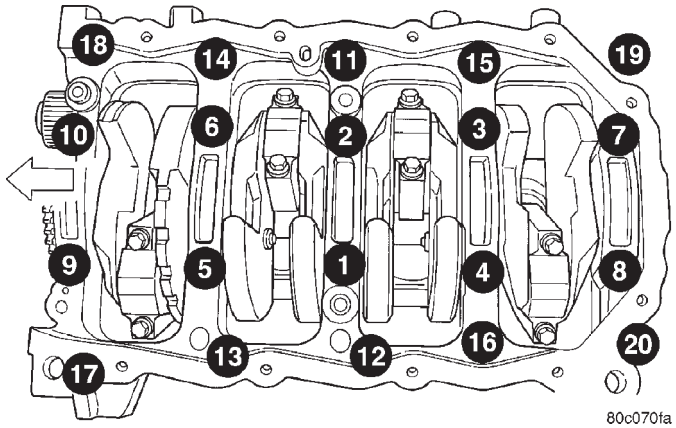

Fig. 56 Main Bearing Caps/Bedplate Tightening Sequence

(6) Position the main bearing/bedplate onto the engine block.

(7) Before installing bolts, lubricate the threads with clean engine oil, wipe off any excess oil.

(8) Install main bearing bedplate to engine block bolts 11, 17 and 20 finger tight. Tighten these bolts down together until the bedplate contacts the cylinder block.

(9) To ensure correct thrust bearing alignment, perform the following steps:

- Step 1: Rotate crankshaft until number 4 piston is at TDC.
- Step 2: Move crankshaft rearward to limits of travel.
- Step 3: Then, move crankshaft forward to limits of travel.
- Step 4: Wedge an appropriate tool between the rear of the cylinder block **(NOT BED PLATE)** and the rear crankshaft counterweight. This will hold the crankshaft in it's furthest forward position.
- Step 5: Install and tighten bolts (1–10) in sequence shown in (Fig. 56) to 41 N·m (30 ft. lbs.).
- Step 6: Remove wedge tool used to hold crankshaft.

(10) Tighten bolts (1–10) again to 41 N·m (30 ft. lbs.) in sequence shown in (Fig. 56).

CAUTION: Do Not use a torque wrench for the following step.

(11) Turn bolts (1–10) an additional 1/4 turn in sequence shown in (Fig. 56).

(12) Install main bearing bedplate to engine block bolts (11–20), and torque each bolt to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 56).

(13) Tighten bolts (11–20) again to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 56).

(14) After the main bearing bedplate is installed, check the crankshaft turning torque. The turning torque should not exceed 5.6 N·m (50 in. lbs.).

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Remove the crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(2) Remove timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(3) Remove crankshaft sprocket using Special Tool 6793 and insert C-4685-C2 (Fig. 57).

CAUTION: Do not nick shaft seal surface or seal bore.

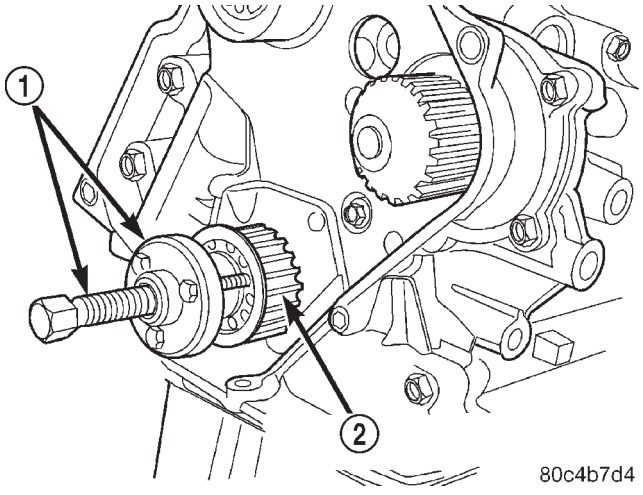

Fig. 57 Crankshaft Sprocket - Removal

1 - SPECIAL TOOL 6793
2 - CRANKSHAFT SPROCKET

CRANKSHAFT OIL SEAL - FRONT (Continued)

(4) Using Tool 6771 to remove front crankshaft oil seal (Fig. 58). Be careful not to damage the seal surface of cover.

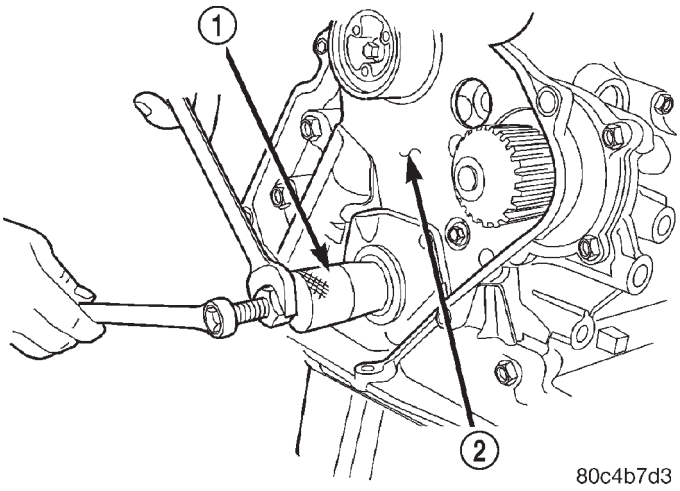

Fig. 58 Front Crankshaft Oil Seal - Removal

1 - SPECIAL TOOL 6771
2 - REAR TIMING BELT COVER

INSTALLATION

(1) Install new seal by using Special Tool 6780 (Fig. 59).

(2) Place seal into opening with seal spring towards the inside of engine. Install seal until flush with cover.

(3) Install crankshaft sprocket using Special Tool 6792 (Fig. 60).

(4) Install timing belt. (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

(5) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

CRANKSHAFT OIL SEAL - REAR

REMOVAL

(1) Remove transaxle. Refer to TRANSMISSION/ TRANSAXLE - REMOVAL for procedure.

(2) Remove flex plate.

(3) Insert a 3/16 flat bladed screwdriver between the dust lip and the metal case of the crankshaft seal. Angle the screwdriver (Fig. 61)through the dust lip against metal case of the seal. Pry out seal.

CAUTION: Do not permit the screwdriver blade to contact crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.

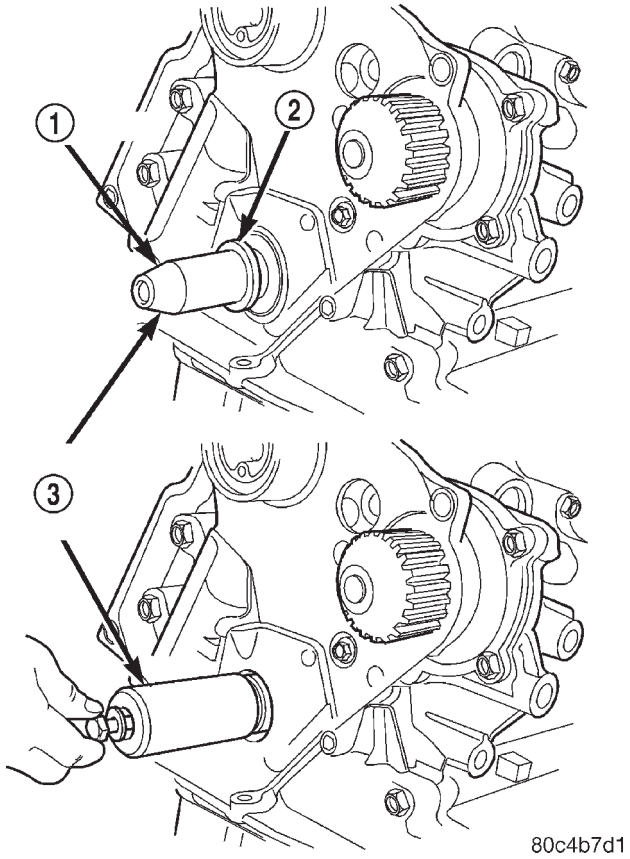

Fig. 59 Crankshaft Front Oil Seal - Installation

4 - REAR CRANKSHAFT SEAL METAL CASE
5 - PRY IN THIS DIRECTION
6 - CRANKSHAFT
7 - SCREWDRIVER
8 - REAR CRANKSHAFT SEAL DUST LIP
9 - SCREWDRIVER

INSTALLATION

CAUTION: If burr or scratch is present on the crankshaft edge (chamfer), cleanup with 400 grit sand paper to prevent seal damage during installation of new seal.

NOTE: When installing seal, no lube on seal is needed.

(1) Place Special Tool 6926-1 Seal Guide on crankshaft (Fig. 62).

(2) Position seal over guide tool (Fig. 62). Guide tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.

CAUTION: If the seal is driven into the block past flush, this may cause an oil leak.

(3) Drive the seal into the block using Special Tool 6926-2 and handle C-4171 (Fig. 63) until the tool bottoms out against the block (Fig. 64).

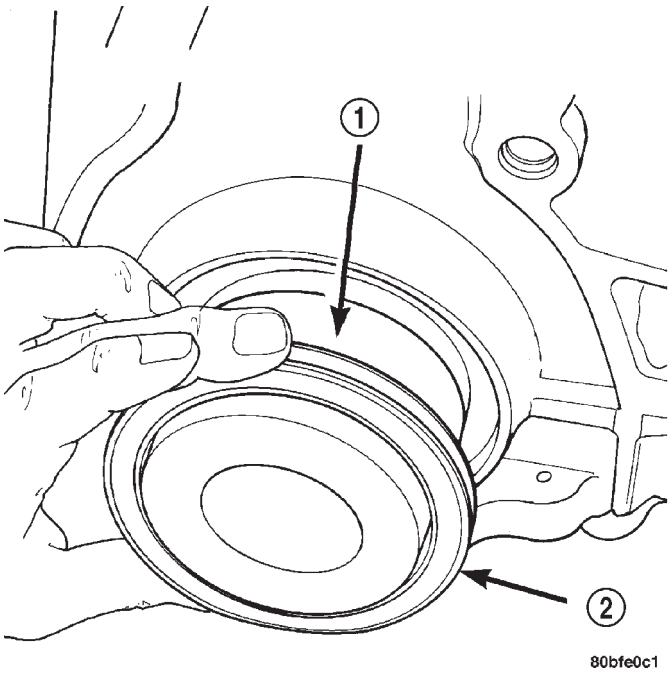

Fig. 62 Rear Crankshaft Seal and Special Tool 6926-1

CRANKSHAFT OIL SEAL - REAR (Continued)

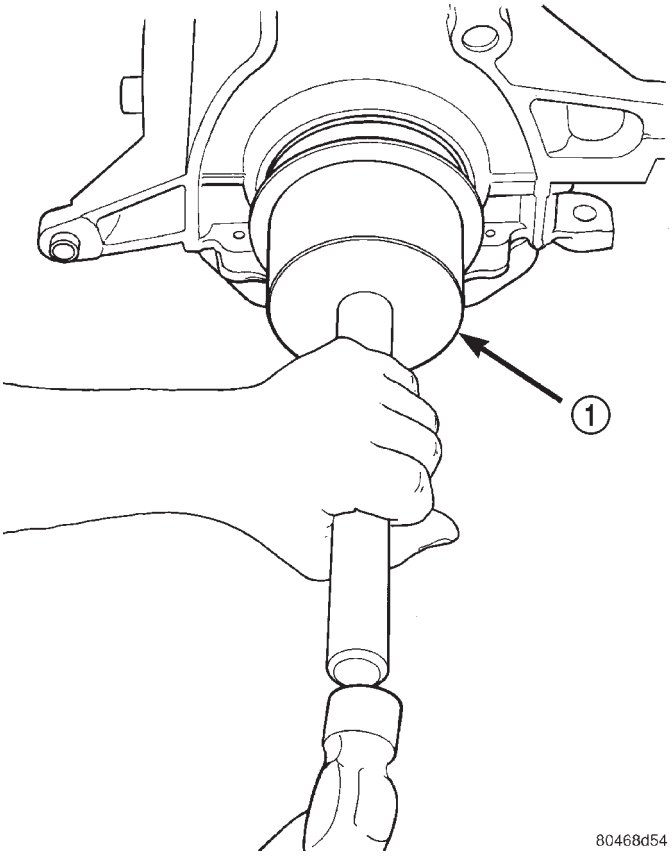

Fig. 64 Rear Crankshaft Seal—Installation

1 - SPECIAL TOOL 6926–2 INSTALLER

(4) Install flex plate. Apply Mopar® Lock & Seal Adhesive to bolt threads and tighten bolts to 95 N·m (70 ft. lbs.).

(5) Install transaxle. Refer to TRANSMISSION/ TRANSAXLE - INSTALLATION for procedure.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons are made of a cast aluminum alloy. The pistons have pressed-in pins attached to forged powdered metal connecting rods. The pistons pin is offset 1 mm (0.0394 in.) towards the thrust side of the piston. The connecting rods are a cracked cap design and are not repairable. Hex head cap screws are used to provide alignment and durability in the assembly. The pistons and connecting rods are serviced as an assembly.

OPERATION

The piston and connecting rod is the link between the combustion force to the crankshaft.

REMOVAL

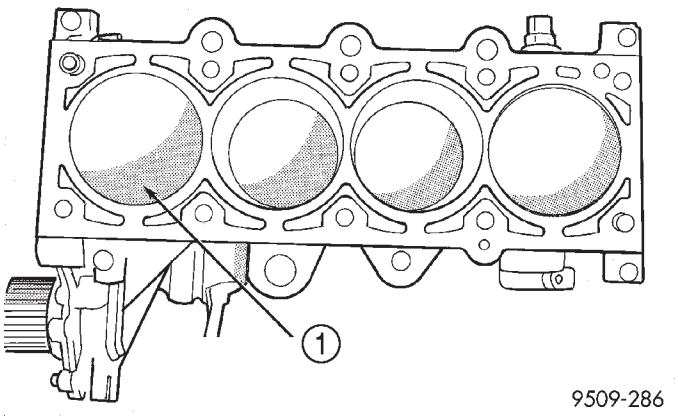

Fig. 65 Piston Markings

1 - DIRECTIONAL ARROW WILL BE IMPRINTED IN THIS AREA

NOTE: Cylinder Head must be removed before Pistons and Rods (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(1) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation**.

(2) Pistons have a directional stamping in the front half of the piston facing towards the **front** of engine (Fig. 65).

(3) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - REMOVAL).

(5) Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap (Fig. 66).

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(6) Remove connecting rod bolts and cap. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.

(7) Pistons and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

(8) Push piston and rod assembly out of cylinder bore.

NOTE: Be careful not to nick crankshaft journals.

PISTON & CONNECTING ROD (Continued)

(9) After removal, install bearing cap on the mating rod.

(10) Repeat procedure for each piston and connecting rod assembly.

(11) Piston and connecting rods are serviced as an assembly.

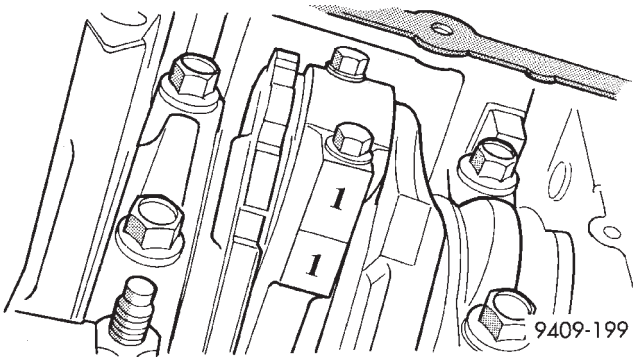

Fig. 66 Identify Connecting Rod to Cylinder

INSTALLATION

(1) Before installing pistons and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap (Fig. 67).

(2) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown in (Fig. 67). As viewed from top.

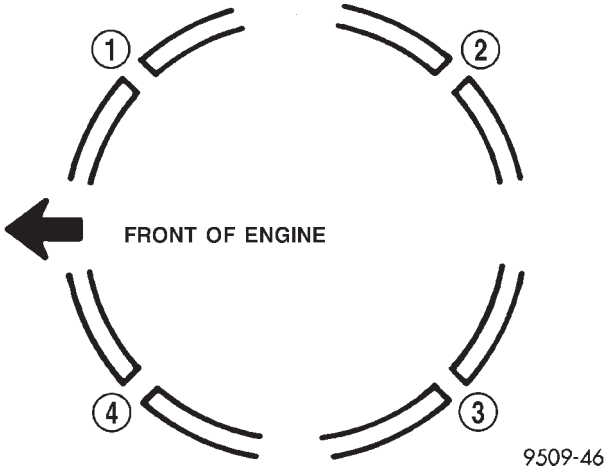

Fig. 67 Piston Ring End Gap Position

1 - GAP OF LOWER SIDE RAIL
2 - NO. 1 RING GAP
3 - GAP OF UPPER SIDE RAIL
4 - NO. 2 RING GAP AND SPACER EXPANDER GAP

(3) Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston (Fig. 68). **Be sure position of rings does not change during this operation** .

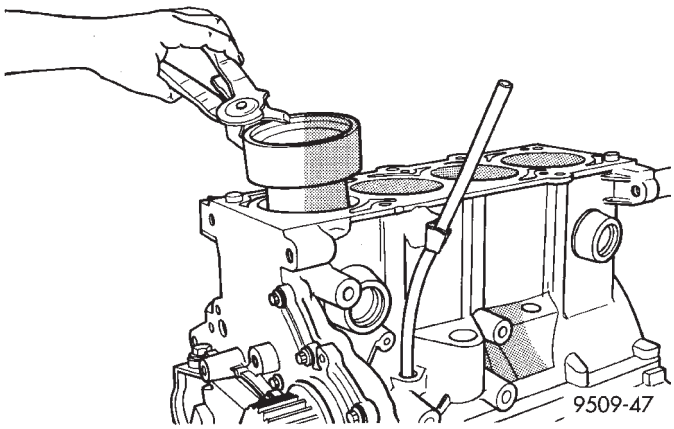

Fig. 68 Piston—Installation

(4) The directional stamp on the piston should face toward the front of the engine (Fig. 65).

(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston assembly into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

NOTE: The connecting rod cap bolts should not be reused.

(7) Before installing the **NEW** bolts the threads should be coated with clean engine oil.

(8) Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.

CAUTION: Do not use a torque wrench for second part of last step.

(9) Tighten the bolts to 27 N·m PLUS 1/4 turn (20 ft. lbs. PLUS 1/4 turn).

(10) Using a feeler gauge, check connecting rod side clearance (Fig. 69).

(11) Install Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - INSTALLATION).

(12) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(13) Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

PISTON & CONNECTING ROD (Continued)

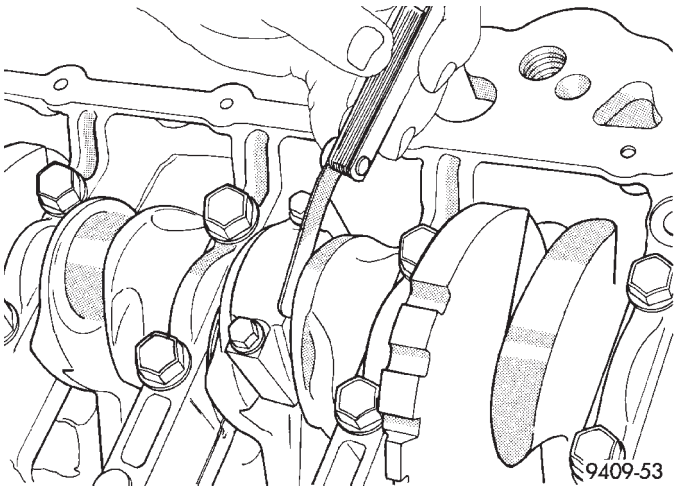

Fig. 69 Checking Connecting Rod Side Clearance

PISTON RINGS

STANDARD PROCEDURE

PISTON RING - FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 inch) from bottom of cylinder bore. Check gap with feeler gauge (Fig. 70). Refer to Engine Specifications.

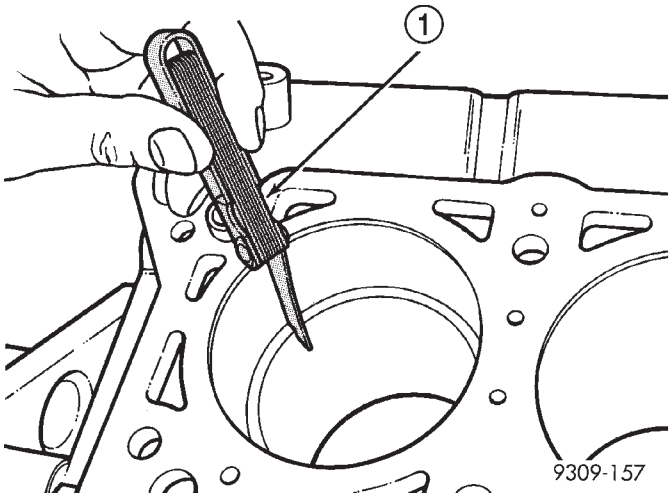

Fig. 70 Piston Ring Gap

1 - FEELER GAUGE

(2) Check piston ring to groove side clearance (Fig. 71). Refer to Engine Specifications.

PISTON RINGS - INSTALLATION

(1) Install rings with manufacturers I.D. mark facing up, to the top of the piston (Fig. 72).

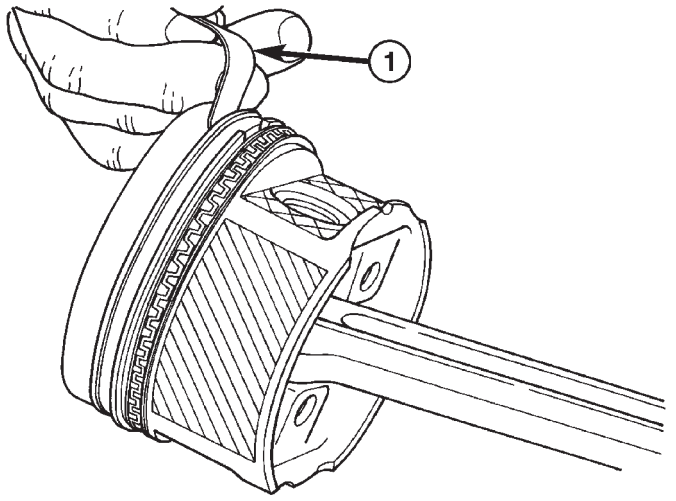

Fig. 71 Piston Ring Side Clearance

1 - FEELER GAUGE

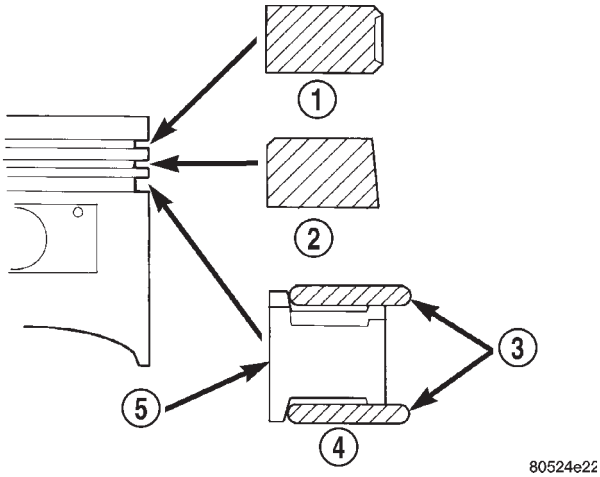

Fig. 72 Piston Ring Installation

1 - NO. 1 PISTON RING
2 - NO. 2 PISTON RING
3 - SIDE RAIL
4 - OIL RING
5 - SPACER EXPANDER

CAUTION: Install piston rings in the following order:

- Oil ring expander.
- Upper oil ring side rail.
- Lower oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

(2) Install the side rail by placing one end between the piston ring groove and the expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander** (Fig. 73).

PISTON RINGS (Continued)

(3) Install upper side rail first and then the lower side rail.

(4) Install No. 2 piston ring and then No. 1 piston ring.

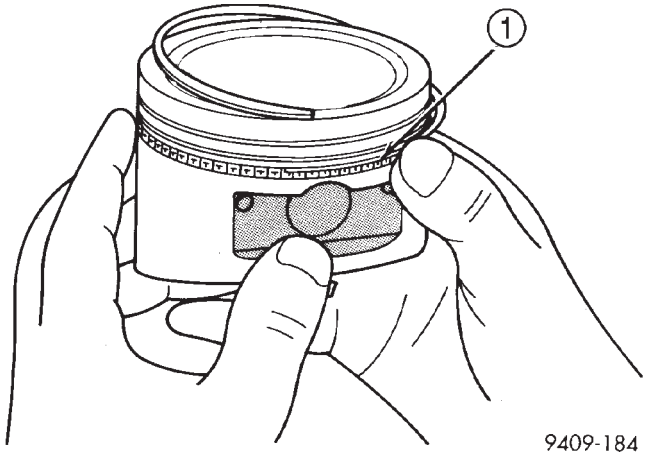

Fig. 73 Installing Side Rail

1 - SIDE RAIL END

(5) Position piston ring end gaps as shown in (Fig. 74).

(6) Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

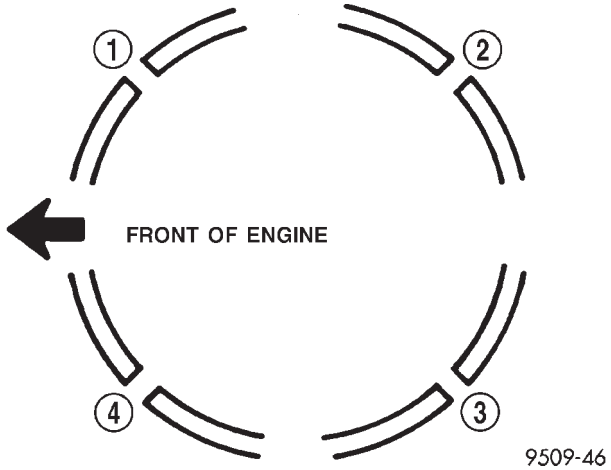

Fig. 74 Piston

1 - GAP OF LOWER SIDE RAIL
2 - NO. 1 RING GAP
3 - GAP OF UPPER SIDE RAIL
4 - NO. 2 RING GAP AND SPACER EXPANDER GAP

VIBRATION DAMPER

REMOVAL

(1) Remove accesory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(2) Remove crankshaft damper bolt.

(3) Remove damper using Special Tool 3-Jaw Puller 1026 and Insert 6827–A (Fig. 75).

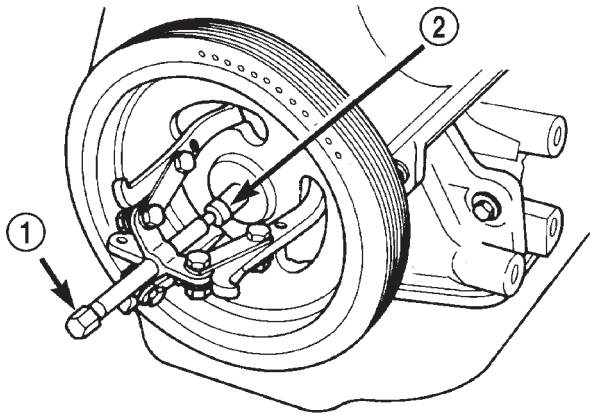

Fig. 75 Crankshaft Vibration Damper - Removal

1 - SPECIAL TOOL 1026 3-JAW PULLER
2 - SPECIAL TOOL 6827–A INSERT

INSTALLATION

(1) Install crankshaft vibration damper using M12 1.75 x 150 mm bolt, washer, thrust bearing and nut from Special Tool 6792 (Fig. 76).

(2) Install crankshaft vibration damper bolt and tighten to 142 N·m (105 ft. lbs.).

(3) Install accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

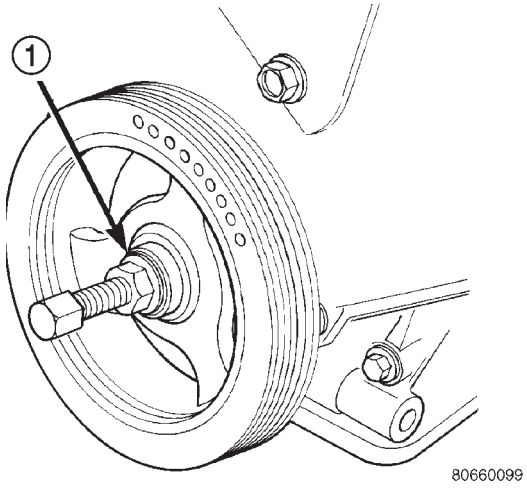

Fig. 76 Crankshaft Vibration Damper - Installation

1 - M12–1.75 × 150 MM BOLT, WASHER AND THRUST BEARING FROM SPECIAL TOOL 6792

STRUCTURAL COLLAR

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove engine front mount bracket and front insulator mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/FRONT MOUNT - REMOVAL)
(3) Remove structural collar attaching bolts (Fig. 77).
(4) Remove collar.

INSTALLATION

CAUTION: Torque procedure for the structural collar must be followed or damage could occur to oil pan and collar.

(1) Perform the following steps for installing structural collar. Refer to (Fig. 77):

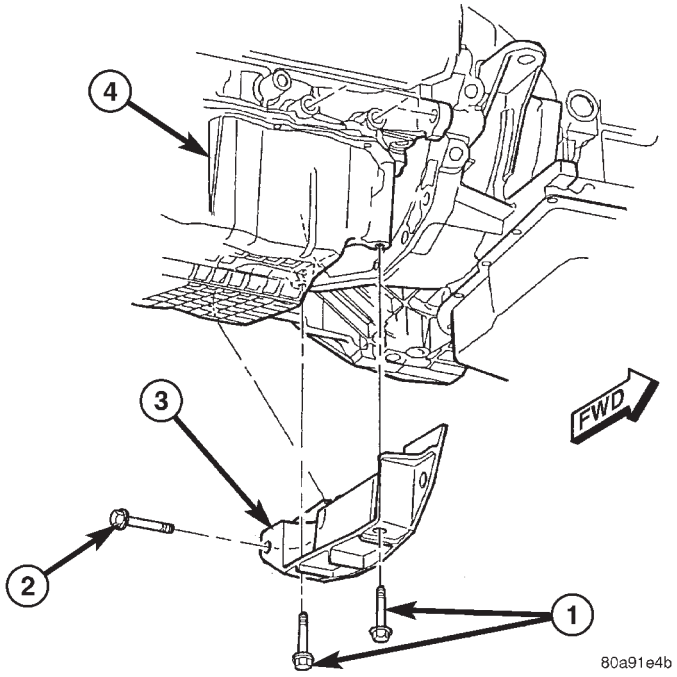

Fig. 77 Structural Collar

1 - BOLT - COLLAR TO OIL PAN
2 - BOLT - COLLAR TO TRANSAXLE
3 - STRUCTURAL COLLAR
4 - OIL PAN

- Step 1: Position collar between transaxle and oil pan. Install collar to transaxle bolt, **hand start only**.
- Step 2: Install collar to oil pan bolts, **hand snug only.**
- Step 3: Final torque collar to transaxle bolts to 101 N·m (75 ft. lbs.)
- Step 4: Final torque collar to oil pan bolts to 54 N·m (40 ft. lbs.).

(2) Install engine front mount bracket and insulator. (Refer to 9 - ENGINE/ENGINE MOUNTING/FRONT MOUNT - INSTALLATION)
(3) Lower vehicle.

ENGINE MOUNTING

DESCRIPTION

The engine mounting system consist of four mounts; right and a left side support the powertrain, and a front and a rear mount control powertrain torque. The right side mount is a hydro-type (Fig. 78), all others are of molded rubber material.

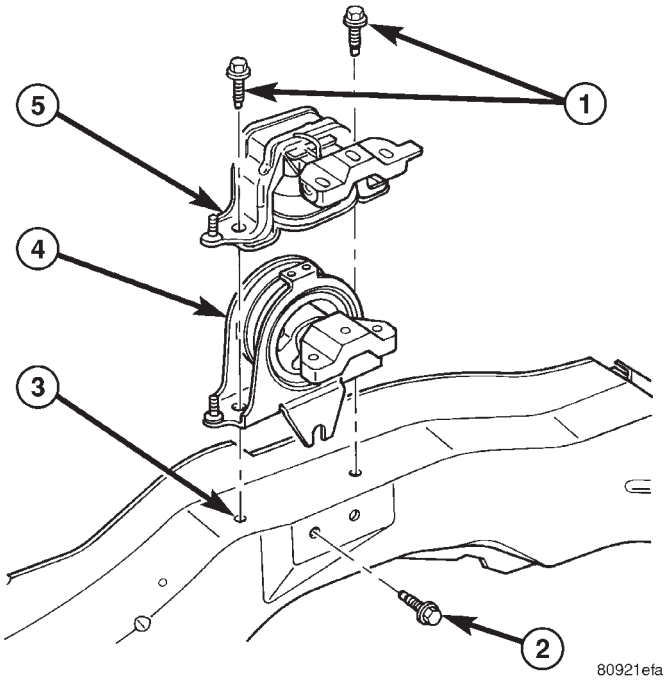

Fig. 78 Engine Hydro-type Mount - Right Side

1 - BOLT
2 - BOLT
3 - FRAME RAIL
4 - RIGHT MOUNT - 2.4L ENGINE
5 - RIGHT MOUNT - 3.3/3.8L ENGINE

FRONT MOUNT

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove the front engine mount through bolt from the insulator (Fig. 79).
(3) Remove the engine front mount bolts and remove the insulator assembly (Fig. 79).
(4) Remove the front mounting bracket from engine, if necessary (Fig. 79).

FRONT MOUNT (Continued)

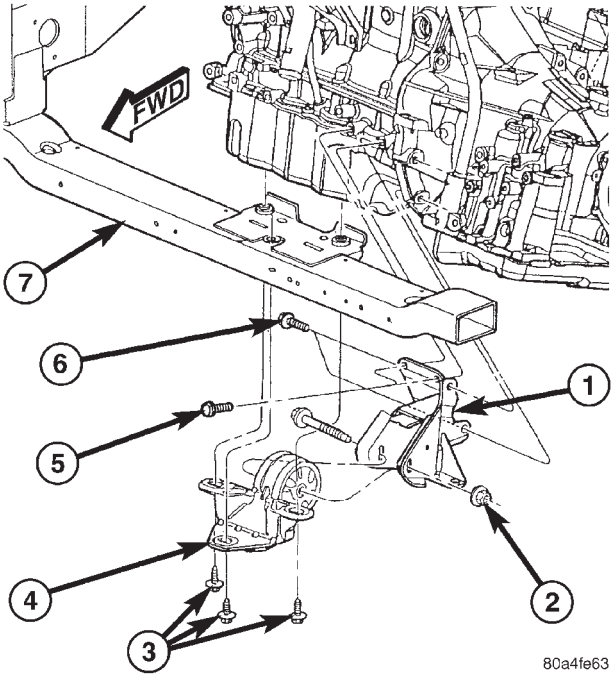

Fig. 79 Front Mount and Bracket

1 - BRACKET - FRONT MOUNT
2 - NUT - 68 N·m (50 ft. lbs.)
3 - BOLT - 54 N·m (40 ft. lbs.)
4 - MOUNT - FRONT INSULATOR
5 - BOLT - 68 N·m (50 ft. lbs.)
6 - BOLT - 68 N·m (50 ft. lbs.)
7 - FRONT CROSSMEMBER

INSTALLATION

(1) Install the front mount bracket to engine, if removed (Fig. 79).
(2) Install the insulator mount assembly (Fig. 79).
(3) Install the front engine mount through bolt to the insulator (Fig. 79).
(4) Lower the vehicle.

LEFT MOUNT

REMOVAL

(1) Raise the vehicle on hoist.
(2) Remove the left front wheel.
(3) Remove the left mount through bolt access cover.
(4) Support the transaxle with a suitable jack.
(5) Remove the engine front mount through bolt to allow left mount removal clearance (Fig. 79).
(6) Remove the left mount through frame rail bolt (Fig. 80).
(7) Lower transaxle for access to horizontal bolts.
(8) Remove the horizontal bolts from the mount to the transaxle (Fig. 81) or (Fig. 82).

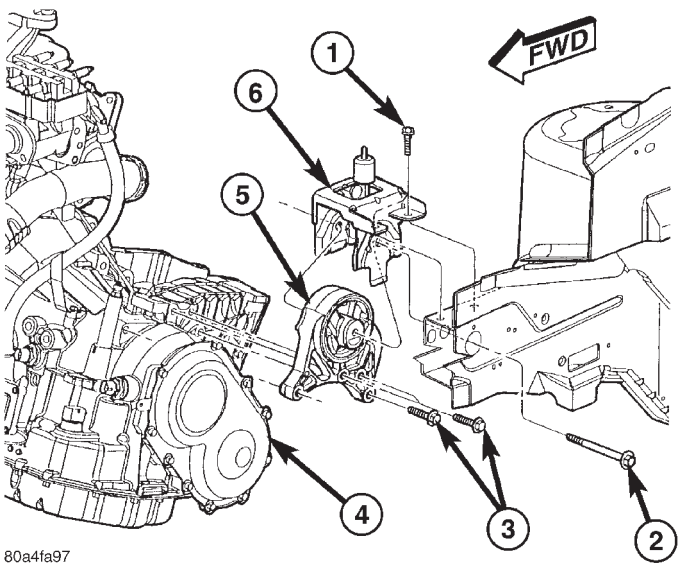

Fig. 80 LEFT MOUNT TO BRACKET

1 - BOLT - BRACKET TO FRAME RAIL 68 N·m (50 ft. lbs.)
2 - BOLT - MOUNT TO RAIL THRU 75 N·m (55 ft. lbs.)
3 - BOLT - LEFT MOUNT TO TRANSAXLE 54 N·m (40 ft. lbs.)
4 - TRANSAXLE
5 - MOUNT - LEFT
6 - BRACKET - LEFT MOUNT

NOTE: To remove mount, additional lowering of transaxle may be required.

(9) Remove left mount.

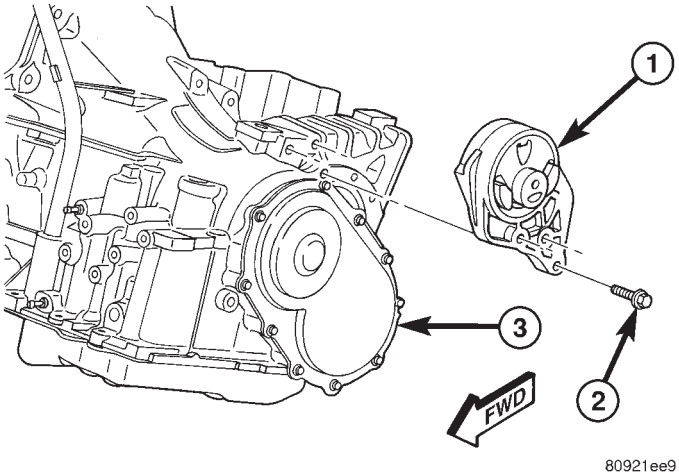

Fig. 81 LEFT MOUNT - 31TH

1 - LEFT MOUNT ASEMBLY
2 - BOLT - 54 N·m (40 ft. lbs.)
3 - TRANSAXLE - 31TH

INSTALLATION

(1) Install left mount on transaxle (Fig. 81) or (Fig. 82).

LEFT MOUNT (Continued)

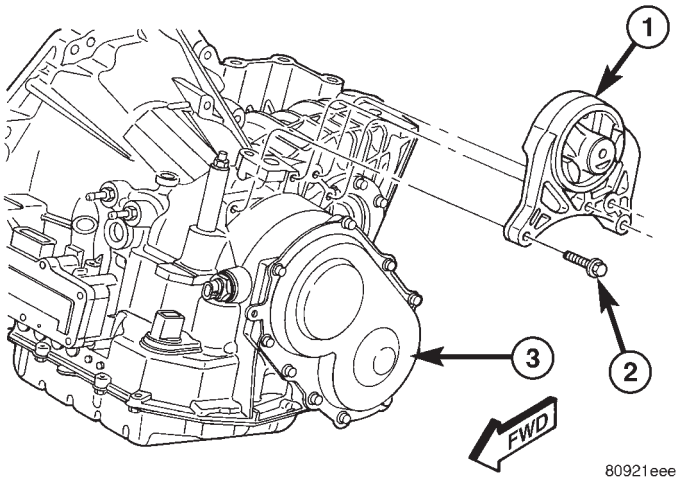

Fig. 82 UNDER CONSTRUCTION

1 - LEFT MOUNT ASSEMBLY
2 - BOLT - 54 N·m (40 ft. lbs.)
3 - TRANSAXLE - 41TE

(2) Raise transaxle with jack until left mount is in position.
(3) Install left mount through bolt (Fig. 80).
(4) Install left mount through bolt access cover.
(5) Install front mount through bolt (Fig. 79).
(6) Install left front wheel.
(7) Lower vehicle.

REAR MOUNT

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove the rear mount heat shield (Fig. 83).
(3) Remove the through bolt from the mount and rear mount bracket (Fig. 84).
(4) Remove the mount bolts (Fig. 84).
(5) Remove the rear mount (Fig. 84).
(6) For rear mount bracket removal, remove the bolts attaching bracket to transaxle (Fig. 85).
(7) Remove rear mount bracket.

INSTALLATION

(1) Install rear mount bracket, if removed (Fig. 85).
(2) Install the rear mount and bolts (Fig. 84). Tighten bolts to 54 N·m (40 ft. lbs.).
(3) Install the mount through bolt to the mount and bracket (Fig. 84). Tighten through bolt to 54 N·m (40 ft. lbs.).
(4) Install the rear mount heat shield (Fig. 83).
(5) Lower vehicle on hoist.

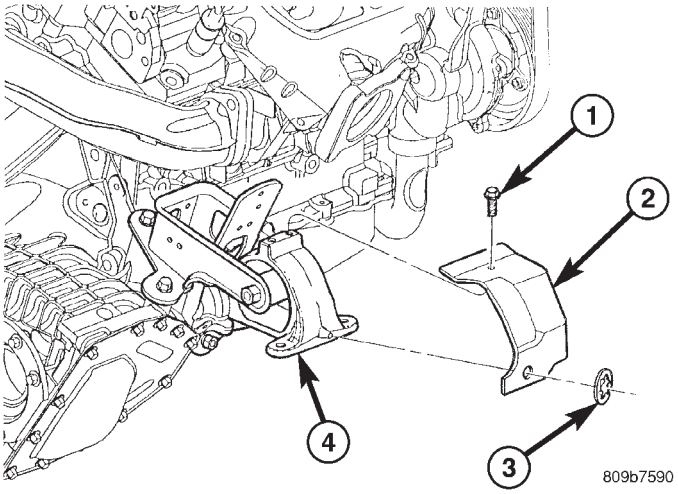

Fig. 83 REAR MOUNT HEAT SHIELD

3 - BOLT - HORIZONTAL 102 N·m (75 ft. lbs.)

RIGHT MOUNT

REMOVAL

(1) Remove air cleaner housing lid and clean air hose from throttle body.
(2) Remove air cleaner element and housing.
(3) Disconnect make-up air hose from cylinder head cover.
(4) Remove the load on the right engine mount by carefully supporting the engine assembly with a floor jack.
(5) Disconnect electrical harness support clips from engine mount bracket.
(6) Remove the vertical bolts attaching the engine mount to the frame rail (Fig. 86).
(7) Loosen the horizontal bolt attaching the engine mount to the frame rail (Fig. 86).
(8) Remove the bolts attaching the engine mount to the engine bracket (Fig. 86).
(9) Remove the right engine mount (Fig. 86).

INSTALLATION

(1) Position right engine mount and install frame rail to mount vertical bolts (Fig. 86).
(2) Tighten engine right mount to rail horizontal bolt (Fig. 86).
(3) Install mount to engine bracket bolts (Fig. 86).
(4) Connect electrical harness support clips to engine mount bracket.
(5) Remove jack from under engine.
(6) Connect make-up air hose to cylinder head cover.
(7) Install air cleaner housing and element.
(8) Install air cleaner housing lid and clean air tube to throttle body.

RIGHT MOUNT (Continued)

4 - RIGHT ENGINE MOUNT
5 - RIGHT FRAME RAIL

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump is mounted in the front engine cover and driven by the crankshaft.

OPERATION

Engine oil drawn up through the pickup tube and is pressurized by the oil pump and routed through the full-flow filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from main bearing journals to connecting rod journals. Balance shaft lubrication is provided through an oil passage from the number one main bearing cap through the balance shaft carrier support leg. This passage directly supplies oil to the front bearings and internal machined passages in the shafts that routes oil from front to the rear shaft bearing journals. A vertical hole at the number five bulkhead routes pressurized oil through a restrictor (integral to the cylinder head gasket) up past a cylinder head bolt to an oil gallery running the length of the cylinder head. The camshaft journals are partially slotted to allow a predetermined amount of pressurized oil to pass into the bearing cap cavities. Lubrication of the camshaft lobes are provided by small holes in the camshaft bearing caps that are directed towards each lobe. Oil returning to the pan from pressurized components supplies lubrication to the valve stems. Cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collars.

DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

(1) Disconnect and remove oil pressure switch. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL)

(2) Install Special Tools C-3292 Gauge with 8406 Adaptor fitting.

(3) Start engine and record oil pressure. Refer to Specifications for correct oil pressure requirements. (Refer to 9 - ENGINE - SPECIFICATIONS)

CAUTION: If oil pressure is 0 at idle, do not perform the 3000 RPM test

(4) If oil pressure is 0 at idle. Shut off engine, check for pressure relief valve stuck open, a clogged oil pick-up screen or a damaged oil pick-up tube O-ring.

(5) After test is complete, remove test gauge and fitting.

(6) Install oil pressure switch and connector. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - INSTALLATION)

OIL

STANDARD PROCEDURE

ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after it has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Remove dipstick and observe oil level. Add oil only when the level is at or below the ADD mark (Fig. 87).

OIL (Continued)

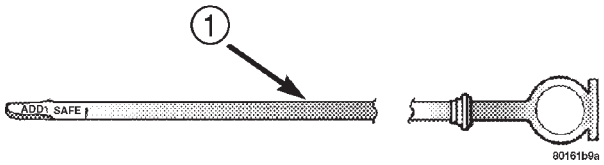

Fig. 87 Oil Level

1 - ENGINE OIL LEVEL DIPSTICK

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Remove oil fill cap.

(3) Hoist and support vehicle on safety stands. Refer to Hoisting and Jacking Recommendations. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.

(6) Remove oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL)

(7) Install and tighten drain plug in crankcase.

(8) Install new oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION)

(9) Lower vehicle and fill crankcase with specified type and amount of engine oil. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION)

(10) Install oil fill cap.

(11) Start engine and inspect for leaks.

(12) Stop engine and inspect oil level.

NOTE: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

OIL FILTER

DESCRIPTION

The engine oil filter (Fig. 88) is a high quality full-flow, disposable type. Replace the oil filter with a Mopar® or the equivalent.

REMOVAL

(1) Raise vehicle on hoist.

(2) Position an oil collecting container under oil filter location.

CAUTION: When servicing the oil filter avoid deforming the filter can by installing the remove/install tool band strap against the can to base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

(3) Using a suitable filter wrench, turn oil filter (Fig. 88) counterclockwise to remove.

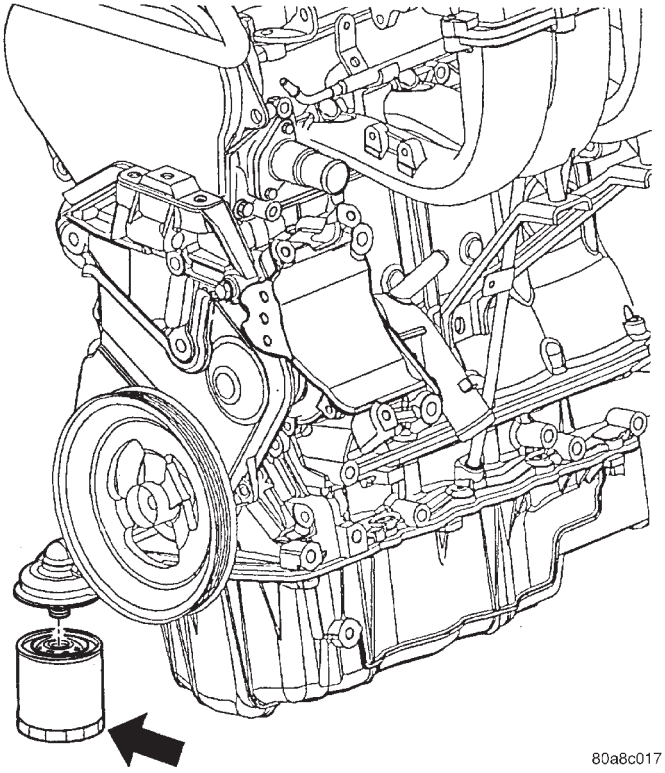

Fig. 88 Oil Filter

OIL FILTER (Continued)

INSTALLATION

(1) Clean and check filter mounting surface. The surface must be smooth, flat and free of debris or pieces of gasket.

(2) Lubricate new oil filter gasket with clean engine oil.

(3) Screw oil filter (Fig. 88) on until the gasket contacts base. Tighten to 12 N·m (105 in. lbs.).

OIL PAN

REMOVAL

(1) Raise vehicle on hoist and drain engine oil.

(2) Remove structural collar. (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL)

(3) Remove air conditioning compressor bracket to oil pan bolt.

(4) Remove bolts attaching oil pan.

(5) Remove oil pan.

(6) Clean oil pan and all gasket surfaces.

INSTALLATION

(1) Apply Mopar® Engine RTV GEN II at the oil pump to engine block parting line (Fig. 89).

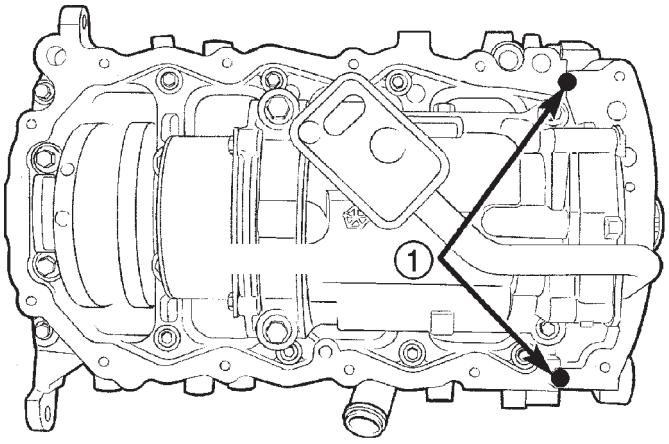

Fig. 89 Oil Pan Sealing - Typical

1 - SEALER LOCATIONS

(2) Install the oil pan gasket to the block.

(3) Install pan and tighten the screws to 12 N·m (105 in. lbs.).

(4) Install air conditioning compressor bracket to oil pan bolt.

(5) Install structural collar. (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION)

(6) Lower vehicle and fill engine crankcase with proper oil to correct level.

OIL PRESSURE SWITCH

REMOVAL

(1) Raise vehicle.

(2) Position oil collecting container under pressure switch location.

(3) Disconnect oil pressure switch electrical connector and remove switch (Fig. 90).

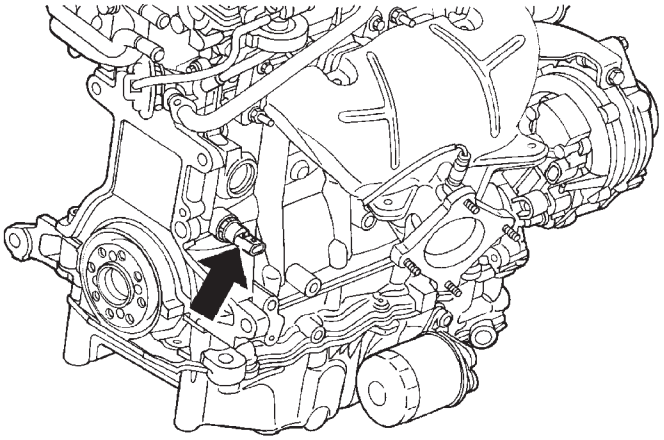

Fig. 90 Engine Oil Pressure Switch

INSTALLATION

(1) Install oil pressure switch. Torque switch to 21 N·m (190 in. lbs.) (Fig. 90).

(2) Connect electrical connector

(3) Lower vehicle.

(4) Start engine and allow to run a minimum of 2 minutes.

(5) Shut engine off and check engine oil level. Adjust level as necessary.

OIL PUMP

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(3) Remove timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(4) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(5) Remove crankshaft sprocket using Special Tools 6793 and C-4685-C2 (Fig. 91).

(6) Remove crankshaft key (Fig. 92).

(7) Remove oil pick-up tube.

(8) Remove oil pump (Fig. 93) and front crankshaft seal.

OIL PUMP (Continued)

1 - SPECIAL TOOL 6793
2 - SPECIAL TOOL C-4685–C2
3 - CRANKSHAFT SPROCKET

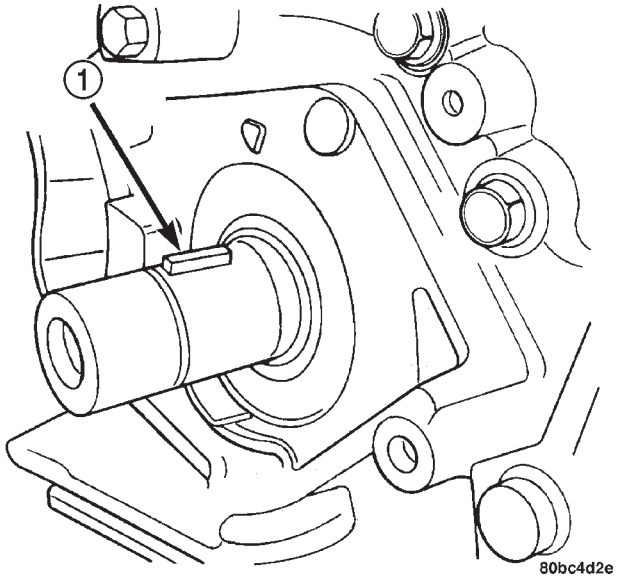

Fig. 92 Crankshaft Key

1 - CRANKSHAFT KEY

DISASSEMBLY

(1) To remove the relief valve, proceed as follows:
(a) Remove the threaded plug and gasket from the oil pump (Fig. 94) .
(b) Remove spring and relief valve (Fig. 94) .
(2) Remove oil pump cover fasteners, and lift off cover (Fig. 95) .
(3) Remove pump rotors (Fig. 95) .
(4) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

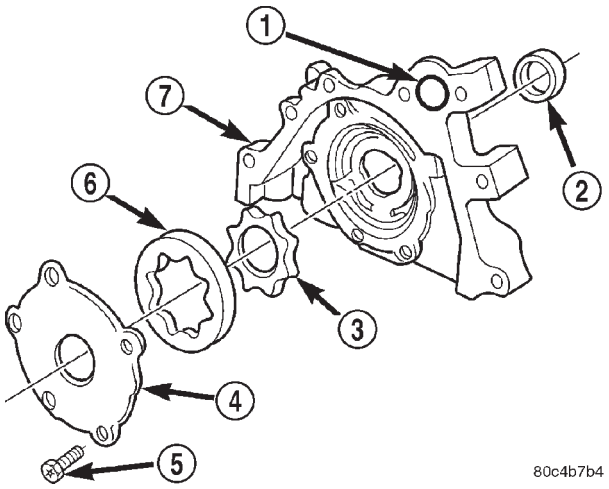

Fig. 96 Oil Pump

1 - O-RING
2 - SEAL
3 - INNER ROTOR
4 - OIL PUMP COVER
5 - FASTENER
6 - OUTER ROTOR
7 - OIL PUMP BODY

CLEANING

(1) Clean all parts thoroughly in a suitable solvent.

INSPECTION

(1) Inspect the mating surface of the oil pump. Surface should be smooth (Fig. 96) . Replace pump cover if scratched or grooved.

(2) Lay a straightedge across the pump cover surface (Fig. 97) . If a 0.025 mm (0.001 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

(3) Measure thickness and diameter of outer rotor. If outer rotor thickness measures 9.40 mm (0.370 in.) or less (Fig. 98) , or if the diameter is 79.95 mm (3.148 in.) or less, replace outer rotor.

(4) If inner rotor measures 9.40 mm (0.370 in.) or less replace inner rotor (Fig. 99) .

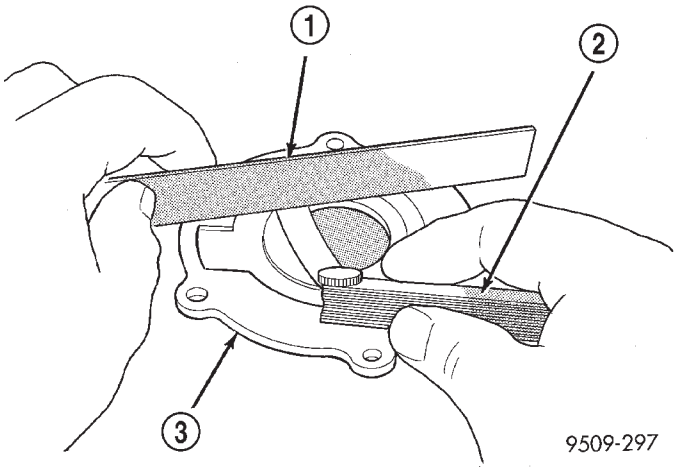

Fig. 97 Checking Oil Pump Cover Flatness

1 - STRAIGHT EDGE
2 - FEELER GAUGE
3 - OIL PUMP COVER

OIL PUMP (Continued)

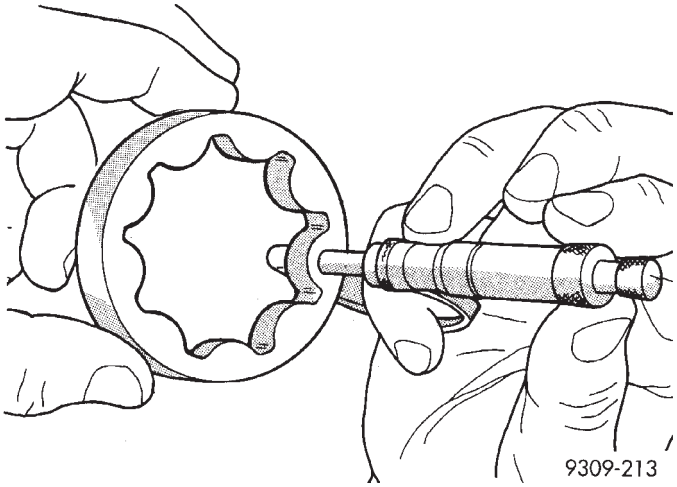

Fig. 98 Measuring Outer Rotor Thickness

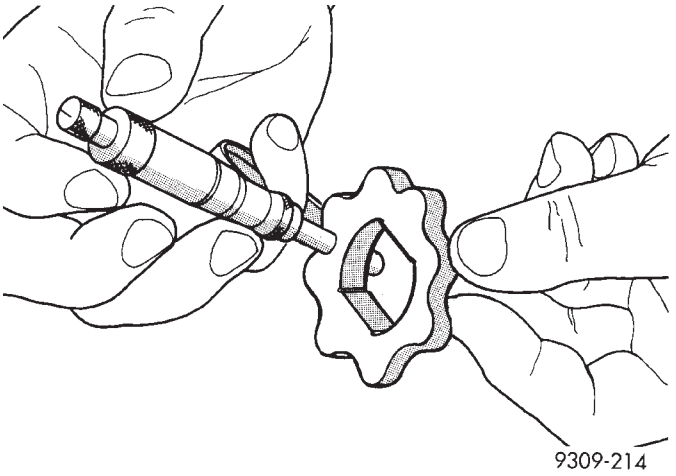

Fig. 99 Measuring Inner Rotor Thickness

ASSEMBLY

(1) Assemble pump, using new parts as required. **Install the inner rotor with chamfer facing the cast iron oil pump cover.**

(2) Prime oil pump before installation by filling rotor cavity with engine oil.

(3) Install cover and tighten fasteners to 12 N·m (105 in. lbs.) (Fig. 95).

CAUTION: Oil pump pressure relief valve must be installed as shown in (Fig. 94) or serious engine damage may occur.

(4) Install relief valve, spring, gasket and cap as shown in (Fig. 94). Tighten cap to 41 N·m (30 ft. lbs.).

INSTALLATION

(1) Make sure all surfaces are clean and free of oil and dirt.

(2) Apply Mopar® Gasket Maker to oil pump as shown in (Fig. 100). Install O-ring into oil pump body discharge passage.

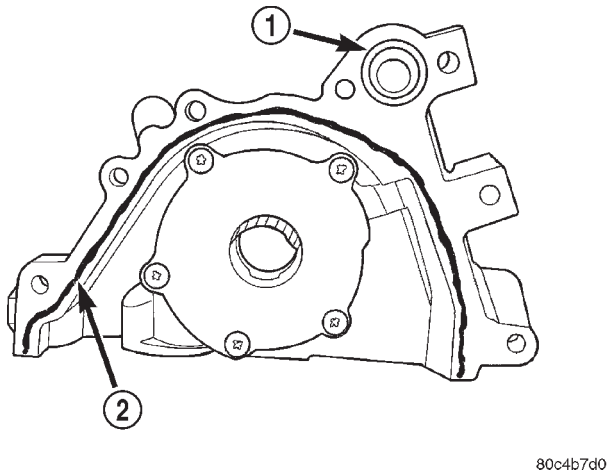

Fig. 100 Oil Pump Sealing

1 - O-RING
2 - SEALER LOCATION

(3) Prime oil pump with engine oil before installation.

(4) Align oil pump rotor flats with flats on crankshaft. Install the oil pump to the block (Fig. 93).

CAUTION: To align, the front crankshaft seal MUST be out of pump, or damage may result.

(5) Install new front crankshaft seal using Special Tool 6780 (Fig. 101).

(6) Install crankshaft key (Fig. 92).

CAUTION: The crankshaft sprocket is set to a predetermined depth from the factory for correct timing belt tracking. If removed, use of Special Tool 6792 is required to set the sprocket to original installation depth. An incorrectly installed sprocket will result in timing belt and engine damage.

(7) Install crankshaft sprocket using Special Tool 6792 (Fig. 102).

(8) Install oil pump pick-up tube.

(9) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(10) Install timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(11) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

INTAKE MANIFOLD

DESCRIPTION

The intake manifold is a two piece aluminum casting (Fig. 103) that attaches to the cylinder head with fasteners. The manifold is a long branch design to enhance low and mid-range torque

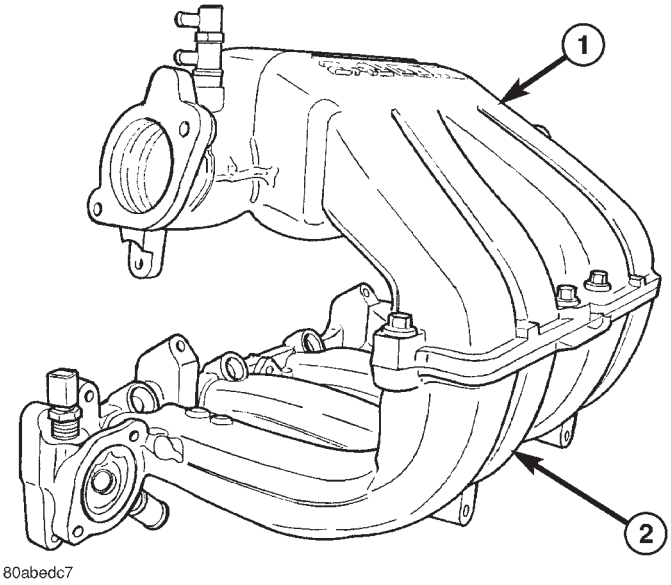

Fig. 103 Intake Manifold - Upper and Lower

1 - UPPER INTAKE MANIFOLD
2 - LOWER INTAKE MANIFOLD

OPERATION

The intake manifold delivers air to the combustion chambers. This air allows the fuel delivered by the fuel injectors to ignite when the spark plugs fire.

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.
(2) Spray a small stream of water (Spray Bottle) at the suspected leak area.
(3) If engine RPM'S change, the area of the suspected leak has been found.
(4) Repair as required.

INTAKE MANIFOLD - UPPER

REMOVAL

(1) Disconnect negative cable from battery.
(2) Disconnect connector from inlet air temperature sensor (Fig. 104).

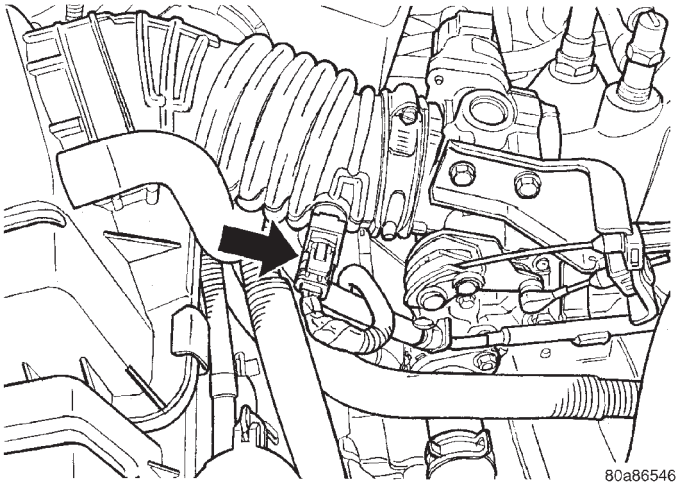

Fig. 104 INLET AIR TEMPERATURE SENSOR - 2.4L

(3) Disconnect air intake tube at throttle body and remove upper air cleaner housing.
(4) Disconnect connector from throttle position sensor (TPS) (Fig. 106).
(5) Disconnect connector from idle air control (IAC) motor (Fig. 106).
(6) Disconnect connector from MAP sensor (Fig. 105).

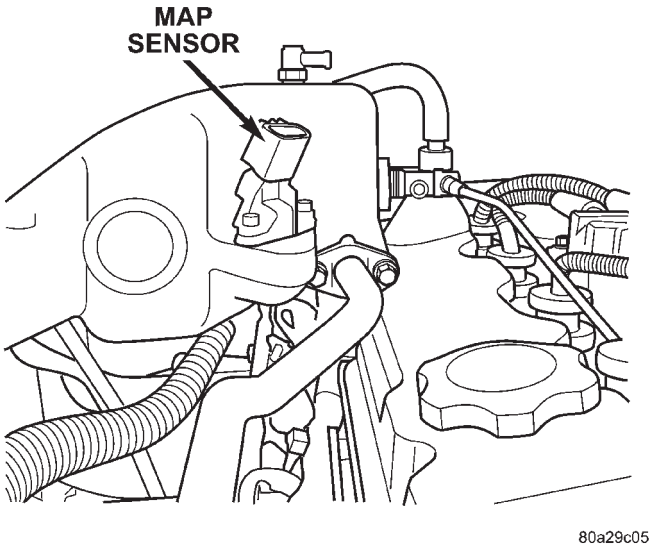

Fig. 105 MAP SENSOR - 2.4L

(7) Remove vacuum lines for purge solenoid and PCV valve at intake manifold.

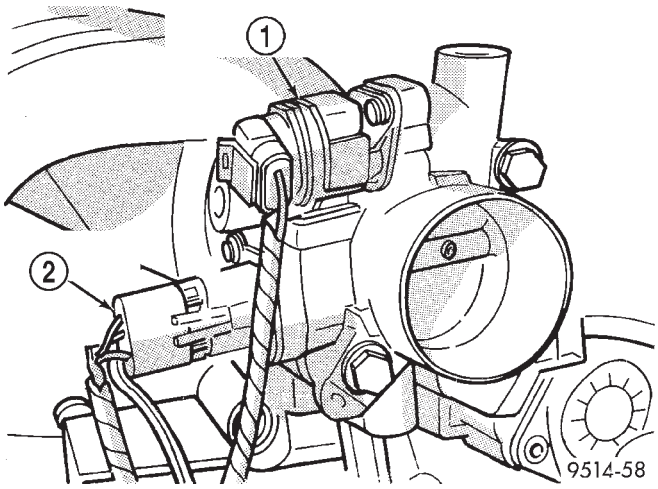

Fig. 106 Throttle Body Electrical Connectors - Typical

1 - IDLE AIR CONTROL MOTOR CONNECTOR
2 - TPS CONNECTOR

(8) Remove vacuum lines for power brake booster, LDP, EGR transducer, and speed control vacuum reservoir (if equipped) at upper intake manifold fittings.
(9) Disconnect throttle, speed control (if equipped), and transaxle control (31TH equipped only) cables from throttle lever and bracket. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL)
(10) Remove the EGR tube. (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/TUBE - REMOVAL)
(11) Remove the upper manifold support bracket bolt to manifold (Fig. 107).

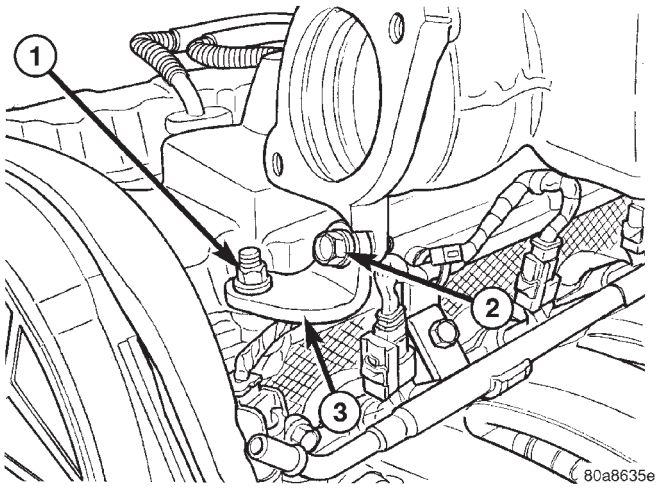

Fig. 107 Upper Intake Manifold Support Bracket

1 - NUT - BRACKET TO CYLINDER HEAD COVER
2 - BOLT - BRACKET TO UPPER INTAKE MANIFOLD
3 - UPPER INTAKE MANIFOLD SUPPORT BRACKET

INTAKE MANIFOLD - UPPER (Continued)

(12) Remove engine oil dipstick from tube.
(13) Remove upper intake manifold bolts (Fig. 108). Remove upper intake manifold.

CAUTION: Cover intake manifold to prevent foreign material from entering engine.

INSPECTION

(1) Check manifold surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.
(2) Inspect manifold for cracks or distortion. Replace manifold if necessary.

INSTALLATION

(1) Clean manifold sealing surfaces.
(2) Apply a 1.5 mm (0.060 in.) bead Mopar® Gasket Maker to the perimeter of the lower intake manifold runner openings.
(3) Install upper intake manifold and tighten fasteners to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 108). Repeat this procedures until all fasteners are at specified torque.

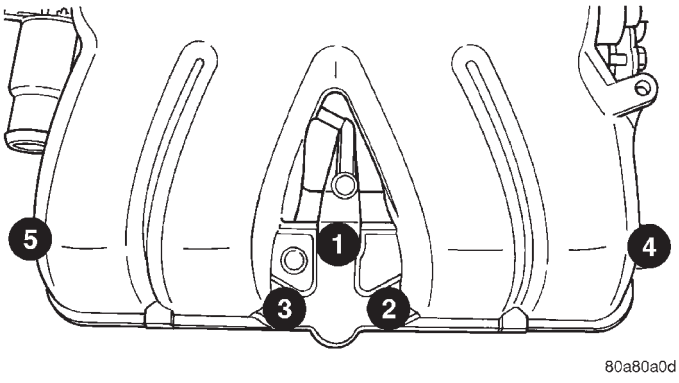

Fig. 108 Upper Intake Manifold Tightening Sequence - 2.4L

(4) Install engine oil dipstick.
(5) Install upper bolt in intake manifold to front support bracket (Fig. 107). Torque to 28 N·m (250 in. lbs.).
(6) Install EGR tube. (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/ TUBE - INSTALLATION)
(7) Install throttle cables in bracket.
(8) Connect throttle, speed control, (if equipped), transaxle control (31TH equipped only) cables to throttle lever.
(9) Connect vacuum lines for power brake booster, LDP, EGR transducer, and speed control vacuum reservoir (if equipped) at upper intake manifold fittings.
(10) Connect vacuum lines for purge solenoid and PCV valve.
(11) Connect electrical connectors for MAP sensor, throttle position sensor (TPS), and idle air control (IAC) motor.
(12) Install air cleaner upper housing and air intake tube to throttle body.
(13) Connect inlet air temperature sensor connector (Fig. 104).
(14) Connect negative cable to battery.

INTAKE MANIFOLD - LOWER

REMOVAL

(1) Perform fuel system pressure release procedure **before attempting any repairs.** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
(2) Remove upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

CAUTION: Cover intake manifold openings to prevent foreign material from entering engine.

(3) Disconnect fuel line. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)
(4) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
(5) Remove heater supply and radiator upper hoses at intake manifold.
(6) Disconnect coolant temperature sensor/fuel injector wire harness connector.
(7) Remove lower intake manifold support bracket upper bolts (Fig. 109).
(8) Loosen the lower intake manfold support bracket lower bolt (Fig. 109).
(9) Disconnect fuel injector harness.
(10) Remove the bolts attaching the power steering reservoir to manifold. Set reservoir aside. **Do not** disconnect line from reservoir.
(11) Remove lower intake manifold fasteners (Fig. 110). Remove the manifold from engine.
(12) Inspect the manifold. (Refer to 9 - ENGINE/ MANIFOLDS/INTAKE MANIFOLD - INSPECTION)

INSPECTION

(1) Check manifold surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.
(2) Inspect manifold for cracks or distortion. Replace manifold if necessary.

INSTALLATION

If the following items were removed, install and torque to specifications:

- Fuel rail bolts - 22 N·m (200 in. lbs.)

INTAKE MANIFOLD - LOWER (Continued)

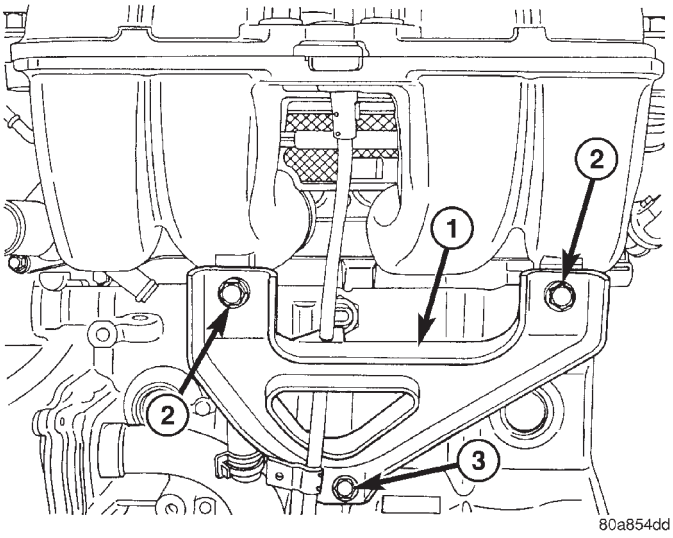

Fig. 109 Lower Intake Manifold Support Bracket

1 - SUPPORT BRACKET
2 - BOLTS - UPPER TO MANIFOLD
3 - BOLT - LOWER TO ENGINE BLOCK

- Coolant outlet connector bolts - 28 N·m (250 in. lbs.)
- Coolant temperature sensor - 7 N·m (60 in. lbs.)

(1) Position a new gasket on cylinder head and install lower manifold.

(2) Install and tighten intake manifold fasteners to 28 N·m (250 in. lbs.) in the sequence shown in (Fig. 110). Repeat procedure until all bolts are at specified torque.

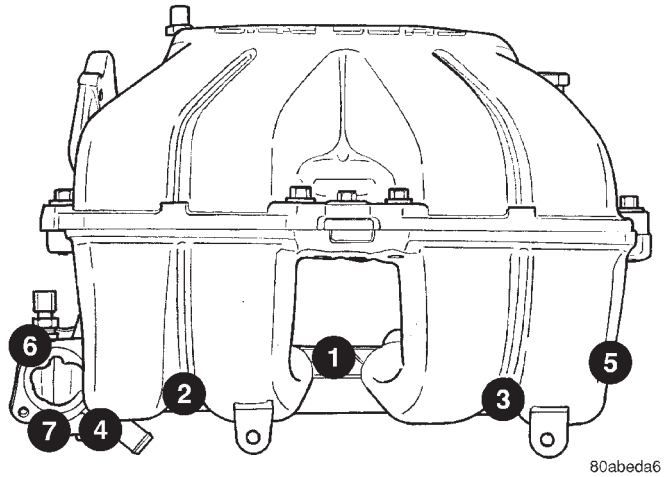

Fig. 110 Lower Intake Manifold Tightening Sequence

(3) Install lower intake manifold support bracket bolts (Fig. 109) and tighten to:

- Bolts to intake 28 N·m (250 in. lbs.)
- Bolt to engine block 54 N·m (40 ft. lbs.)

(4) Position power steering reservoir on manifold and install bolts.

(5) Connect the fuel line. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)

(6) Connect coolant temperature sensor/fuel injector wiring harness electrical connector.

(7) Install the radiator upper and heater supply hoses.

(8) Install the upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(9) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifold is made of Hi-Silicone Moly nodular cast iron for strength and high temperatures. The manifold attaches to the cylinder head.

OPERATION

The exhaust manifold collects the exhaust gasses exiting the combustion chambers. Then it channels the exhaust gasses to the exhaust pipe attached to the manifold.

REMOVAL

(1) Raise vehicle and disconnect exhaust pipe from the exhaust manifold.

(2) Disconnect upstream oxygen sensor connector at the rear of exhaust manifold.

(3) Remove the bolts attaching the manifold to the cylinder head.

(4) Remove exhaust manifold.

(5) Inspect the manifold. (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSPECTION)

CLEANING

(1) Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

(1) Inspect manifold gasket surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.

(2) Inspect manifolds for cracks or distortion. Replace manifold as necessary.

INSTALLATION

(1) Install exhaust manifold with a new gasket. Tighten attaching nuts in the sequence shown in (Fig. 111) to 19 N·m (170 in. lbs.).

EXHAUST MANIFOLD (Continued)

(2) Attach exhaust pipe to exhaust manifold and tighten fasteners to 37 N·m (27 ft. lbs.).

(3) Install and connect the oxygen sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O2 SENSOR - COMPONENT LOCATION)

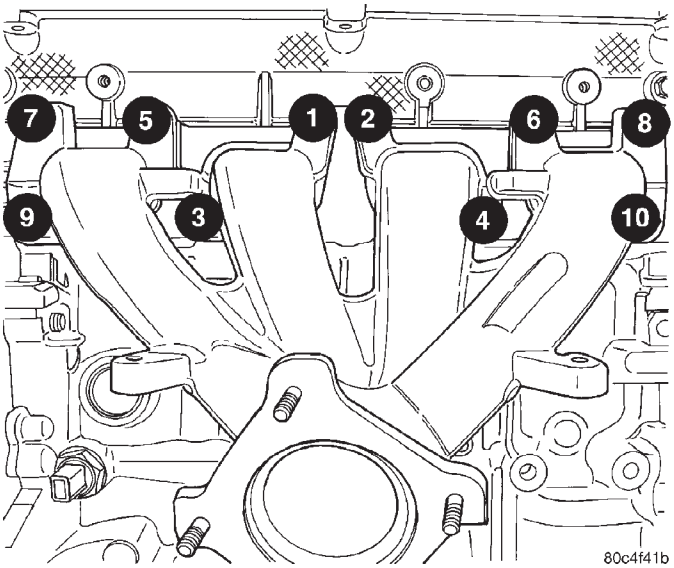

Fig. 111 Exhaust Manifold Tightening Sequence

TIMING BELT COVER(S)

REMOVAL

FRONT COVER

(1) Remove crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(2) Remove generator drive belt tensioner assembly. (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL)

(3) Remove timing belt front cover bolts (Fig. 112) and remove covers.

REAR COVER

(1) Remove front covers.

(2) Remove engine mount bracket (Fig. 113).

(3) Remove timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(4) Hold camshaft sprocket with Special Tool 6847 while removing center bolt (Fig. 114).

(5) Remove timing belt idler pulley.

(6) Remove rear cover fasteners and remove cover from engine (Fig. 115).

INSTALLATION

REAR COVER

(1) Install timing belt rear cover and bolts (Fig. 115).

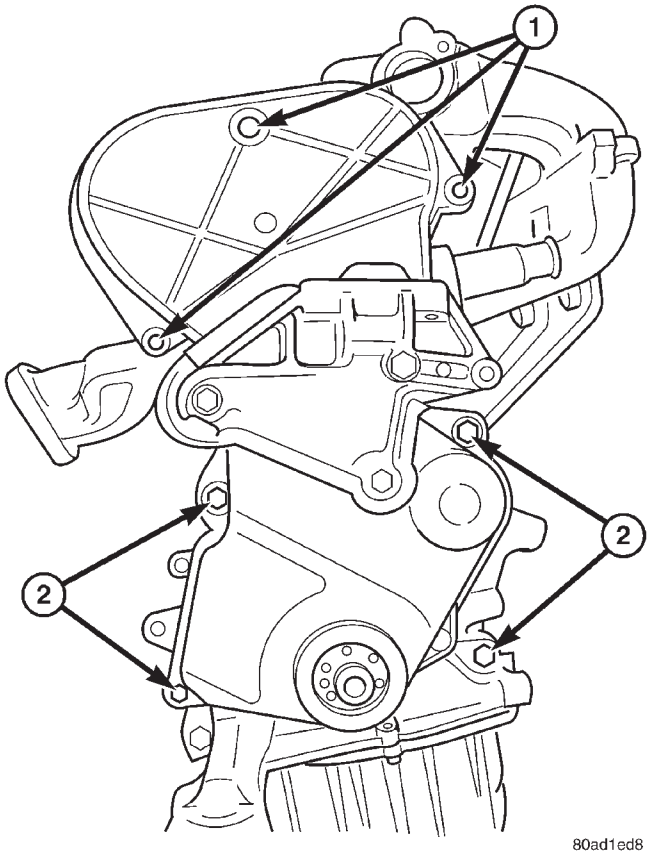

Fig. 112 Timing Belt Front Covers

1 - BOLTS - UPPER FRONT COVER 7 N·m (60 in. lbs.)
2 - BOLTS - LOWER FRONT COVER 7 N·m (60 in. lbs.)

CAUTION: Do not use an impact wrench for tightening camshaft sprocket bolt. Damage to the timing locating pin can occur. Hand tighten using a wrench ONLY.

(2) Install camshaft sprockets. Hold sprockets with Special Tool 6848 and tighten center bolt to 101 N·m (75 ft. lbs.).

(3) Install timing belt idler pulley and tighten mounting bolt to 61 N·m (45 ft. lbs.).

(4) Install timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

(5) Install engine mount bracket and tighten bolts to 61 N·m (45 ft. lbs.) (Fig. 113).

(6) Install front covers.

FRONT COVER

(1) Install timing belt front covers (Fig. 112). Tighten fasteners to 7 N·m (60 in. lbs.).

(2) Install generator drive belt tensioner. (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - INSTALLATION)

TIMING BELT COVER(S) (Continued)

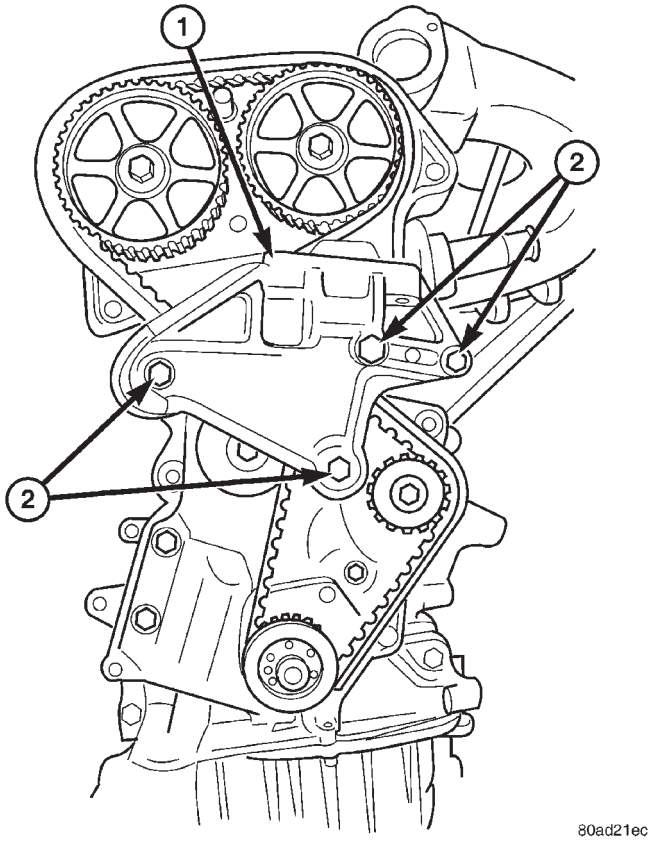

Fig. 113 ENGINE FRONT MOUNT BRACKET

1 - ENGINE MOUNT BRACKET
2 - BOLTS - 61 N·m (45 ft. lbs.)

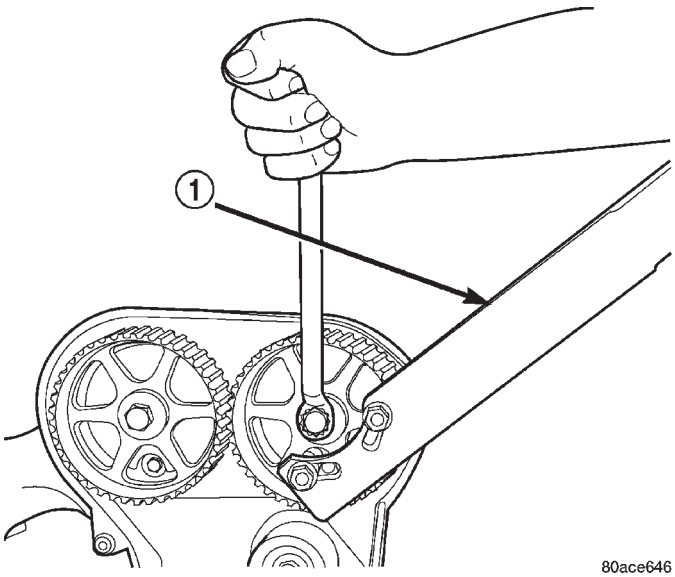

Fig. 114 Camshaft Sprocket - Removal/Installation

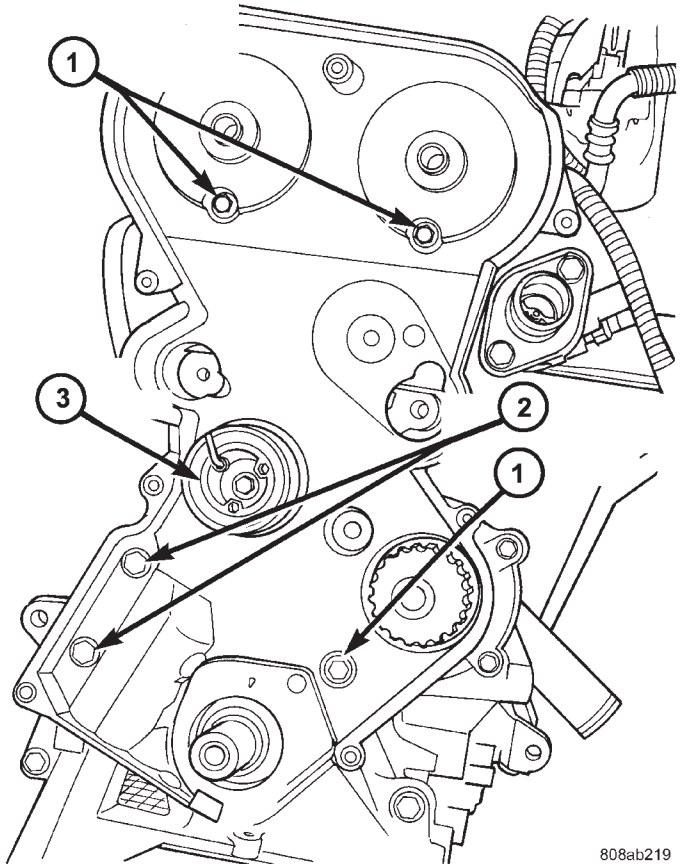

Fig. 115 Timing Belt Rear Cover

1 - BOLTS - REAR COVER 12 N·m (105 in. lbs.)
2 - BOLTS - REAR COVER 28 N·m (250 in. lbs.)
3 - TIMING BELT TENSIONER

(3) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

TIMING BELT AND SPROCKET(S)

REMOVAL

REMOVAL - TIMING BELT

(1) Remove air cleaner upper cover, housing, and clean air tube.
(2) Remove make-up air hose from cylinder head cover.
(3) Raise vehicle on hoist.
(4) Remove right front wheel.
(5) Remove right inner splash shield.
(6) Remove accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL)

TIMING BELT AND SPROCKET(S) (Continued)

(7) Remove crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(8) Remove air conditioner/generator belt tensioner and pulley assembly. (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL)

(9) Remove timing belt lower front cover bolts and remove cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(10) Lower vehicle.

(11) Remove bolts attaching timing belt upper front cover and remove cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(12) Remove right engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL)

(13) Remove engine mount bracket (Fig. 116).

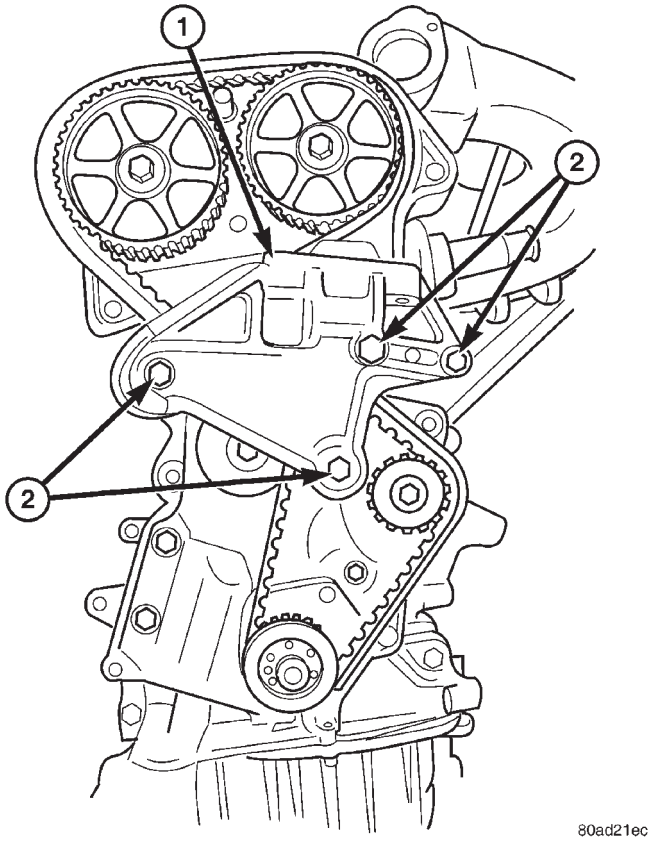

Fig. 116 Engine Mount Bracket

1 - ENGINE MOUNT BRACKET
2 - BOLTS - 61 N·m (45 ft. lbs.)

CAUTION: When aligning crankshaft and camshaft timing marks always rotate engine from crankshaft. Camshaft should not be rotated after timing belt is removed. Damage to valve components may occur. Always align timing marks before removing timing belt.

(14) Before the removal of the timing belt, rotate crankshaft until the TDC mark on oil pump housing aligns with the TDC mark on crankshaft sprocket (trailing edge of sprocket tooth) (Fig. 117).

NOTE: The crankshaft sprocket TDC mark is located on the trailing edge of the sprocket tooth. Failure to align trailing edge of sprocket tooth to TDC mark on oil pump housing will cause the camshaft timing marks to be misaligned.

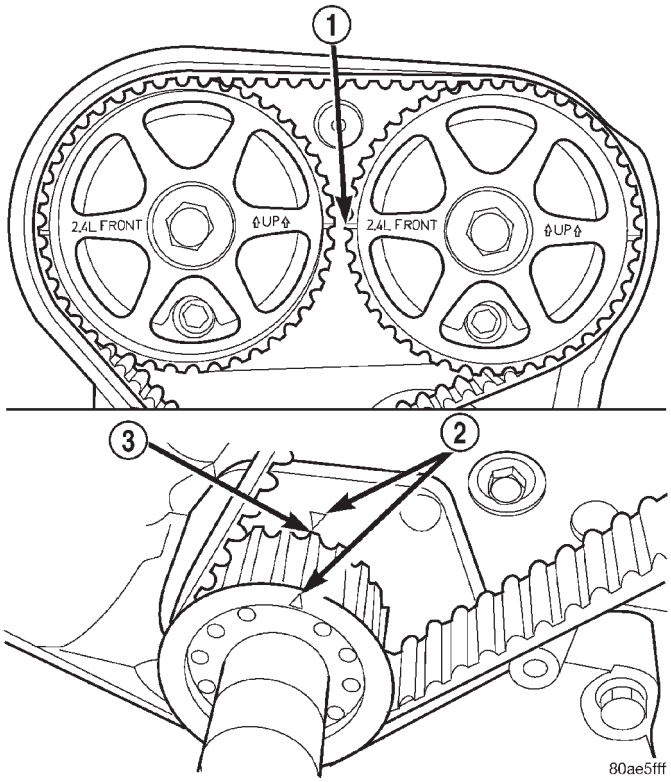

Fig. 117 Crankshaft and Camshaft Timing

1 - CAMSHAFT TIMING MARKS
2 - CRANKSHAFT TDC MARKS
3 - TRAILING EDGE OF SPROCKET TOOTH

(15) Install 6 mm Allen wrench into belt tensioner. Before rotating the tensioner, insert the long end of a 1/8” or 3 mm Allen wrench into the pin hole on the front of the tensioner (Fig. 118). While rotating the tensioner counterclockwise, push in lightly on the 1/8” or 3 mm Allen wrench, until it slides into the locking hole.

(16) Remove timing belt.

TIMING BELT AND SPROCKET(S) (Continued)

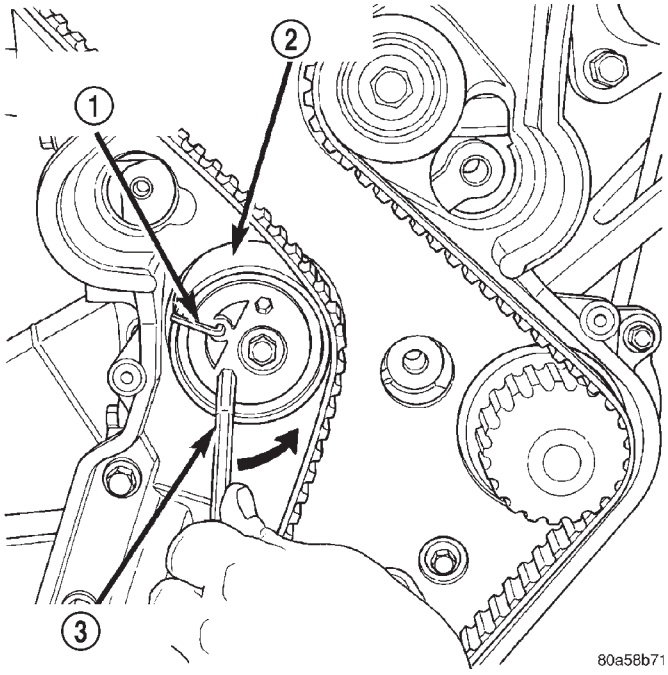

Fig. 118 Locking Timing Tensioner

1 - 1/8 OR 3mm ALLEN WRENCH
2 - BELT TENSIONER
3 - 6mm ALLEN WRENCH

REMOVAL - CRANKSHAFT SPROCKET

(1) Disconnect negative battery cable.

(2) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(3) Remove crankshaft sprocket using Special Tools 6793 and insert C-4685-C2 (Fig. 119).

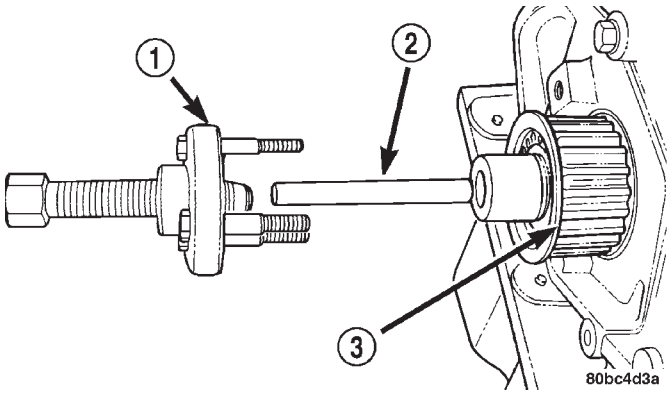

Fig. 119 Crankshaft Sprocket - Removal

1 - SPECIAL TOOL 6793
2 - SPECIAL TOOL C-4685–C2
3 - CRANKSHAFT SPROCKET

CLEANING

Do Not attempt to clean a timing belt. If contamination from oil, grease, or coolants have occurred, the timing belt should be replaced.

Clean all sprockets using a suitable solvent. Clean all sprocket grooves of any debris.

INSTALLATION

INSTALLATION - CRANKSHAFT SPROCKET

CAUTION: The crankshaft sprocket is set to a predetermined depth from the factory for correct timing belt tracking. If removed, use of Special Tool 6792 is required to set the sprocket to original installation depth. An incorrectly installed sprocket will result in timing belt and engine damage.

(1) Install crankshaft sprocket using Special Tool 6792 (Fig. 120).

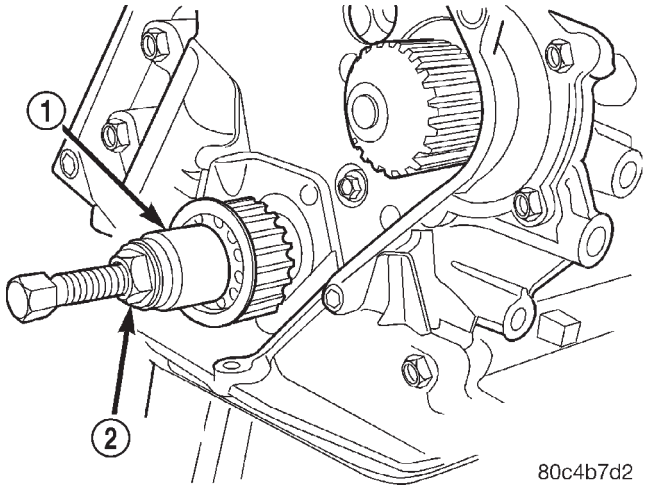

Fig. 120 Crankshaft Sprocket - Installation

1 - SPECIAL TOOL 6792
2 - TIGHTEN NUT TO INSTALL

(2) Install timing belt. (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

TIMING BELT AND SPROCKET(S) (Continued)

INSTALLATION - TIMING BELT

CAUTION: The crankshaft sprocket is set to a predetermined depth from the factory for correct timing belt tracking. If removed, use of Special Tool 6792 is required to set the sprocket to original installation depth. An incorrectly installed sprocket will result in timing belt and engine damage.

(1) Set crankshaft sprocket to TDC by aligning the sprocket with the arrow on the oil pump housing.

(2) Set camshafts timing marks so that the exhaust camshaft sprocket is a 1/2 notch below the intake camshaft sprocket (Fig. 121).

CAUTION: Ensure that the arrows on both camshaft sprockets are facing up.

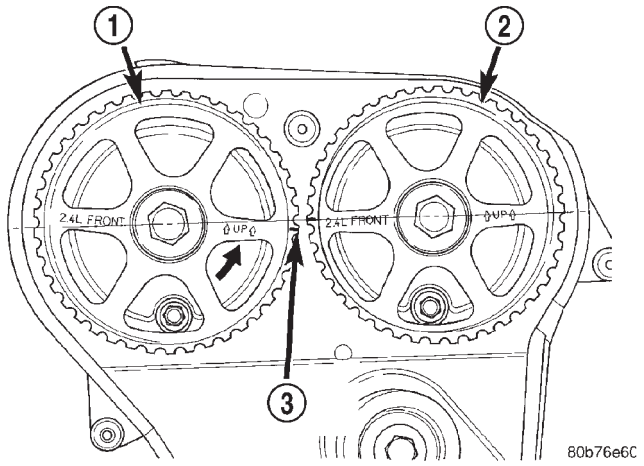

Fig. 121 Camshaft Sprocket Alignment

1 - CAMSHAFT SPROCKET-EXHAUST
2 - CAMSHAFT SPROCKET-INTAKE
3 - 1/2 NOTCH LOCATION

(3) Install timing belt. Starting at the crankshaft, go around the water pump sprocket, idler pulley, camshaft sprockets and then around the tensioner (Fig. 122).

(4) Move the exhaust camshaft sprocket counterclockwise (Fig. 122) to align marks and take up belt slack.

NOTE: A new tensioner is held in the wound position by a pull pin.

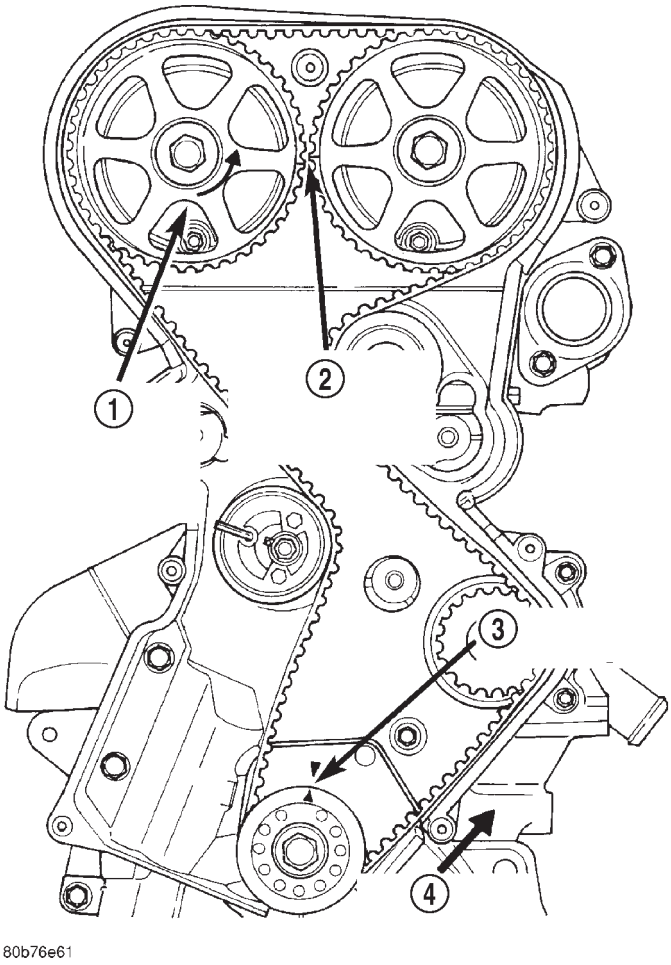

Fig. 122 Timing Belt - Installation

1 - ROTATE CAMSHAFT SPROCKET TO TAKE UP BELT SLACK
2 - CAMSHAFT TIMING MARKS 1/2 NOTCH LOCATION
3 - CRANKSHAFT AT TDC
4 - INSTALL BELT IN THIS DIRECTION

TIMING BELT AND SPROCKET(S) (Continued)

(5) Remove the pull pin or Allen wrench from the belt tensioner.

(6) Once the timing belt has been installed and tensioner released, rotate the crankshaft two (2) complete revolutions. Verify that the TDC marks on crankshaft and timing marks on the camshafts are aligned as shown in (Fig. 123).

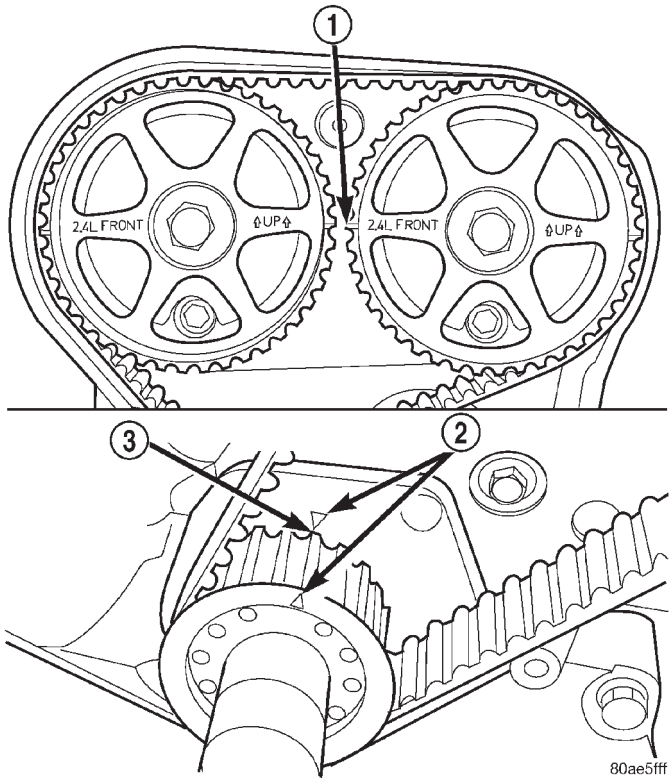

Fig. 123 Crankshaft and Camshaft Timing

1 - CAMSHAFT TIMING MARKS
2 - CRANKSHAFT TDC MARKS
3 - TRAILING EDGE OF SPROCKET TOOTH

(7) Install engine mount bracket to engine (Fig. 116).

(8) Install timing belt front covers and bolts. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(9) Install air conditioning/generator belt tensioner and pulley. (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - INSTALLATION)

(10) Install right engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION)

(11) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

(12) Install accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(13) Install drive belt splash shield.

(14) Install right front wheel.

(15) Connect make-up air hose to cylinder head cover.

(16) Install air cleaner housing, upper cover, and clean air tube.

TIMING BELT TENSIONER & PULLEY

REMOVAL

(1) Remove the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(2) Remove timing belt idler pulley.

(3) Hold camshaft sprocket with Special Tool 6847 while removing bolt (Fig. 124). Remove both cam sprockets.

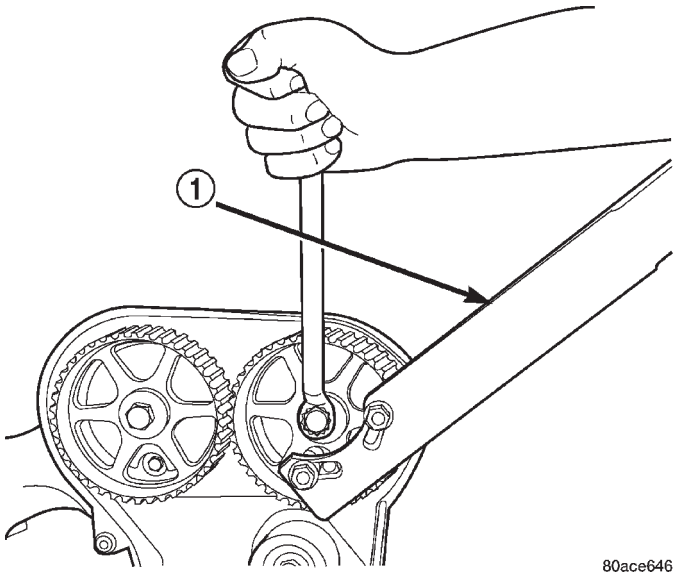

Fig. 124 Camshaft Sprocket - Removal/Installation

1 - SPECIAL TOOL 6847

TIMING BELT TENSIONER & PULLEY (Continued)

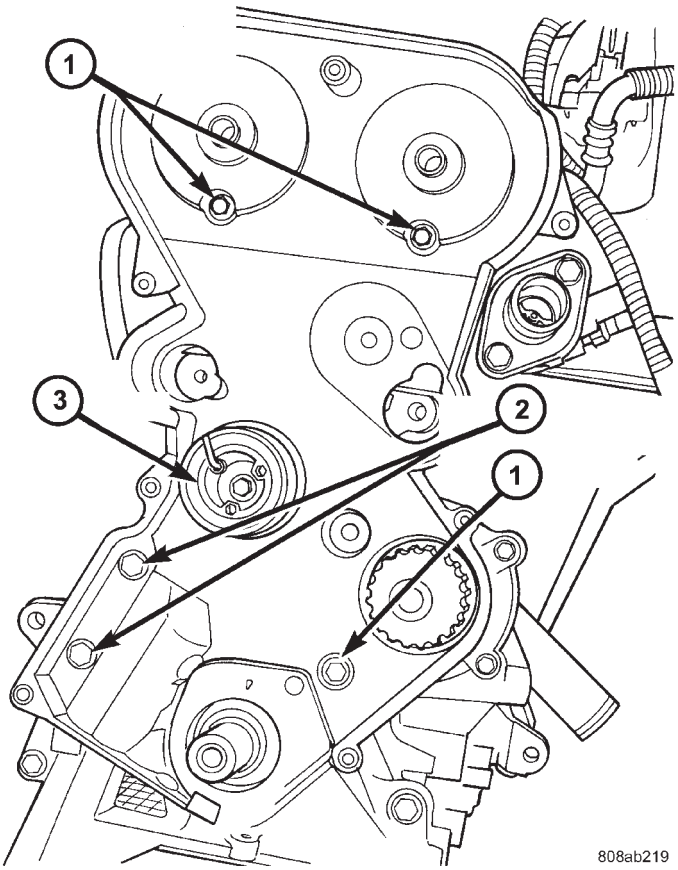

Fig. 125 Rear Timing Belt Cover Fasteners

1 - BOLTS - REAR COVER 12 N·m (105 in. lbs.)
2 - BOLTS - REAR COVER 28 N·m (250 in. lbs.)
3 - TIMING BELT TENSIONER

(4) Remove rear timing belt cover fasteners and remove cover from engine (Fig. 125).

(5) Remove lower bolt attaching timing belt tensioner assembly to engine and remove tensioner **as an assembly** (Fig. 126).

INSTALLATION

(1) Align timing belt tensioner assembly to engine and install lower mounting bolt **but do not tighten** (Fig. 126). To properly align tensioner assembly—install one of the engine bracket mounting bolts (M10) 5 to 7 turns into the tensioner's upper mounting location (Fig. 126).

(2) Torque the tensioner's lower mounting bolt to 61 N·m (45 ft. lbs.). Remove the upper bolt used for tensioner alignment.

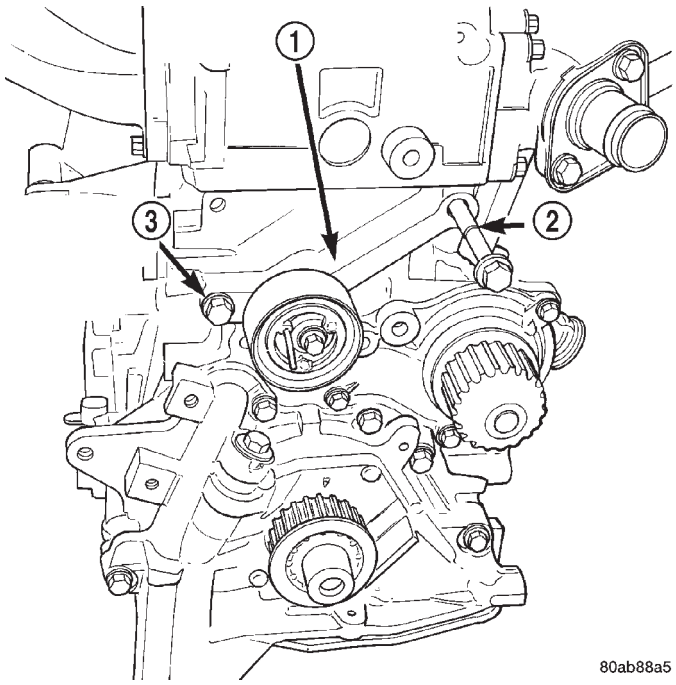

Fig. 126 Timing Belt Tensioner Assembly—Removal/ Installation

1 - TIMING BELT TENSIONER ASSEMBLY
2 - TENSIONER ASSEMBLY UPPER BOLT
3 - TENSIONER ASSEMBLY LOWER BOLT

(3) Install rear timing belt cover and fasteners (Fig. 125).

(4) Install timing belt idler pulley and torque mounting bolt to 61 N·m (45 ft. lbs.).

(5) Install camshaft sprockets. Use Special Tool 6847 to hold sprockets (Fig. 124), torque bolts to 101 N·m (75 ft. lbs.).

(6) Install the timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

BALANCE SHAFTS AND CARRIER ASSEMBLY

DESCRIPTION

The 2.4L engine is equipped with two nodular cast iron balance shafts installed in a cast aluminum carrier attached to the lower cylinder block (Fig. 127).

BALANCE SHAFTS AND CARRIER ASSEMBLY (Continued)

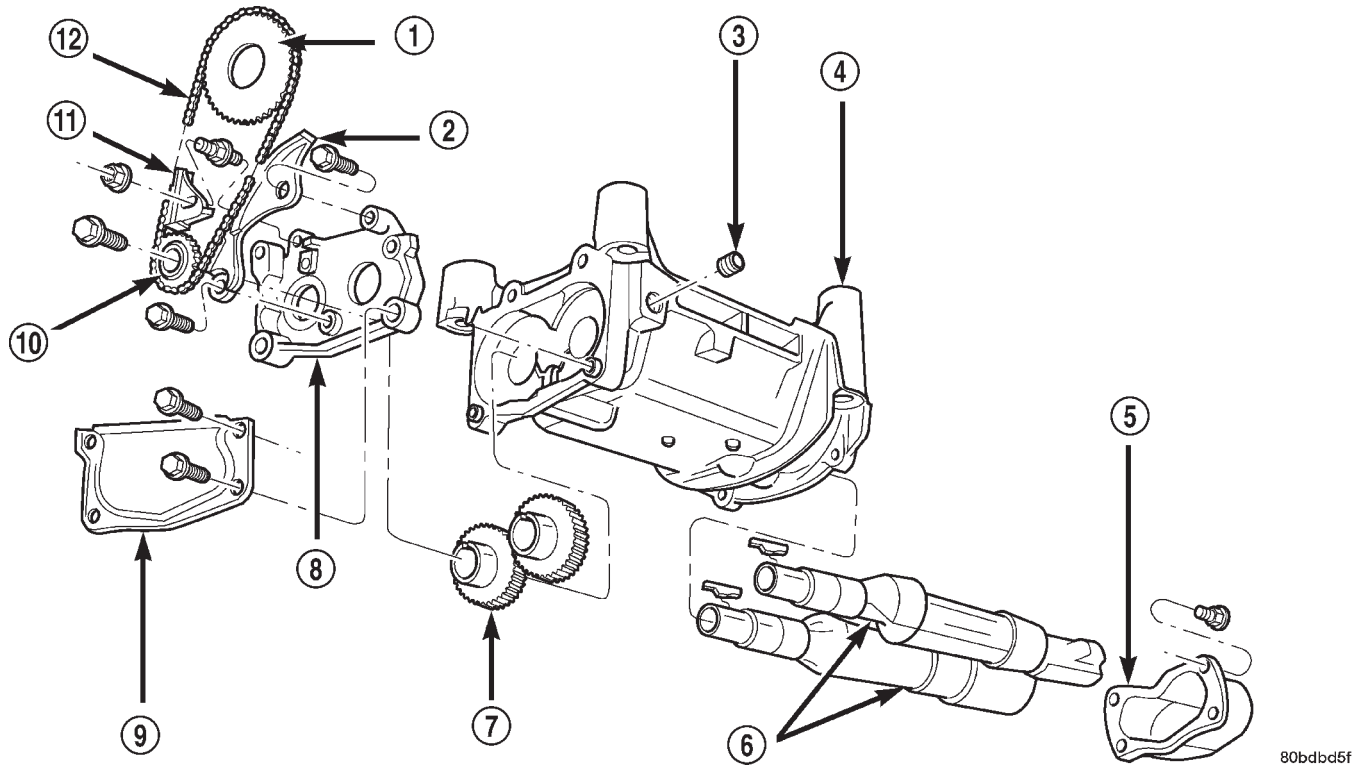

Fig. 127 Balance Shafts and Carrier Assembly

2 - TENSIONER
3 - PLUG
4 - CARRIER
5 - REAR COVER
6 - BALANCE SHAFTS
7 - GEARS
8 - GEAR COVER
9 - CHAIN COVER
10 - SPROCKET
11 - GUIDE
12 - CHAIN

OPERATION

The balance shafts are driven by the crankshaft via a roller chain and sprockets. The balance shafts are connected by helical gears. The dual counter rotating shafts decrease second order vertical shaking forces caused by component movement.

REMOVAL

BALANCE SHAFTS/CHAIN/SPROCKETS

NOTE: For service procedures requiring only temporary relocation of carrier assembly refer to BALANCE SHAFT CARRIER procedure below.

(1) Drain engine oil.
(2) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(3) If replacing crankshaft sprocket, remove oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
(4) Remove chain cover, guide and tensioner (Fig. 128).
(5) Remove screw retaining balance shaft drive sprocket (Fig. 129). Remove chain and sprocket.
(6) Using two wide pry bars, work the crankshaft sprocket back and forth until it is off the crankshaft-shaft.
(7) Remove gear cover retaining stud (double ended to also retain chain guide). Remove cover and balance shaft gears (Fig. 130).
(8) Remove rear cover and balance shafts (Fig. 131).
(9) Remove four carrier to crankcase attaching bolts to separate carrier from engine bedplate.

BALANCE SHAFT CARRIER

The following components will remain intact during carrier removal: Gear cover, gears, balance shafts and the rear cover (Fig. 127).
(1) Drain engine oil.
(2) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(3) Remove chain cover, guide and tensioner (Fig. 128).

BALANCE SHAFTS AND CARRIER ASSEMBLY (Continued)

3 - NICKEL PLATED LINK AND DOT

(4) Remove screw retaining balance shaft drive sprocket (Fig. 129).

(5) Move balance shaft inboard through drive chain sprocket. Sprocket will hang in lower chain loop.

(6) Remove carrier to crankcase attaching bolts to remove carrier.

INSTALLATION

BALANCE SHAFT INSTALLATION/TIMING

Balance shaft and carrier assembly installation is the reverse of the removal procedure. **During installation crankshaft-to-balance shaft timing must be established. Refer to Timing procedure in this section.**

(1) With balance shafts installed in carrier (Fig. 127) position carrier on crankcase and install four attaching bolts and tighten to 54 N·m (40 ft. lbs.).

(2) Turn balance shafts until both shaft key ways are up, parallel to vertical centerline of engine. Install short hub drive gear on sprocket driven shaft and long hub gear on gear driven shaft. After installation gear and balance shaft keyways must be up with gear timing marks meshed as shown in (Fig. 132).

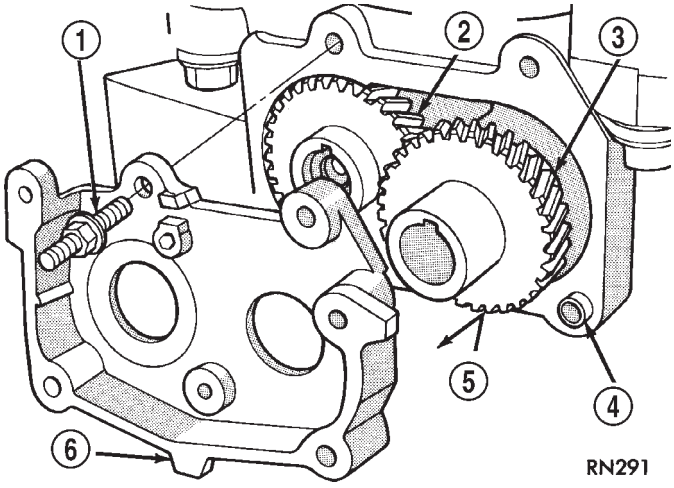

Fig. 130 Gear Cover and Gears

1 - STUD (DOUBLE ENDED)
2 - DRIVE GEAR
3 - DRIVEN GEAR
4 - CARRIER DOWEL
5 - GEAR(S)
6 - GEAR COVER

(3) Install gear cover and tighten double ended stud/washer fastener to 12 N·m (105 in. lbs.).

BALANCE SHAFTS AND CARRIER ASSEMBLY (Continued)

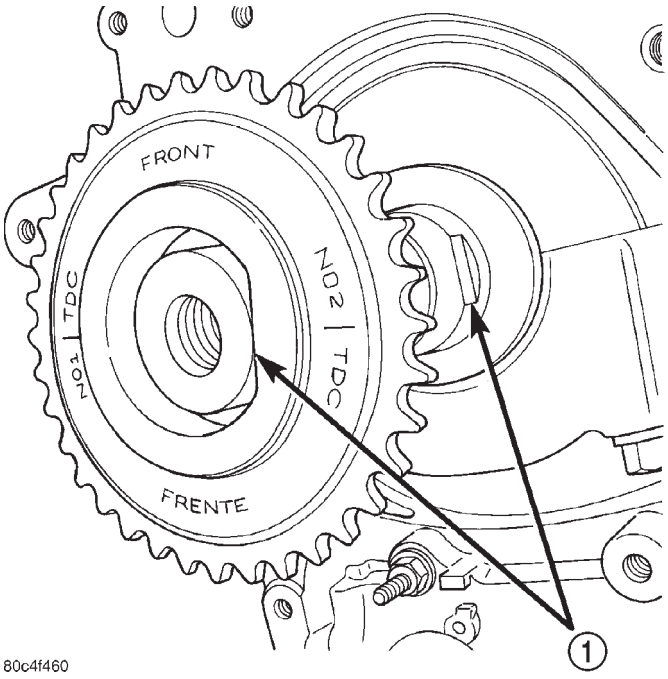

Fig. 133 Balance Shaft Sprocket Alignment to Crankshaft

1 - ALIGN FLATS

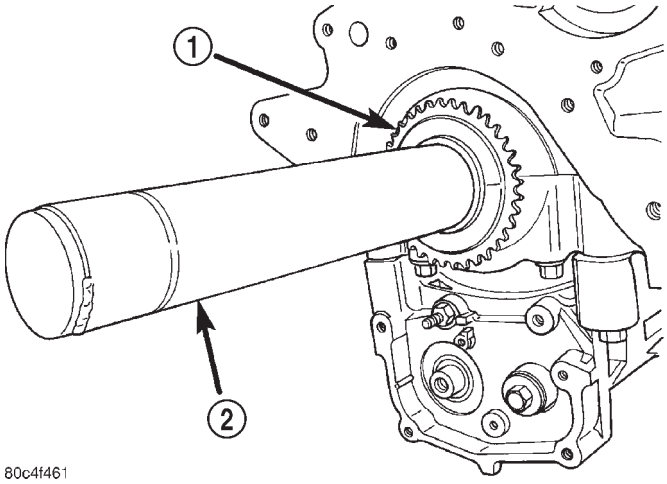

Fig. 134 Balance Shaft Drive

1 - SPROCKET
2 - SPECIAL TOOL 6052

(4) Align flat on balance shaft drive sprocket to the flat on crankshaft (Fig. 133).

(5) Install balance shaft drive sprocket on crankshaft using Special Tool 6052 (Fig. 134).

(6) Turn crankshaft until number 1 cylinder is at top dead center (TDC). The timing marks on the chain sprocket should line up with the parting line on the left side of number one main bearing cap. (Fig. 135).

(7) Place chain over crankshaft sprocket so that the plated link of the chain is over the number 1 cylinder timing mark on the balance shaft crankshaft sprocket (Fig. 135).

(8) Place balance shaft sprocket into the timing chain (Fig. 135) and align the timing mark on the sprocket (dot) with the (lower) plated link on the chain.

NOTE: The lower plated link is 8 links from the upper link.

BALANCE SHAFTS AND CARRIER ASSEMBLY (Continued)

(9) With balance shaft keyways pointing up (12 o'clock) slide the balance shaft sprocket onto the nose of the balance shaft. The balance shaft may have to be pushed in slightly to allow for clearance.

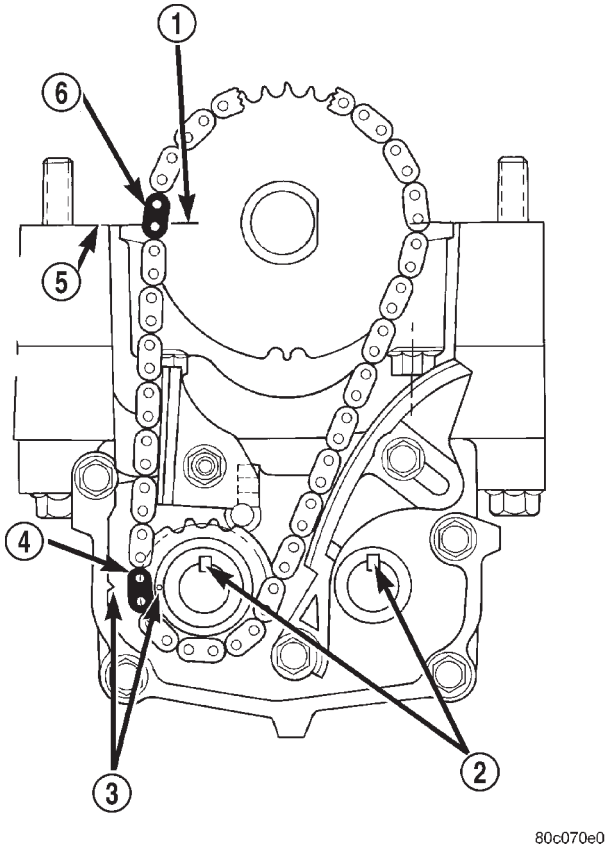

Fig. 135 Balance Shaft Timing

1 - MARK ON SPROCKET
2 - KEYWAYS UP
3 - ALIGN MARKS
4 - PLATED LINK
5 - PARTING LINE (BEDPLATE TO BLOCK)
6 - PLATED LINK

NOTE: THE TIMING MARK ON THE SPROCKET, THE (LOWER) NICKEL PLATED LINK, AND THE ARROW ON THE SIDE OF THE GEAR COVER SHOULD LINE UP WHEN THE BALANCE SHAFTS ARE TIMED CORRECTLY.

(10) If the sprockets are timed correctly, install the balance shaft bolts and tighten to 28 N·m (250 in. lbs.). A wood block placed between crankcase and crankshaft counterbalance will prevent crankshaft and gear rotation.

(11) **CHAIN TENSIONING:**

(a) Install chain tensioner loosely assembled.

(b) Position guide on double ended stud making sure tab on the guide fits into slot on the gear cover. Install and tighten nut/washer assembly to 12 N·m (105 in. lbs.).

(c) Place a shim 1 mm (0.039 in.) thick x 70 mm (2.75 in.) long or between tensioner and chain. Push tensioner and shim up against the chain. **Apply firm pressure 2.5–3 Kg (5.5–6.6 lbs.) directly behind the adjustment slot to take up all slack.** Chain must have shoe radius contact as shown in (Fig. 136).

(d) With the load applied, tighten top tensioner bolt first, then bottom pivot bolt. Tighten bolts to 12 N·m (105 in. lbs.). Remove shim.

(e) Install carrier covers and tighten screws to 12 N·m (105 in. lbs.).

(12) If removed, install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(13) Install pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(14) Fill engine crankcase with proper oil to correct level.

ENGINE 3.3/3.8L

DESCRIPTION

The 3.3 Liter (201 cu. in.) and 3.8 Liter (231 cu. in.) engines are 60° V-6 engines with cast iron cylinder blocks and aluminum cylinder heads (Fig. 1). The engine uses a single, block mounted camshaft with pushrods to actuate the valves. These engines do not have provisions for a free wheeling valve train.

The firing order is 1–2–3–4–5–6. The cylinders are numbered from the front of the engine to the rear. The front cylinder bank is numbered 2, 4, and 6. The rear cylinder bank is numbered 1, 3, and 5.

The engine identification number is located on the rear of the cylinder block just below the cylinder head (Fig. 2).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE

DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Hydraulic Lash Adjuster Noise Diagnosis
- Engine Oil Leak Inspection

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING)
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - SPECIFICATIONS)
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing belt/chain.
ENGINE STALLS OR IDLES ROUGH	1. Idle speed too low.	1. Test minimum air flow. (Refer to Appropriate Diagnostic Information)
	2. Incorrect fuel mixture.	2. (Refer to Appropriate Diagnostic Information)
	3. Intake manifold leakage.	3. Inspect intake manifold, manifold gasket, and vacuum hoses.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)

ENGINE 3.3/3.8L (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head gasket.	5. Replace cylinder head gasket.
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Install new parts, as necessary.
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Contamination in fuel system.	4. Clean system and replace fuel filter.

ENGINE 3.3/3.8L (Continued)

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES	1. High or low oil level in crankcase.	1. Check and correct engine oil level.
	2. Thin or diluted oil.	2. Change oil to correct viscosity.
	3. Thick oil	3. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	4. Low oil pressure.	4. Check and correct engine oil pressure problem.
	5. Dirt in hydraulic lifters/lash adjusters.	5. Replace hydraulic lifters/lash adjusters.
	6. Worn rocker arms.	6. Inspect oil supply to rocker arms.
	7. Worn hydraulic lifters/lash adjusters.	7. Replace hydraulic lifters/lash adjusters.
	8. Worn valve guides.	8. Replace cylinder head assembly.
	9. Excessive runout of valve seats on valve faces.	9. Grind valve seats and valves.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Connecting rod journal out-of-round.	6. Replace crankshaft or grind surface.
	7. Misaligned connecting rods.	7. Replace bent connecting rods.

ENGINE 3.3/3.8L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Excessive end play.	6. Check thrust bearing for wear on flanges.
	7. Crankshaft journal out-of-round or worn.	7. Replace crankshaft or grind journals.
	8. Loose flywheel or torque converter.	8. Tighten to correct torque.
OIL PRESSURE DROP	1. Low oil level.	1. Check engine oil level.
	2. Faulty oil pressure sensor/switch.	2. Replace oil pressure sensor/ switch.
	3. Low oil pressure.	3. Check oil pressure sensor/switch and main bearing oil clearance.
	4. Clogged oil filter.	4. Install new oil filter.
	5. Worn parts in oil pump.	5. Replace worn parts or pump.
	6. Thin or diluted oil.	6. Change oil to correct viscosity.
	7. Oil pump relief valve stuck.	7. Remove valve and inspect, clean, or replace.
	8. Oil pump suction tube loose.	8. Remove oil pan and install new tube or clean, if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Excessive bearing clearance.	10. Measure bearings for correct clearance.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket(s).
	2. Loose fastener, broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Misaligned or deteriorated cup or threaded plug.	3. Replace as necessary.

ENGINE 3.3/3.8L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Replace cylinder head assembly.
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

DIAGNOSIS AND TESTING - ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

(5) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:

- Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
- Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
- Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
- If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

ENGINE 3.3/3.8L (Continued)

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.

(4) If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

(7) After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Check engine oil level and add oil if necessary.

(2) Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

(3) Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.

(4) Remove the Auto Shutdown (ASD) relay from the PDC.

(5) Be sure throttle blade is fully open during the compression check.

(6) Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

(7) Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.

(8) Repeat the previous step for all remaining cylinders.

(9) Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.

(10) If one or more cylinders have abnormally low compression pressures, repeat the compression test.

(11) If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

ENGINE 3.3/3.8L (Continued)

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

STANDARD PROCEDURE

STANDARD PROCEDURE - MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

(1) Remove oil film from surface to be checked. Plastigage is soluble in oil.

(2) Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes (Fig. 3). (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap bolts of the bearing being checked to the proper specifications.

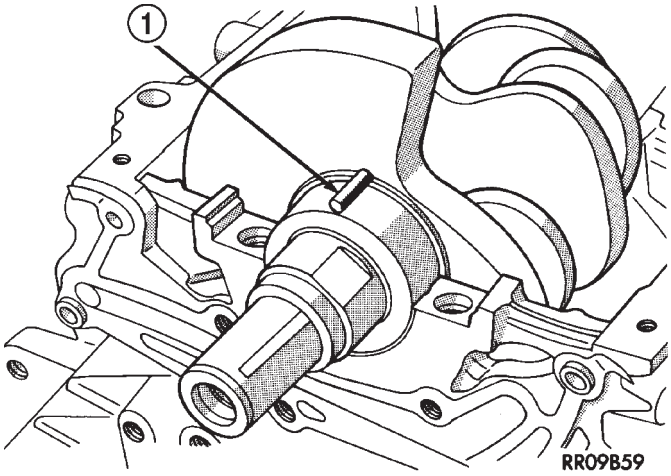

Fig. 3 Plastigage Placed in Lower Shell—Typical

1 - PLASTIGAGE

(3) Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

(4) Install the proper crankshaft bearings to achieve the specified bearing clearances.

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

ENGINE 3.3/3.8L (Continued)

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bedplate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 4)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 4)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 4)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

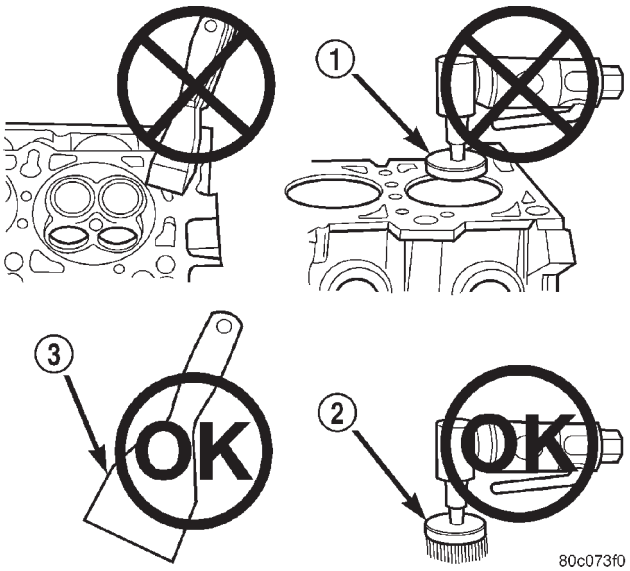

Fig. 4 Proper Tool Usage For Surface Preparation

1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER

ENGINE 3.3/3.8L (Continued)

STANDARD PROCEDURE - HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

(1) Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.
(2) Remove negative battery cable.
(3) Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.
(4) With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.
(5) Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).
(6) Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)
(7) Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

(8) Install new spark plugs.
(9) Drain engine oil and remove oil filter.
(10) Install a new oil filter.
(11) Fill engine with specified amount of approved oil.
(12) Connect negative battery cable.
(13) Start engine and check for any leaks.

STANDARD PROCEDURE - REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 5).

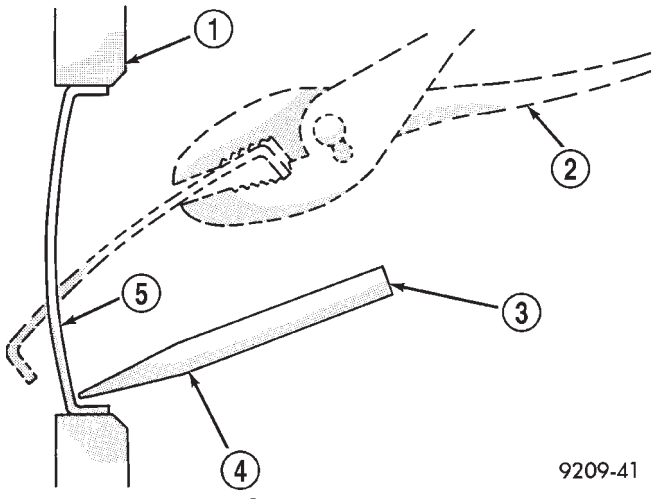

Fig. 5 Core Hole Plug Removal

1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

ENGINE 3.3/3.8L (Continued)

REMOVAL - ENGINE ASSEMBLY

(1) Perform fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
(2) Disconnect negative battery cable.
(3) Remove air cleaner and hoses.
(4) Disconnect the fuel line from fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
(5) Remove the wiper module (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).
(6) Block off heater hoses to the rear heater system using pinch-off pliers (if equipped).
(7) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(8) Disconnect the heater hoses.
(9) Remove the radiator upper support crossmember (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL).
(10) Remove the radiator fans (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
(11) Disconnect the throttle cables from the throttle body.
(12) Disconnect the MAP, IAC, and TPS electrical connectors.
(13) Disconnect the EGR transducer electrical connector (if equipped).
(14) Disconnect the vacuum hoses from throttle body.
(15) Disconnect the brake booster and speed control vacuum hoses.
(16) Disengage wire harness clip from the right side engine mount.
(17) Remove the power steering reservoir from mounting position and set aside. **Do not** disconnect hose.
(18) Disconnect ground strap from rear of cylinder head.
(19) Disconnect engine coolant temperature (ECT) sensor and ignition coil electrical connectors.
(20) Disconnect the fuel injector electrical harness connector and disengage clip from support bracket.
(21) Disconnect camshaft and crankshaft position sensor electrical connectors.
(22) Evacuate air conditioning system. Refer to 24 - HEATING & AIR CONDITIONING.
(23) Disconnect A/C compressor electrical connector.
(24) Disconnect the A/C lines from compressor. Cover and seal all openings of hoses and compressor.
(25) Remove the radiator upper hose.
(26) Disengage electrical harness clip at transaxle dipstick tube.
(27) Remove transaxle dipstick tube. Seal opening using a suitable plug.

NOTE: When the transaxle cooler lines are removed from the rolled-groove type fittings at the transaxle, damage to the inner wall of the hose will occur. To prevent prevent potential leakage, the cooler hoses must be cut off flush at the transaxle fitting, and a service cooler hose splice kit must be installed upon reassembly.

(28) Using a blade or suitable hose cutter, cut transaxle oil cooler lines off flush with fittings. Plug cooler lines and fittings to prevent debris from entering transaxle or cooler circuit. A service splice kit will be installed upon reassembly.
(29) Disconnect transaxle shift linkage and electrical connectors.
(30) Raise vehicle on hoist and drain the engine oil.
(31) Remove the axle shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)
(32) Remove crossmember cradle plate (Fig. 6).

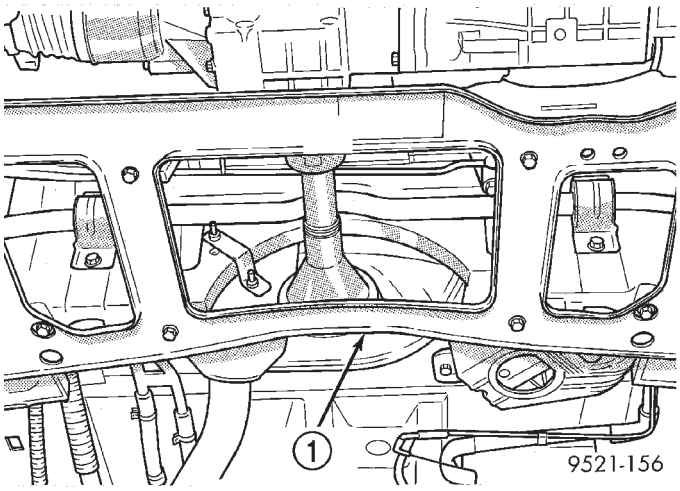

Fig. 6 Crossmember Cradle Plate

1 - CRADLE PLATE

ENGINE 3.3/3.8L (Continued)

(33) **AWD equipped:** Remove the power transfer unit (PTU) (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).

(34) Disconnect exhaust pipe from the manifold (Fig. 7).

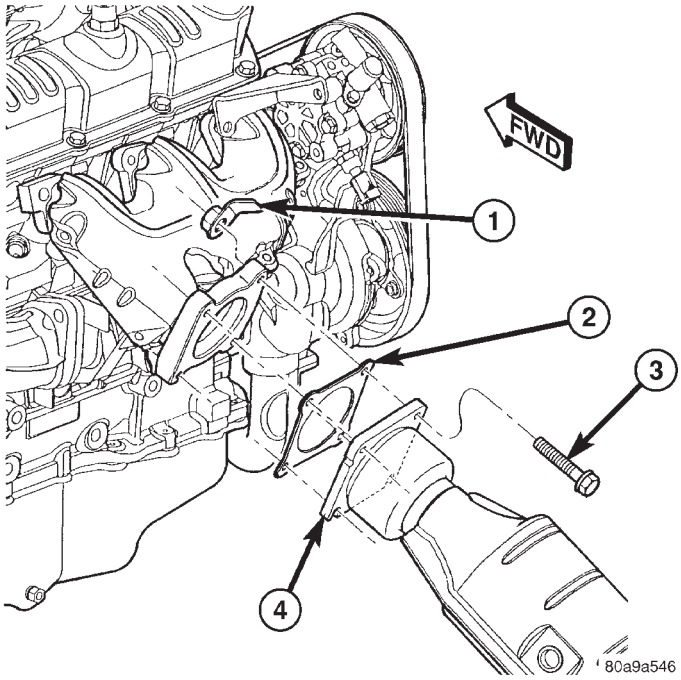

Fig. 7 Catalytic Converter to Exhaust Manifold

1 - FLAG NUT
2 - GASKET
3 - BOLT
4 - CATALYTIC CONVERTER

(35) Remove front engine mount and bracket as an assembly.

(36) Remove the engine rear mount bracket.

(37) Remove the engine to transaxle struts (Fig. 8).

(38) Remove transaxle case cover (Fig. 8).

(39) Remove flex plate to torque converter bolts. Mark torque converter to flex plate for orientation for reassembly.

(40) Remove the power steering pressure hose support clip attaching bolt.

(41) Disconnect the knock sensor electrical connector (3.8L only).

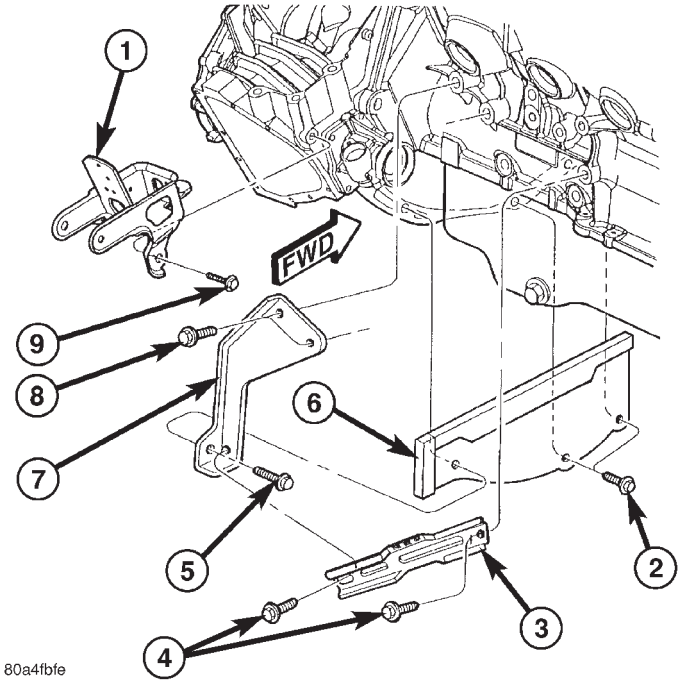

Fig. 8 POWERTRAIN SUPPORTS AND DUST COVER

1 - BRACKET - ENGINE REAR MOUNT
2 - BOLT - TRANSAXLE CASE COVER
3 - STRUT - TRANSAXLE TO ENGINE HORIZONTAL
4 - BOLT - HORIZONTAL STRUT
5 - BOLT - STRUT TO TRANSAXLE
6 - COVER - TRANSAXLE CASE LOWER
7 - STRUT - TRANSAXLE TO ENGINE
8 - BOLT - STRUT TO ENGINE
9 - BOLT - ENGINE REAR MOUNT BRACKET

(42) Disconnect the engine block heater electrical connector (if equipped).

(43) Remove the accessory belt splash shield.

(44) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(45) Disconnect the radiator lower hose.

(46) Remove air conditioning compressor from engine.

(47) Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

ENGINE 3.3/3.8L (Continued)

(48) Remove the water pump pulley attaching bolts and position pulley between pump hub and housing.

(49) Disconnect the oil pressure switch electrical connector.

(50) Disconnect wiring harness support clip from engine oil dipstick tube.

(51) Install Special Tools 6912 and 8444 Adapters on the right side (rear) of engine block (Fig. 9).

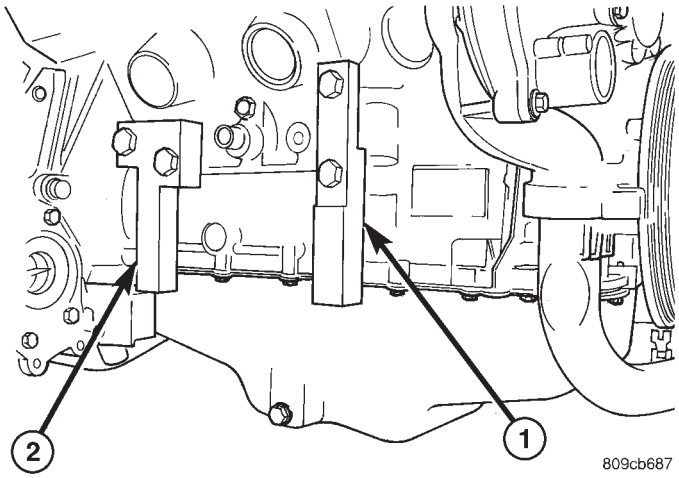

Fig. 9 ADAPTER TOOLS MOUNTED ON BLOCK

1 - SPECIAL TOOL 6912
2 - SPECIAL TOOL 8444

(52) Lower the vehicle.

(53) Remove the power steering pump and set aside.

(54) Raise vehicle enough to allow engine dolly Special Tool 6135 and cradle Special Tool 6710 with post Special Tool 6848 and adaptor Special Tool 6909 to be installed under vehicle (Fig. 12).

(55) Loosen cradle/post mounts to allow movement for positioning posts into locating holes on the engine (Fig. 10) and (Fig. 11). Slowly lower vehicle and position cradle/post mounts until the engine is resting on posts. Tighten all cradle/post mounts to cradle frame. This will keep mounts from moving when removing or installing engine and transmission.

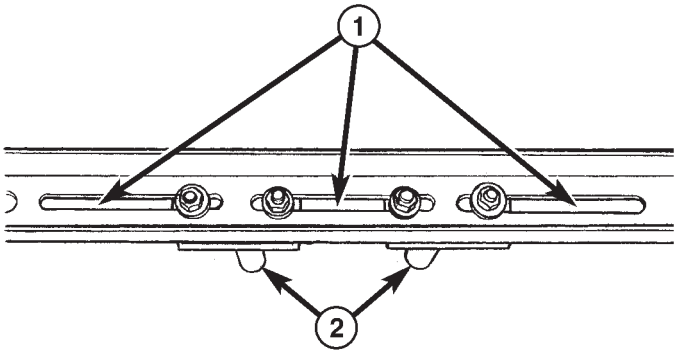

Fig. 10 Positioning Special Tool 6848 for use with Adapters 8444 & 6912

4 - SPECIAL TOOLS 6848

(56) Lower vehicle so the weight of **ONLY THE ENGINE AND TRANSMISSION** is on the cradle.

(57) Install and secure the safety straps to the cradle fixture and around the engine (Fig. 12).

(58) Remove the engine right side mount to engine attaching bolts (Fig. 13).

(59) Remove the left mount through bolt (Fig. 14).

(60) Raise vehicle slowly. It is necessary to move the engine/transmission assembly with the dolly to allow for removal around body flanges.

ENGINE 3.3/3.8L (Continued)

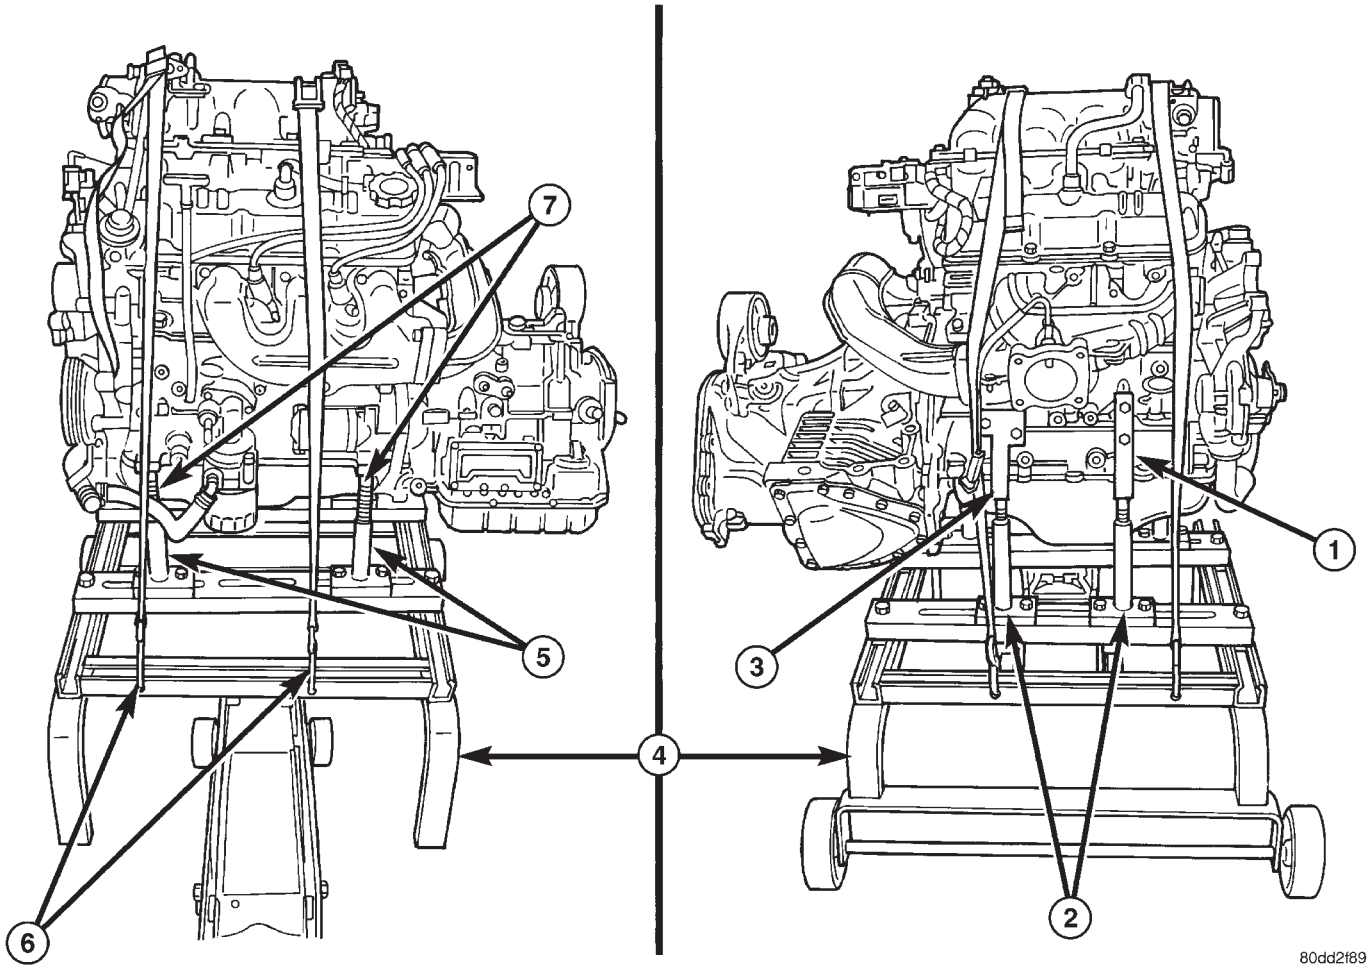

Fig. 12 Positioning Engine Cradle Support Post Mounts

1 - SPECIAL TOOL 8444

5 - SPECIAL TOOLS 6848
6 - SAFETY STRAPS
7 - SPECIAL TOOLS 6909

INSTALLATION - ENGINE ASSEMBLY

(1) Position engine and transmission assembly under vehicle. Slowly lower the vehicle down over the engine and transmission. It is necessary to move the engine/transmission assembly with the dolly for clearance around body flanges.

(2) Align engine and transmission mounts to attaching points. Install mounting bolts at the right engine mount (Fig. 13) and left transmission mount (Fig. 14).

(3) Remove the safety straps from around engine.

(4) Slowly raise vehicle enough to remove the engine dolly and cradle Special Tools 6135, 6710, 6848 and 6909 (Fig. 12).

(5) Remove Special Tools 6912 and 8444 (Fig. 9).

(6) Lower the vehicle.

(7) Install power steering pump and pressure line support.

(8) Install the generator and wiring harness (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(9) Raise vehicle.

(10) Attach wiring harness support clip to the engine oil dipstick tube.

(11) Connect oil pressure switch electrical connector.

(12) Install the A/C compressor.

(13) Install the water pump pulley.

(14) Connect the radiator lower hose.

(15) Install the accessory drive belt and splash shield (Refer to 7 - COOLING/ACCESSORY DRIVE/ DRIVE BELTS - INSTALLATION).

(16) Connect the engine block heater electrical connector (if equipped).

(17) Connect the knock sensor electrical connector (3.8L only).

(18) Install the torque converter to flex plate bolts.

(19) Install the transaxle case cover (Fig. 8).

ENGINE 3.3/3.8L (Continued)

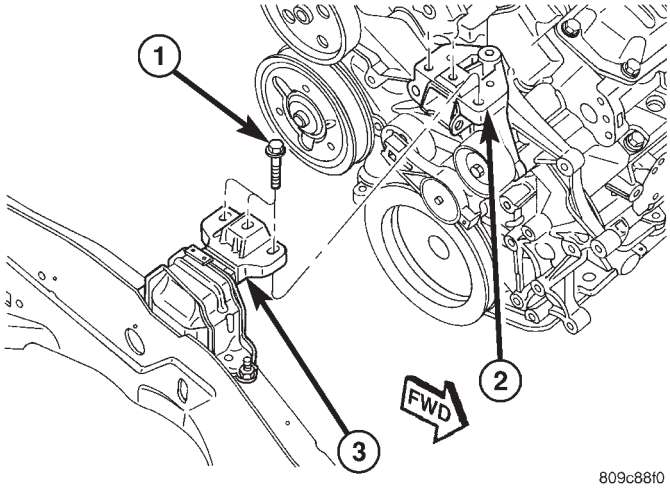

Fig. 13 Right Mount to Engine

1 - BOLT
2 - MOUNT BRACKET
3 - ENGINE RIGHT MOUNT ASSEMBLY

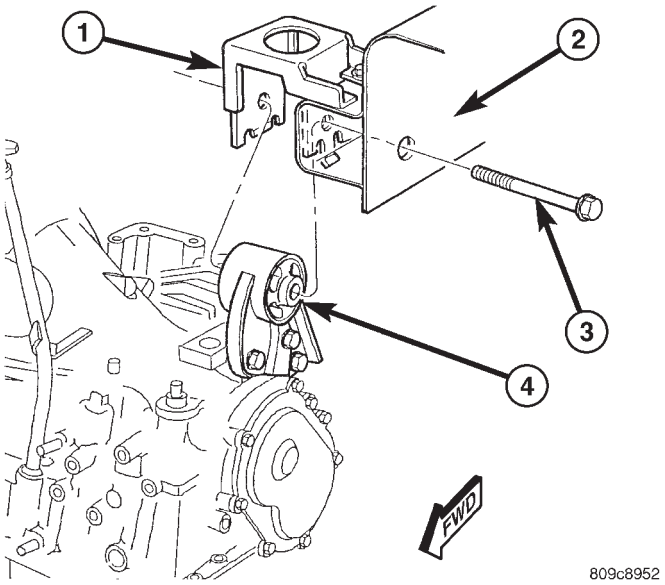

Fig. 14 LEFT MOUNT TO FRAME BRACKET

1 - FRAME BRACKET
2 - FRAME RAIL - LEFT
3 - BOLT
4 - TRANSAXLE MOUNT

(20) Install the powertrain struts (Fig. 8).
(21) Install the engine rear mount bracket.
(22) Install the engine front mount and bracket assembly.
(23) **AWD equipped;** Install the power transfer unit (PTU) (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - INSTALLATION).
(24) Install the axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
(25) Connect exhaust pipe to manifold (Fig. 7).
(26) Install crossmember cradle plate (Fig. 6).
(27) Lower vehicle.
(28) Connect transaxle shift linkage.
(29) Connect transaxle electrical connectors.
(30) Remove plugs from transmission cooler hoses and install transaxle oil cooler line service splice kit. Refer to instructions included with kit.
(31) Install transaxle dipstick tube and attach electrical harness clip.
(32) Connect the A/C lines to compressor.
(33) Connect the A/C compressor electrical connector.
(34) Evacuate and recharge A/C system.
(35) Connect crankshaft and camshaft position sensors.
(36) Connect the fuel injector electrical harness connector and engage clip to support bracket.
(37) Connect engine coolant temperature (ECT) sensor and ignition coil electrical connectors.
(38) Connect the ground strap to rear of cylinder head.
(39) Install power steering reservoir.
(40) Engage wire harness clip to engine right side mount.
(41) Connect the brake booster and speed control vacuum hoses.
(42) Connect the vacuum hoses to the throttle body.
(43) Connect the EGR transducer electrical connector (if equipped).
(44) Connect the TPS, IAC, and MAP sensor electrical connectors.
(45) Connect throttle cables to throttle body.
(46) Install the radiator fans (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
(47) Connect the radiator upper hose.
(48) Connect the heater hoses. Remove pinch-off pliers from the rear heater hoses (if equipped).
(49) Install the radiator upper support crossmember (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION).
(50) Install the wiper module (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).
(51) Connect the fuel line to fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE).
(52) Install the air cleaner and hoses.
(53) Install new oil filter. Fill engine crankcase with proper oil to correct level.
(54) Connect negative cable to battery.
(55) Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
(56) Start engine and run until operating temperature is reached.
(57) Adjust transmission linkage, if necessary.

ENGINE 3.3/3.8L (Continued)

SPECIFICATIONS

3.3/3.8L ENGINE

DESCRIPTION	SPECIFICATION
General Specification	
Type	60° V-6 Engine
Number of Cylinders	6
Displacement	
—3.3L	3.3 Liters (201 cu. in.)
—3.8L	3.8 Liters (231 cu. in.)
Bore	
—3.3L	93.0 mm (3.66 in.)
—3.8L	96.0 mm (3.779 in.)
Stroke	
—3.3L	81.0 mm (3.188 in.)
—3.8L	87.0 mm (3.425 in.)
Compression Ratio	
—3.3L	9.35:1
—3.8L	9.6:1
Firing Order	1-2-3-4-5-6
Cylinder Number (Front to Rear)	
—Front Bank	2,4,6
—Rear Bank	1,3,5
Compression Pressure—Minimum	689.5 kPa (100 psi)
Max. Variation Between Cylinders	25%
Cylinder Block	
Cylinder Bore Diameter (Standard)	
—3.3L	92.993–93.007 mm (3.661–3.6617 in.)

AIR CLEANER ELEMENT

REMOVAL

(1) Unsnap 2 clips.

(2) Lift cover and pull toward the engine and remove cover tabs from air box.

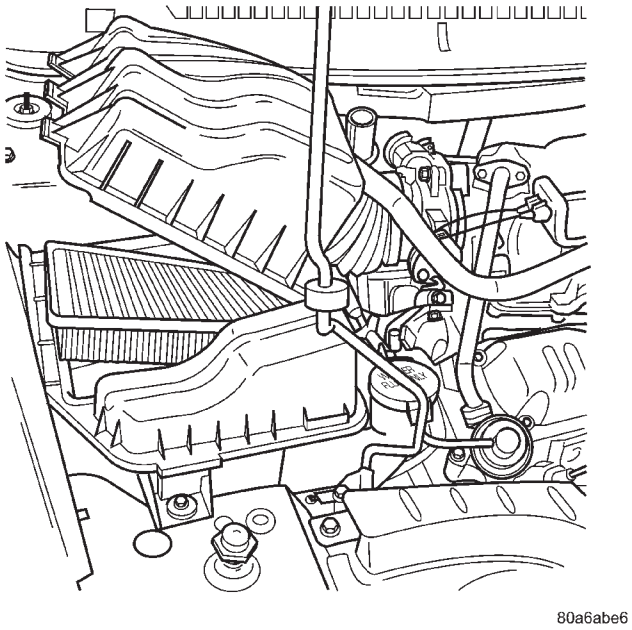
(3) Lift cover and remove the element (Fig. 15).

INSTALLATION

(1) Install the air filter element into air box (Fig. 15).

(2) Move cover so that the tabs insert into the air box.

(3) Push cover down and snap the 2 clips.



80a6abe6

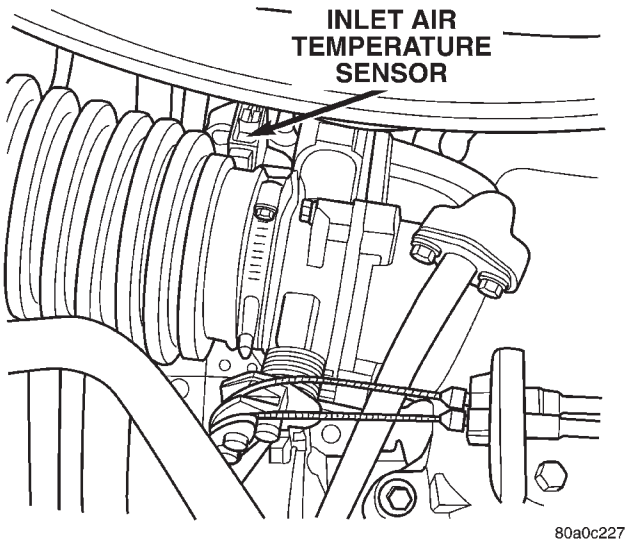
Fig. 15 AIR BOX COVER

AIR CLEANER HOUSING

REMOVAL

(1) Disconnect the negative battery cable.

(2) Disconnect the inlet air temperature sensor (Fig. 16).



80a0c227

Fig. 16 Inlet Air Temperature Sensor

(3) Remove the inlet hose to throttle body.

(4) Remove the bolt for air box at upper radiator cross member.

(5) Pull air box up and off over the single locating pin.

(6) Remove air box from vehicle

AIR CLEANER HOUSING (Continued)

INSTALLATION

(1) Install air box into vehicle and onto the locating pin.
(2) Install bolt to hold air box to the upper radiator cross member.
(3) Install the inlet hose to the throttle body.
(4) Connect the inlet air temperature sensor (Fig. 16).
(5) Connect the negative battery cable.

CYLINDER HEAD

DESCRIPTION

The aluminum cylinder heads (Fig. 17) are designed to create high flow combustion chambers to improve performance, while minimizing the change to the burn rate in the chamber. The cylinder head incorporates the combustion chamber. Two valves per-cylinder are used with inserted valve seats and guides. A multi-layer steel (MLS) type gasket is used between the cylinder head and engine block.

OPERATION

The cylinder head closes the combustion chamber, allowing the pistons to compress the fuel/air mixture for ignition. The valves are actuated by the lobe profiles on the camshaft to open and close at specified duration to either allow clean air in the combustion chamber or the exhaust gases out; depending on the stroke of the engine.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL - CYLINDER HEAD

(1) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
(2) Disconnect negative cable from battery.
(3) Remove upper and lower intake manifolds. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

WARNING: INTAKE MANIFOLD GASKET IS MADE OF VERY THIN METAL AND MAY CAUSE PERSONAL INJURY, HANDLE WITH CARE.

CYLINDER HEAD (Continued)

2 - RETAINERS
3 - VALVE SPRINGS
4 - VALVE STEM SEALS
5 - SPRING SEATS
6 - CYLINDER HEAD
7 - VALVE - EXHAUST
8 - VALVE - INTAKE

(4) Remove the cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(5) Remove the spark plugs from cylinder head.

(6) Remove the dipstick and tube (Fig. 18).

(7) Remove exhaust manifold(s). (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL)

(8) Remove rocker arm and shaft assemblies.(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL) Remove push rods and **mark positions to ensure installation in original locations.**

(9) Remove the eight head bolts from each cylinder head and remove cylinder heads (Fig. 22).

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

(1) Before cleaning, check for leaks, damage and cracks.

(2) Clean cylinder head and oil passages.

(3) Check cylinder head for flatness (Fig. 19).

(4) Cylinder head must be flat within:

- Standard dimension = less than 0.05 mm (0.002 inch.)
- Service Limit = 0.2 mm (0.008 inch.)
- Grinding Limit = Maximum of 0.2 mm (0.008 inch.) is permitted.

CYLINDER HEAD (Continued)

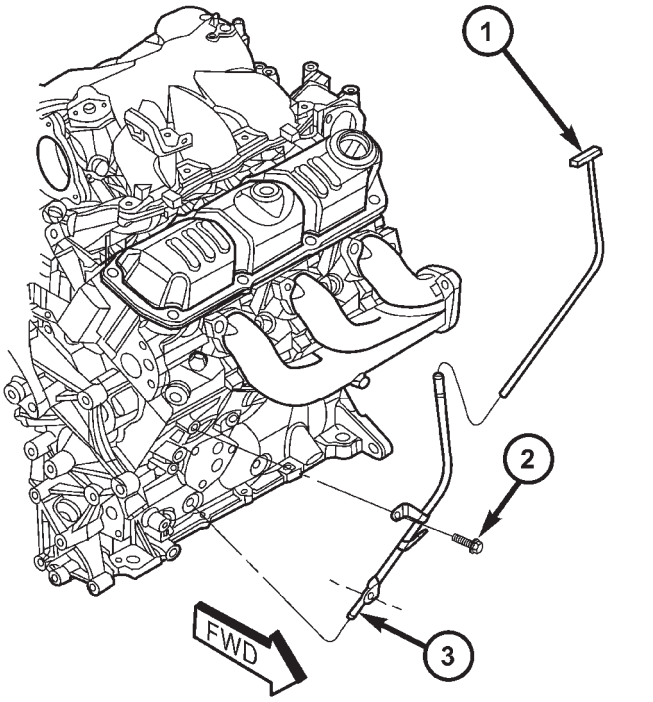

Fig. 18 DIPSTICK & TUBE

1 - DIPSTICK
2 - BOLT
3 - TUBE

CAUTION: 0.20 mm (0.008 in.) MAX is a combined total dimension of the stock removal limit from cylinder head and block top surface (Deck) together.

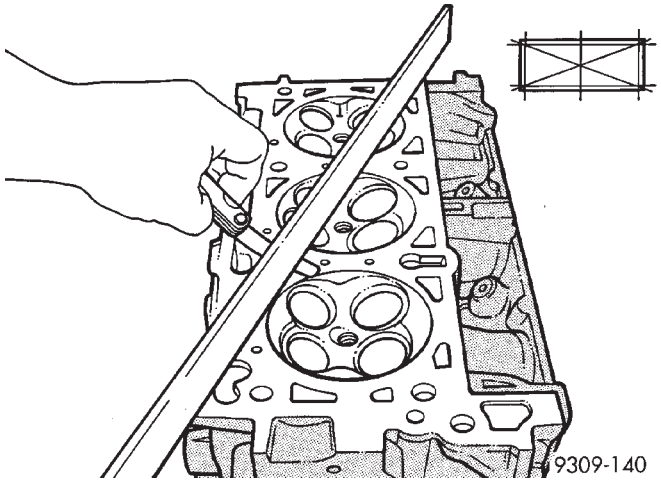

Fig. 19 Checking Cylinder Head Flatness—Typical

INSTALLATION - CYLINDER HEAD

(1) Clean all sealing surfaces of engine block and cylinder heads. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

(2) Position new gasket(s) on engine block (Fig. 20). The left bank gasket is identified with the "L" stamped in the exposed area of the gasket located at front of engine (shown in (Fig. 20)). The right bank gasket is identified with a "R" stamped in the exposed area of the gasket also, but is located at the rear of the engine.

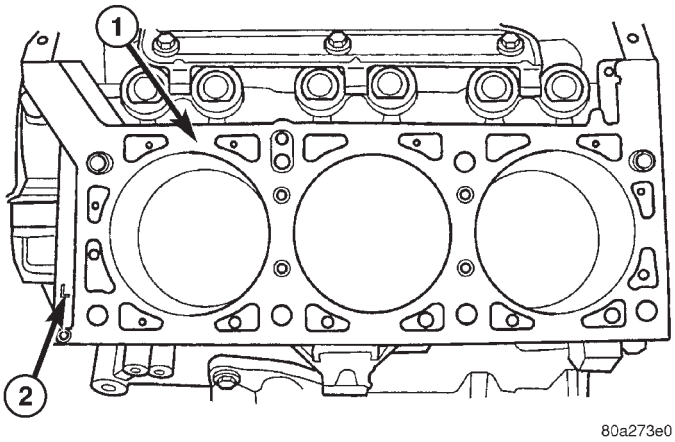

Fig. 20 Head Gasket Installation

1 - CYLINDER HEAD GASKET
2 - LOCATION IDENTIFICATION (L = LEFT BANK, R = RIGHT BANK)

(3) **The cylinder head bolts are torqued using the torque yield method, they should be examined BEFORE reuse. If the threads are necked down, the bolts must be replaced** (Fig. 21).

(4) Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt should be replaced.

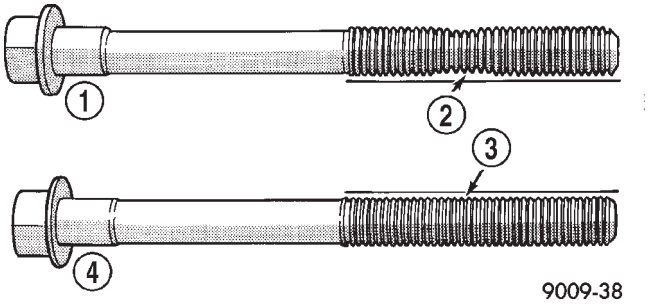

Fig. 21 Checking Bolts for Stretching (Necking)

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

(5) Tighten the cylinder head bolts 1–8 in the sequence shown in (Fig. 22). Using the 4 step torque turn method, tighten according to the following values:

- Step 1: Bolts 1 – 8 to 61 N·m (45 ft. lbs.)

CYLINDER HEAD (Continued)

- Step 2: Bolts 1 – 8 to 88 N·m (65 ft. lbs.)
- Step 3: Bolts 1 – 8 (again) to 88 N·m (65 ft. lbs.)
- Step 4: Bolts 1 – 8 turn an additional 1/4 Turn. **(Do not use a torque wrench for this step.)**

NOTE: Bolt torque after 1/4 turn should be over 122 N·m (90 ft. lbs.). If not, replace the bolt.

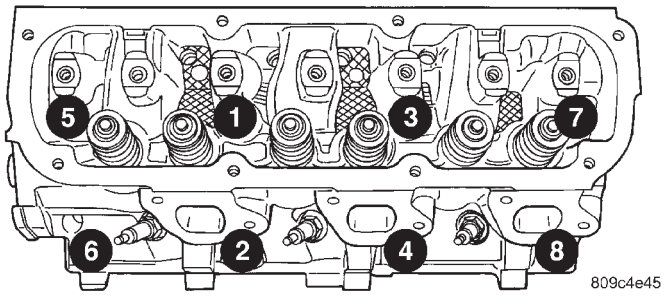

Fig. 22 CYLINDER HEAD TIGHTENING SEQUENCE

(6) Inspect push rods and replace worn or bent rods.

(7) Install the push rods.

(8) Install the rocker arm and shaft assemblies. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION)

(9) Install the cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

(10) Install the exhaust manifolds. (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION)

(11) Install new O-ring on dipstick tube. Install dipstick tube assembly (Fig. 18).

(12) Install the spark plugs.

(13) Install upper and lower intake manifolds. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(14) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(15) Connect negative cable to battery.

CYLINDER HEAD COVER(S)

DESCRIPTION

The cylinder head covers are made of stamped steel. The covers are sealed with steel reinforced silicon rubber gaskets. The cylinder head cover uses rubber isolators at each fastener location (Fig. 23).

NOTE: Due to the tight packaging near the cylinder head covers, which makes spill clean-up difficult, a spill during an engine oil change may be misinterpreted as an oil leak. When investigating an oil leak in the location of the cylinder head covers and intake manifold, follow the procedure found in Oil Leak Diagnosis (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for determining the source of a leak.

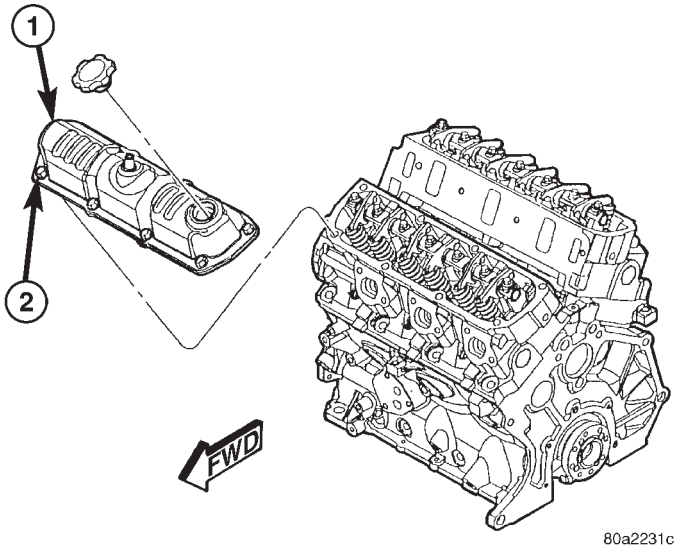

Fig. 23 Cylinder Head Cover

1 - CYLINDER HEAD COVER
2 - BOLT

CYLINDER HEAD COVER - RIGHT

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the wiper module. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL)

(3) Disconnect spark plug wires from plugs.

(4) Disconnect power steering pump supply hose support clip from cylinder head cover (Fig. 24).

(5) Disconnect PCV hose from cylinder head cover (Fig. 25).

(6) Remove cylinder head cover bolts.

(7) Remove cylinder head cover and gasket (Fig. 23).

INSTALLATION

(1) Clean cylinder head and cover mating surfaces. Inspect cylinder head cover surface for flatness. Replace gasket as necessary.

(2) Inspect seal on the cover bolt for wear or damage (Fig. 26). Replace bolt assembly as necessary.

NOTE: The cylinder head cover bolts contain a torque limiter sleeve and a seal (Fig. 26). The seal and torque sleeve is replaced with the bolt.

4 - GASKET

(5) Tighten cylinder head cover bolts to 12 N·m (105 in. lbs.) (Fig. 27).

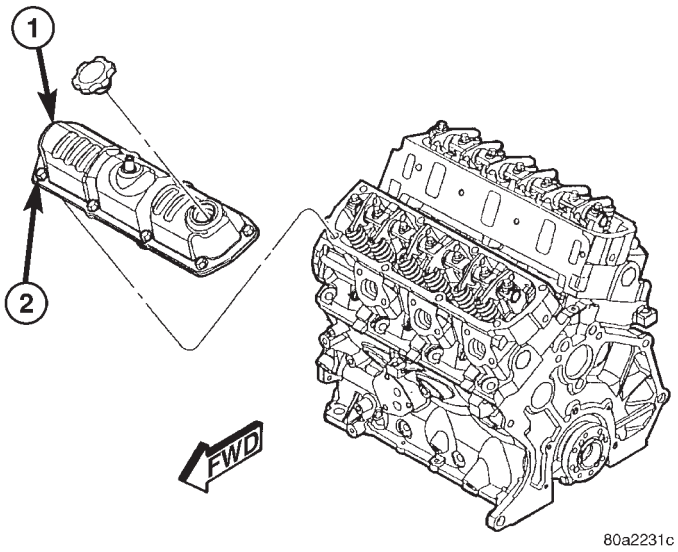

Fig. 27 Cylinder Head Cover

1 - CYLINDER HEAD COVER
2 - BOLT

(6) Connect PCV hose to cylinder head cover.

(7) Connect power steering pump supply hose support clip to cylinder head cover (Fig. 24).

(8) Connect spark plug wires to spark plugs.

(9) Install wiper module. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION)

(10) Connect negative cable to battery.

CYLINDER HEAD COVER - LEFT

REMOVAL

(1) Disconnect spark plug wires from spark plugs.
(2) Disconnect crankcase vent hose from cylinder head cover.
(3) Remove cylinder head cover bolts.
(4) Remove cylinder head cover and gasket.

INSTALLATION

(1) Clean cylinder head and cover mating surfaces. Inspect cylinder head cover surface for flatness. Replace gasket as necessary.
(2) Assemble gasket to cylinder cover by inserting the fasteners through each bolt hole on cover and gasket (Fig. 26).
(3) Install the cylinder head cover and bolts (Fig. 27).
(4) Tighten cylinder head cover bolts to 12 N·m (105 in. lbs.) (Fig. 27).
(5) Connect crankcase vent hose.
(6) Connect spark plug wires to spark plugs.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves have chrome plated valve stems with four-bead lock grooves. The valve stem seals are made of Viton rubber.

OPERATION

The two valves per cylinder are opened using hydraulic lifters, push rods, and rocker arms.

STANDARD PROCEDURE - REFACING VALVES AND VALVE SEATS

The intake and exhaust valves and seats are machined to specific angles (Fig. 28).

VALVES

(1) Inspect the remaining margin after the valves are refaced (Fig. 29). (Refer to 9 - ENGINE - SPECIFICATIONS)

VALVE SEATS

CAUTION: Remove metal from valve seat only. Do not remove material from cylinder head (Fig. 30).

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

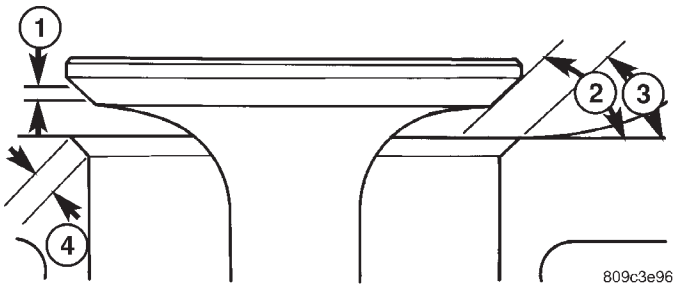

Fig. 28 Valve Face and Seat

1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA

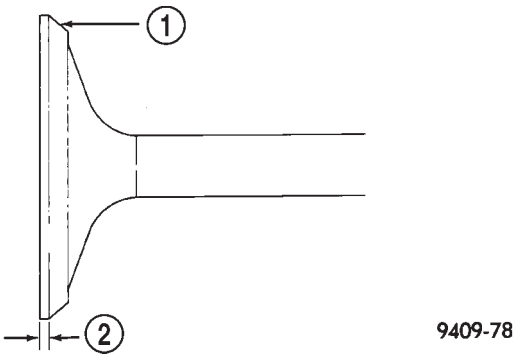

Fig. 29 Valve Margin

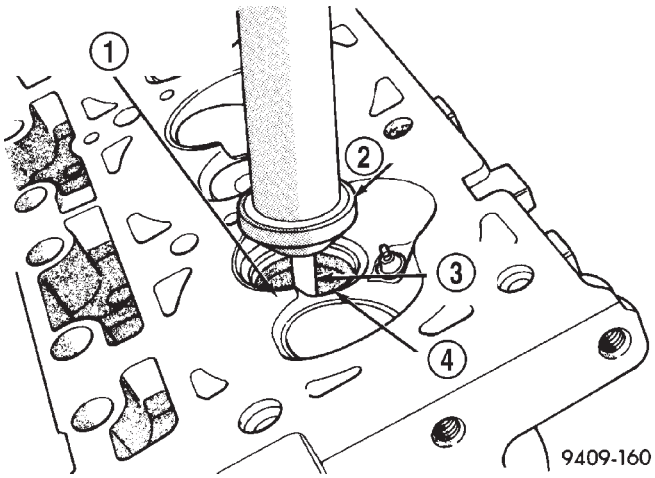

Fig. 30 Refacing Valve Seats

1 - REFACING STONE MUST NOT CUT INTO CYLINDER HEAD
2 - STONE
3 - PILOT
4 - SEAT

INTAKE/EXHAUST VALVES & SEATS (Continued)

(2) Measure the concentricity of valve seat using dial indicator (Fig. 31). Total runout should not exceed 0.051 mm (0.002 in.) total indicator reading.

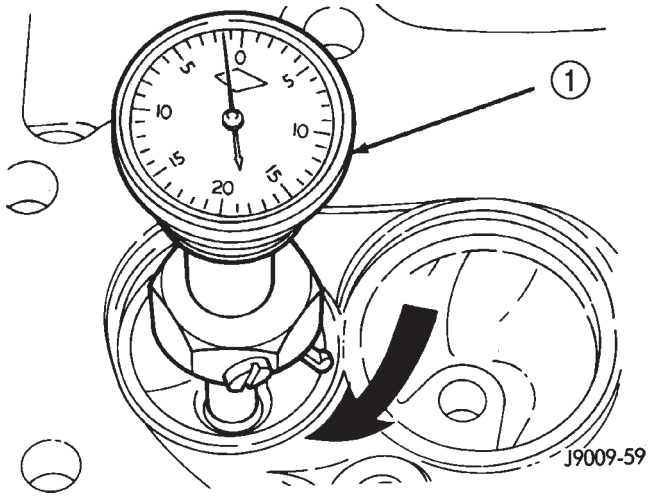

Fig. 31 Measurement of Valve Seat Runout

1 - DIAL INDICATOR

(3) Inspect the valve seat using Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY**with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to top edge of valve face, lower valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of valve face raise valve seat with a 65 degrees stone.

NOTE: Valve seats which are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise cylinder head must be replaced.

(4) When seat is properly positioned the width of intake and exhaust seats should be 1.50–2.00 mm (0.059–0.078 in.) (Fig. 28).

(5) After grinding the valve seats or faces, install the valve in cylinder head and check valve installed height by measuring from valve tip to spring seat (Fig. 32). Remove valve from cylinder head and grind valve tip until within specifications. Check valve tip for scoring. The tip chamfer should be reground (if necessary) to prevent seal damage when the valve is installed.

(6) Check the valve spring installed height after refacing the valve and seat (Fig. 32).**If valves and/or seats are reground, measure the installed height of springs (Fig. 32), make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than specifications, install a 0.794 mm (0.0312 in.) spacer in head counterbore to bring spring height back within specifications.**

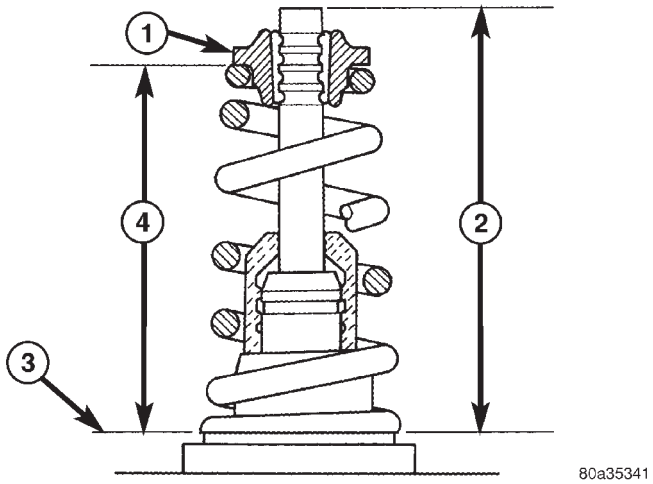

Fig. 32 Checking Valve and Spring Installed Height

1 - SPRING RETAINER
2 - VALVE INSTALLED HEIGHT* - 48.1–49.7 mm (1.89–1.95 in.)
3 - CYINDER HEAD SURFACE
4 - SPRING INSTALLED HEIGHT* - 41.1–42.7 mm (1.61–1.68 in.)
*(MEASURED FROM TOP OF SPRING SEAT)

REMOVAL

(1) With cylinder head removed, compress valve springs using Valve Spring Compressor Tool C-3422-D with adapter 8464 (Refer to 9 - ENGINE - SPECIAL TOOLS).

(2) Remove valve retaining locks.

(3) Slowly release valve spring compressor. Remove valve spring retainer, valve spring, and valve stem seal.

(4) Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves to insure installation in original location.

CLEANING

(1) Clean all valves thoroughly and discard burned, warped and cracked valves.

INSPECTION

VALVES

(1) Clean and inspect valves thoroughly. Replace burned, warped and cracked valves.

(2) Measure valve stems for wear (Fig. 33). For valve specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

NOTE: Valve stems are chrome plated and should not be polished (Fig. 33).

INTAKE/EXHAUST VALVES & SEATS (Continued)

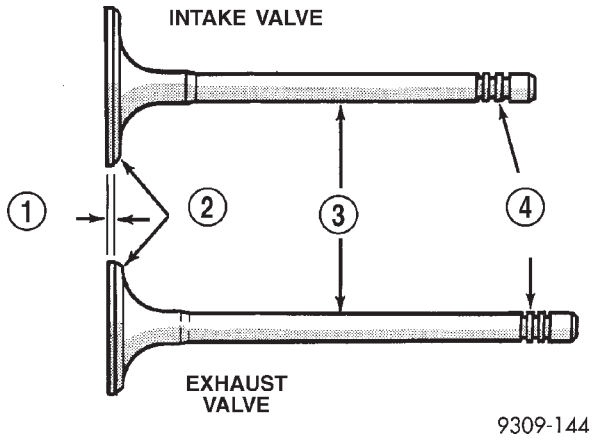

Fig. 33 Intake and Exhaust Valves

1 - MARGIN
2 - FACE
3 - STEM
4 - VALVE SPRING RETAINER LOCK GROOVES

VALVE GUIDES

(1) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(2) Measure valve stem-to-guide clearance as follows:

(3) Install valve into cylinder head so it is 15 mm (0.590 inch.) off the valve seat. A small piece of hose may be used to hold valve in place.

(4) Attach dial indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured (Fig. 34).

(5) Move valve to and from the indicator. For clearance specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

NOTE: Replace cylinder head if stem-to-guide clearance exceeds specifications, or if guide is loose in cylinder head.

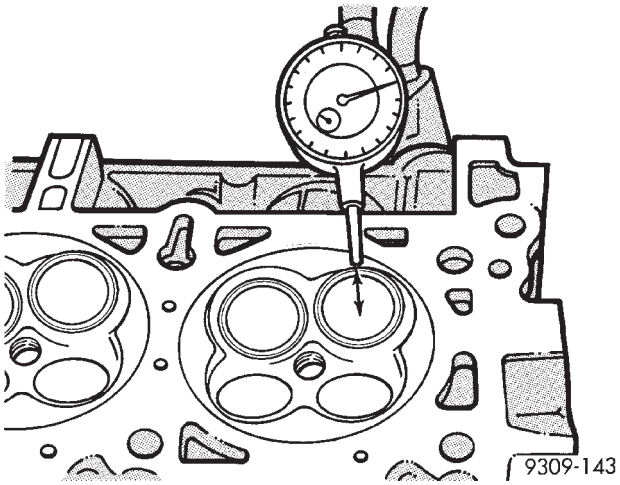

Fig. 34 Measuring Valve Guide Wear - Typical

INSTALLATION

(1) Coat valve stems with clean engine oil and insert them in cylinder head.

(2) Install valve spring seat on head (Fig. 36).

(3) Install new seals on all valve stems and over valve guides (Fig. 36). Install valve springs and valve retainers (Fig. 36).

(4) Install the valve springs. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION)

VALVE SPRINGS

DESCRIPTION

The valve springs are a bee-hive shaped design (Fig. 35). The springs are seated on a steel washer on the cylinder head with retainers and locks retaining the springs (Fig. 36). The springs are installed with the smaller diameter against spring retainer (Fig. 35).

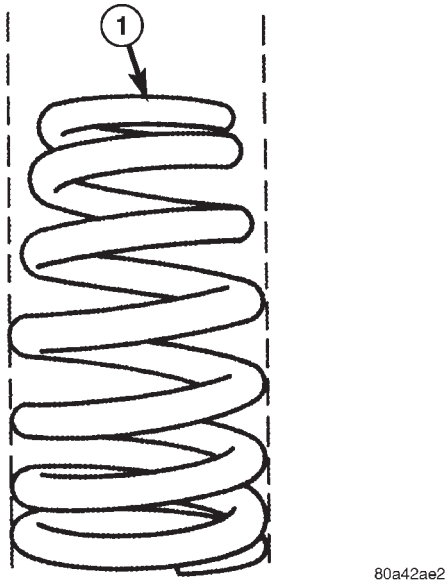

Fig. 35 Valve Spring

1 - VALVE SPRING (TOP - SMALLER DIAMETER)

OPERATION

The valve spring returns the valve against its seat for a positive seal of the combustion chamber.

VALVE SPRINGS (Continued)

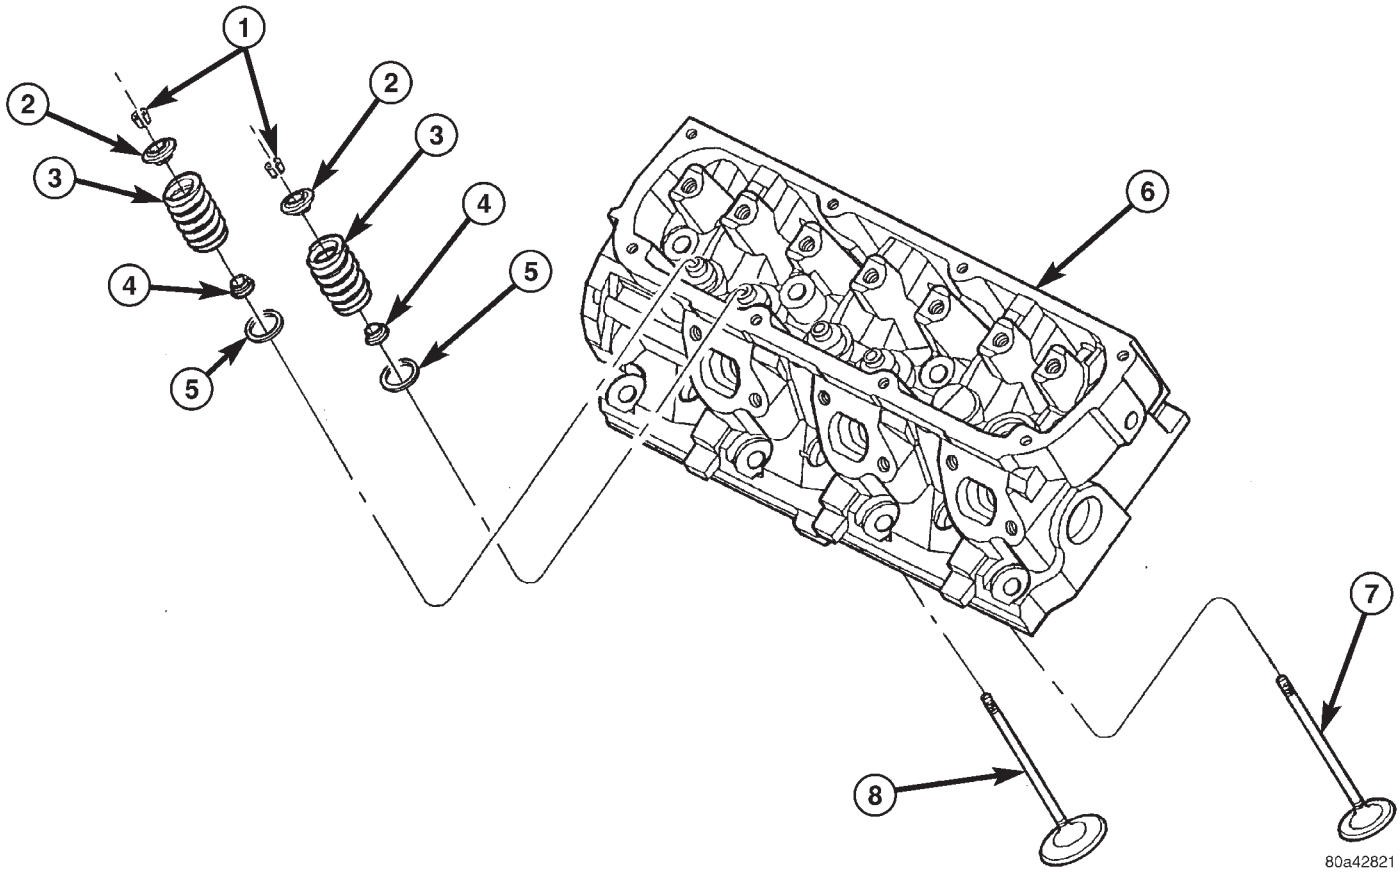

Fig. 36 VALVE COMPONENTS

1 - VALVE LOCKS
2 - RETAINERS
3 - VALVE SPRINGS
4 - VALVE STEM SEALS
5 - SPRING SEATS
6 - CYLINDER HEAD
7 - VALVE - EXHAUST
8 - VALVE - INTAKE

REMOVAL

REMOVAL - CYLINDER HEAD OFF

(1) With the cylinder head on a bench, position Special Tool C-3422-D with 8464 Adapter on the valve and spring retainer (Fig. 37).

(2) Compress the spring only enough to remove the valve retainer locks.

(3) Slowly release the spring tension and remove the valve spring and retainer.

(4) For removal of the valve stem seal (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - REMOVAL).

REMOVAL - CYLINDER HEAD ON

(1) Disconnect negative cable from battery.

(2) Remove spark plug wires and all spark plugs.

(3) Remove cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(4) Remove rocker arms and shaft. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL)

(5) Rotate engine until the piston in the cylinder bore requiring spring removal is at TDC.

(6) Install Special Tool 8453 to the cylinder head (Fig. 38). Tighten the attaching bolts to 23 N·m (200 in. lbs.).

(7) Install a spark plug adapter in the spark plug hole. Connect air hose that can supply 620.5–689 kPa (90–100 psi) of air pressure to adapter. This is to hold valves in place while servicing components.

(8) Locate the forcing screw and spring retainer adapter assembly over the spring requiring removal (Fig. 38).

(9) Slowly turn the forcing screw clockwise (compressing the valve spring) until the valve keepers can be removed.

(10) Turn forcing screw counterclockwise to relieve spring tension. Remove retainer and valve spring.

VALVE SPRINGS (Continued)

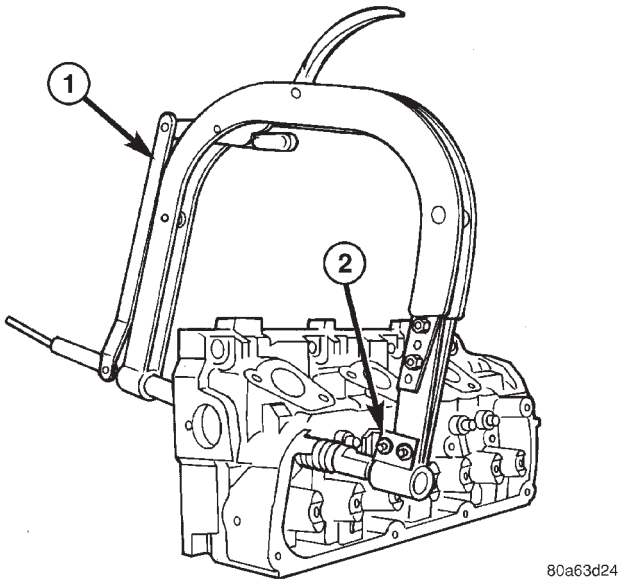

Fig. 37 VALVE SPRING - REMOVE/INSTALL

1 - SPECIAL TOOL C-3422-D SPRING COMPRESSOR
2 - SPECIAL TOOL 8464 ADAPTER

(11) Repeat procedure for each cylinder requiring valve spring removal.

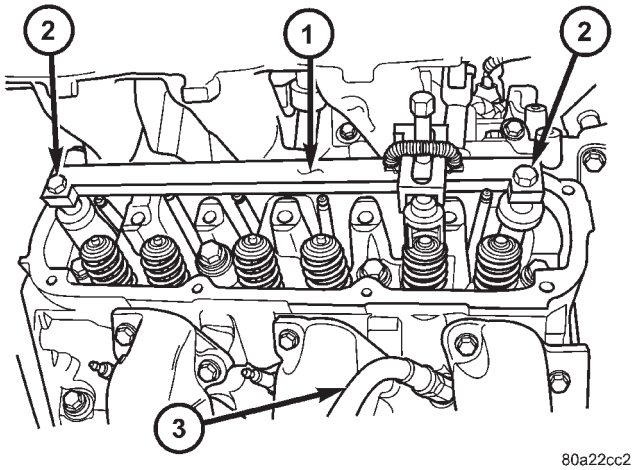

Fig. 38 VALVE SPRING - REMOVE/INSTALL (HEAD ON)

1 - SPECIAL TOOL 8453
2 - BOLTS - SPECIAL TOOL ATTACHING
3 - AIR SUPPLY HOSE ADAPTER

INSPECTION

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested (Fig. 39). **As an example;** the compression length of a spring to be tested is 38.00 mm (1.496 in.). Turn the table of Tool C-647 until surface is in line with the 38.00 mm (1.496 in.) mark on the threaded stud and the zero mark on the front. Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Engine Specifications to obtain specified height and allowable tensions (Refer to 9 - ENGINE - SPECIFICATIONS). Replace any springs that do not meet specifications.

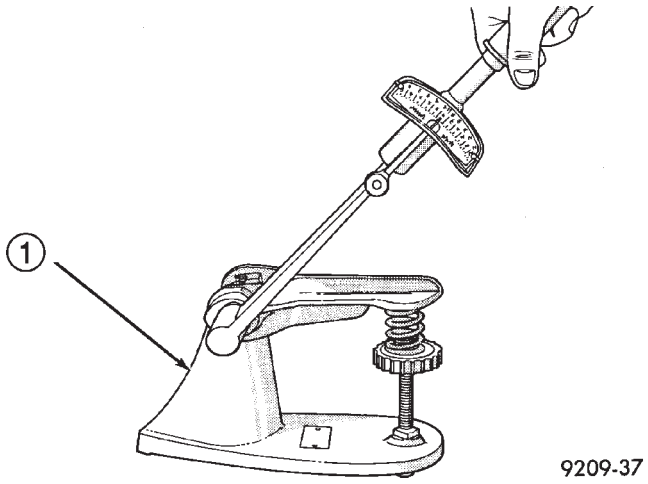

Fig. 39 TESTING VALVE SPRING

1 - SPECIAL TOOL C-647

INSTALLATION

INSTALLATION - CYLINDER HEAD OFF

(1) If removed, install a new valve stem seal (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - INSTALLATION).

(2) Position valve spring and retainer on spring seat.

(3) Using Special Tool C-3422-D with 8464 Adapter (Fig. 37), compress the spring only enough to install the valve retainer locks. Install valve retainer locks.

(4) Slowly release the spring tension. Ensure the retainer locks are seated properly.

INSTALLATION - CYLINDER HEAD ON

(1) The intake valve stem seals should be pushed firmly and squarely over the valve guide using the valve stem as guide. **Do Not Force** seal against top of guide. When installing the valve retainer locks, compress the spring **only enough** to install the locks.

CAUTION: Do not pinch seal between retainer and top of valve guide.

VALVE SPRINGS (Continued)

(2) Follow the same procedure on the remaining 5 cylinders using the firing sequence 1-2-3-4-5-6. **Make sure piston in cylinder is at TDC on the valve spring that is being covered.**

(3) Remove spark plug adapter tool.

(4) Install rocker arms and shaft assembly. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION)

(5) Install cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

(6) Install spark plugs and connect wires.

(7) Connect negative cable to battery.

ROCKER ARMS

DESCRIPTION

DESCRIPTION - ROCKER ARMS

The rocker arms are installed on the rocker arm shaft. The rocker arms and shaft assembly is attached to the cylinder head with seven bolts and retainers. The rocker arms are made of stamped steel.

DESCRIPTION - PUSHRODS

The pushrods are made of steel and are a hollow design. The pushrods are positioned between the hydraulic lifter and the rocker arm.

OPERATION

OPERATION - ROCKER ARMS

The rocker arm pivots on the rocker shaft. Rocker arms are used to translate up and down motions provided by the camshaft, hydraulic lifter, and pushrod on one end, into a down and up motions on the valve stem on the opposing end.

OPERATION - PUSHRODS

The pushrod is a solid link between the hydraulic lifter and the rocker arm. Also, the pushrod supplies engine oil from the hydraulic lifter to the rocker arm.

REMOVAL - ROCKER ARMS AND SHAFT

(1) Remove the cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

NOTE: Rocker arm shaft bolts are captured to the shaft.

(2) Loosen the rocker shaft bolts (Fig. 40), rotating one turn each, until all valve spring pressure is relieved.

(3) Remove the rocker arms and shaft assembly (Fig. 40).

(4) For rocker arm disassembly procedures, (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - DISASSEMBLY).

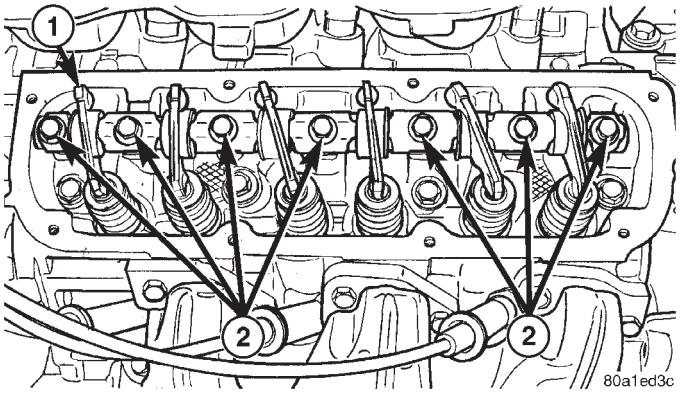

Fig. 40 ROCKER ARMS AND SHAFT

1 - ROCKER ARMS AND SHAFT ASSEMBLY
2 - ROCKER SHAFT BOLTS

DISASSEMBLY - ROCKER ARMS AND SHAFT

CAUTION: Do not attempt to drive the bolt from the rocker shaft. This can damage the retainer and bolt assembly.

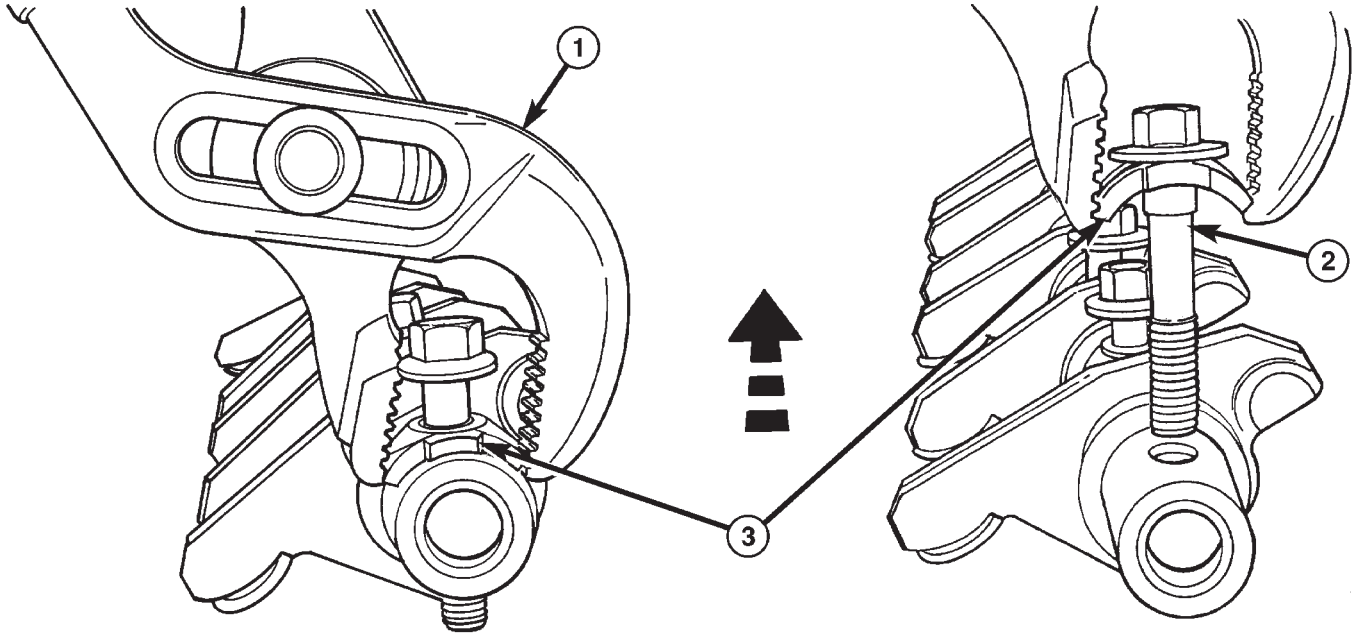
(1) Remove the rocker arm retainer and bolt by performing the following procedure:

(a) Using adjustable pliers, grip the edges of the retainer (Fig. 41).

(b) Apply an upward force with a slight rocking motion until the retainer disengages from shaft (Fig. 41).

(2) Remove rocker arms (Fig. 42). Identify the component locations for reassembly in original locations.

ROCKER ARMS (Continued)



80a1ec81

Fig. 41 ROCKER ARM RETAINER - REMOVAL

1 - ADJUSTABLE PLIERS
2 - ROCKER SHAFT BOLT
3 - ROCKER ARM RETAINER

ASSEMBLY - ROCKER ARMS AND SHAFT

(1) Install rocker arms on the shaft (Fig. 42). Install in the orginal positions if re-used. **Ensure** the rocker shaft, all the retainers and washers are properly positioned and installed in the correct locations (Fig. 42).

(2) Install rocker arms and shaft to the cylinder head. (Refer to 9 - ENGINE/CYLINDER HEAD/ ROCKER ARMS - INSTALLATION)

INSTALLATION - ROCKER ARMS AND SHAFT

CAUTION: Ensure the longer shaft retaining bolt is installed in the proper location on the rocker shaft. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - ASSEMBLY)

(1) Position the rocker arm and shaft assemblies on the pedestal mounts.

CAUTION: Ensure all pushrods are properly located on the lifter and the rocker arm socket.

(2) Align each rocker arm socket with each push-rod end.

CAUTION: The rocker arm shaft should be tightened down slowly, starting with the center bolts. Allow 20 minutes lifter bleed down time after installation of the rocker shafts before engine operation.

(3) Slowly tighten rocker shaft bolts evenly until shaft is seated. Tighten bolts to 23 N·m (200 in. lbs.) (Fig. 43).

(4) Install the cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

ROCKER ARMS (Continued)

VALVE STEM SEALS

DESCRIPTION

The valve stem seals are made of Viton rubber. The seals are positioned over the valve stem and seated on the valve guide (Fig. 44).

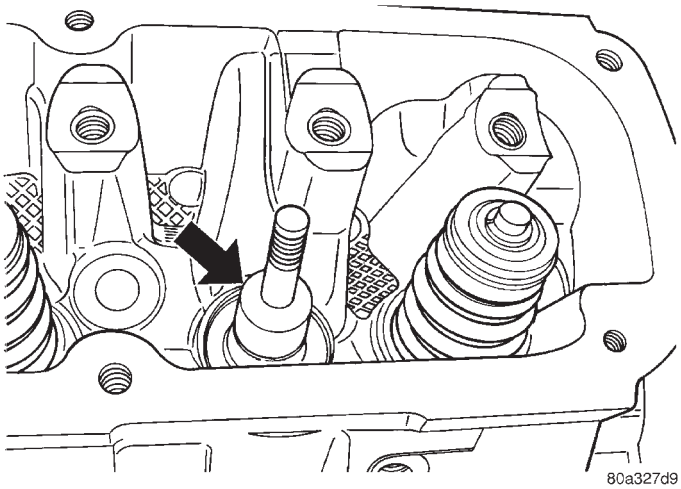

Fig. 44 Valve Stem Seal

VALVE STEM SEALS (Continued)

REMOVAL

(1) Remove the valve springs. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - REMOVAL)

(2) Remove the valve stem seal (Fig. 44).

INSTALLATION

(1) Install the valve stem seal squarely over the valve guide, using the valve stem as a guide (Fig. 44). Do not force the seal against top of the valve guide.

(2) Install the valve spring. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION)

ENGINE BLOCK

DESCRIPTION

The cylinder block is made of cast iron and is a deep skirt design.

STANDARD PROCEDURE - CYLINDER BORE HONING

(1) Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

(2) Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

(3) Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40-60 degrees, the cross hatch angle is most satisfactory for proper seating of rings (Fig. 45).

(4) A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

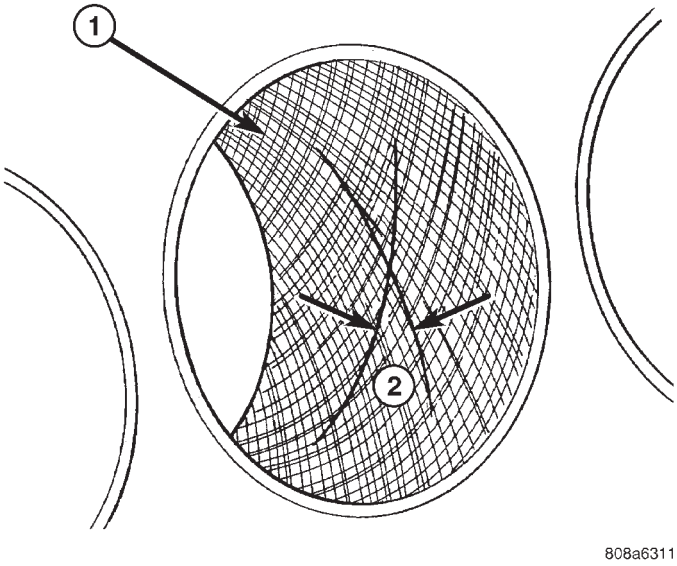

Fig. 45 Cylinder Bore Cross-Hatch Pattern

1 - CROSS-HATCH PATTERN
2 - 40°–60°

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

(1) Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

(2) If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).

(3) Examine block and cylinder bores for cracks or fractures.

(4) Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

ENGINE BLOCK (Continued)

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Fig. 46) (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

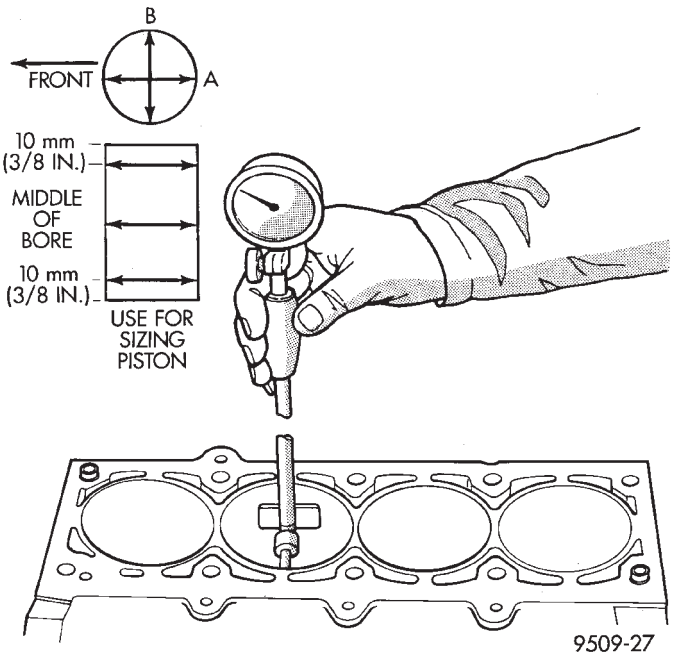

Fig. 46 Checking Cylinder Bore Size

Measure the cylinder bore at three levels in directions A and B (Fig. 46). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CAMSHAFT & BEARINGS (IN BLOCK)

DESCRIPTION

The nodular iron camshaft is mounted in the engine block and supported with four steel backed aluminum bearings (Fig. 47). A thrust plate, located in front of the first bearing, is bolted to the block and controls the camshaft end play (Fig. 47). To distinguish camshafts between the 3.3L and 3.8L engines, a cast-in ring is located between the rear bearing journal and rear lobe (Fig. 48). The 3.3L engine application is as-cast only. The 3.8L engine application the cast ring is machined off.

OPERATION

The camshaft is driven by the crankshaft through a timing chain and sprockets. The camshaft has precisely machined (egg-shaped) lobes to provide accurate valve timing and duration.

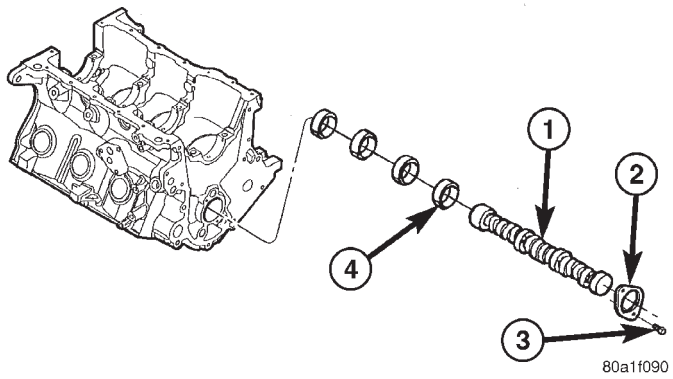

Fig. 47 CAMSHAFT AND BEARINGS

1 - CAMSHAFT
2 - THRUST PLATE
3 - BOLT
4 - CAMSHAFT BEARINGS (SERVICED WITH BLOCK)

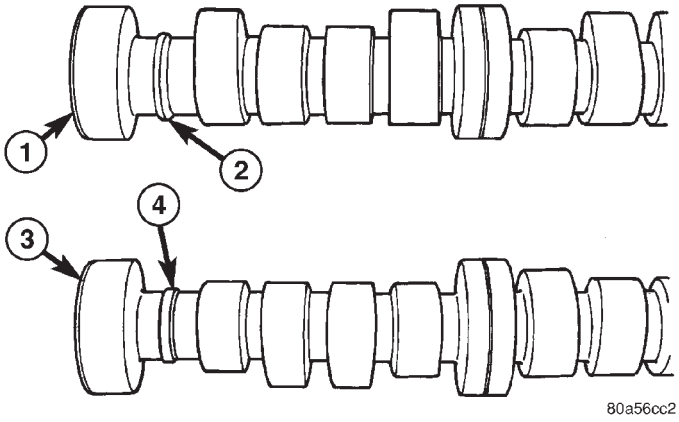

Fig. 48 CAMSHAFT IDENTIFICATION

1 - CAMSHAFT - 3.3L ENGINE
2 - CAST-IN RING
3 - CAMSHAFT - 3.8L ENGINE
4 - MACHINED CAST-IN RING

REMOVAL

(1) Remove the engine assembly from vehicle. (Refer to 9 - ENGINE - REMOVAL)

Remove the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)

(2) Remove the timing chain and camshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(3) Remove the hydraulic lifters. (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - REMOVAL). Identify each tappet for reinstallation in original location.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(4) Remove camshaft thrust plate (Fig. 47).

(5) Install a long bolt into front of camshaft to facilitate removal of the camshaft.

(6) Remove the camshaft (Fig. 47), being careful not to damage cam bearings with the cam lobes.

NOTE: The camshaft bearings are serviced with the engine block.

INSPECTION

(1) Check the cam lobes and bearing surfaces for abnormal wear and damage (Fig. 49). Replace camshaft as required.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the lifters.

(2) Measure the lobe actual wear (unworn area - wear zone = actual wear) (Fig. 49) and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

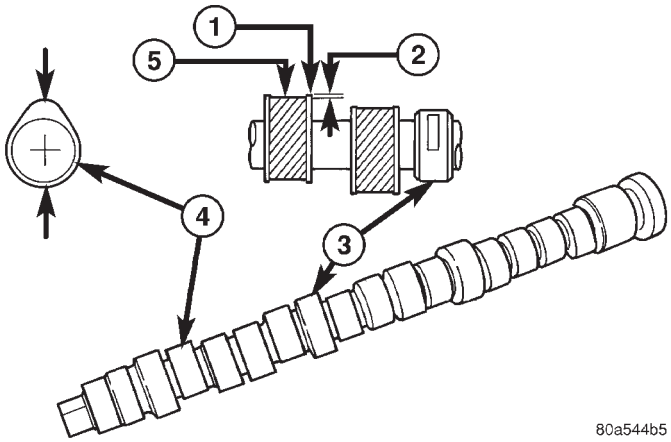

Fig. 49 Checking Camshaft for Wear (Typical)

1 - UNWORN AREA
2 - ACTUAL WEAR
3 - BEARING JOURNAL
4 - LOBE
5 - WEAR ZONE

INSTALLATION

(1) Lubricate camshaft lobes and camshaft bearing journals with engine oil.

(2) Install a long bolt into the camshaft to assist in the installation of the camshaft.

(3) Carefully install the camshaft in engine block.

(4) Install camshaft thrust plate and bolts (Fig. 47). Tighten to 12 N·m (105 in. lbs.) torque.

(5) Measure camshaft end play. (Refer to 9 - ENGINE - SPECIFICATIONS) If not within specifications, replace thrust plate.

(6) Install the timing chain and sprockets. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/ CHAIN AND SPROCKETS - INSTALLATION)

NOTE: When camshaft is replaced, all of the hydraulic lifters must be replaced also.

(7) Install the hydraulic lifters (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - INSTALLATION). Each lifter reused must be installed in the same position from which it was removed.

(8) Install the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(9) Install the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)

(10) Install the cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

(11) Install the lower and upper intake manifolds. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(12) Install the engine assembly. (Refer to 9 - ENGINE - INSTALLATION)

CONNECTING ROD BEARINGS

STANDARD PROCEDURE - MEASURING CONNECTING ROD BEARING CLEARANCE

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Install cap with the tangs on the same side as the rod. Fit all rods on one bank until complete. Connecting rod bearings are available in the standard size and the following undersizes: 0.025 mm (0.001 in.) and 0.250 mm (0.010 in.).

CAUTION: Install the bearings in pairs. Do not use a new bearing half with an old bearing half. Do not file the rods or bearing caps.

Measure connecting rod journal for taper and out-of-round. (Refer to 9 - ENGINE/ENGINE BLOCK/ CRANKSHAFT - INSPECTION)

The connecting rod bearing clearances can be determined by use of Plastigage or the equivalent. The following is the recommended procedure for the use of Plastigage:

(1) Rotate the crankshaft until the connecting rod to be checked is at the bottom of its stroke.

(2) Remove oil film from surface to be checked. Plastigage is soluble in oil.

CONNECTING ROD BEARINGS (Continued)

(3) Place a piece of Plastigage across the entire width of the bearing shell in the bearing cap approximately 6.35 mm (1/4 in.) off center and away from the oil hole. In addition, suspect areas can be checked by placing Plastigage in that area.

(4) Assemble the rod cap with Plastigage in place. Tighten the rod cap to the specified torque. **Do not rotate the crankshaft while assembling the cap or the Plastigage may be smeared, giving inaccurate results.**

(5) Remove the bearing cap and compare the width of the flattened Plastigage with the scale provided on the package (Fig. 50). Locate the band closest to the same width. This band indicates the amount of oil clearance. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Refer to Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale. If the bearing clearance exceeds wear limit specification, replace the bearing.**

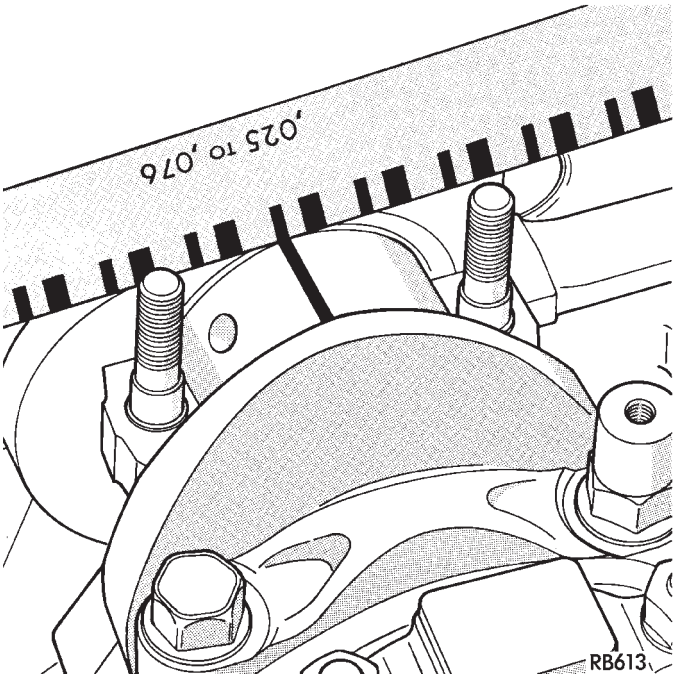

Fig. 50 Measuring Connecting Rod Bearing Clearance

CRANKSHAFT

DESCRIPTION

DESCRIPTION - 3.3L

The nodular iron crankshaft is supported by four main bearings, with number two position the thrust bearing (Fig. 51). Crankshaft end sealing is provided by front and rear rubber seals.

9 - ENGINE BLOCK
10 - MAIN BEARING - UPPER
11 - CRANKSHAFT
12 - MAIN BEARING - LOWER

OPERATION

The crankshaft transfers force generated by combustion within the cylinder to the flywheel or flexplate.

STANDARD PROCEDURE - MEASURING CRANKSHAFT END PLAY

(1) Mount a dial indicator to front of engine with the locating probe on nose of crankshaft (Fig. 53).
(2) Move crankshaft all the way to the rear of its travel.
(3) Zero the dial indicator.
(4) Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

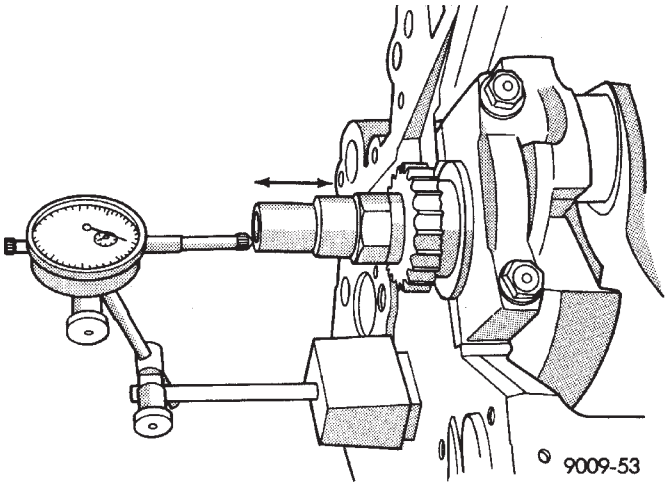

Fig. 53 Checking Crankshaft End Play—Typical

REMOVAL

(1) Remove the engine assembly. (Refer to 9 - ENGINE - REMOVAL)
(2) Separate transaxle from engine.
(3) Mount engine on an engine stand.
(4) Remove the oil filter.
(5) Remove the oil pan and oil pick-up tube. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
(6) Remove the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)
(7) Remove timing chain and sprockets. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
(8) Remove crankshaft rear oil seal and retainer. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL)
(9) Rotate the crankshaft until connecting rod cap is accessible.
(10) Mark connecting rod cap position using a suitable marker/scribe tool.
(11) Remove connecting rod bearing cap. Use care to prevent damage to the crankshaft bearing surfaces.
(12) Repeat removal procedure for each connecting rod cap.

CRANKSHAFT (Continued)

(13) Remove and discard the main bearing cross bolts and washers (3.8L engine only).

NOTE: Install new cross bolt and washer assembly (3.8L engine only) upon reassembly.

(14) Remove the main bearing cap bolts
(15) Remove the main bearing caps.
(16) Remove the crankshaft from engine block.

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring (Fig. 54). Limits of taper or out of round on any crankshaft journals should within specitifications. (Refer to 9 - ENGINE - SPECIFICATIONS) Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

CAUTION: With the nodular cast iron crankshafts, it is important that the final paper or cloth polish be in the same direction as normal rotation in the engine.

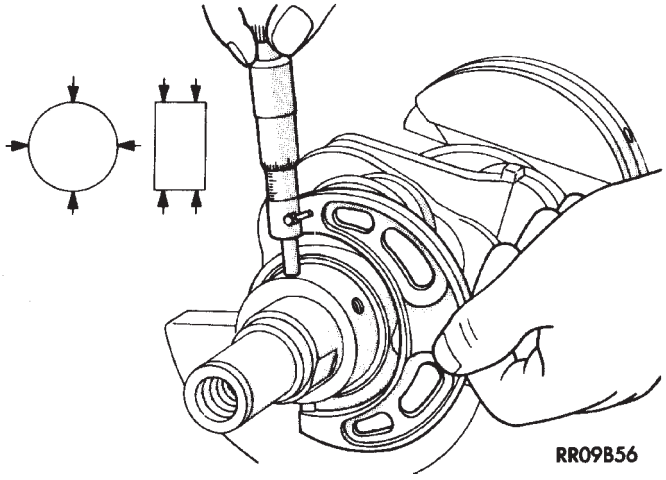

Fig. 54 Crankshaft Journal Measurements

INSTALLATION

(1) Lubricate with engine oil and install the crankshaft main bearing halves in the engine block.
(2) Position the crankshaft in engine block (Fig. 56).
(3) Perform main bearing fitting procedure. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE)
(4) Inspect main cap bolts for stretching (Fig. 55). Replace bolts that are stretched.

NOTE: The main cap bolts should be examined before reuse. Bolt stretch can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced (Fig. 55).

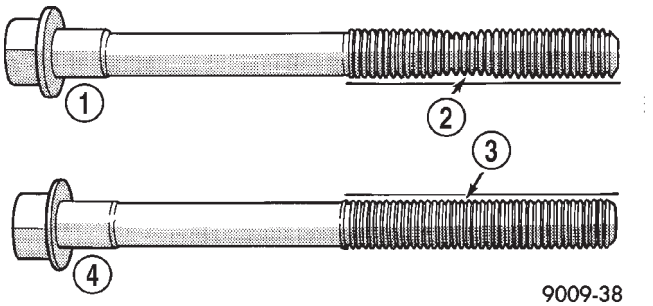

Fig. 55 Check for Stretched (Necked) Bolts

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

(5) Install the main bearing caps and bolts. Tighten bolts to 41 N·m (30 ft. lbs.) plus ¼ turn.

NOTE: Install new cross bolt and washer assembly (3.8L engine only) upon reassembly.

(6) Install and tighten the NEW cross bolts and washer assemblies (3.8L engine only) to 61 N·m (45 ft. lbs.) (Fig. 57).
(7) Position and install the connecting rod and bearing caps on the crankshaft. (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE)
(8) Install the crankshaft rear oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)
(9) Install the crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)
(10) Install the timing chain and camshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE - MAIN BEARING FITTING

Bearing caps are not interchangeable and should be marked at removal to insure correct assembly (Fig. 58). Upper and lower bearing halves are NOT interchangeable. Lower main bearing halves of 1, 3 and 4 are interchangeable. Upper main bearing halves of 1, 3 and 4 are interchangeable.

CRANKSHAFT MAIN BEARINGS (Continued)

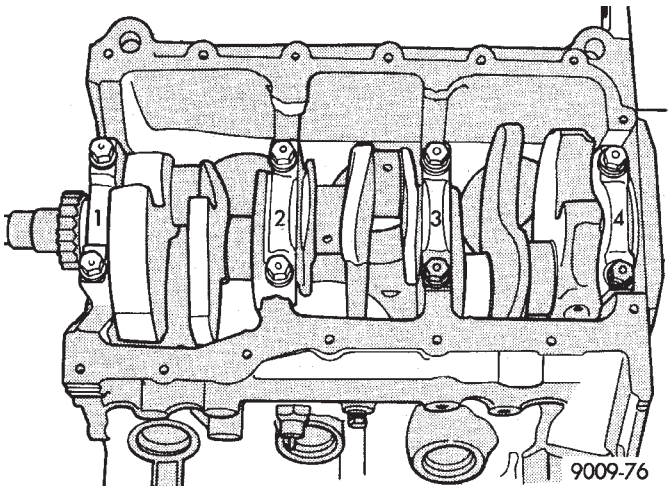

Fig. 58 Main Bearing Cap Identification

Upper and lower number 2 bearing halves are flanged to carry the crankshaft thrust loads and are NOT interchangeable with any other bearing halves in the engine (Fig. 59). All bearing cap bolts removed during service procedures are to be cleaned and lubricated with engine oil before installation. Bearing shells are available in standard and the following undersizes: 0.025 mm (0.001 in.) and 0.254 mm (0.010 in). Never install an undersize bearing that will reduce clearance below specifications.

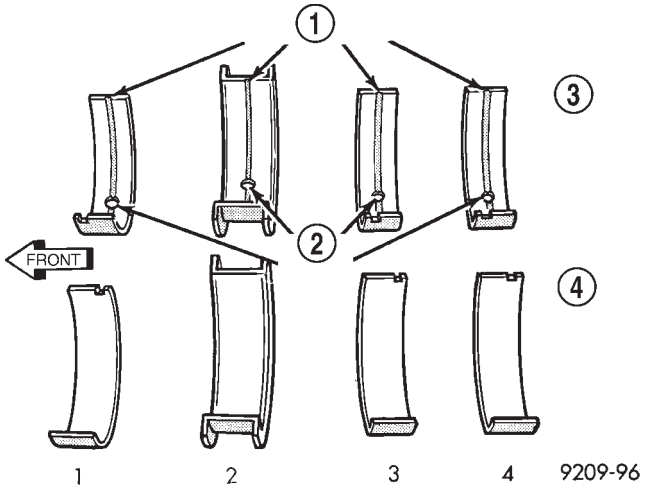

Fig. 59 Main Bearing Identification

1 - OIL GROOVES
2 - OIL HOLES
3 - UPPER BEARINGS
4 - LOWER BEARINGS

CRANKSHAFT BEARING OIL CLEARANCE

Inspect the crankshaft bearing journals. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - INSPECTION)

Engine crankshaft bearing clearances can be determined by use of Plastigage or the equivalent. The following is the recommended procedures for the use of Plastigage with the engine in the vehicle or engine on a repair stand.

PLASTIGAGE METHOD—ENGINE IN-VEHICLE

NOTE: The total clearance of the main bearings can only be determined with the engine in the vehicle by removing the weight of the crankshaft. This can be accomplished by either of two following methods:

(1) Preferred method:

a. Shim the bearings adjacent to the bearing to be checked in order to remove the clearance between upper bearing shell and the crankshaft. This can be accomplished by placing a minimum of 0.254 mm (0.010 in.) shim (e. g. cardboard, matchbook cover, etc.) between the bearing shell and the bearing cap on the adjacent bearings and tightening bolts to 14–20 N·m (10–15 ft. lbs.).

- When checking #1 main bearing shim #2 main bearing.
- When checking #2 main bearing shim #1 & #3 main bearing.
- When checking #3 main bearing shim #2 & #4 main bearing.
- When checking #4 main bearing shim #3 main bearing.

NOTE: Remove all shims before reassembling engine.

(2) Alternative Method:

a. Support the weight of the crankshaft with a jack under the counterweight adjacent to the bearing being checked.

(3) Remove oil film from surface to be checked. Plastigage is soluble in oil.

(4) Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes (Fig. 60). (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap bolts of the bearing being checked to the proper specifications.

(5) Remove the bearing cap and compare the width of the flattened Plastigage (Fig. 61) with the scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. (Refer to 9 - ENGINE - SPECIFICATIONS) **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

CRANKSHAFT MAIN BEARINGS (Continued)

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

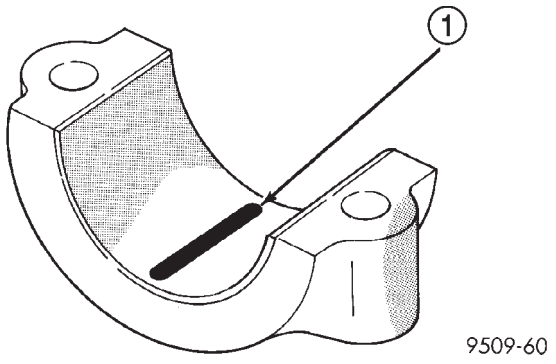

Fig. 60 Plastigage Placed in Lower

1 - PLASTIGAGE

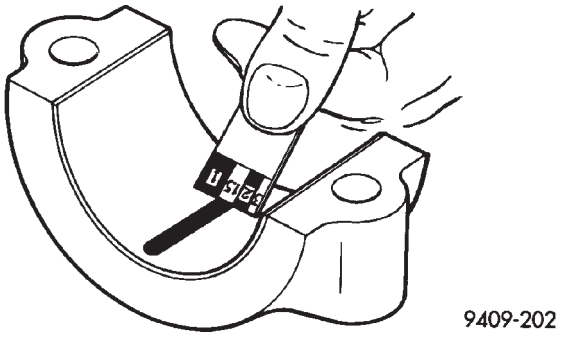

Fig. 61 Clearance Measurement

PLASTIGAGE METHOD—ENGINE OUT-OF-VEHICLE

(1) With engine in the inverted position (crankshaft up) and mounted on a repair stand, remove main journal cap.

(2) Remove oil from journal and bearing shell.

(3) Cut Plastigage to same length as width of the bearing and place it in parallel with the journal axis (Fig. 60).

(4) Carefully install the main bearing cap and tighten the bolts to specified torque.

CAUTION: Do not rotate crankshaft or the Plastigage will be smeared.

(5) Carefully remove the bearing cap and measure the width of the Plastigage at the widest part using the scale on the Plastigage package (Fig. 61). Refer to Engine Specifications for proper clearances (Refer to 9 - ENGINE - SPECIFICATIONS). If the clearance exceeds the specified limits, replace the main bearing(s) with the appropriate size, and if necessary, have the crankshaft machined to next undersize.

REMOVAL - CRANKSHAFT MAIN BEARINGS

(1) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(2) Identify main bearing caps before removal.

(3) Remove bearing caps one at a time. Remove upper half of bearing by inserting Special Main Bearing Tool C-3059 (Fig. 62) into the oil hole of crankshaft.

(4) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

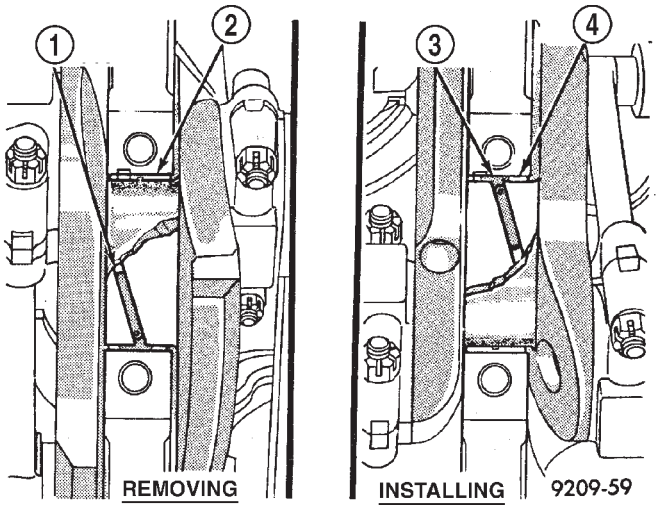

Fig. 62 Upper Main Bearing Removing/Installing With Special Tool C-3059

1 - SPECIAL TOOL C-3059
2 - BEARING
3 - SPECIAL TOOL C-3059
4 - BEARING

INSTALLATION - CRANKSHAFT MAIN BEARINGS

NOTE: One main bearing should be selectively fitted while all other main bearing caps are properly tightened.

(1) For main bearing fitting procedure, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE)

(2) Start bearing in place, and insert Main Bearing Tool C-3059 into oil hole of crankshaft (Fig. 62).

(3) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Special Main Bearing Tool C-3059.

(4) Inspect main cap bolts for stretching (Fig. 63). Replace bolts that are stretched.

CRANKSHAFT MAIN BEARINGS (Continued)

NOTE: The main cap bolts should be examined before reuse. Bolt stretch can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced (Fig. 63).

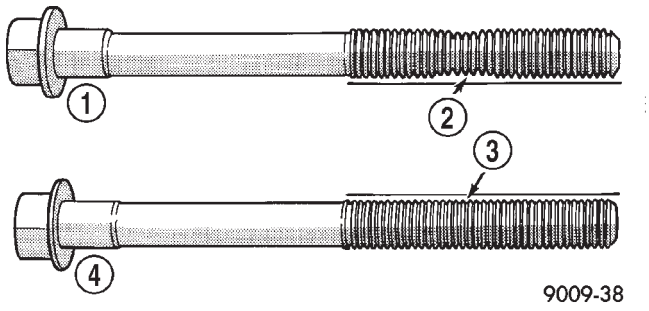

Fig. 63 Check for Stretched (Necked) Bolts

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

(5) Install each main cap and tighten bolts finger tight.

(6) Tighten number 1, 3 and 4 main cap bolts to 41 N·m + 1/4 Turn (30 ft. lbs.+ 1/4 Turn).

(7) Rotate the crankshaft until the number 6 piston is at TDC.

(8) To ensure correct thrust bearing alignment the following procedure must be done:

a. Move crankshaft all the way to the rear of its travel.

b. Then, move crankshaft all the way to the front of its travel.

c. Wedge an appropriate tool between the rear of the cylinder block and rear crankshaft counterweight. This will hold the crankshaft in it's most forward position.

d. Tighten the #2 Thrust Bearing cap bolts to 41 N·m + 1/4 Turn (30 ft. lbs.+ 1/4 Turn). Remove the holding tool.

(9) Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

(10) Fill engine crankcase with proper oil to correct level.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Disconnect negative cable from battery.

(2) Raise vehicle on hoist. Remove right wheel and inner splash shield.

(3) Remove accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(4) Remove crankshaft damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(5) Position Special Tool 6341A on crankshaft nose. Carefully screw the tool into the seal until it engages firmly (Fig. 64). Be careful not to damage that crankshaft seal surface of cover

(6) Remove oil seal by turning the forcing screw until the seal disengages from the cover (Fig. 65).

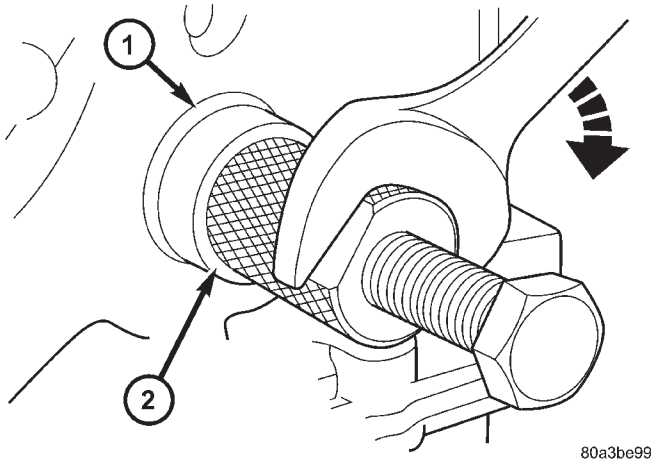

Fig. 64 Engaging Tool into Seal

1 - SEAL
2 - SPECIAL TOOL 6341A

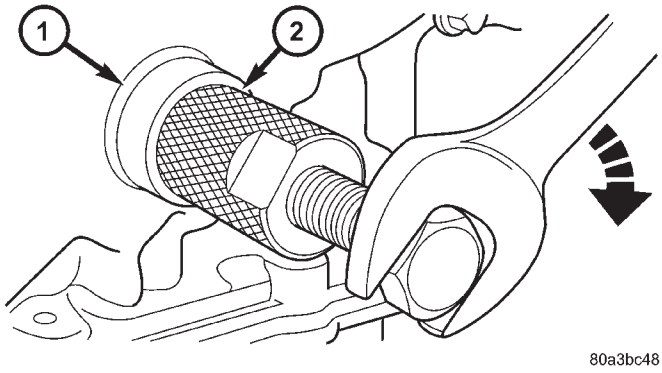

Fig. 65 Crankshaft Front Seal Removal

1 - SEAL
2 - SPECIAL TOOL 6341A

CRANKSHAFT OIL SEAL - FRONT (Continued)

INSTALLATION

(1) Position Special Tool C-4992-2 Guide, on the crankshaft nose (Fig. 66).

(2) Position new seal over the guide with the seal spring in the direction of the engine front cover (Fig. 66).

(3) Install seal using Special Tool C-4992-1 until seal is flush with cover. (Fig. 66).

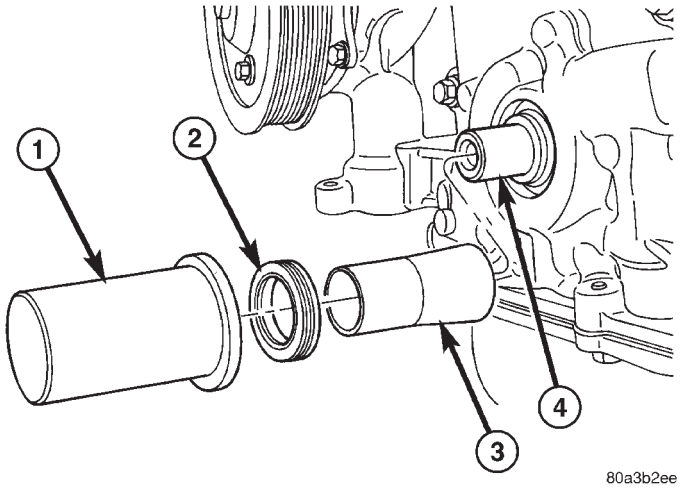

Fig. 66 CRANKSHAFT FRONT SEAL INSTALLATION

1 - SPECIAL TOOL C-4992-1
2 - SEAL
3 - SPECIAL TOOL C-4992-2
4 - CRANKSHAFT

(4) Install crankshaft damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

(5) Install accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(6) Install inner splash shield and right front wheel.

(7) Lower vehicle and connect negative cable to battery.

CRANKSHAFT OIL SEAL - REAR

REMOVAL

(1) Remove the transaxle. Refer to TRANSAXLE AND POWER TRANSFER UNIT for procedure.

(2) Remove the flex plate. (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - REMOVAL)

(3) Insert a 3/16 flat bladed pry tool between the dust lip and the metal case of the crankshaft seal. Angle the pry tool (Fig. 67) through the dust lip against metal case of the seal. Pry out seal.

CAUTION: Do not permit the pry tool blade to contact crankshaft seal surface. Contact of the pry tool blade against crankshaft edge (chamfer) is permitted.

4 - REAR CRANKSHAFT SEAL METAL CASE
5 - PRY IN THIS DIRECTION
6 - CRANKSHAFT
7 - SCREWDRIVER
8 - REAR CRANKSHAFT SEAL DUST LIP
9 - SCREWDRIVER

INSTALLATION

CAUTION: If burr or scratch is present on the crankshaft edge (chamfer), cleanup with 400 grit sand paper to prevent seal damage during installation of new seal.

(1) Place Special Tool 6926-1 magnetic pilot tool on crankshaft (Fig. 68).

(2) Place seal over Special Tool 6926-1 Pilot. Using Special Tool 6926-2 Installer with C-4171 Handle, drive seal into the retainer housing (Fig. 68).

(3) Install the flex plate. (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - INSTALLATION)

(4) Install transaxle. Refer to TRANSAXLE AND POWER TRANSFER UNIT for procedure.

CRANKSHAFT OIL SEAL - REAR (Continued)

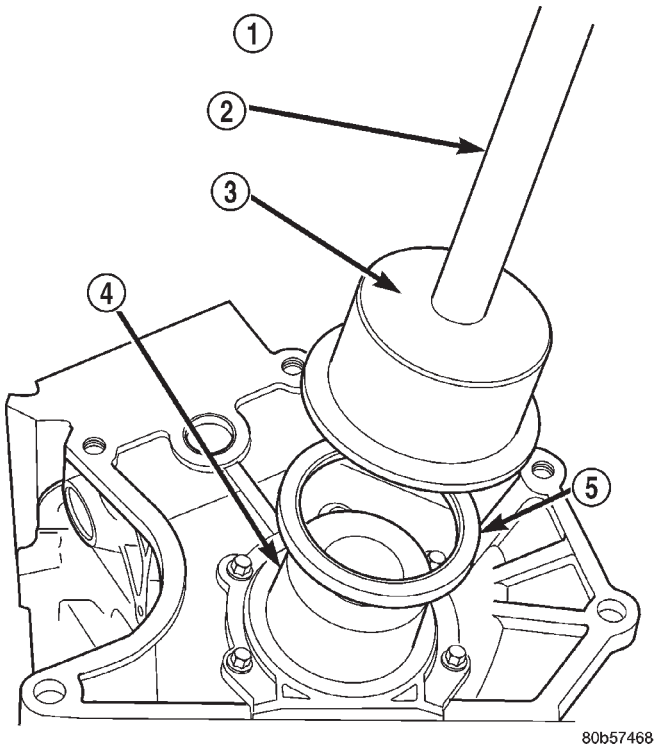

Fig. 68 Rear Crankshaft Oil Seal—Installation

5 - SEAL

CRANKSHAFT REAR OIL SEAL RETAINER

REMOVAL

(1) Remove crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

(2) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) Remove oil seal retainer screws (Fig. 69).

(4) Remove oil seal retainer (Fig. 69).

(5) Clean engine block and retainer of oil and gasket material. Make sure surfaces are clean and free of oil.

INSTALLATION

(1) Position new gasket and install retainer on block (Fig. 69). Tighten attaching screws to 12 N·m (105 in. lbs.).

(2) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(3) Install oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION).

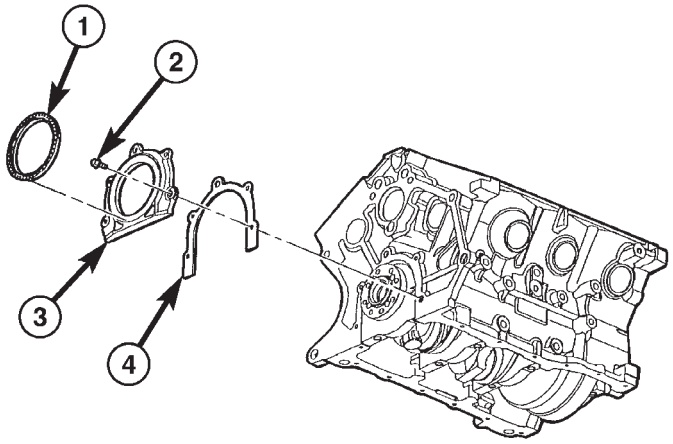

Fig. 69 CRANKSHAFT REAR OIL SEAL

1 - OIL SEAL
2 - BOLT
3 - RETAINER - OIL SEAL
4 - GASKET

FLEX PLATE

REMOVAL

(1) Remove the transaxle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL).

(2) Remove flex plate attaching bolts.

(3) Remove the flex plate (Fig. 70).

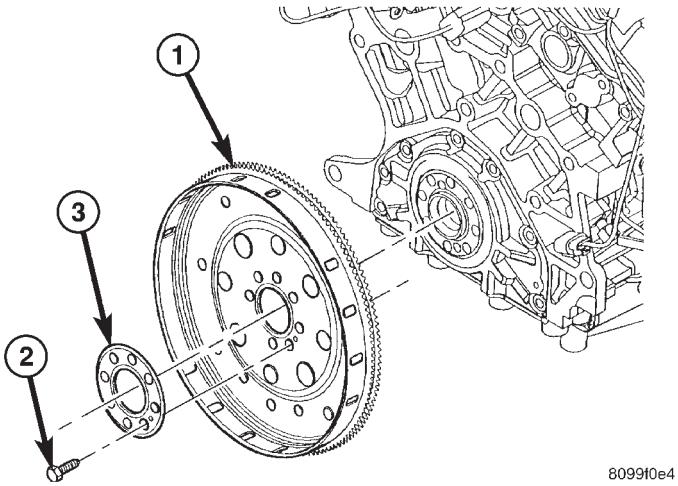

Fig. 70 FLEX PLATE

1 - FLEX PLATE
2 - BOLT (QTY. 8)
3 - BACKING PLATE

INSTALLATION

(1) Position flex plate with backing plate on the crankshaft (Fig. 70).

(2) Apply Mopar® Lock & Seal Adhesive to the flex plate bolts.

FLEX PLATE (Continued)

(3) Install flex plate bolts (Fig. 70). Tighten bolts to 95 N·m (70 ft. lbs.).

(4) Install the transaxle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION).

HYDRAULIC LIFTERS (CAM IN BLOCK)

DESCRIPTION

The hydraulic lifters are a roller type design and are positioned in the cylinder block. The lifters are aligned and retained by a yoke and a retainer (Fig. 71).

Lifter alignment is maintained by machined flats on lifter body. Lifters are fitted in pairs into six aligning yokes. The aligning yokes are secured by a yoke retainer (Fig. 71).

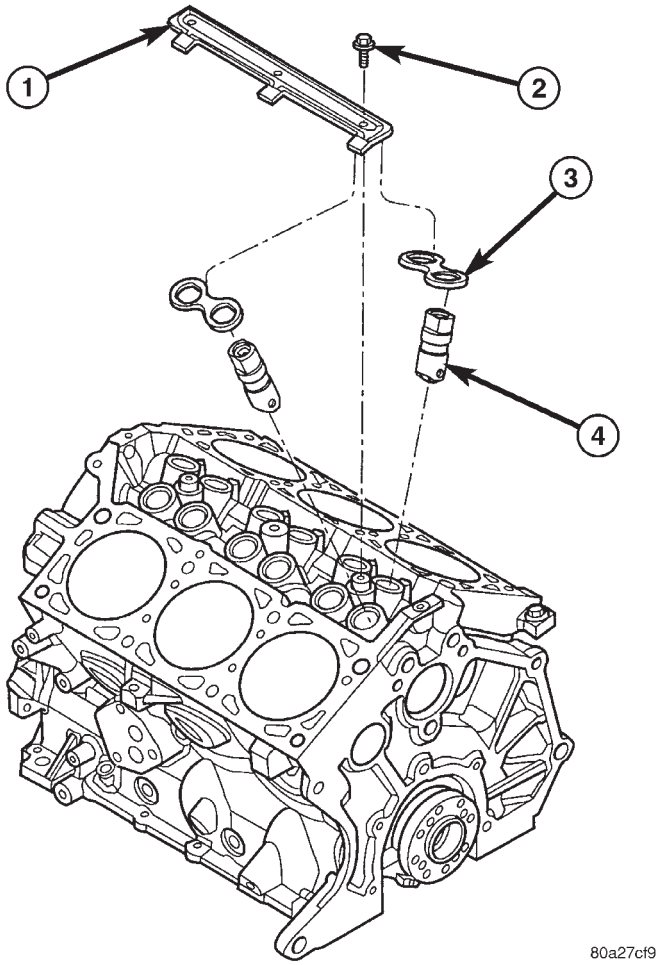

Fig. 71 Hydraulic Lifters

1 - YOKE RETAINER
2 - BOLT - YOKE RETAINER
3 - ALIGNING YOKE
4 - HYDRAULIC LIFTER

DIAGNOSIS AND TESTING - HYDRAULIC LIFTERS

HYDRAULIC LIFTERS DIAGNOSIS - PRELIMINARY STEP

Before disassembling any part of the engine to correct lifter noise, check the engine oil pressure. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING)

Check engine oil level. The oil level in the pan should never be above the MAX mark on dipstick, or below the MIN mark. Either of these two conditions could cause noisy lifters.

OIL LEVEL TOO HIGH

If oil level is above the MAX mark on dipstick, it is possible for the connecting rods to dip into the oil while engine is running and create foaming. Foam in oil pan would be fed to the hydraulic lifters by the oil pump causing them to become soft and allow valves to seat noisily.

OIL LEVEL TOO LOW

Low oil level may allow pump to take in air which when fed to the lifters it causes them to become soft and allows valves to seat noisily. Any leaks on intake side of pump, through which air can be drawn, will create the same lifter noise. Check the lubrication system from the intake strainer to the oil pump cover, including the relief valve retainer cap. When lifter noise is due to aeration, it may be intermittent or constant, and usually more than one lifter will be noisy. When oil level and leaks have been corrected, the engine should be operated at fast idle to allow all of the air inside of the lifters to be bled out.

VALVE TRAIN NOISE

To determine source of valve train noise, operate engine at idle with cylinder head covers removed and listen for source of the noise.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy lifters. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

Valve lifter noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger which will necessitate replacing the lifter, or by the plunger partially sticking in the lifter body cylinder. A heavy click is caused either by a lifter check valve not seating, or by foreign particles becoming wedged between

HYDRAULIC LIFTERS (CAM IN BLOCK) (Continued)

the plunger and the lifter body causing the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, lifter assembly should be removed for inspection.

REMOVAL

(1) Remove the cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)

(2) Remove the yoke retainer and aligning yokes (Fig. 73).

(3) Remove the hydraulic lifters. If necessary use Special Tool C-4129, or equivalent to remove lifters from bores. If lifters are to be reused, identify each lifter to ensure installation in original location.

INSTALLATION

(1) Lubricate the lifters with engine oil.

NOTE: Position the lifter in bore with the lubrication hole facing upward (Fig. 72).

(2) Install the hydraulic lifters with the lubrication hole facing upward towards middle of block (Fig. 72). Install lifters in original positions, if reused.

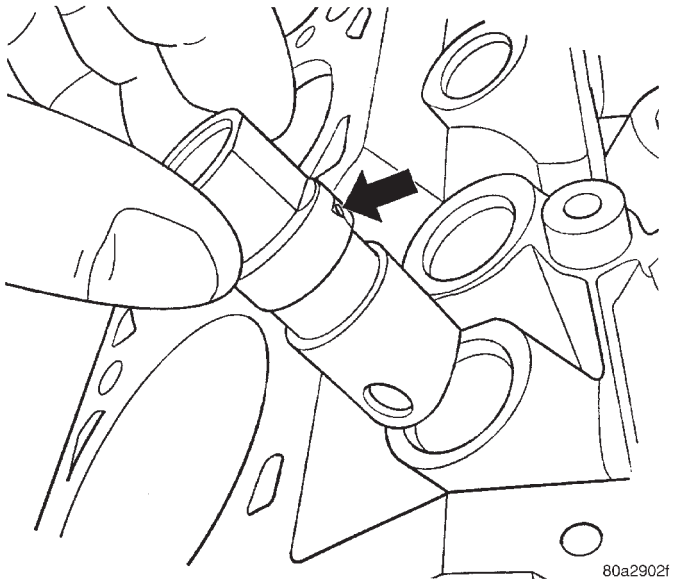

Fig. 72 LIFTER LUBRICATION HOLE

(3) Install lifter aligning yokes (Fig. 73).

(4) Install yoke retainer and torque screws to 12 N·m (105 in. lbs.) (Fig. 73).

(5) Install the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)

(6) Start and operate engine. Warm up to normal operating temperature.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic lifters have filled with oil and have become quiet.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons are made of cast aluminum alloy and are a strutless, short skirt design. The piston rings consist of two compression rings and a three piece oil ring. Piston pins connect the piston to the forged steel connecting rods. The piston pins are a press fit into the connecting rod.

OPERATION

The piston and connecting rod is the link between the combustion force to the crankshaft.

PISTON & CONNECTING ROD (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURE - FITTING CONNECTING RODS

The bearing caps are not interchangeable or reversible, and should be marked at removal to ensure correct reassembly. The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Install cap with the tangs on the same side as the rod. For connecting rod bearing fitting (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE). Fit all connecting rods on one bank until complete.

NOTE: The connecting rod cap bolts should be examined before reuse. Bolt stretch can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced (Fig. 74).

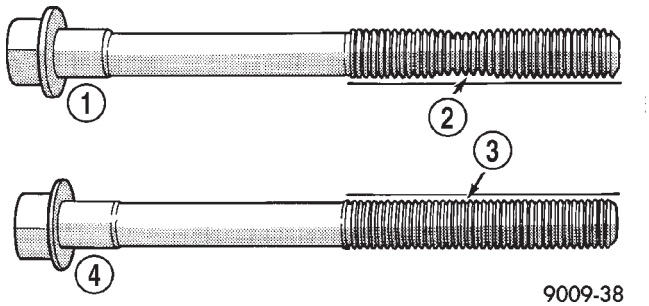

Fig. 74 Check for Stretched (Necked) Bolts

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

(1) Before installing the nuts the threads should be oiled with engine oil.

(2) Install nuts finger tight on each bolt then alternately torque each nut to assemble the cap properly.

(3) Tighten the nuts to 54 N·m PLUS 1/4 turn (40 ft. lbs. PLUS 1/4 turn).

(4) Using a feeler gauge, check connecting rod side clearance (Fig. 75). Refer to Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

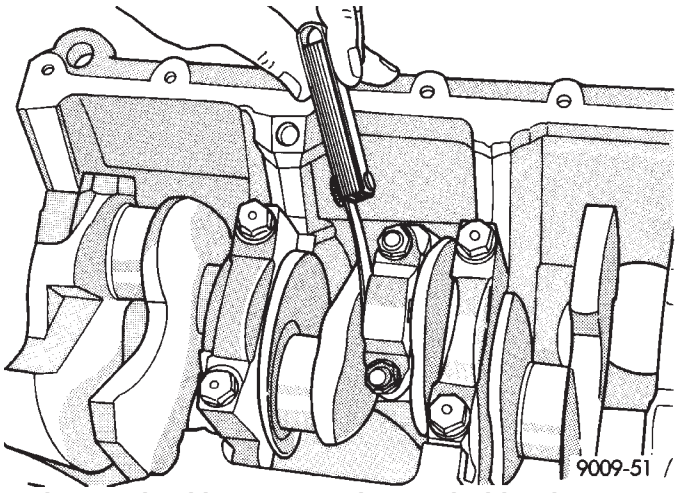

Fig. 75 Checking Connecting Rod Side Clearance

STANDARD PROCEDURE - FITTING PISTONS

The piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin at size location shown in (Fig. 76). Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line shown in (Fig. 77). Refer to Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).**

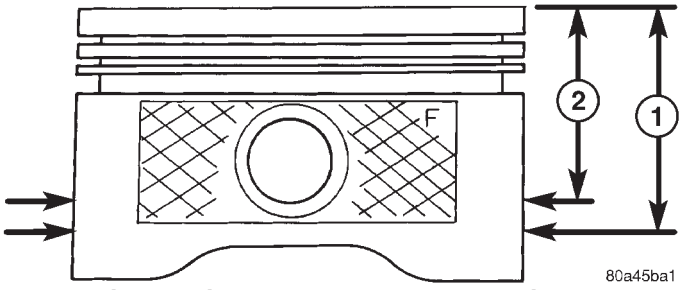

Fig. 76 Piston Measurement Locations

1 - 39.8 mm (1.56 in.) 3.3L ENGINE
2 - 33.0 mm (1.29 in.) 3.8L ENGINE

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)

(3) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(4) Remove the top ridge of cylinder bores with a reliable ridge reamer, if necessary, before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation. Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so that each connecting rod is centered in cylinder bore.**

PISTON & CONNECTING ROD (Continued)

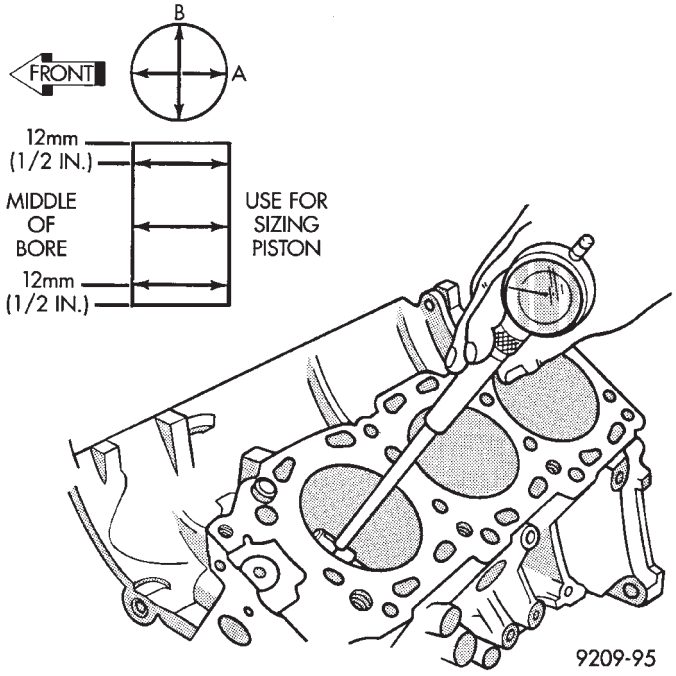

Fig. 77 Checking Cylinder Bore Size

(5) Inspect connecting rods and connecting rod caps for cylinder identification. Identify them, if necessary (Fig. 78).

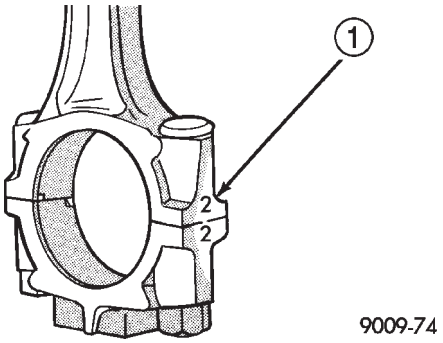

Fig. 78 Identify Connecting Rod to Cylinder

1 - CYLINDER NUMBER

(6) Remove connecting rod cap. Install connecting rod bolt protectors on connecting rod bolts (Fig. 79).

(7) Remove each piston and connecting rod assembly out of the cylinder bore.

NOTE: Be careful not to nick crankshaft journals.

(8) After removal, install bearing cap on the mating rod.

INSTALLATION

(1) Before installing pistons and connecting rod assemblies into the bore, ensure that compression ring gaps are staggered so that neither is in line with oil ring rail gap (Fig. 80).

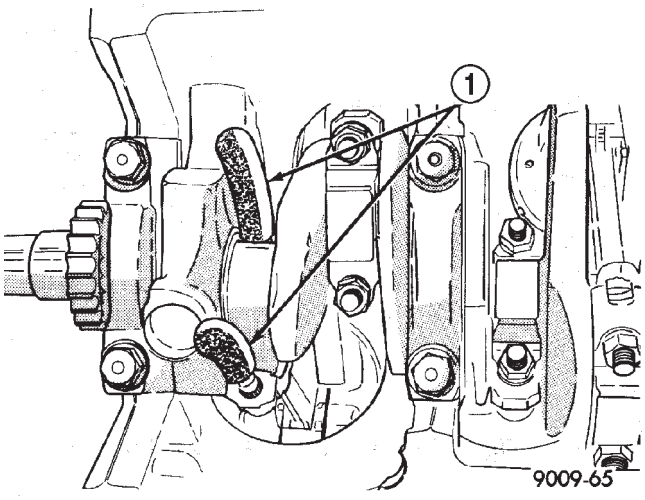

Fig. 79 Connecting Rod Protectors

1 - COVER ROD BOLTS WITH A SUITABLE COVERING WHEN REMOVING OR INSTALLING PISTON ASSEMBLY

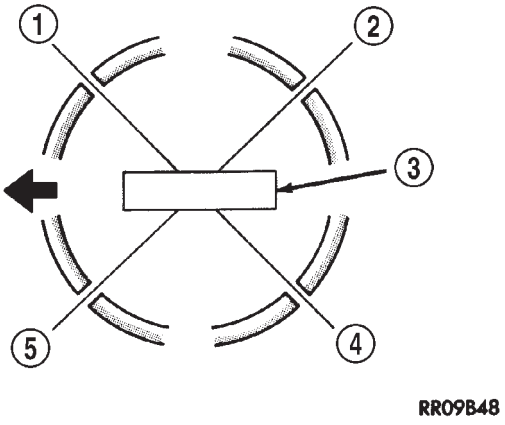

Fig. 80 Piston Ring End Gap Position

1 - SIDE RAIL UPPER
2 - NO. 1 RING GAP
3 - PISTON PIN
4 - SIDE RAIL LOWER
5 - NO. 2 RING GAP AND SPACER EXPANDER GAP

(2) Before installing the ring compressor, ensure the oil ring expander ends are butted and the rail gaps located as shown in (Fig. 80).

(3) Lubricate the piston and rings with clean engine oil. Position a ring compressor over the piston and rings, and tighten the compressor (Fig. 81). **Be sure position of rings does not change during this operation.**

(4) Position upper bearing onto connecting rod. Lubricate bearing with oil.

(5) Install connecting rod bolt protectors (rubber hose or equivalent) on the connecting rod bolts (Fig. 81).

PISTON & CONNECTING ROD (Continued)

(6) The pistons are marked with a “F” located near the piston pin. Install piston with this mark positioned to front of engine on both cylinder banks. The connecting rod oil squirt hole faces the major thrust (right) side of the engine block (Fig. 82).

(7) Rotate crankshaft until the connecting rod journal is located in the center of the cylinder bore. Insert connecting rod and piston into cylinder bore. Carefully guide connecting rod over the crankshaft journal (Fig. 81).

(8) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

(9) Install lower bearing shell and connecting rod cap (Fig. 81). Install nuts on cleaned and oiled rod bolts and tighten to 54 N·m (40 ft. lbs.) PLUS ¼ turn.

(10) Repeat procedure for each piston and connecting rod installation.

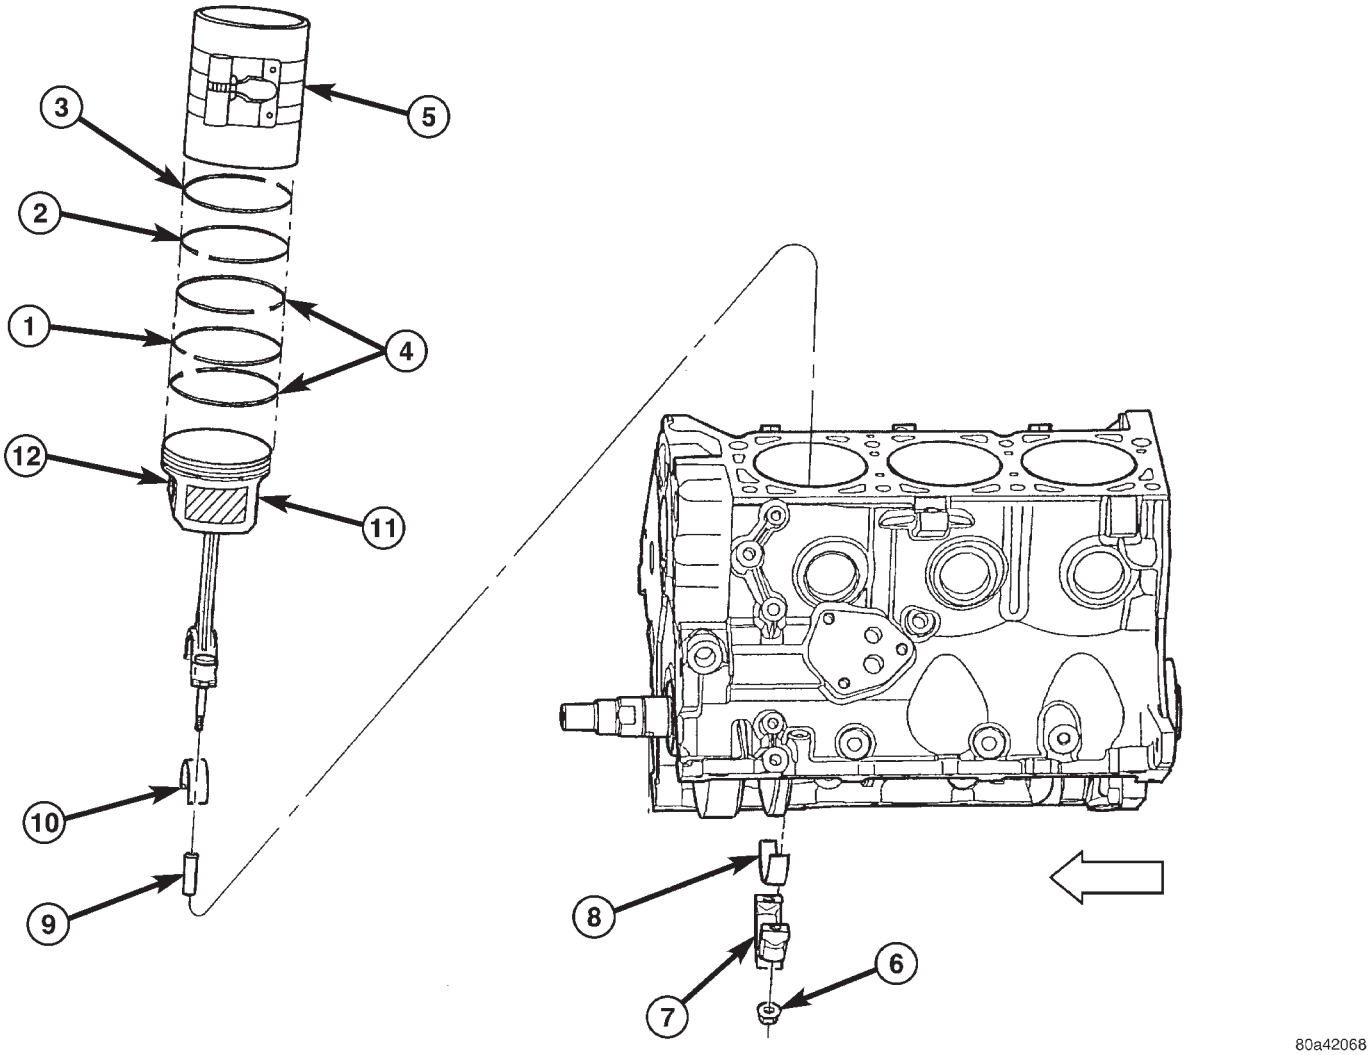

Fig. 81 PISTON AND CONNECTING ROD INSTALLATION

(11) Install the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)

(12) Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

(13) Fill engine crankcase with proper oil to correct level.

(14) Connect negative cable to battery.

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

(1) Wipe cylinder bore clean. Insert the ring and push down with piston to ensure squareness in bore to approximately 12 mm (0.50 in.) from top of cylinder bore. Check ring gap with a feeler gauge (Fig. 83). For clearance specification (Refer to 9 - ENGINE - SPECIFICATIONS).

(2) Check piston ring to groove side clearance (Fig. 84). For clearance specification (Refer to 9 - ENGINE - SPECIFICATIONS)

PISTON RINGS (Continued)

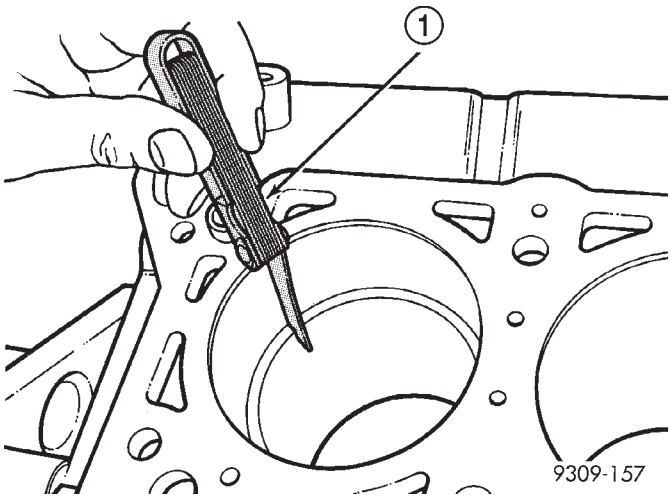

Fig. 83 Piston Ring Gap

1 - FEELER GAUGE

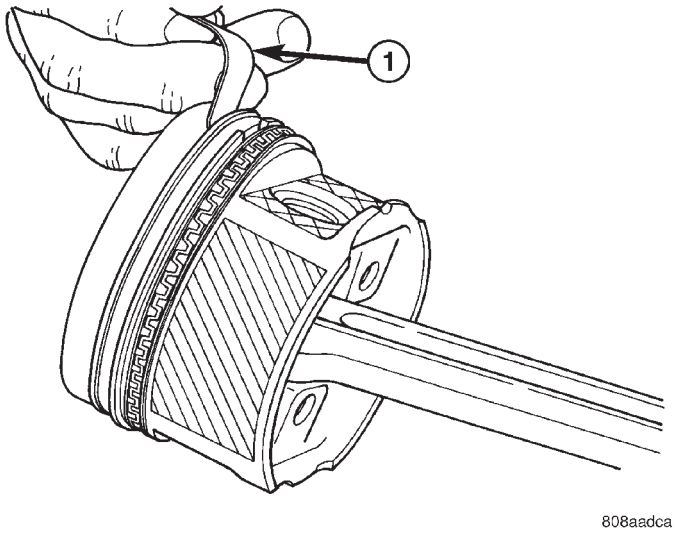

Fig. 84 Piston Ring Side Clearance

1 - FEELER GAUGE

REMOVAL

(1) Remove piston and connecting rod. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - REMOVAL)

(2) Remove No. 1 and No.2 piston rings from piston using a ring expander tool (Fig. 87).

(3) Remove upper oil ring side rail (Fig. 86).

(4) Remove lower oil ring side rail (Fig. 86).

(5) Remove oil ring expander (Fig. 86).

INSTALLATION

(1) Install rings with manufacturers I.D. mark (if present) facing up, to the top of the piston (Fig. 85).

CAUTION: Install piston rings in the following order:

a. Oil ring expander.
b. Upper oil ring side rail.
c. Lower oil ring side rail.
d. No. 2 Intermediate piston ring.
e. No. 1 Upper piston ring.

4 - OIL RING
5 - SPACER EXPANDER

(2) Install the side rail by placing one end between the piston ring groove and the expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander** (Fig. 86).

(3) Install upper side rail first and then the lower side rail.

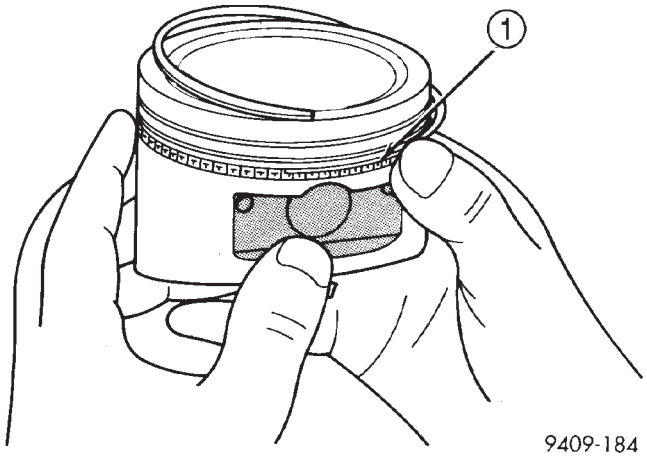

Fig. 86 Oil Ring Side Rail

1 - SIDE RAIL END

PISTON RINGS (Continued)

(4) Install No. 2 piston ring and then No. 1 piston ring (Fig. 87).

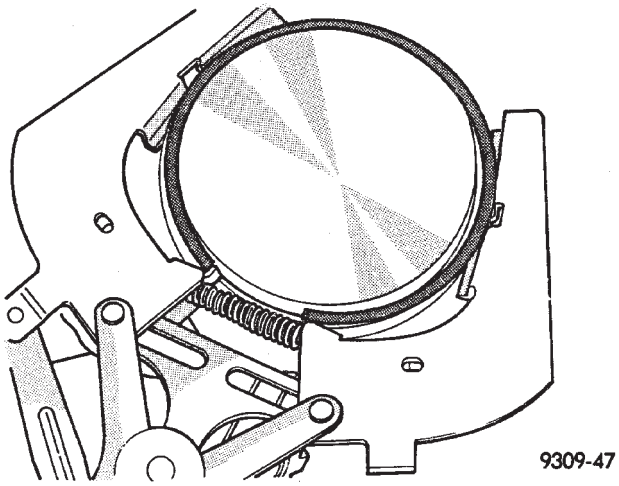

Fig. 87 Piston Ring Installation

(5) Position piston ring end gaps as shown in (Fig. 88).

(6) Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

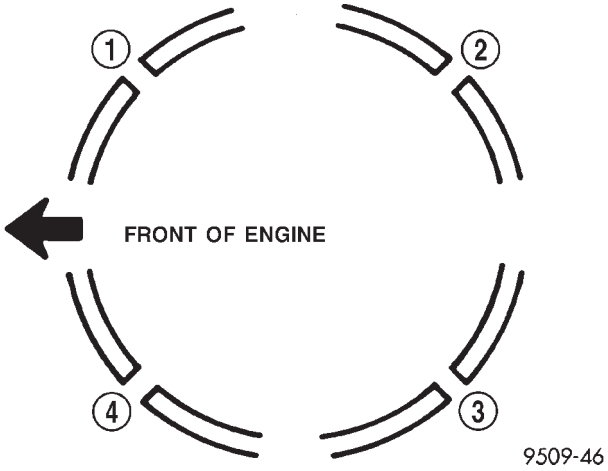

Fig. 88 Piston Ring End Gap Position

1 - GAP OF LOWER SIDE RAIL
2 - NO. 1 RING GAP
3 - GAP OF UPPER SIDE RAIL
4 - NO. 2 RING GAP AND SPACER EXPANDER GAP

VIBRATION DAMPER

REMOVAL

(1) Disconnect negative cable from battery.

(2) Raise vehicle on hoist.

(3) Remove the right front wheel and inner splash shield.

(4) Remove the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(5) Remove vibration damper bolt.

(6) Insert Special Tool 8450 into crankshaft nose (Fig. 89).

(7) Position 3-jaw puller Special Tool 1026 on damper as shown in (Fig. 89). Turn puller forcing screw until damper releases from crankshaft.

(8) Remove the crankshaft vibration damper.

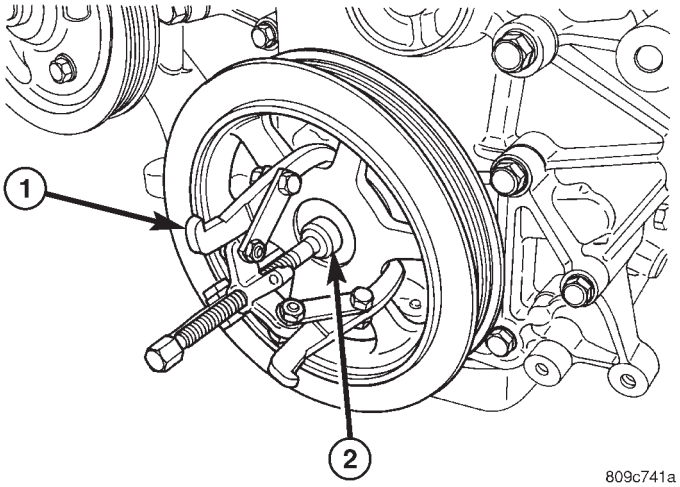

Fig. 89 Vibration Damper - Removal

1 - SPECIAL TOOL 8450 - INSERT
2 - SPECIAL TOOL 1026 - 3 JAW PULLER

INSTALLATION

(1) Install crankshaft vibration damper using the forcing screw, nut, and thrust bearing/washer from Special Tool 8452 (Fig. 90).

NOTE: To minimize friction and prolong tool life, lubricate the threads on the forcing screw of Special Tool 8452.

(2) Position vibration damper on crankshaft.

(3) Screw Special Tool 8452 into crankshaft until the bolt seats. Turn the nut to install damper until it seats fully.

(4) Remove Special Tool 8452.

(5) Install vibration damper bolt. Torque bolt to 54 N·m (40 ft. lbs.).

VIBRATION DAMPER (Continued)

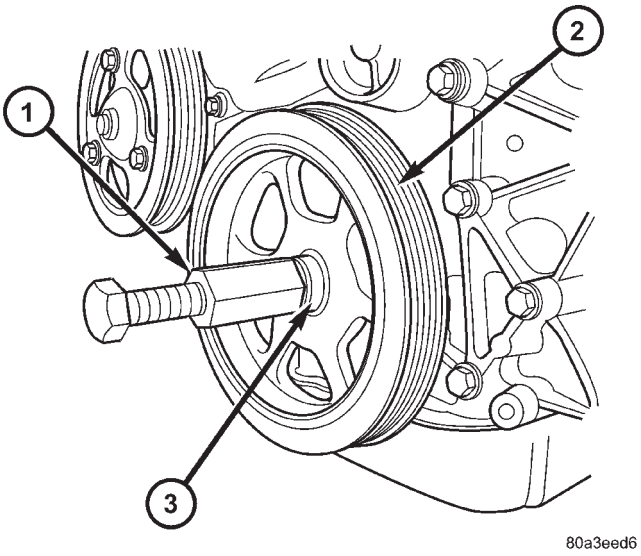

Fig. 90 Vibration Damper - Installation

1 - FORCING SCREW / NUT FROM SPECIAL TOOL 8452
2 - VIBRATION DAMPER
3 - THRUST BEARING / WASHER

(6) Install the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(7) Install inner splash shield and right front wheel.

(8) Connect negative cable to battery.

ENGINE MOUNTING

DESCRIPTION

The engine mounting system consist of four mounts; right and a left side support the powertrain, and a front and a rear mount control powertrain torque. The right side mount is a hydro-type (Fig. 91), all others are of molded rubber material.

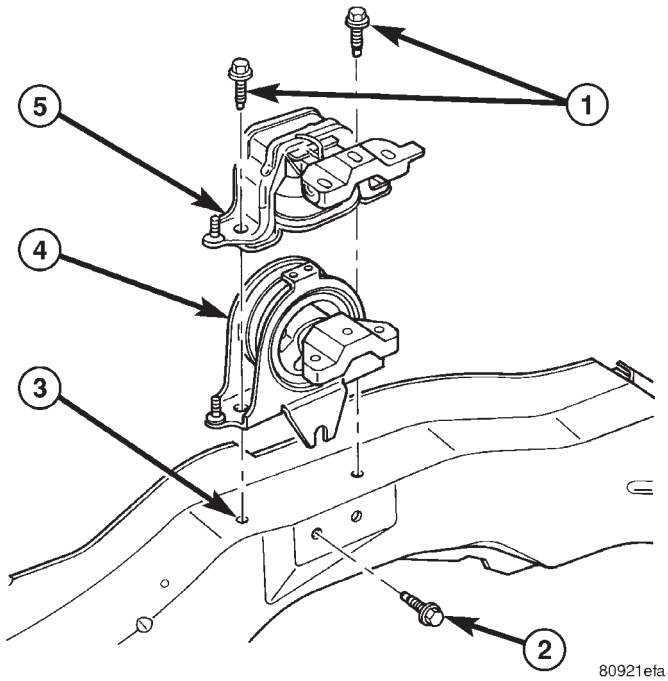

Fig. 91 Engine Hydro-type Mount - Right Side

1 - BOLT
2 - BOLT
3 - FRAME RAIL
4 - RIGHT MOUNT - 2.4L ENGINE
5 - RIGHT MOUNT - 3.3/3.8L ENGINE

FRONT MOUNT

REMOVAL

(1) Support the engine and transmission assembly with a floor jack so it will not rotate.

(2) Remove the front engine mount through bolt from the insulator and front crossmember mounting bracket (Fig. 92).

(3) Remove six screws from air dam to allow access to the front mount screws.

(4) Remove the front engine mount screws and remove the insulator assembly (Fig. 92).

(5) Remove the front mounting bracket, if necessary (Fig. 92).

INSTALLATION

(1) Install the front mounting bracket, if removed (Fig. 92).

(2) Install the front engine mount through bolt from the insulator and front crossmember mounting bracket (Fig. 92).

(3) Install the insulator assembly and mounting screws (Fig. 92).

FRONT MOUNT (Continued)

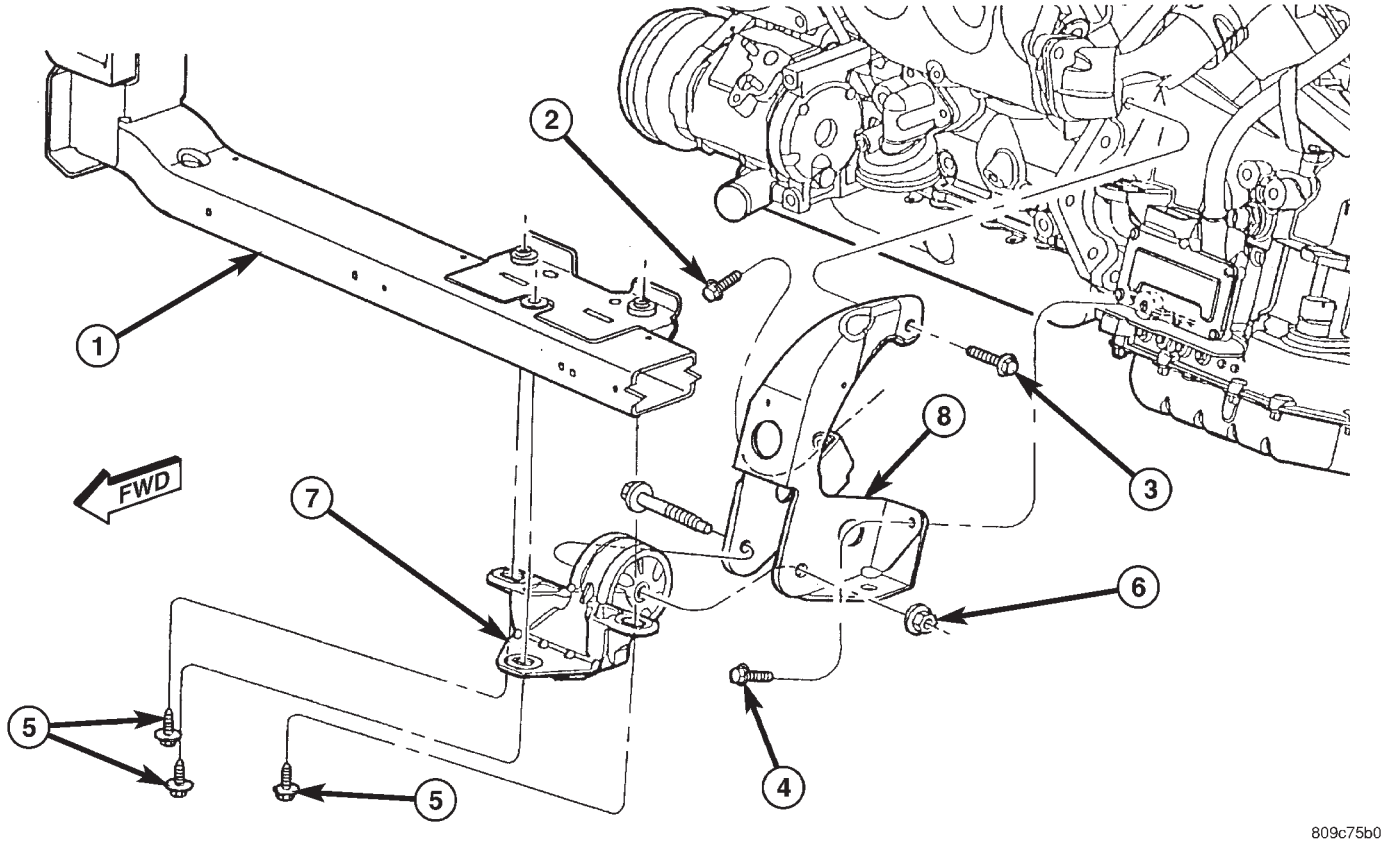

Fig. 92 Engine Mounting - Front

1 - CROSSMEMBER	5 - BOLT 54 N·m (40 ft. lbs.)
2 - BOLT - 68 N·m (50 ft. lbs.)	6 - NUT - 68 N·m (50 ft. lbs.)
3 - BOLT - 102 N·m (75 ft. lbs.)	7 - MOUNT - ENGINE FRONT
4 - BOLT - 68 N·m (50 ft. lbs.)	8 - BRACKET - ENGINE FRONT MOUNT

LEFT MOUNT

REMOVAL

(1) Raise the vehicle on hoist.
(2) Remove the left front wheel.
(3) Remove the left mount through bolt access cover.
(4) Support the transaxle with a suitable jack.
(5) Remove the engine front mount through bolt to allow left mount removal clearance (Fig. 92).
(6) Remove the left mount through frame rail bolt (Fig. 93).
(7) Lower transaxle for access to horizontal bolts.
(8) Remove the horizontal bolts from the mount to the transaxle (Fig. 94) or (Fig. 95).

NOTE: To remove mount, additional lowering of transaxle may be required.

(9) Remove left mount.

INSTALLATION

(1) Install left mount on transaxle (Fig. 94) or (Fig. 95).
(2) Raise transaxle with jack until left mount is in position.
(3) Install left mount through bolt (Fig. 93).
(4) Install left mount through bolt access cover.
(5) Install front mount through bolt (Fig. 92).
(6) Install left front wheel.
(7) Lower vehicle.

LEFT MOUNT (Continued)

2 - BRACKET - REAR MOUNT
3 - BOLT - HORIZONTAL 102 N·m (75 ft. lbs.)

RIGHT MOUNT

REMOVAL

(1) Remove air cleaner housing lid and clean air hose from throttle body.
(2) Remove air cleaner element and housing.
(3) Disconnect make-up air hose from cylinder head cover.
(4) Remove the load on the right engine mount by carefully supporting the engine assembly with a floor jack.
(5) Disconnect electrical harness support clips from engine mount bracket.
(6) Remove the bolts attaching the engine mount to the frame rail (Fig. 99).
(7) Remove the three bolts attaching the engine mount to the engine bracket (Fig. 99).
(8) Remove the right engine mount (Fig. 99).

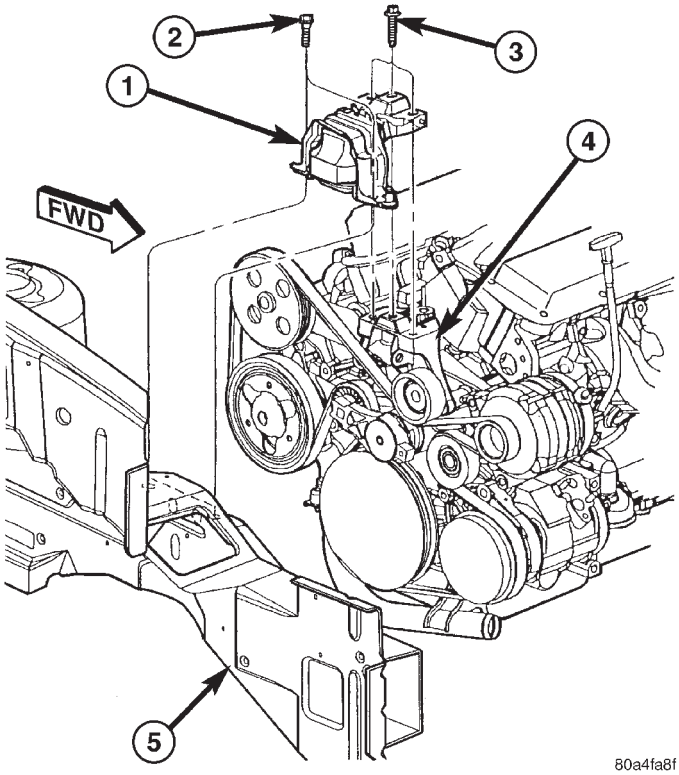

Fig. 99 Right Engine Mount

1 - RIGHT ENGINE MOUNT
2 - BOLT - MOUNT TO FRAME RAIL
3 - BOLT - MOUNT TO ENGINE
4 - ENGINE MOUNT BRACKET
5 - RIGHT FRAME RAIL

INSTALLATION

(1) Install engine bracket (if removed). Tighten bolts to 33 N·m (24 ft. lbs.).
(2) Position right engine mount and install frame rail to mount bolts (Fig. 99). Tighten bolts to 68 N·m (50 ft. lbs.).
(3) Install the mount to engine bracket bolts and tighten to 54 N·m (40 ft. lbs.). (Fig. 99)
(4) Connect electrical harness support clips to engine mount bracket.
(5) Remove jack from under engine.
(6) Connect make-up air hose to cylinder head cover.
(7) Install air cleaner housing and element.
(8) Install air cleaner housing lid and clean air tube to throttle body.

LUBRICATION

DESCRIPTION

The lubrication system is a full flow filtration pressure feed type. The oil pump is mounted in the timing chain cover and is driven by the crankshaft

OPERATION

Oil from the oil pan is pumped by a internal gear type oil pump directly coupled to the crankshaft. The pressure is regulated by a relief valve located in the timing chain cover. The oil is pumped through an oil filter and feeds a main oil gallery. This oil gallery feeds oil under pressure to the main and rod bearings, camshaft bearings. Passages in the cylinder block feed oil to the hydraulic lifters and rocker shaft brackets which feeds the rocker arm pivots (Fig. 100).

DIAGNOSIS AND TESTING - ENGINE OIL PRESSURE

(1) Disconnect and remove oil pressure switch (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL).
(2) Install Special Tools C-3292 Gauge with 8406 Adaptor. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
(3) Start engine and record oil pressure. Refer to Oil Pressure in Engine Specifications for the correct pressure (Refer to 9 - ENGINE - SPECIFICATIONS).

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Open hood, remove oil fill cap.

(3) Hoist and support vehicle on safety stands. Refer to Hoisting and Jacking Recommendations. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Place a suitable drain pan under crankcase drain (Fig. 101).

(5) Remove drain plug from crankcase (Fig. 101) and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.

(6) Remove oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL)

(7) Install and tighten drain plug in crankcase.

(8) Install new oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION)

OIL (Continued)

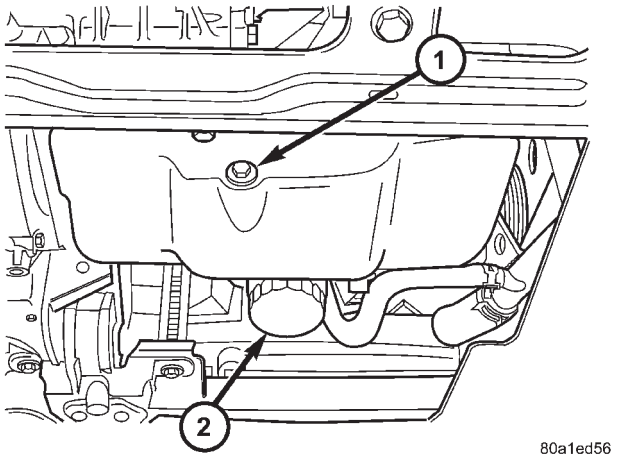

Fig. 101 Engine Oil Drain Plug and Oil Filter

1 - DRAIN PLUG
2 - OIL FILTER

(9) Lower vehicle and fill crankcase with specified type and amount of engine oil. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION)
(10) Install oil fill cap.
(11) Start engine and inspect for leaks.
(12) Stop engine and inspect oil level.

NOTE: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

STANDARD PROCEDURE - ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after it has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading (Fig. 102). Add only when the level is at or below the ADD mark.

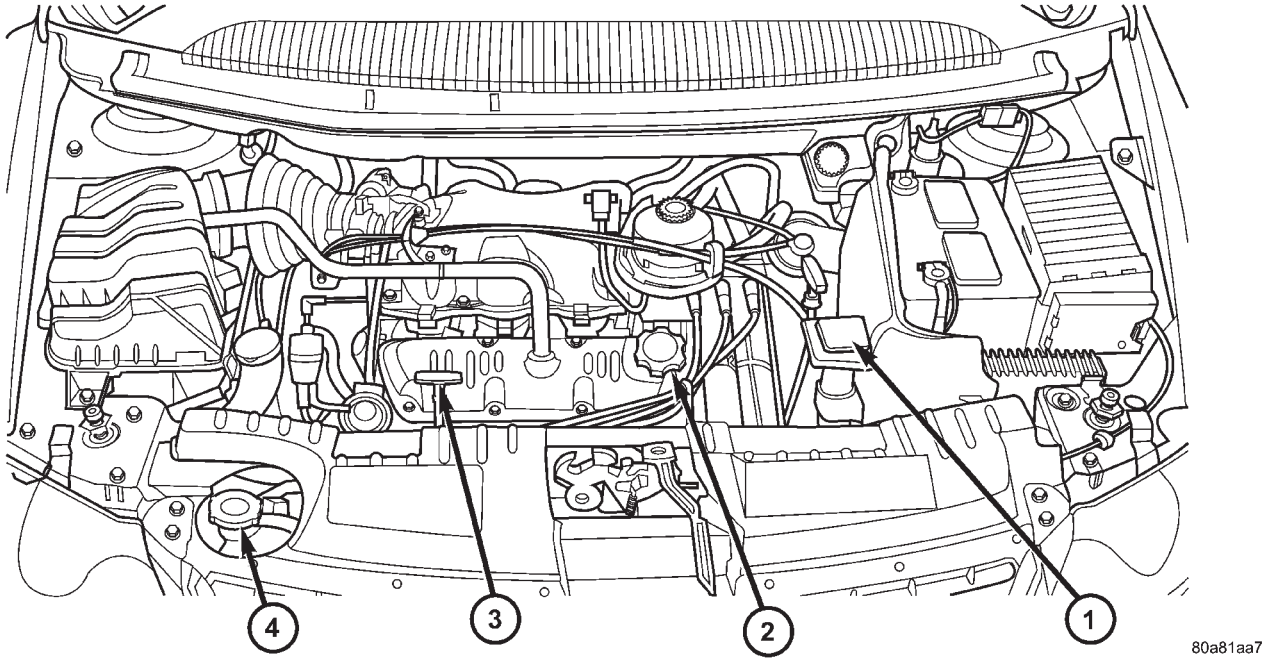

Fig. 102 Engine Oil Level Dipstick and Fill Locations

4 - RADIATOR PRESSURE CAP

OIL COOLER & LINES

DESCRIPTION

An engine oil cooler is used on 3.3/3.8L engines (Heavy Duty Cooling Only) (Fig. 104). The cooler is a coolant-to-oil type and mounted between the oil filter and engine block.

OPERATION

Engine oil travels from the oil filter and into the oil cooler. Engine oil then exits the cooler into the main gallery. Engine coolant flows into the cooler from the heater return tube and exits into the water pump inlet.

REMOVAL

(1) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAINING).

(2) Disconnect oil cooler inlet and outlet hoses (Fig. 103).

(3) Remove oil filter.

(4) Remove oil cooler attachment fitting (Fig. 104).

(5) Remove oil cooler.

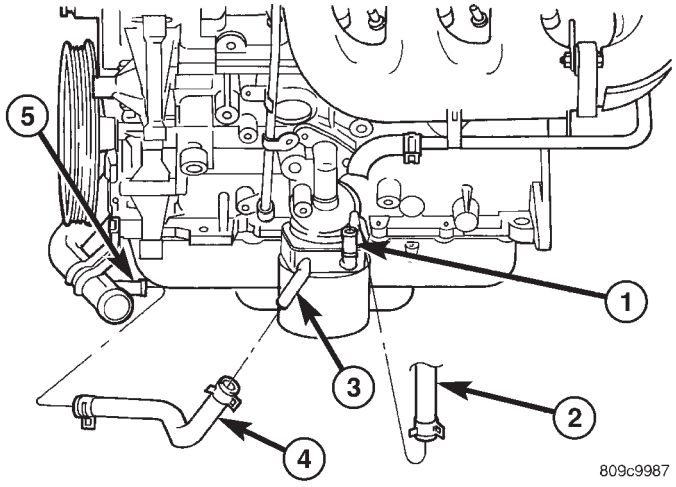

Fig. 103 Engine Oil Cooler Hoses

1 - OIL COOLER INLET TUBE
2 - INLET HOSE
3 - OIL COOLER OUTLET TUBE
4 - OUTLET HOSE
5 - WATER PUMP INLET TUBE

INSTALLATION

(1) Lubricate seal and position oil cooler to connector fitting on oil filter adapter (Fig. 104).

NOTE: Position the flat side of oil cooler parallel to oil pan rail.

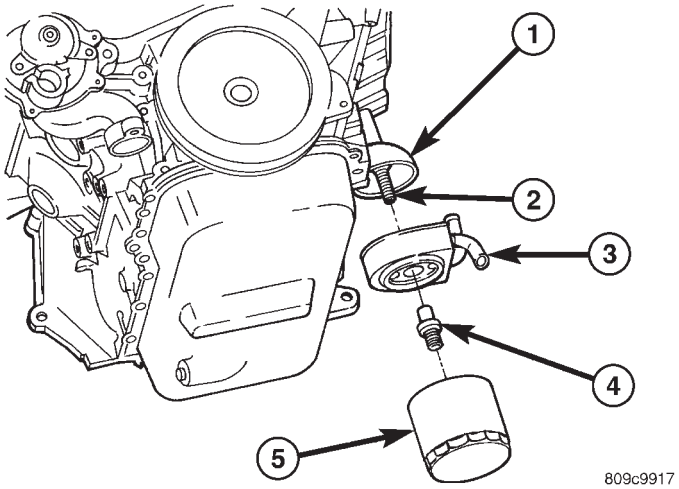

Fig. 104 Engine Oil Cooler - 3.3/3.8L (Heavy Duty Cooling)

1 - OIL FILTER ADAPTER
2 - CONNECTOR
3 - ENGINE OIL COOLER
4 - OIL COOLER ATTACHMENT FITTING
5 - OIL FILTER

(2) Install oil cooler attachment fitting and tighten to 27 N·m (20 ft. lbs.) (Fig. 104).

(3) Install oil filter.

(4) Connect oil cooler inlet and outlet hoses (Fig. 103).

(5) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM FILLING).

OIL FILTER

REMOVAL

CAUTION: When servicing the oil filter avoid deforming the filter can by installing the remove/install tool band strap against the can-to-base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

(1) Using suitable oil filter wrench, turn filter counterclockwise to remove from oil filter adapter (Fig. 105). Properly discard used oil filter.

INSTALLATION

(1) Wipe oil filter adapter base clean and inspect gasket contact surface.

(2) Lubricate gasket of new filter with clean engine oil.

(3) Install new filter until gasket contacts base (Fig. 105). Tighten filter 1 turn or 20 N·m (15 ft. lbs.). Use filter wrench if necessary.

(4) Start engine and check for leaks.

OIL FILTER ADAPTER

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove the oil filter.
(3) Disconnect oil pressure switch electrical connector.
(4) Remove oil filter adapter attaching bolts (Fig. 105).
(5) Remove oil filter adapter and seal (Fig. 105).

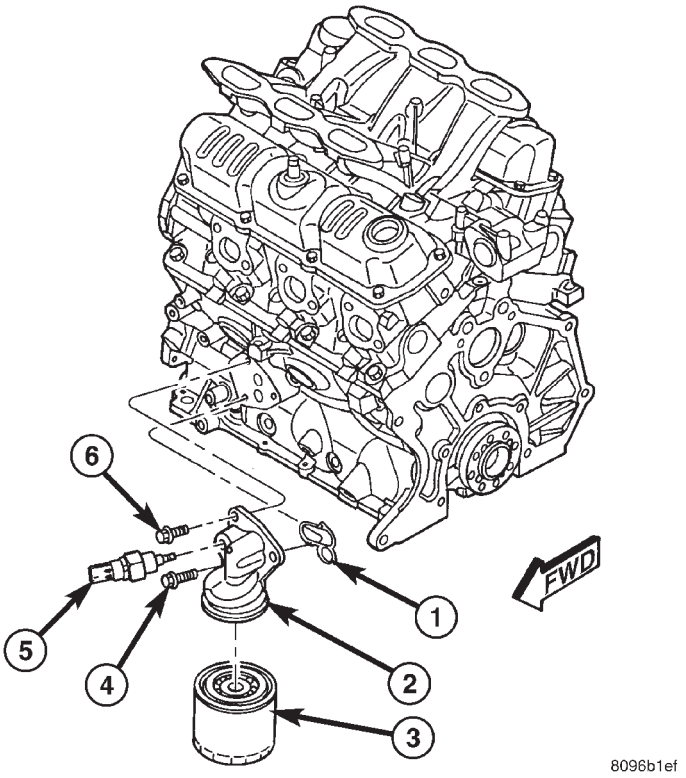

Fig. 105 OIL FILTER ADAPTER

1 - SEAL
2 - OIL FILTER ADAPTER
3 - OIL FILTER
4 - BOLT
5 - OIL PRESSURE SWITCH
6 - BOLT

INSTALLATION

(1) Clean oil filter adapter and install new seal.
(2) Position adapter on engine block and install bolts (Fig. 105).
(3) Tighten adapter bolts to 28 N·m (250 in. lbs.).
(4) Connect oil pressure switch electrical connector (Fig. 105).
(5) Install the oil filter.
(6) Lower vehicle on hoist.
(7) Start engine and allow to run approximately 2 minutes.
(8) Turn off engine and check oil level. Adjust oil level as necessary.

OIL PAN

REMOVAL

(1) Disconnect negative cable from battery and remove engine oil dipstick.
(2) Raise vehicle on hoist and drain engine oil.
(3) Remove drive belt splash shield.
(4) Remove strut to transaxle attaching bolt (Fig. 106). Loosen strut to engine block attaching bolts.
(5) Remove transaxle case cover (Fig. 106).

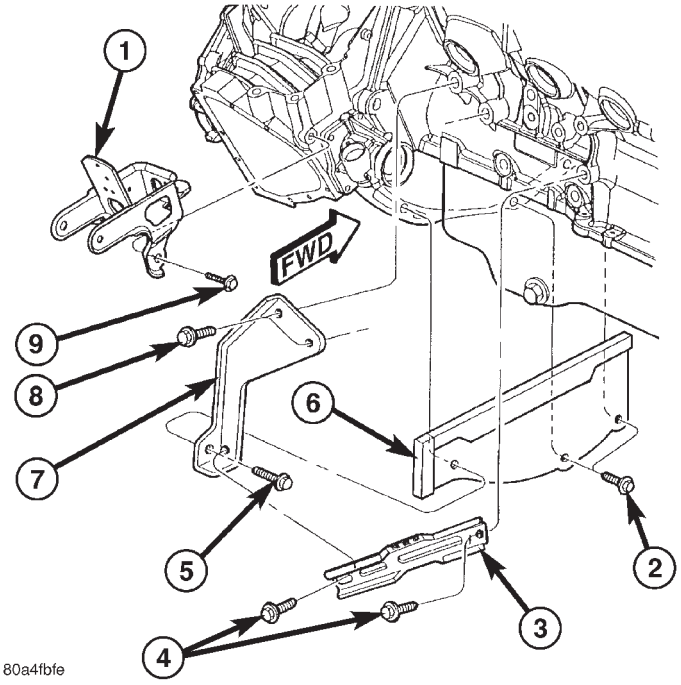

Fig. 106 Powertrain Struts and Transaxle Case Cover

1 - BRACKET - ENGINE REAR MOUNT
2 - BOLT - TRANSAXLE CASE COVER
3 - STRUT - TRANSAXLE TO ENGINE HORIZONTAL
4 - BOLT - HORIZONTAL STRUT

7 - STRUT - TRANSAXLE TO ENGINE
8 - BOLT - STRUT TO ENGINE
9 - BOLT - ENGINE REAR MOUNT BRACKET

(6) Remove oil pan fasteners (Fig. 107).
(7) Remove the oil pan and gasket (Fig. 107).

CLEANING

(1) Clean oil pan with solvent and wipe dry with a clean cloth.
(2) Clean all gasket material from mounting surfaces of pan and block.

OIL PAN (Continued)

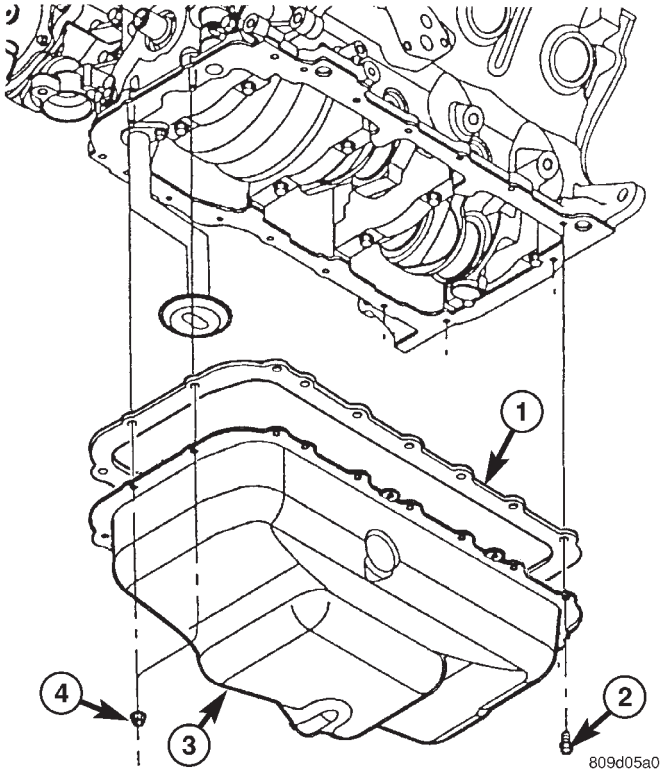

Fig. 107 OIL PAN

1 - GASKET
2 - BOLT
3 - OIL PAN
4 - NUT

(3) Clean oil screen and pick-up tube in clean solvent.

INSPECTION

(1) Inspect oil drain plug and plug hole for stripped or damaged threads and repair as necessary. Install a new drain plug gasket. Tighten to 27 N·m (20 ft. lbs.).

(2) Inspect oil pan mounting flange for bends or distortion. Straighten flange if necessary.

(3) Inspect condition of oil screen and pick-up tube.

INSTALLATION

(1) Clean sealing surfaces and apply a 1/8 inch bead of Mopar® Engine RTV GEN II at the parting line of the chain case cover and the rear seal retainer (Fig. 108).

(2) Position a new pan gasket on oil pan (Fig. 107).

(3) Install oil pan and tighten fasteners to 12 N·m (105 in. lbs.) (Fig. 107).

(4) Install cover to transaxle case (Fig. 106).

(5) Install the strut bolt to transaxle housing (Fig. 106). Tighten all bending brace bolts.

(6) Install the drive belt splash shield.

(7) Lower vehicle and install oil dipstick.

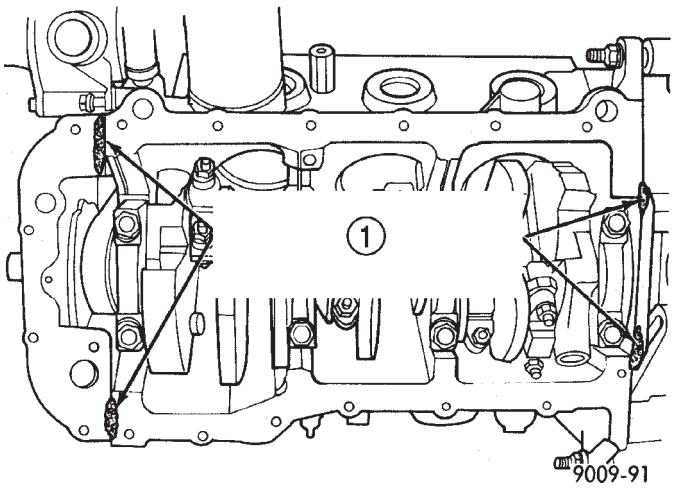

Fig. 108 Oil Pan Sealing

1 - SEALER LOCATIONS

(8) Connect negative cable to battery.

(9) Fill crankcase with oil to proper level.

OIL PRESSURE RELIEF VALVE

REMOVAL

(1) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Drill a 3.175 mm (1/8 in.) hole in the center of the retainer cap (Fig. 109). Insert a self-threading sheet metal screw into the cap.

(3) Using suitable pliers, remove cap and discard.

(4) Remove spring and relief valve (Fig. 109).

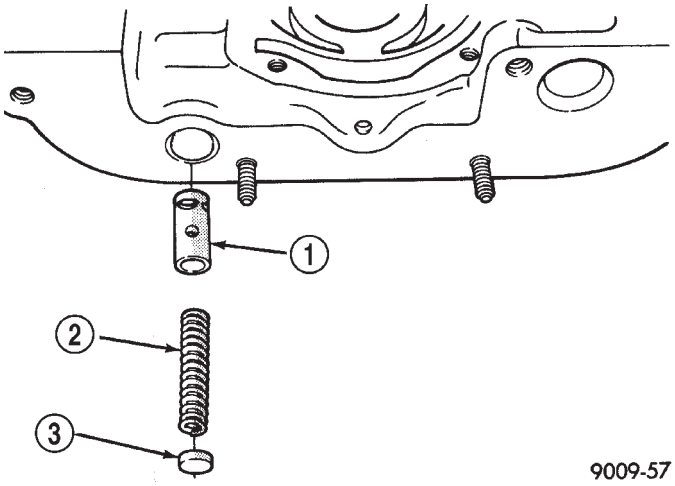

Fig. 109 Oil Pressure Relief Valve

1 - RELIEF VALVE
2 - SPRING
3 - RETAINER CAP

OIL PRESSURE RELIEF VALVE (Continued)

INSTALLATION

(1) Clean relief valve, spring and bore.

NOTE: Lubricate relief valve with clean engine oil before installing.

(2) Install relief valve and spring into housing.
(3) Install new retainer cap until flush with sealing surface.
(4) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
(5) Fill crankcase with proper oil to correct level.

OIL PRESSURE SWITCH

DESCRIPTION

The engine oil pressure switch is located on the lower left front side of the engine. It screws into the oil filter adapter. The normally closed switch provides an input through a single wire to the low pressure indicator light on the instrument cluster.

OPERATION

The oil pressure switch provides a ground for the instrument cluster low oil pressure indicator light. The switch receives oil pressure input from the engine main oil gallery. When engine oil pressure is greater than 27.5 Kpa (4 psi), the switch contacts open, providing a open circuit to the low pressure indicator light. For wiring circuits and diagnostic information, (Refer to Appropriate Wiring/Diagnostic Information).

REMOVAL

(1) Raise vehicle on hoist.
(2) Disconnect electrical connector from switch.
(3) Remove oil pressure switch (Fig. 110).

INSTALLATION

(1) Install oil pressure switch. Torque oil pressure switch to 23 N·m (200 in. lbs.) (Fig. 110).
(2) Connect electrical connector to switch.
(3) Lower the vehicle.
(4) Start engine and check for leaks.
(5) Check engine oil level. Adjust as necessary.

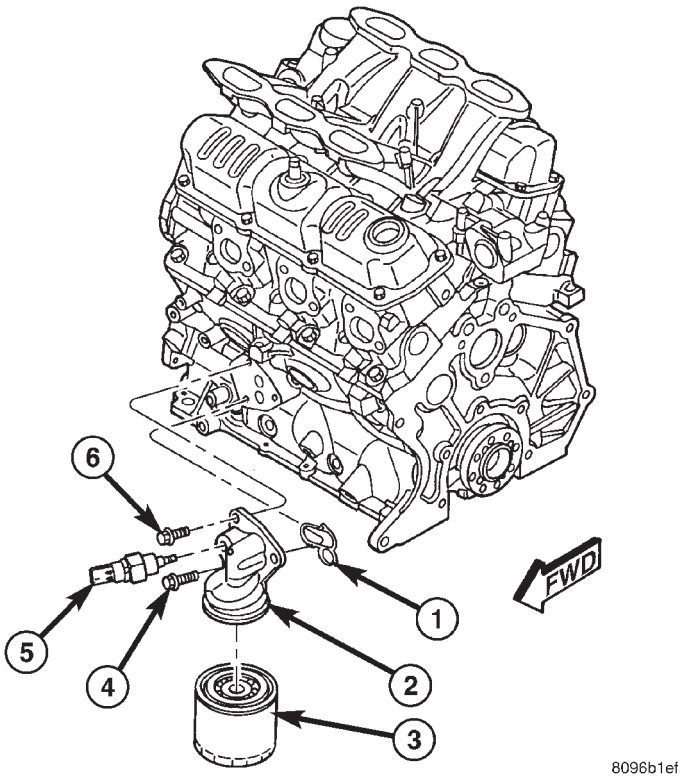

Fig. 110 OIL FILTER ADAPTER

1 - SEAL
2 - OIL FILTER ADAPTER
3 - OIL FILTER
4 - BOLT
5 - OIL PRESSURE SWITCH
6 - BOLT

OIL PUMP

DESCRIPTION

The oil pump is located in the timing chain cover. It is driven by the crankshaft.

REMOVAL

The oil pump is contained within the timing chain cover housing (Fig. 111).

(1) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(2) Remove the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(3) Disassemble oil pump from timing chain cover. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - DISASSEMBLY)

(4) Clean and Inspect oil pump components. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - CLEANING) (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSPECTION)

OIL PUMP (Continued)

DISASSEMBLY

(1) Remove oil pump cover screws, and lift off cover (Fig. 111).

(2) Remove oil pump rotors (Fig. 111).

(3) Clean and inspect oil pump components. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - CLEANING) (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSPECTION)

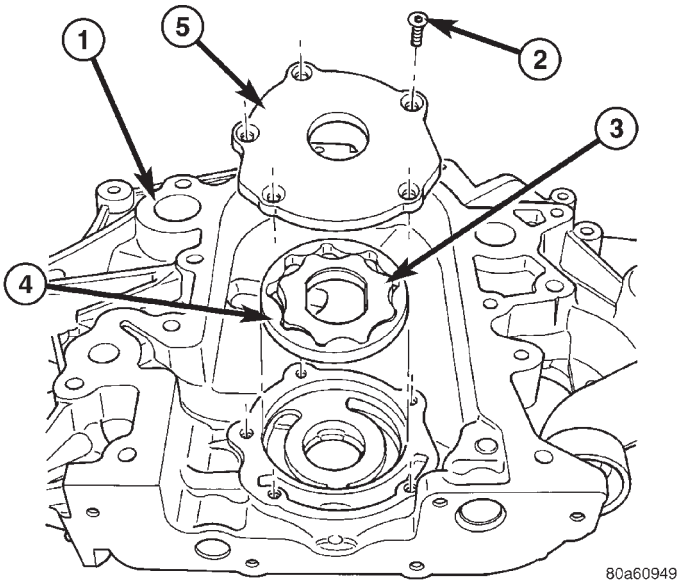

Fig. 111 OIL PUMP

1 - TIMING CHAIN COVER
2 - SCREWS
3 - INNER ROTOR
4 - OUTER ROTOR
5 - COVER

CLEANING

(1) Clean all parts thoroughly in a suitable solvent.

INSPECTION

(1) Inspect mating surface of the chain case cover. Surface should be smooth. Replace cover if scratched or grooved.

(2) Lay a straightedge across the pump cover surface (Fig. 112). If a 0.025 mm (0.001 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

(3) Measure thickness and diameter of outer rotor. If outer rotor thickness measures 7.64 mm (0.301 in.) or less (Fig. 113), or if the diameter is 79.95 mm (3.148 in.) or less, replace outer rotor.

(4) If inner rotor thickness measures 7.64 mm (0.301 in.) or less, replace inner rotor (Fig. 114).

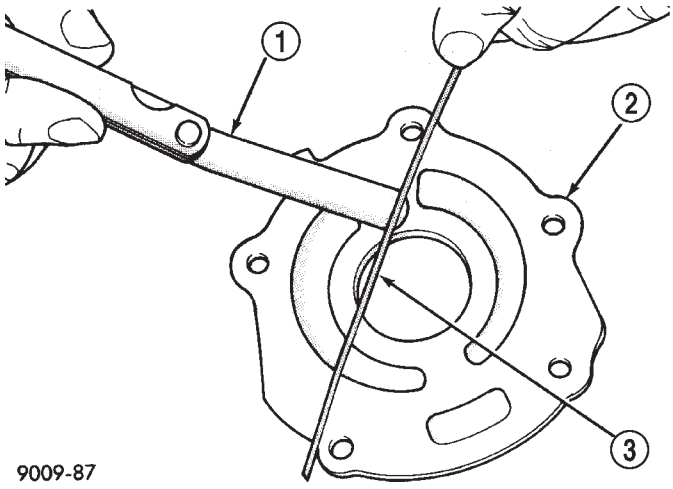

Fig. 112 Checking Oil Pump Cover Flatness

1 - FEELER GAUGE
2 - OIL PUMP COVER
3 - STRAIGHT EDGE

(5) Install outer rotor into chain case cover. Press rotor to one side with fingers and measure clearance between rotor and chain case cover (Fig. 115). If measurement is 0.39 mm (0.015 in.) or more, replace chain case cover, only if outer rotor is in specification.

(6) Install inner rotor into chain case cover. If clearance between inner and outer rotors (Fig. 116) is 0.203 mm (0.008 in.) or more, replace both rotors.

(7) Place a straightedge across the face of the chain case cover, between bolt holes. If a feeler gauge of 0.10 mm (0.004 in.) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 117). **ONLY** if rotors are in specs.

OIL PUMP (Continued)

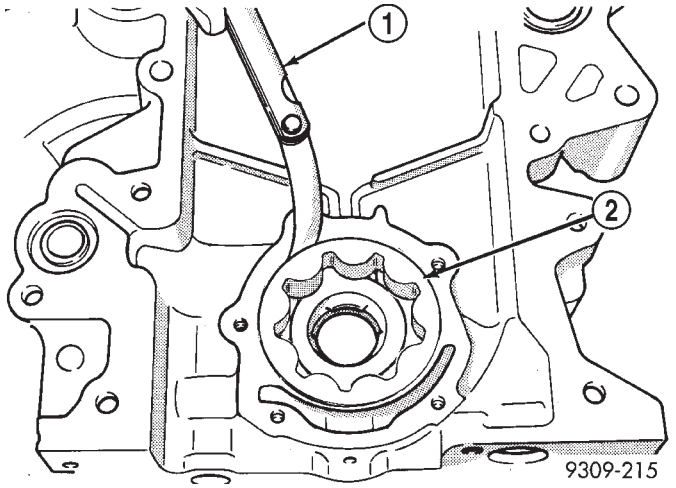

Fig. 115 Measuring Outer Rotor Clearance in Housing

1 - FEELER GAUGE
2 - OUTER ROTOR

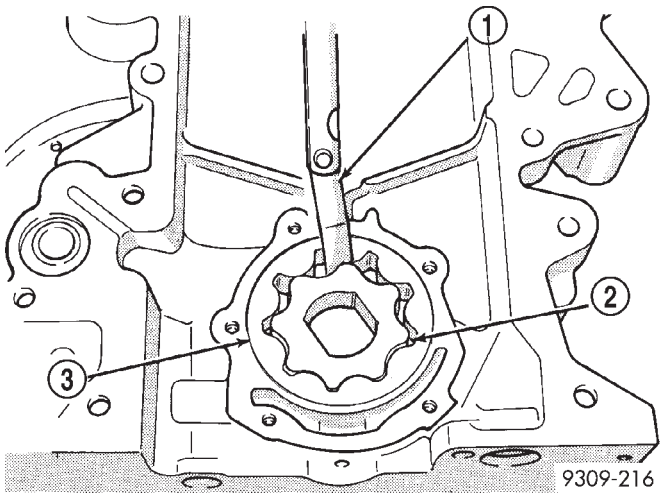

Fig. 116 Measuring Clearance Between Rotors

1 - FEELER GAUGE
2 - INNER ROTOR
3 - OUTER ROTOR

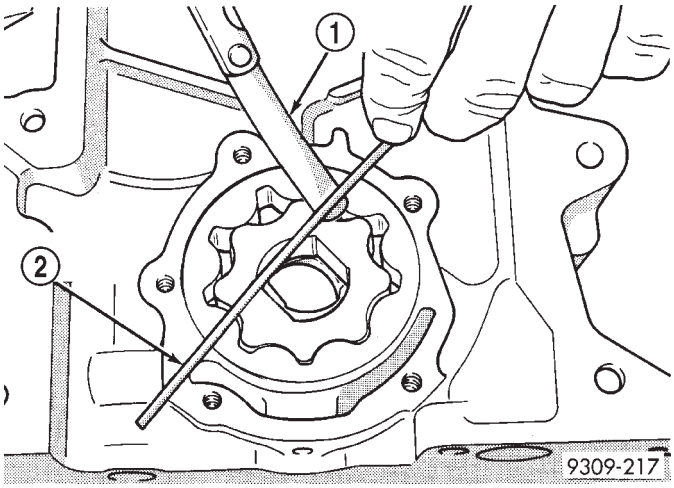

Fig. 117 Measuring Clearance Over Rotors

1 - FEELER GAUGE
2 - STRAIGHT EDGE

(8) Remove oil pressure relief valve. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE RELIEF VALVE - REMOVAL)

(9) Inspect oil pressure relief valve and bore. Inspect for scoring, pitting and free valve operation in bore (Fig. 118). Small marks may be removed with 400-grit wet or dry sandpaper.

(10) The relief valve spring has a free length of approximately 49.5 mm (1.95 inches) it should test between 19.5 and 20.5 pounds when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet specifications.

OIL PUMP (Continued)

(11) If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

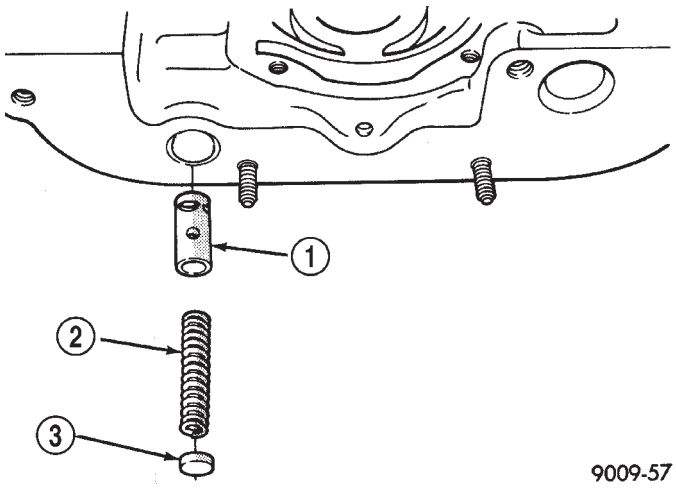

Fig. 118 Oil Pressure Relief Valve

1 - RELIEF VALVE
2 - SPRING
3 - RETAINER CAP

ASSEMBLY

(1) Assemble pump, using new parts as required. **Install the inner rotor with chamfer facing the cast iron oil pump cover.**

(2) Prime oil pump before installation by filling rotor cavity with engine oil.

(3) Install cover and tighten screws to 12 N·m (105 in. lbs.).

(4) If removed, install the oil pressure relief valve. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE RELIEF VALVE - INSTALLATION)

INSTALLATION

(1) Install oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - ASSEMBLY)

(2) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION) and oil pan (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

INTAKE MANIFOLD

DESCRIPTION

The intake system is made up of an upper and lower intake manifold. The upper intake manifold is made of a composite for both the 3.3L engine and for the 3.8L engine (Fig. 123). The lower intake manifold is common between the two engines (Fig. 127). It also provides coolant crossover between cylinder heads and houses the coolant thermostat (Fig. 127).

The intake manifold utilizes a compact design with very low restriction and outstanding flow balance. This design allows the engine to perform with a wide torque curve while increasing higher rpm horsepower.

If, for some reason, the molded-in vacuum ports break, the composite manifold can be salvaged. The vacuum ports are designed to break at the shoulder, if overloaded. Additional material in the shoulder area provides sufficient stock to repair. For more information and procedure, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - STANDARD PROCEDURE). Also, if the special screws that attach the MAP sensor, power steering reservoir, throttle cable bracket, and the EGR tube become stripped, an oversized screw is available to repair the stripped-out condition. For more information and procedure, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - STANDARD PROCEDURE)

OPERATION

The intake manifold delivers air to the combustion chambers. This air allows the fuel delivered by the fuel injectors to ignite when the spark plugs fire.

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.

(2) Spray a small stream of water (Spray Bottle) at the suspected leak area.

(3) If engine RPM'S change, the area of the suspected leak has been found.

(4) Repair as required.

INTAKE MANIFOLD - UPPER

STANDARD PROCEDURE

STANDARD PROCEDURE - MANIFOLD STRIPPED THREAD REPAIR

The composite upper intake manifold thread bosses, if stripped out, can be repaired by utilizing a

repair screw available through Mopar® parts. Repair screws are available for the following manifold attached components:

- MAP sensor
- Power steering reservoir
- EGR tube
- Throttle cable bracket

The repair screws require a unique tightening torque specification from the original screw. Refer to the following chart for specification.

DESCRIPTION	TORQUE*
STRIP-OUT REPAIR SCREWS ONLY	
MAP Sensor Repair Screw	4 N·m (35 in. lbs.)
Power Steering Reservoir Repair Screw	9 N·m (80 in. lbs.)
EGR Tube Attaching Repair Screw	9 N·m (80 in. lbs.)
Throttle Cable Bracket Repair Screw	9 N·m (80 in. lbs.)
*Install Slowly Using Hand Tools Only	

STANDARD PROCEDURE - INTAKE MANIFOLD VACUUM PORT REPAIR

The composite intake manifold vacuum ports can be repaired. Although, if the manifold plenum chamber is damaged or cracked, the manifold must be replaced.

To repair a broken or damaged vacuum nipple (port) on the composite intake manifold, perform the following procedure:

PARTS REQUIRED	TOOLS REQUIRED
· Brass Nipple – 1/4″ O.D. x 1/8″ pipe thread (LDP/Speed Control Port)	· Pipe Tap – 1/8″ - 18 NPT · Drill Bit – 11/32″ · File/Sandpaper
· Brass Nipple – 1/2″ O.D. x 1/4″ pipe thread (Brake Booster Port)	· Pipe Tap – 1/4″ - 18 NPT · Drill Bit – 7/16″ · File/Sandpaper

NOTE: While performing this procedure, avoid getting the manifold material residue into the plenum chamber.

(1) File or sand the remaining port back until a flat surface is obtained (plane normal to nipple (port) axis).

(2) Drill out the nipple (port) base using a 7/16” (brake booster port) or 11/32” (LDP/speed control port) drill bit (Fig. 119).

(3) Using a 1/4”–18 NPT (brake booster port) or 1/8”–18 NPT (LDP/speed control port) pipe tap, cut internal threads (Fig. 119). Use caution to start tap in a axis same as original nipple.

(4) Apply Mopar® Thread Sealant to threads of repair nipple(s).

(5) Install repair nipple(s). Do not over torque repair nipple(s).

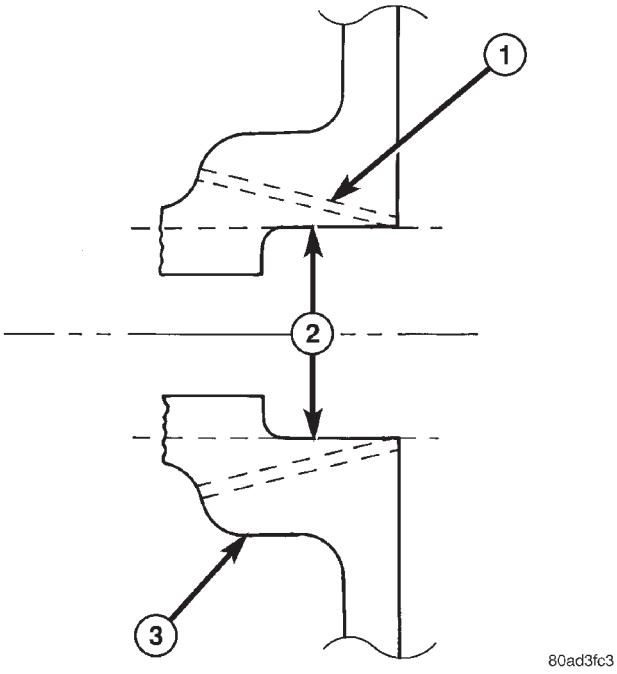

Fig. 119 Intake Manifold Port Repair

1 - BRAKE BOOSTER PORT = 1/4″–18 NPT PIPE TAP
1 - LDP/SPEED CONTROL PORT = 1/8″–18 NPT PIPE TAP
2 - DRILL BIT = 7/16″ BRAKE BOOSTER PORT
2 - DRILL BIT = 11/32″ LDP/SPEED CONTROL PORT
3 - INTAKE MANIFOLD

REMOVAL - UPPER INTAKE MANIFOLD

(1) Disconnect battery negative cable.

(2) Disconnect inlet air temperature (IAT) sensor electrical connector.

(3) Remove air inlet resonator to throttle body hose assembly.

(4) Disconnect throttle and speed control cables from throttle body (Refer to 14 - FUEL SYSTEM/ FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL).

(5) Disconnect make-up air hose support clip from throttle cable bracket.

(6) Disconnect the automatic idle speed (AIS) motor and throttle position sensor (TPS) wiring connectors from throttle body.

INTAKE MANIFOLD - UPPER (Continued)

(7) Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

(8) Disconnect the vapor purge vacuum hose from throttle body.

(9) Disconnect the PCV hose (Fig. 120).

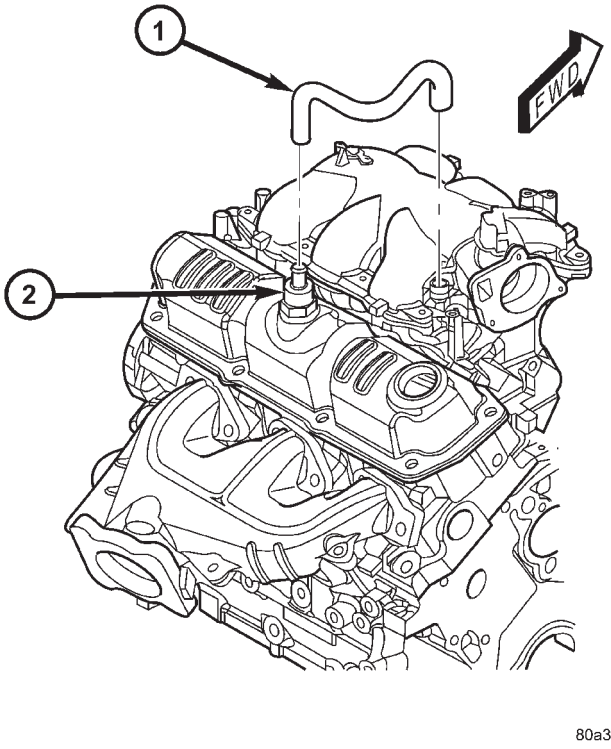

Fig. 120 PCV & HOSE

1 - HOSE - PCV
2 - PCV VALVE

(10) Remove the power steering reservoir attaching bolts and only loosen the nut (Fig. 121). Lift reservoir up to disengage lower mount from stud. Set reservoir aside. **Do not** disconnect hose.

(11) Disconnect the brake booster and leak detection pump (LDP) hoses from intake manifold (Fig. 122).

(12) Remove intake manifold bolts and remove the manifold (Fig. 123).

(13) Cover the lower intake manifold with a suitable cover while the upper manifold is removed.

(14) Clean and inspect the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - CLEANING) and (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSPECTION).

CLEANING

(1) Discard gasket(s).

(2) Clean all sealing surfaces.

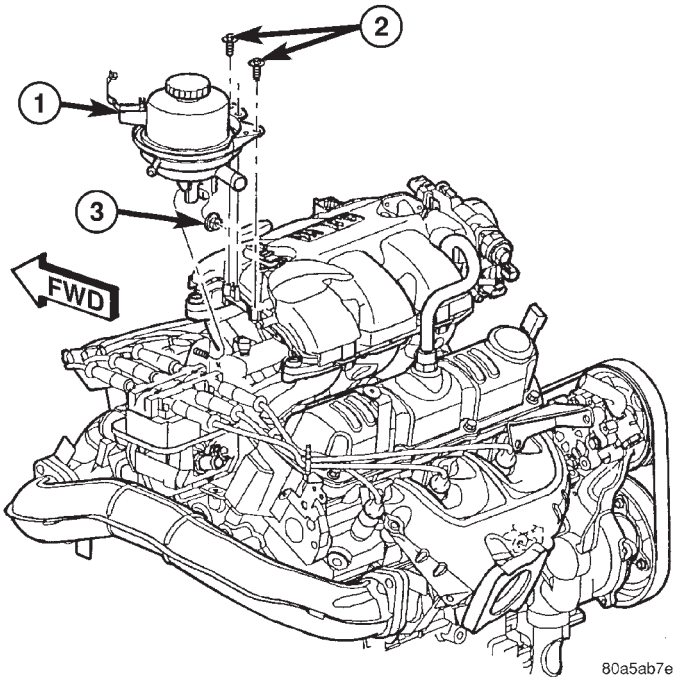

Fig. 121 POWER STEERING FLUID RESERVOIR

1 - POWER STEERING RESERVOIR
2 - BOLT - RESERVOIR TO MANIFOLD
3 - NUT - RESERVOIR TO COIL BRACKET

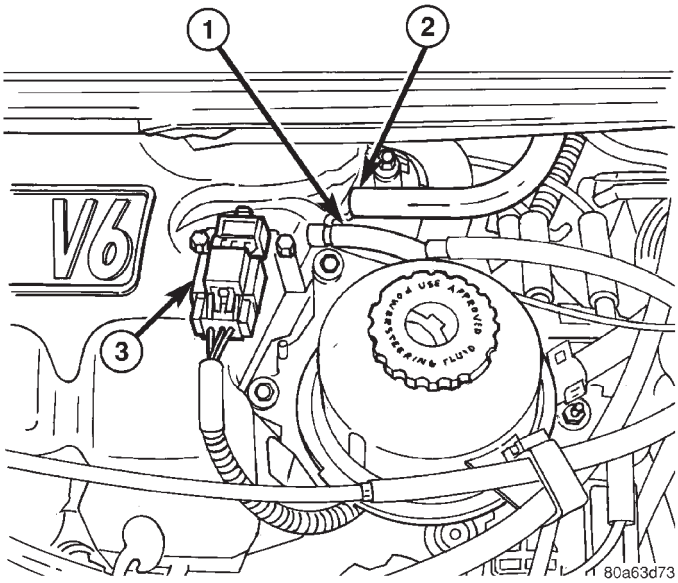

Fig. 122 BRAKE BOOSTER & LDP VACUUM HOSES

INTAKE MANIFOLD - UPPER (Continued)

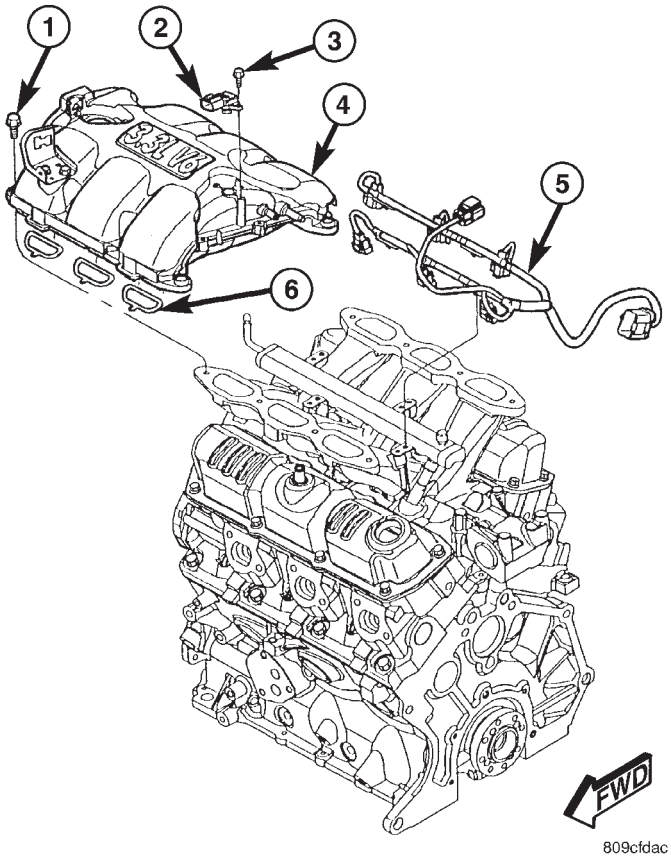

Fig. 123 INTAKE MANIFOLD - UPPER

1 - BOLT
2 - MAP SENSOR
3 - SCREW
4 - MANIFOLD - UPPER
5 - WIRE HARNESS
6 - GASKET (3 PER CYL. BANK)

INSPECTION

Check manifold for:

- Damage and cracks.
- Mounting surface distortion by using a straight-edge and thickness gauge.

INSTALLATION - UPPER INTAKE MANIFOLD

(1) If the following components were removed from manifold, install and tighten to specifications:

CAUTION: The special screws used for the composite manifold attached components must be installed slowly using hand tools only. This requirement is to prevent the melting of material that causes stripped threads. If threads become stripped, an oversize repair screw is available. For more information and procedure (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - STANDARD PROCEDURE - MANIFOLD STRIPPED THREAD REPAIR).

- MAP sensor - 1.7 N·m (15 in. lbs.)
- Throttle cable bracket - 5.6 N·m (50 in. lbs.)

(2) Remove covering on lower intake manifold and clean surfaces.

(3) Inspect manifold gasket condition. Gaskets can be re-used, if not damaged. To replace, remove gasket from upper manifold (Fig. 123). Position new gasket in seal channel and press lightly in-place. Repeat procedure for each gasket position.

(4) Position upper manifold on lower manifold (Fig. 123). Install and tighten bolts to 12 N·m (105 in. lbs.) following torque sequence in (Fig. 124).

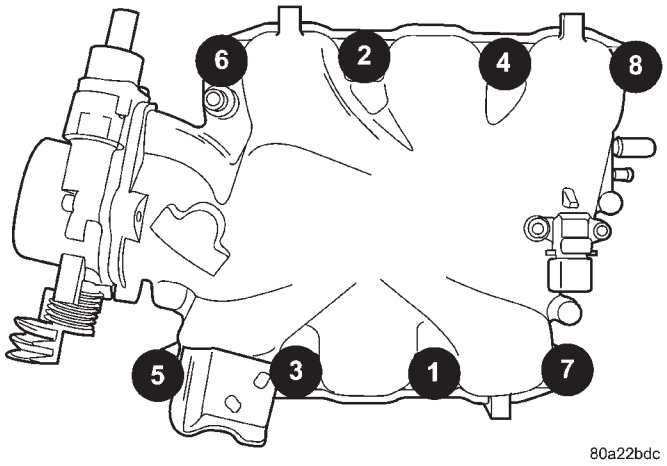

Fig. 124 UPPER MANIFOLD TIGHTENING SEQUENCE

(5) Connect the MAP sensor electrical connector.

(6) Connect the brake booster and LDP vacuum hose to intake manifold (Fig. 122).

CAUTION: The special screws used for attaching the EGR tube and power steering reservoir to the manifold must be installed slowly using hand tools only. This requirement is to prevent the melting of material that causes stripped threads. If threads become stripped, an oversize repair screw is available. For more information and procedure (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - STANDARD PROCEDURE - MANIFOLD STRIPPED THREAD REPAIR).

(7) Install the power steering reservoir (Fig. 121). Tighten screws to manifold to 5.6 N·m (50 in. lbs.).

(8) Connect throttle and speed control cables to throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION)

(9) Attach make up air hose clip into the hole in the throttle cable bracket.

(10) Connect the wiring connectors to the throttle position sensor (TPS) and Automatic Idle Speed (AIS) motor.

INTAKE MANIFOLD - UPPER (Continued)

(11) Install air cleaner and air inlet hose assembly.
(12) Connect the inlet air temperature (IAT) sensor electrical connector.
(13) Connect battery negative cable.

INTAKE MANIFOLD - LOWER

REMOVAL - LOWER INTAKE MANIFOLD

(1) Perform fuel system pressure release procedure **(before attempting any repairs).** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
(2) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
(3) Remove the upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
(4) Remove the fuel line. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE) (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)
(5) Remove ignition coil and bracket (Fig. 125).
(6) Disconnect heater supply hose and engine coolant temperature sensor (Fig. 126).
(7) Disconnect the fuel injector wire harness.
(8) Remove the fuel injectors and rail assembly (Fig. 125).
(9) Remove radiator upper hose.
(10) Remove the intake manifold bolts.
(11) Remove lower intake manifold (Fig. 127).

WARNING: INTAKE MANIFOLD GASKET IS MADE OF VERY THIN METAL AND MAY CAUSE PERSONAL INJURY, HANDLE WITH CARE.

(12) Remove intake manifold seal retainers screws (Fig. 127). Remove intake manifold gasket.
(13) Inspect and clean manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSPECTION) (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - CLEANING)

CLEANING

(1) Discard gasket(s).
(2) Clean all sealing surfaces.

INSPECTION

Check for:
- Damage and cracks of each section.
- Clogged water passages in end cross-overs (if equipped).
- Check for cylinder head mounting surface distortion using a straightedge and thickness gauge. (Refer to 9 - ENGINE/CYLINDER HEAD - INSPECTION)

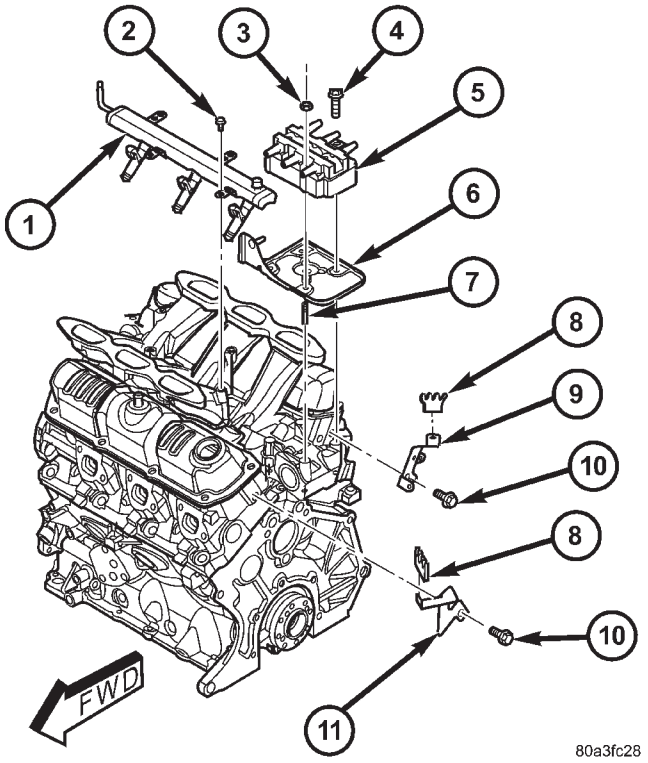

Fig. 125 FUEL RAIL AND IGNITION COIL & BRACKET

8 - SEPARATOR - SPARK PLUG CABLE
9 - BRACKET - SPARK PLUG CABLE SEPARATOR
10 - BOLT - SEPARATOR BRACKET
11 - BRACKET - SPARK PLUG CABLE SEPARATOR

INSTALLATION - LOWER INTAKE MANIFOLD

(1) Place a bead (approximately 1/4 in. diameter) of Mopar® Engine RTV GEN II onto each of the **four** manifold to cylinder head gasket corners (Fig. 128).
(2) Carefully install the new intake manifold gasket (Fig. 127). Tighten end seal retainer screws to 12 N·m (105 in. lbs.).
(3) Install lower intake manifold (Fig. 127). Install the bolts and torque to 1 N·m (10 in. lbs.). Then torque bolts to 22 N·m (200 in. lbs.) in sequence shown in (Fig. 129). Then torque again to 22 N·m (200 in. lbs.). After intake manifold is in place, **inspect to make sure seals are in place.**
(4) Install the fuel injectors and rail assembly. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION)
(5) Connect fuel injector electrical harness.

INTAKE MANIFOLD - LOWER (Continued)

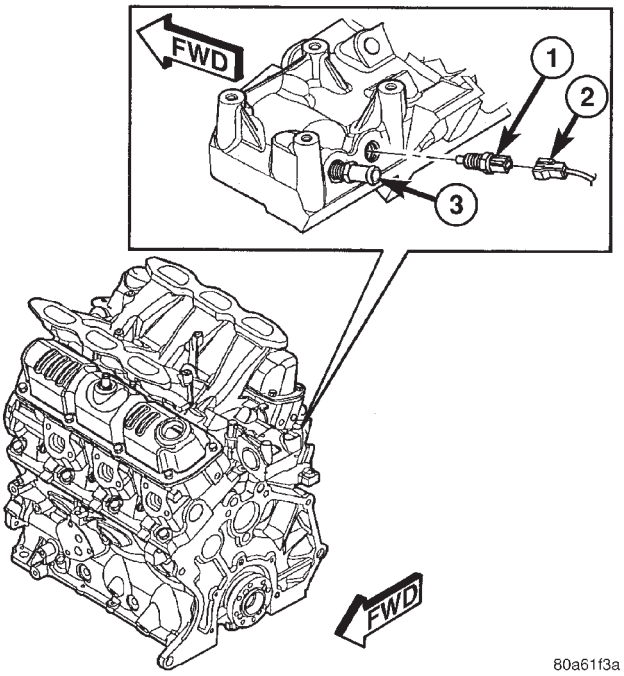

Fig. 126 ECT SENSOR & HEATER SUPPLY

1 - ENGINE COOLANT TEMPERATURE SENSOR
2 - CONNECTOR - ENGINE COOLANT SENSOR
3 - FITTING - HEATER SUPPLY

(6) Connect the engine coolant temperature sensor (Fig. 126).

(7) Connect the heater supply (Fig. 126) and radiator upper hoses to manifold.

(8) Connect the fuel line. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)

(9) Install the upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(10) Connect negative battery cable.

(11) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds are log type and made of Hi-Sil-Moly (high temperature resistant) nodular cast iron. The exhaust manifolds are attached directly to the cylinder heads and a cross-over pipe connects the two manifolds.

OPERATION

The exhaust manifolds collects the exhaust gases exiting the combustion chambers. It then channels the exhaust gases to the exhaust pipe that is attached to the rear (right side) manifold.

EXHAUST MANIFOLD - RIGHT

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove the wiper module. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL)

(3) Disconnect spark plug wires.

(4) Remove bolts fastening crossover pipe to exhaust manifold (Fig. 130).

(5) Disconnect and remove the upstream oxygen sensor (Fig. 133).

(6) Remove the heat shield attaching screws (Fig. 133).

(7) Remove the upper heat shield (Fig. 133).

(8) Raise vehicle on hoist and remove drive belt shield.

(9) Loosen the power steering pump support strut lower bolt (Fig. 131).

(10) Disconnect downstream oxygen sensor connector.

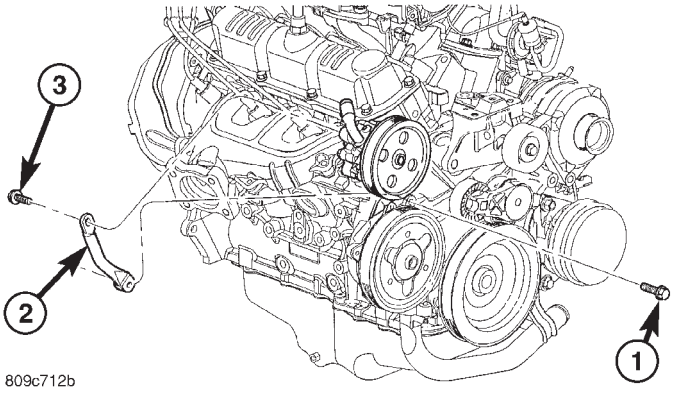

Fig. 131 P/S PUMP STRUT

1 - BOLT - LOWER
2 - STRUT - P/S PUMP
3 - BOLT - UPPER

(11) Disconnect catalytic converter pipe from exhaust manifold (Fig. 132).

(12) Lower vehicle and remove the power steering pump support strut upper bolt (Fig. 131).

(13) Remove bolts attaching exhaust manifold to cylinder head and remove manifold (Fig. 133).

(14) Inspect and clean manifold. (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - CLEANING) (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSPECTION)

CLEANING

(1) Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

EXHAUST MANIFOLD - RIGHT (Continued)

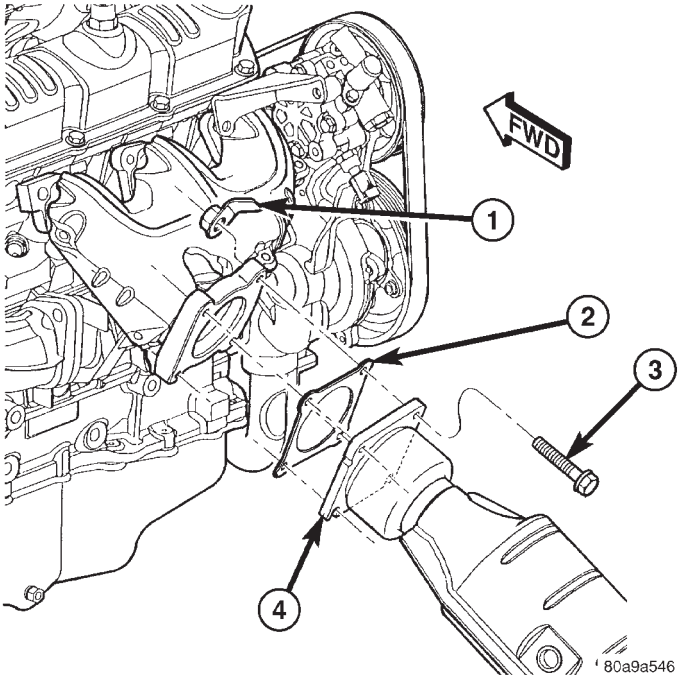

Fig. 132 Catalytic Converter to Exhaust Manifold

1 - FLAG NUT
2 - GASKET
3 - BOLT
4 - CATALYTIC CONVERTER

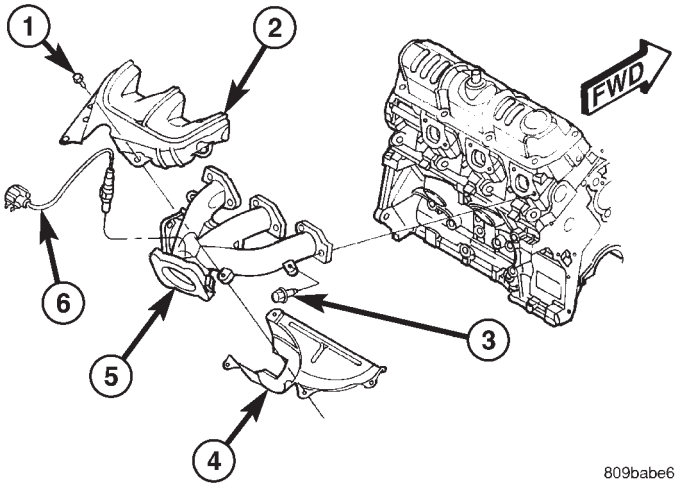

Fig. 133 EXHAUST MANIFOLD - RIGHT

2 - HEAT SHIELD - UPPER
3 - BOLT - EXHAUST MANIFOLD
4 - HEAT SHIELD - LOWER
5 - EXHAUST MANIFOLD - RIGHT
6 - OXYGEN SENSOR - UPSTREAM

INSPECTION

Inspect exhaust manifolds for damage or cracks and check distortion of the cylinder head mounting surface and exhaust crossover mounting surface with a straightedge and thickness gauge (Fig. 134).

Manifold surface flatness limits should not exceed 1.0 mm (0.039 in.).

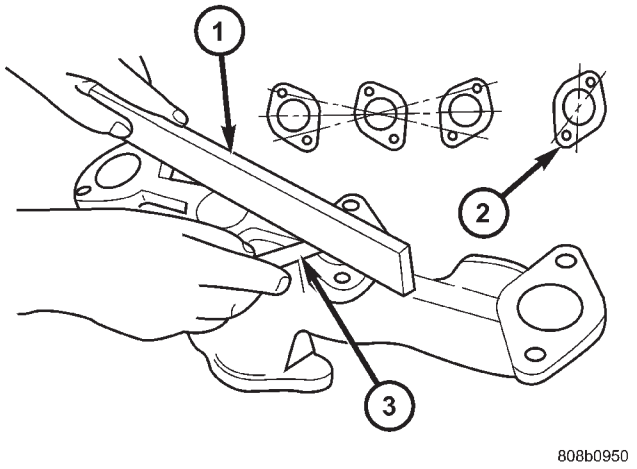

Fig. 134 Check Exhaust Manifold Mounting

1 - STRAIGHT EDGE
2 - CROSSOVER PIPE MOUNTING SURFACE
3 - FEELER GAUGE

INSTALLATION

(1) Position exhaust manifold on cylinder head and install bolts to center runner (cylinder #3) and initial tighten to 2.8 N·m (25 in. lbs.) (Fig. 133)

(2) Using a new gasket, attach crossover pipe to exhaust manifold and tighten bolts to 41 N·m (30 ft. lbs.) (Fig. 130).

NOTE: Inspect crossover pipe fasteners for damage from heat and corrosion. The cross-over bolts are made of a special stainless steel alloy. If replacement is required, OEM bolts are highly recommended.

(3) Install the remaining manifold attaching bolts. Tighten all bolts to 23 N·m (200 in. lbs.).

(4) Position the power steering pump support strut and install upper bolt (Fig. 131).

(5) Install heat shield and attaching screws (Fig. 133).

(6) Install and connect upstream oxygen sensor (Fig. 133).

(7) Raise the vehicle.

(8) Attach catalytic converter pipe to exhaust manifold using new gasket and tighten bolts to 37 N·m (27 ft. lbs.) (Fig. 132).

(9) Connect downstream oxygen sensor connector.

(10) Tighten the power steering pump support strut lower bolt (Fig. 131).

(11) Install the belt splash shield and lower the vehicle.

EXHAUST MANIFOLD - RIGHT (Continued)

(12) Install the wiper module. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION)
(13) Connect battery negative cable.

EXHAUST MANIFOLD - LEFT

REMOVAL

(1) Disconnect battery negative cable.
(2) Remove bolts attaching crossover pipe to exhaust manifold (Fig. 135).

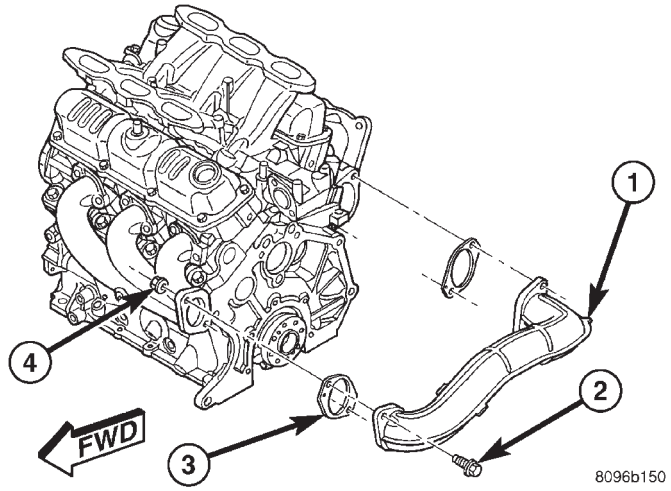

Fig. 135 CROSS-OVER PIPE

1 - CROSS-OVER PIPE
2 - BOLT
3 - GASKET
4 - FLAG NUT

(3) Disconnect left cylinder bank spark plug wires.
(4) Remove heat shield attaching bolts (Fig. 136).
(5) Remove bolts attaching exhaust manifold to cylinder head (Fig. 136).
(6) Remove the exhaust manifold (Fig. 136).
(7) Inspect and clean manifold. (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSPECTION) (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - CLEANING)

CLEANING

(1) Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

Inspect exhaust manifolds for damage or cracks and check distortion of the cylinder head mounting surface and exhaust crossover mounting surface with a straightedge and thickness gauge (Fig. 137).

Manifold surface flatness limits should not exceed 1.0 mm (0.039 in.).

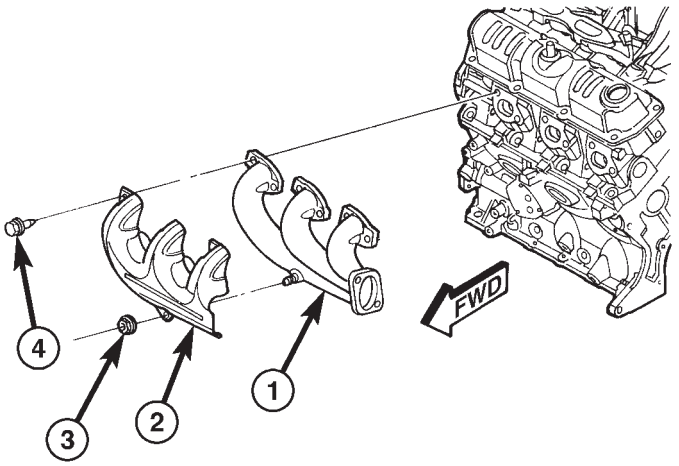

Fig. 136 EXHAUST MANIFOLD - LEFT

1 - EXHAUST MANIFOLD - LEFT BANK
2 - HEAT SHIELD
3 - NUT - HEAT SHIELD
4 - BOLT - EXHAUST MANIFOLD

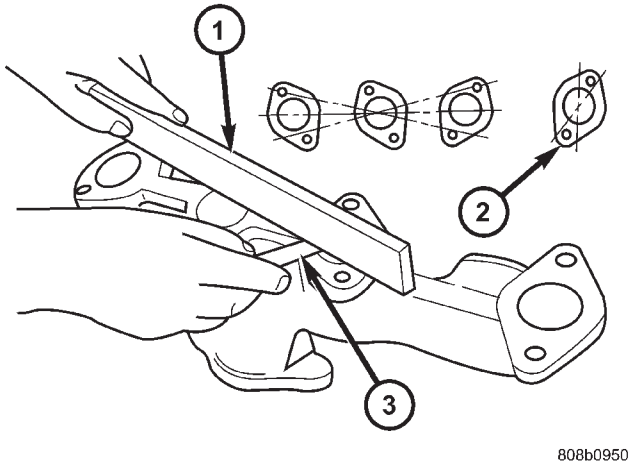

Fig. 137 Check Exhaust Manifold Mounting

1 - STRAIGHT EDGE
2 - CROSSOVER PIPE MOUNTING SURFACE
3 - FEELER GAUGE

INSTALLATION

(1) Position exhaust manifold on cylinder head (Fig. 136). Install bolts to center runner (cylinder #4) and initial tighten to 2.8 N·m (25 in. lbs.).

(2) Using a new gasket, attach crossover pipe to exhaust manifold and tighten bolts to 41 N·m (30 ft. lbs.) (Fig. 135).

NOTE: Inspect crossover pipe fasteners for damage from heat and corrosion. The cross-over bolts are made of a special stainless steel alloy. If replacement is required, OEM bolts are highly recommended.

EXHAUST MANIFOLD - LEFT (Continued)

(3) Position heat shield on manifold (Fig. 136).
(4) Install the remaining manifold attaching bolts. Tighten all bolts to 23 N·m (200 in. lbs.).
(5) Install and tighten heat shield attaching nut to 12 N·m (105 in. lbs.) (Fig. 136).
(6) Connect battery negative cable.

VALVE TIMING

STANDARD PROCEDURE

STANDARD PROCEDURE - VALVE TIMING VERIFICATION

(1) Remove front cylinder head cover and all 6 spark plugs.
(2) Rotate engine until the #2 piston is at TDC of the compression stroke.
(3) Install a degree wheel on the crankshaft pulley.
(4) With proper adaptor, install a dial indicator into #2 spark plug hole. Using the indicator find TDC on the compression stroke.
(5) Position the degree wheel to zero.
(6) Remove dial indicator from spark plug hole.
(7) Place a 5.08 mm (0.200 in.) spacer between the valve stem tip of #2 intake valve and rocker arm pad. Allow tappet to bleed down to give a solid tappet effect.
(8) Install a dial indicator so plunger contacts the #2 intake valve spring retainer as nearly perpendicular as possible. Zero the indicator.
(9) Rotate the engine clockwise until the intake valve has lifted .254 mm (0.010 in.).

CAUTION: Do not turn crankshaft any further clockwise as intake valve might bottom and result in serious damage.

(10) Degree wheel should read 6 degrees BTDC to 6 degrees ATDC.

STANDARD PROCEDURE - MEASURING TIMING CHAIN WEAR

NOTE: This procedure must be performed with the timing chain cover removed (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).

(1) Position a scale next to timing chain so that any movement of chain may be measured (Fig. 138).
(2) Position a torque wrench and socket on the camshaft sprocket attaching bolt. Apply force in the direction of crankshaft rotation to take up slack to the following torque:
- 41 N·m (30 ft. lb.) with cylinder heads installed
- 20 N·m (15 ft. lb.) with cylinder heads removed

NOTE: With torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block crankshaft to prevent rotation.

(3) Holding a measuring scale along edge of chain links (Fig. 138).
(4) Apply force in the reverse direction to the following torque:
- 41 N·m (30 ft. lb.) with cylinder heads installed
- 20 N·m (15 ft. lb.) with cylinder heads removed

(5) Measure amount of sprocket/chain movement.
(6) Install a new timing chain and sprockets if movement exceeds 3.175 mm (1/8 in.).

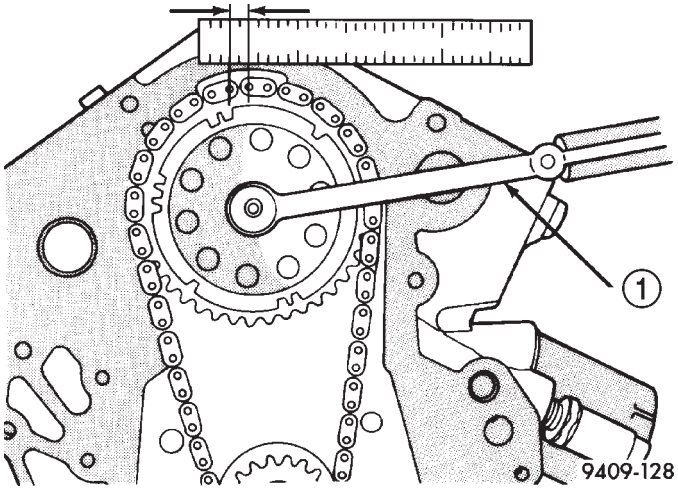

Fig. 138 Measuring Timing Chain Wear

1 - TORQUE WRENCH

TIMING CHAIN COVER

REMOVAL

(1) Disconnect negative cable from battery.
(2) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
(3) Raise vehicle on hoist.
(4) Drain engine oil.
(5) Remove right wheel and inner splash shield.
(6) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
(7) Remove oil pick-up tube (Fig. 139).
(8) Remove accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
(9) Remove A/C compressor and set aside.
(10) Remove crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)
(11) Remove radiator lower hose.

TIMING CHAIN COVER (Continued)

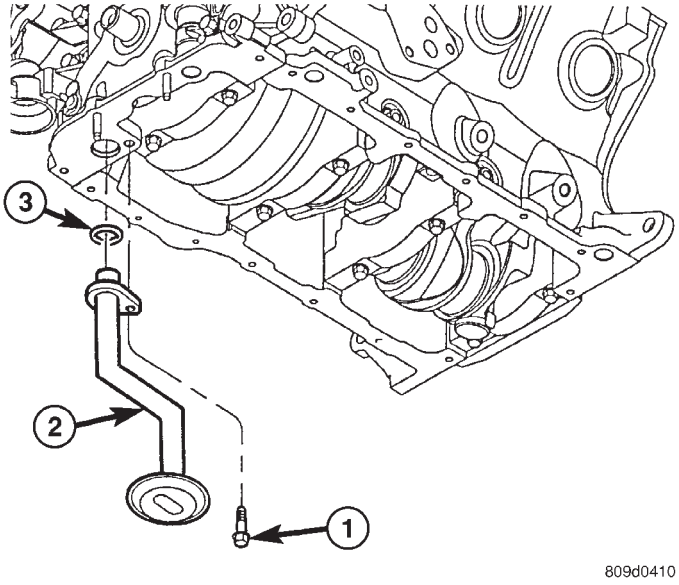

Fig. 139 OIL PICKUP TUBE

1 - BOLT
2 - OIL PICK-UP TUBE
3 - O-RING

(12) Remove heater hose from timing chain cover housing (Fig. 140) or water pump inlet tube (if engine oil cooler equipped) (Fig. 141).

2 - HOSE - HEATER RETURN
3 - TUBE ASSEMBLY - HEATER RETURN
4 - BOLT - TUBE ASSEMBLY
5 - BOLT - TUBE ASSEMBLY
6 - HOSE - HEATER RETURN/OIL COOLER OUTLET

(13) Remove the right side engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL)

(14) Remove idler pulley from engine bracket (Fig. 142).

(15) Remove the engine mount bracket (Fig. 142).

(16) Remove camshaft position sensor from timing chain cover (Fig. 142).

(17) Remove the water pump for cover removal clearance. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL)

(18) Remove the bolt attaching the power steering pump support strut to the front cover (Fig. 143).

(19) Remove the timing chain cover fasteners. Remove timing chain cover (Fig. 144).

INSTALLATION

(1) Be sure mating surfaces of chain case cover and cylinder block are clean and free from burrs. Crankshaft oil seal must be removed to insure correct oil pump engagement.

NOTE: DO NOT USE SEALER ON COVER GASKET

(2) Position new gasket on timing cover (Fig. 144). Adhere new gasket to chain case cover, making sure that the lower edge of the gasket is flush to 0.5 mm (0.020 in.) passed the lower edge of the cover.

TIMING CHAIN COVER (Continued)

9 - BOLT - MOUNT BRACKET (HORIZONTAL)

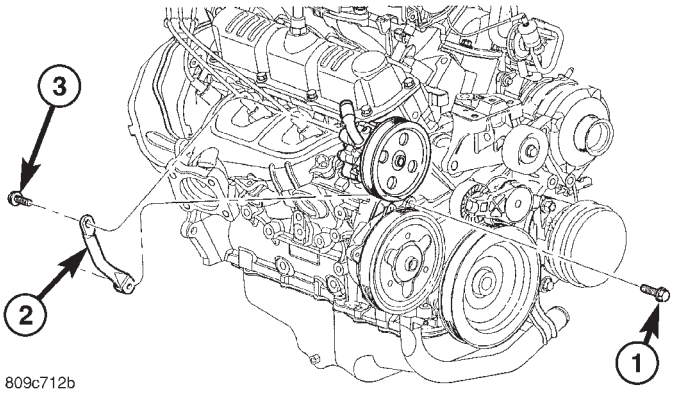

Fig. 143 Power Steering Pump Strut

1 - BOLT - LOWER
2 - STRUT - P/S PUMP
3 - BOLT - UPPER

(3) Rotate crankshaft so that the oil pump drive flats are in the vertical position.

(4) Position oil pump inner rotor so the mating flats are in the same position as the crankshaft drive flats (Fig. 144).

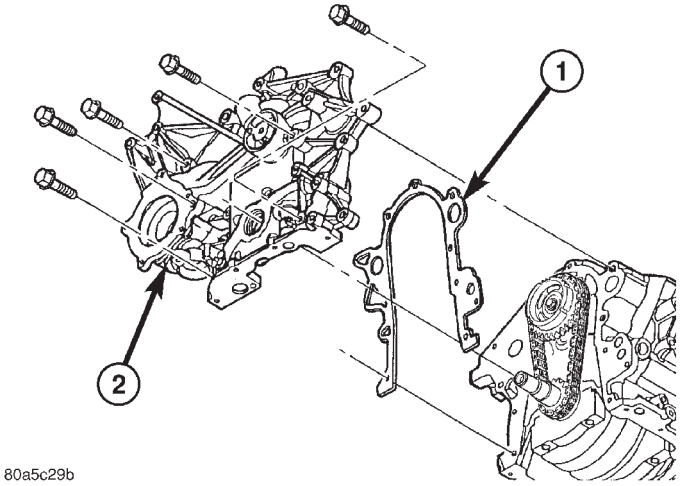

Fig. 144 Timing Chain Cover and Gasket

1 - GASKET
2 - TIMING CHAIN COVER

CAUTION: Make sure the oil pump is engaged on the crankshaft correctly or severe damage may result.

(5) Install timing cover (Fig. 144).

(6) Install timing chain cover bolts. Tighten M8 bolts to 27 N·m (20 ft. lbs.) and M10 bolts to 54 N·m (40 ft. lbs.) (Fig. 145).

(7) Install crankshaft front oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION)

(8) Install water pump and pulley. (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION)

(9) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

(10) Install engine mount bracket (Fig. 142) and tighten M10 to 54 N·m (40 ft. lbs.), M8 bolt to 28 N·m (21 ft. lb. lbs.).

(11) Install idler pulley on engine mount bracket (Fig. 142).

(12) Install right side engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION)

(13) Install camshaft position sensor (Refer to 8 - ELECTRICAL/IGNITION CONTROL/CAMSHAFT POSITION SENSOR - INSTALLATION).

(14) Connect the heater return hose at rear of timing chain cover (Fig. 140) or at water pump inlet tube (if engine oil cooler equipped) (Fig. 141).

(15) Connect the radiator lower hose.

(16) Install A/C compressor.

(17) Install accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

TIMING CHAIN COVER (Continued)

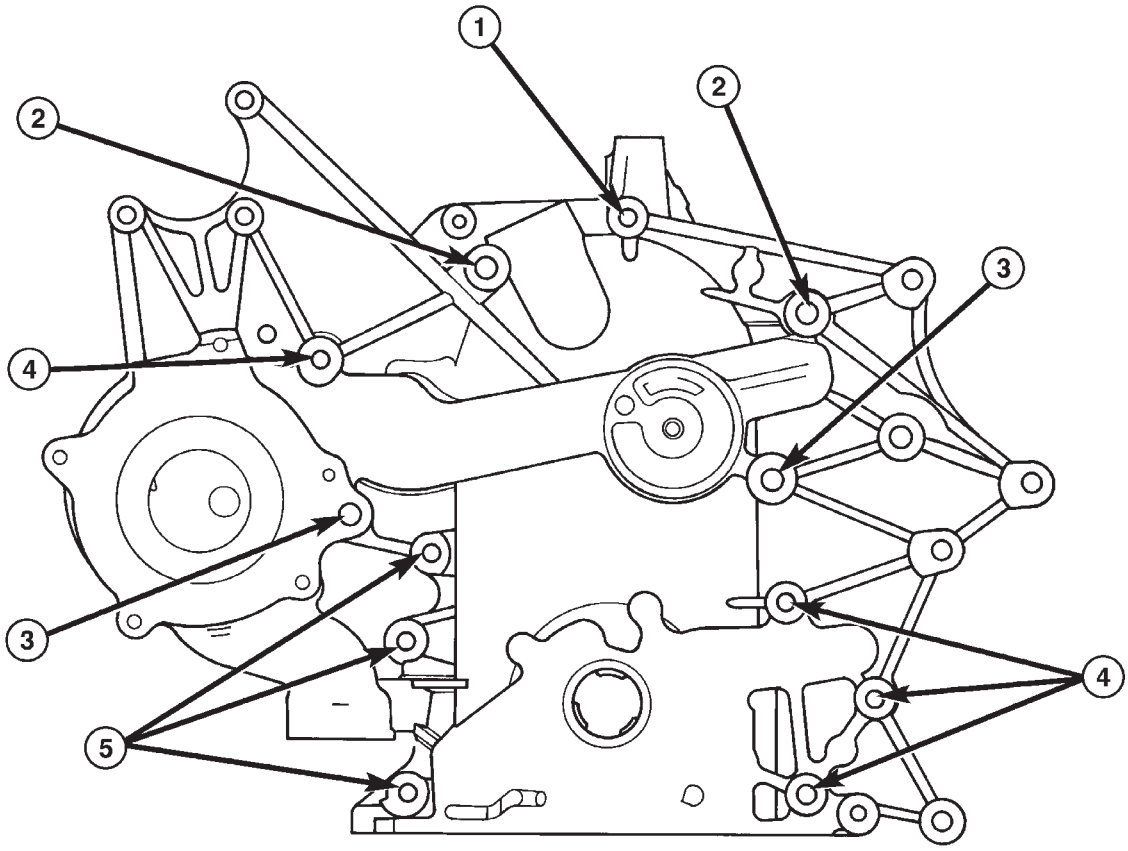

Fig. 145 TIMING CHAIN COVER BOLT LOCATIONS

3 - BOLT - M10 x 1.5 x 85
4 - BOLT - M8 x 1.25 x 80
5 - BOLT - M8 x 1.25 x 45

(18) Install oil pump pick-up tube with new O-ring. Tighten attaching bolt to 28 N·m (250 in. lbs.).

(19) Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

(20) Install inner splash shield and right front wheel.

(21) Fill crankcase with engine oil to proper level.

(22) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

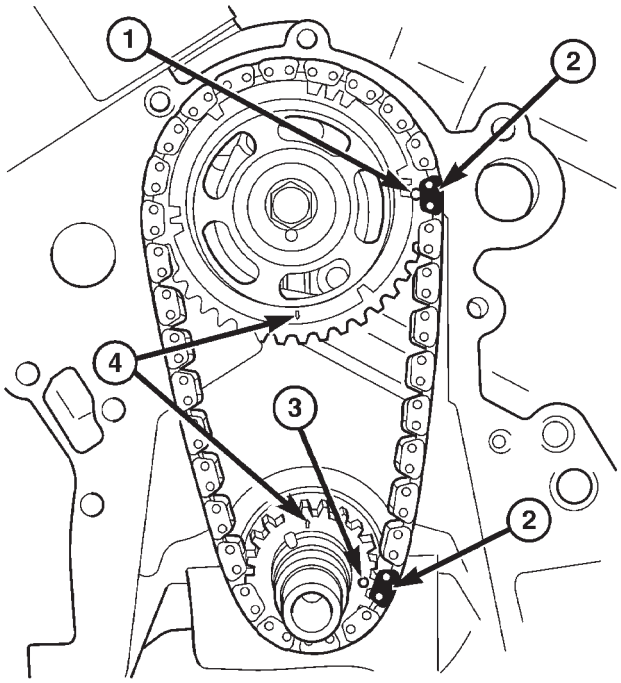
(23) Connect negative cable to battery.

TIMING CHAIN AND SPROCKETS

REMOVAL

REMOVAL - TIMING CHAIN AND CAMSHAFT SPROCKET

(1) Disconnect negative cable from battery.
(2) Remove the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)
(3) Rotate engine by turning crankshaft until the timing marks are aligned as shown in (Fig. 146).
(4) Remove camshaft sprocket attaching bolt.
(5) Remove the timing chain with camshaft sprocket.
(6) Remove the crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)



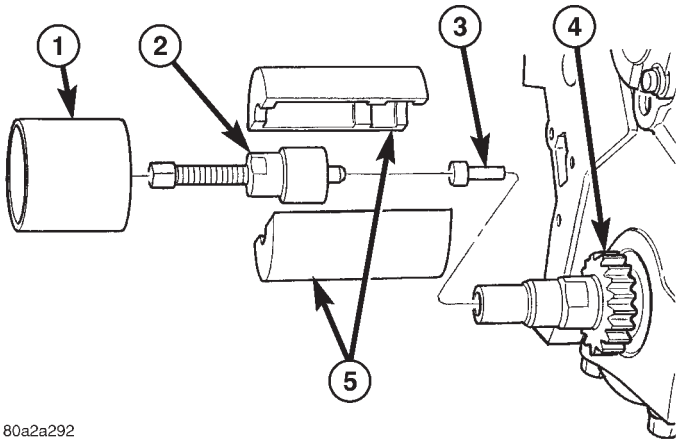
80a2ca28

Fig. 146 Timing Mark Alignment

1 - CAMSHAFT SPROCKET TIMING MARK (DOT)
2 - PLATED LINK
3 - CRANKSHAFT SPROCKET TIMING MARK (DOT)
4 - ARROWS

REMOVAL - CRANKSHAFT SPROCKET

(1) Remove the timing chain. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
(2) Using Special Tools 8539, 5048-6, and 5048-1, remove the crankshaft sprocket while holding the crankshaft from turning (Fig. 147). Be careful not to damage the crankshaft surfaces.



80a2a292

Fig. 147 CRANKSHAFT SPROCKET - REMOVAL

1 - SPECIAL TOOL 5048-6
2 - SPECIAL TOOL 5048-1
3 - SPECIAL TOOL 8450
4 - CRANKSHAFT SPROCKET
5 - SPECIAL TOOL 8539

INSTALLATION

INSTALLATION - CRANKSHAFT SPROCKET

(1) Position the sprocket on the crankshaft (timing mark out) with the timing slot aligned with the timing pin.
(2) Install sprocket using Special Tool 8452 (Fig. 148). Install sprocket until it is fully seats on the crankshaft.
(3) Install the timing chain and camshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

INSTALLATION - TIMING CHAIN AND CAMSHAFT SPROCKET

(1) Rotate crankshaft so the timing arrow is to the 12 o'clock position (Fig. 146).

NOTE: Lubricate timing chain and sprockets with clean engine oil before installation.

(2) While holding camshaft sprocket and chain in hand, place timing chain around the sprocket, aligning the plated link with the dot on the sprocket. Position the timing arrow to the 6 o'clock position (Fig. 146).

TIMING CHAIN AND SPROCKETS (Continued)

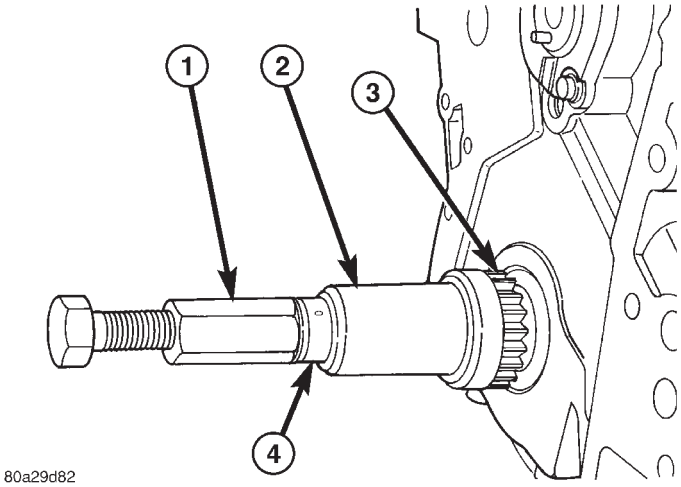


Fig. 148 CRANKSHAFT SPROCKET - INSTALLATION

1 - SPECIAL TOOL 8452-3
2 - SPECIAL TOOL 8452-1
3 - CRANKSHAFT SPROCKET
4 - THRUST BEARING / WASHER

(3) Place timing chain around crankshaft sprocket with the plated link lined up with the dot on the sprocket. Install camshaft sprocket into position.

(4) Use a straight edge to check alignment of timing marks.

(5) Install camshaft sprocket bolt and washer. Tighten bolt to 54 N·m (40 ft. lbs.).

(6) Rotate crankshaft 2 revolutions and check timing mark alignment (Fig. 146). If timing marks do not line up, remove camshaft sprocket and realign.

(7) Install the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(8) Connect negative cable to battery.

ENGINE 2.5L TURBO DIESEL

DESCRIPTION

DESCRIPTION - 2.5L COMMON RAIL DIESEL ENGINE

This 2.5 Liter (2500cc) four-cylinder “common rail” direct injection engine is an in-line overhead valve diesel engine. This engine utilizes a cast iron cylinder block and an aluminum cylinder head. The engine is turbocharged and intercooled. The engine also has four valves per cylinder and dual overhead camshafts (Fig. 1).

DESCRIPTION	SPECIFICATION
Displacement	2.5L (2499 cc)
Bore	92.00
Stroke	94.00
Compression Ratio	17.5:1
Vacuum at Idle	685.8 mm/Hg (27.0 In/Hg)
Belt Tension	Automatic Belt Tensioner

DESCRIPTION	SPECIFICATION
Thermostat Opening	80°C ± 2°C
Generator Rating	Denso 12V-95A
Cooling System Capacity	13.8 Liters W/O Auxiliary Heater 16.6 Liters With Auxiliary Heater
Engine Oil Capacity	6.0L W/Filter Change
Timing System	Belt Driven Camshafts In Cylinder Head Cover
Air Intake	Dry Filter
Fuel Feed	Vane Pump Incorporated In Injection Pump
Fuel System	Direct Fuel Injection
Combustion Cycle	4 Stroke
Cooling System	Water Cooling
Injection Pump	Rotary Pump and Electronically Managed
Lubrication	Pressure Lubricated By Rotary Pump
Engine Rotation	Clockwise Viewed From Front Cover

ENGINE 2.5L TURBO DIESEL (Continued)

DESCRIPTION - ENGINE COVER

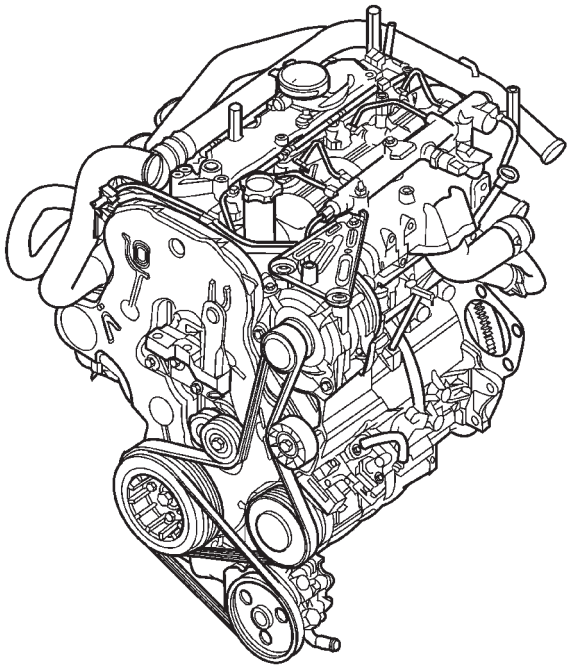

Fig. 1 2.5L COMMON RAIL DIESEL ENGINE

The engine cover is a black plastic cover used to cover the top of the engine (Fig. 10). It is used to isolate engine noises.

REMOVAL

REMOVAL - 2.5L DIESEL ENGINE

(1) Disconnect negative battery cable.
(2) Remove engine cover (Fig. 2). (Refer to 9 - ENGINE - REMOVAL)
(3) Remove air cleaner housing, MAF sensor, and air intake tube assembly (Fig. 3).
(4) Remove coolant pressure tank pressure cap.
(5) Raise vehicle on hoist.
(6) Drain cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(7) Remove lower splash shield.
(8) Remove splash shield side panels.

(10) Disconnect high pressure line at pump (Fig. 4).

(11) Disconnect power steering pump return hose clamp (Fig. 4).

(12) Remove power steering return line retaining clamp (Fig. 4).

(13) Remove power steering line clamps from oil pan (Fig. 4).

(14) Remove power steering pump reservoir and bracket (Fig. 4).

(15) Drain coolant system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).

(16) Remove coolant pressure tank (Fig. 5).

(20) Disconnect upper radiator hose at engine (Fig. 7).
(21) Disconnect lower radiator hose at engine (Fig. 7).
(22) Disconnet brake booster vacuum supply hose.
(23) Disconnect heater core return hose at engine.
(24) Disconnect egr solenoid vacuum line at brake booster check valve.
(25) Disconnect fuel injector, cam sensor, boost pressure/intake air temp sensor, fuel rail high pressure, and egr solenoid connectors (Fig. 8).
(26) Disconnect generator electrical connectors.
(27) Disconnect coolant temp sensor and glow plug electrical connectors.
(28) Disconnect injection pump and A/C compressor electrical connectors.
(29) Disconnect starter electrical connectors.
(30) Disconnect ground wires at engine block.
(31) Raise vehicle on hoist.
(32) Disconnect oil temp sensor, oil pressure sensor, engine speed sensor, and vehicle speed sensor electrical connector (Fig. 9).

(33) Remove front wheels.
(34) Remove the suspension cradle assembly (Refer to 13 - FRAME & BUMPERS/FRAME/ENGINE CRADLE CROSSMEMBER - REMOVAL).
(35) Remove both axle shaft assemblies (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).
(36) Disconnect the clutch slave cylinder quick disconnect line (RHD only)(Refer to 6 - CLUTCH/SLAVE CYLINDER - REMOVAL).
(37) Disconnect reverse lamp connector.
(38) Disconnect shifter cables at the tranmission (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/GEAR SHIFT CABLE - REMOVAL).
(39) Disconnect exhaust pipe from the turbocharger downpipe and reposition to right side of vehicle.
(40) Disconnect cabin heater coolant line (Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - REMOVAL).
(41) Remove front engine mount bracket retaining bolts from lower radiator support
(42) Lower vehicle. Evacuate the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/

PLUMBING/REFRIGERANT - STANDARD PROCEDURE).

(43) Disconnect the A/C lines at the A/C compressor.

(44) Disconnect the fuel supply and return lines.

(45) Position engine cradle under engine and lower vehicle over cradle.

(46) Remove right engine mount bolts.

(47) Remove left engine mount through bolt.

(48) Raise vehicle, leaving engine and transmission on engine cradle.

(49) Lift engine from engine cradle and diassemble as necessary.

REMOVAL - ENGINE COVER

(1) Remove engine cover retaining bolts.

(2) Remove engine cover from engine (Fig. 10).

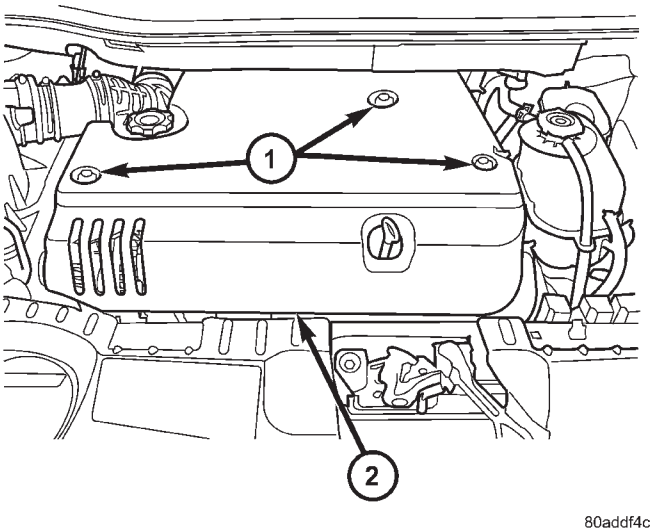

Fig. 10 ENGINE COVER

1 - ENGINE COVER MOUNTING BOLTS

ENGINE 2.5L TURBO DIESEL (Continued)

INSTALLATION

INSTALLATION - 2.5L TURBO DIESEL ENGINE

(1) Reassembly engine and transmission assembly and install on engine cradle.

(2) Position engine and cradle assembly under vehicle.

(3) Slowly lower the vehicle down over the engine and cradle assembly.

(4) Install right engine mount bolts. Torque to 54N·m (40 ft. lbs.)

(5) Install left engine mount through bolt. Torque to 75N·m (55 ft. lbs.)

(6) Raise vehicle and engine from engine cradle.

(7) Attach front engine mount bracket to lower radiator support. Torque to 54N·m (40 ft. lbs.)

(8) Connect cabin heater coolant hose.

(9) Connect exhaust pipe to the turbocharger downpipe flange. Torque to 28 N·m (250 in. lbs.)

(10) Connect reverse lamp electrical connector at transmission.

(11) Connect both shifter cables (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/GEAR SHIFT CABLE - INSTALLATION).

(12) Connect the clutch slave cylinder quick disconnect connector (RHD only)(Refer to 6 - CLUTCH/ SLAVE CYLINDER - INSTALLATION).

(13) Install engine harness into bracket on transmission.

(14) Lower vehicle.

(15) Connect fuel supply and return lines.

(16) Connect A/C lines to A/C compressor. Torque to 23N·m (17 ft. lbs.)

(17) Route engine wiring harnes to proper location.

(18) Connect engine harness ground cables to engine block

(19) Connect starter solenoid electrical connector and battery feed wire to starter. Torque to 10N·m (90 in. lbs.)

(20) Connect A/C compressor, injection pump, glow plugs, and coolant temperature sensor electrical connectors.

(21) Connect generator electrical connector. Torque to 9N·m (75 in. lbs.)

(22) Connect the fuel injector, fuel pressure sensor, boost pressure/intake air temp sensor, cam sensor, and egr solenoid electrical connectors (Fig. 8).

(23) Connect egr solenoid vacuum supply line to brake boost vacuum supply line.

(24) Connect brake booster vacuum supply line.

(25) Connect heater core return hose to coolant pipe.

(26) Connect lower radiator hose to engine (Fig. 7).

(27) Install charger air cooler inlet hose (Fig. 6).

(28) Install charge air cooler outlet hose (Fig. 6).

(29) Connect upper radiator hose to engine (Fig. 7).

(30) Install battery shield.

(31) Install coolant reserve pressure container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - INSTALLATION).

(32) Install power steering reservoir and bracket (Fig. 4).

(33) Raise vehicle

(34) Connect oil pressure sensor, oil temperature sensor, engine speed sensor, and vehicle speed sensor electrical connector (Fig. 9).

(35) Install suspension cradle in vehicle (Refer to 13 - FRAME & BUMPERS/FRAME/ENGINE CRADLE CROSSMEMBER - INSTALLATION).

(36) Install both axle shaft assemblies (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).

(37) Connect the power steering supply, pressure, and return lines to power steering pump (Fig. 4).

(38) Install the power steering line brackets on oil pan (Fig. 4).

(39) Install lower splash shield and side panels.

(40) Install both front wheel and tire assemblies.

(41) Lower vehicle.

(42) Install air cleaner housing, MAF sensor, and air intake tube assembly (Fig. 3).

(43) Refill transmission to proper level (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/FLUID - STANDARD PROCEDURE).

(44) Refill engine coolant (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).

(45) Recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE) .

(46) Install engine cover (Refer to 9 - ENGINE - INSTALLATION) (Fig. 2).

(47) Connect negative battery cable.

INSTALLATION - ENGINE COVER

(1) Install engine cover on engine.

(2) Install the engine cover mounting bolts (Fig. 10).

CYLINDER HEAD

STANDARD PROCEDURE

STANDARD PROCEDURE - VALVE SERVICE

This procedure is done with the engine cylinder head removed from the block.

DISASSEMBLY

(1) Remove the engine cylinder head from the cylinder block. Refer to cylinder head removal and installation in this section.

(2) Use Valve Spring Compressor Tool and compress each valve spring.

(3) Remove the valve locks, retainers, and springs.

(4) Use an Arkansas smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.

(5) Remove the valves, and place them in a rack in the same order as removed.

VALVE CLEANING

(1) Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

(2) Clean all grime and gasket material from the engine cylinder head machined gasket surface.

INSPECTION

(1) Inspect for cracks in the combustion chambers and valve ports.

(2) Inspect for cracks on the exhaust seat.

(3) Inspect for cracks in the gasket surface at each coolant passage.

(4) Inspect valves for burned, cracked or warped heads.

(5) Inspect for scuffed or bent valve stems.

(6) Replace valves displaying any damage.

(7) Check valve spring height (Fig. 11).

VALVE REFACING

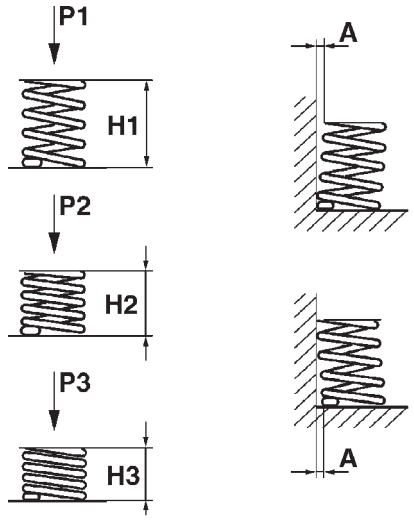
(1) Use a valve refacing machine to reface the intake and exhaust valves to the specified angle.

(2) After refacing, a margin of at least 4.52-4.49 mm (.178-.177 inch) must remain (Fig. 12). If the margin is less than 4.49 mm (.177 inch), the valve must be replaced.

VALVE SEAT REFACING

(1) Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.

(2) Use tapered stones to obtain the specified seat width when required.



80bfe1e8

Fig. 11 VALVE SPRING CHART

	LOAD Kg		HEIGHT mm	STATE
P1	0.00	H1	45.26	FREE LENGTH
P2	182-5 +10%	H2	38.00	VALVE CLOSED
P3	395±5%	H3	28.20	VALVE OPEN

VALVE STAND DOWN

Valve stand down is to maintain the adequate compression ratio.

(1) Invert cylinder head.

(2) Fit each valve to its respective valve guide.

(3) Using a straight edge and feeler gauge, check valve head stand down: Inlet valve head stand down 1.08 to 1.34 mm (.042 to .052 ins.) and exhaust valve stand down .99 to 1.25 mm (.035 to .049 ins.).

(4) If valve head stand down is not in accordance with above, discard original valves, check stand down with new valves and recut valve seat inserts to obtain correct stand down.

VALVE GUIDES

(1) Valve Guides height requirement.

(2) Measurement A (Fig. 13): 16.50 - 17.00 mm. Measurment B : 14.50 - 15.00 mm.

VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT

(1) Measure and record internal diameter of valve guides. Valve guide internal diameter is 8.0 to 8.015 mm (.3149 to .3155 ins.).

(2) Measure valve stems and record diameters. Intake valve stem diameter 7.94 to 7.96 mm (.3125 to

CYLINDER HEAD (Continued)

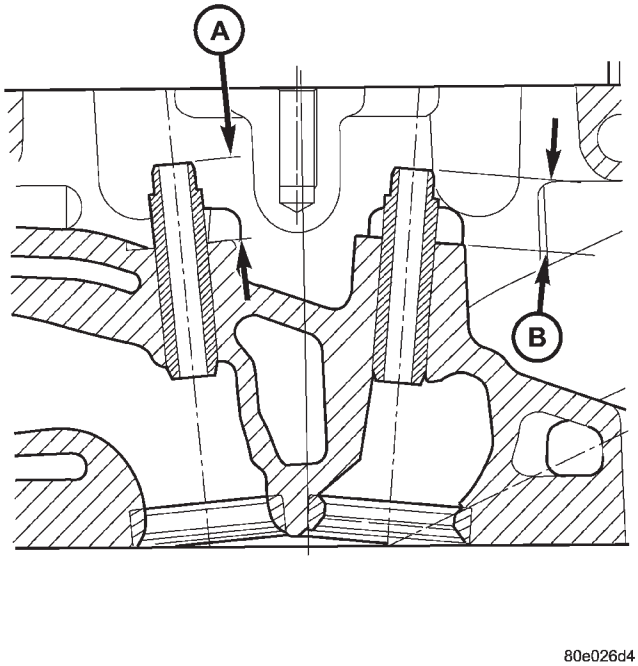

Fig. 13 VALVE GUIDE HEIGHT

.3133 in). Exhaust valve stem diameter 7.92 to 7.94 mm (.3118 to .31215 in).

(3) Subtract diameter of valve stem from internal diameter of its respective valve guide to obtain valve stem clearance in valve guide. Clearance of inlet valve stem in valve guide is .040 to .075 mm (.0015 to .0029 in). Clearance of exhaust valve stem in valve guide is .060 to .093 mm (.0023 to .0036 in).

(4) If valve stem clearance in valve guide exceeds tolerances, new valve guides must be installed.

STANDARD PROCEDURE - MEASURING PISTON PROTRUSION

(1) Use special tool VM.1010 with dial indicator special tool VM.1013 (Fig. 14).

(2) Bring the piston of cylinder no. 1 exactly to top dead center.

(3) Zero the dial indicator on the cylinder block mating surface.

(4) Setup the dial indicator on the piston crown (above the center of the piston pin) 5mm (1/8 in.) from the edge of the piston and note the measurement.

(5) Repeat the procedure with the rest of the cylinders.

(6) Establish the thickness of the steel gasket by averaging the four piston potrusion readings.

CYLINDER HEAD (Continued)

Measure Dimension (mm)	0.49-0.60
Cylinder Head Gasket Thickness (mm)	1.32 No Holes or Notches
Piston Clearance (mm)	0.72-0.83
Measure Dimension (mm)	0.61-0.70
Cylinder Head Gasket Thickness (mm)	1.42 1 Hole or Notch
Piston Clearance (mm)	0.72-0.84
Measure Dimension (mm)	0.71-0.83
Cylinder Head Gasket Thickness (mm)	1.52 2 Holes or Notches
Piston Clearance (mm)	0.68-0.81

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(3) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(4) Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(5) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Remove generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(8) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).

CAUTION: Before removing the cylinder head cover/intake manifold or timing belt the engine must put at 90° after TDC. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

(9) Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(10) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(11) Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(12) Remove cylinder head cover/intake manifold (Fig. 15)(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

11 - ROCKER ARM AND LIFTER ASSEMBLY

CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.

Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

INSPECTION

Use a straightedge and feeler gauge to check the flatness of the engine cylinder head and block mating surfaces.

The minimum cylinder head thickness is 89.95mm (3.541 in.).

INSTALLATION

CAUTION: Piston protrusion must be measured to determine cylinder head gasket thickness if one or more cylinder liners have been replaced (Refer to 9 - ENGINE/CYLINDER HEAD - STANDARD PROCEDURE).

NOTE: If cylinder liner(s) have not been removed, the same thickness head gasket that was removed can be used.

(1) Clean and inspect gasket mating surfaces.
(2) Position correct head gasket on engine block.
(3) Place cylinder head on engine block (Fig. 18).

CAUTION: New cylinder head bolts must be used.

(4) Tighten cylinder head bolts following procedure below.

Cylinder Head Bolt Torquing Procedure

(1) Lubricate cylinder head bolts with engine oil.
(2) Torque bolts to 30N·m in numerical starting with bolt #1 (Fig. 19).
(3) Tighten all bolts an additional 75°, starting with bolt #4 then 5-6-7-8-9-10-1-2-3 (Fig. 19).
(4) Tighten all bolts an additional 50° in numerical order starting with bolt #11 then 12-13-14-15-16-17-18 (Fig. 19).
(5) Without loosening any bolts tighten all bolts an additional 75° in the following seguence: 4-5-6-7-8-9-10-1-2-3-11-12-13-14-15-16-17-18.

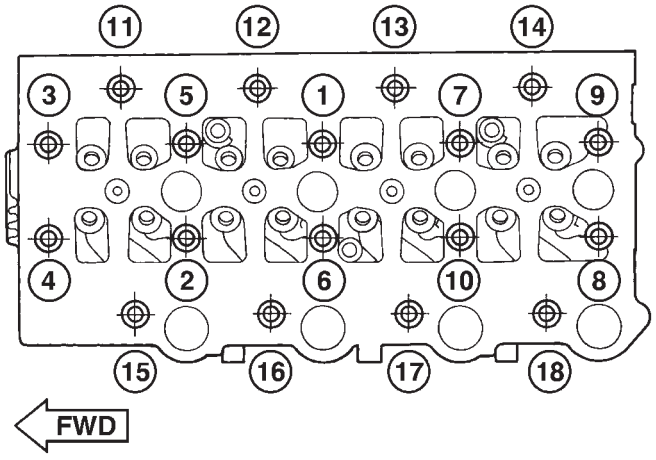

Fig. 19 CYLINDER HEAD TORQUE SEQUENCE

CYLINDER HEAD (Continued)

(5) Slide exhaust manifold and turbocharger on exhaust manifold studs (Fig. 17).

(6) Install exhaust manifold retaining nuts. Torque nuts to 32.4N·m.

(7) Install exhaust manifold heat shield (Fig. 17). Torque bolts to 27.5N·m.

(8) Install turbocharger outlet to charge air cooler pipe (Fig. 16).

(9) Install thermostat housing to upper radiator hose pipe (Fig. 16). Install retaining bolt and torque to 47.1N·m.

(10) Install coolant recovery pressure container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - INSTALLATION).

(11) Connect glow plug and coolant temperature sensor electrical connectors.

(12) Install new cylinder head cover/intake manifold gasket.

(13) Install rocker arm and lifter assemblies.**Be sure to put rocker arm and lifter assemblies in same location as removed.**

(14) Install cylinder head cover/intake manifold (Fig. 15)(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(15) Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(16) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(17) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(18) **Remove crankshaft and both camshaft locking pins at this time** (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).

(19) Install generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(20) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(21) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(22) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(23) Install air cleaner housing assembly.

(24) Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(25) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

(26) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(27) Connect negative battery cable.

CAMSHAFT(S)

DESCRIPTION

The camshafts are made of gray cast iron with eight machined lobes and four bearing journals (Fig. 20).

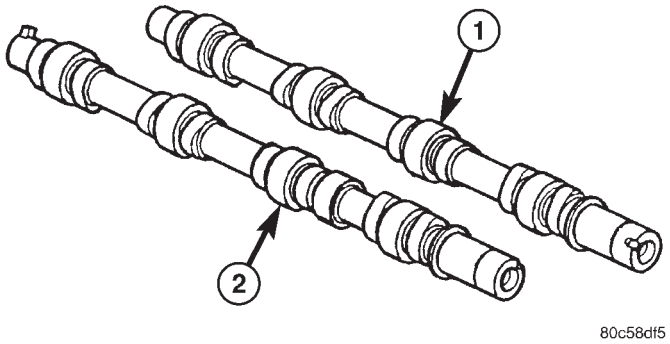

Fig. 20 CAMSHAFTS

1 - INTAKE CAMSHAFT
2 - EXHAUST CAMSHAFT

OPERATION

When the camshaft rotates the lobes actuate the hydraulic lifters and rocker arms, forcing downward on the rocker arms which opens the valves.

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(3) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(4) Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(5) Remove air cleaner housing.

(6) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(8) Remove generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(9) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).

CAMSHAFT(S) (Continued)

CAUTION: Before removing the cylinder head cover/ intake manifold or timing belt the engine must put at 90° after TDC. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

(10) Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(11) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(12) Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(13) Remove cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(14) With cylinder head cover/intake manifold on work bench, remove plugs at rear of cylinder head cover/intake manifold.
(15) Remove camshaft oil seals (Fig. 21).
(16) Remove snapring and thrust washer from camshaft (Fig. 21).
(17) Slide camshaft through access hole at rear of cylinder head cover/intake manifold.

INSTALLATION

(1) Lubricate the camshafts with Mopar® Engine Oil Supplement, or equivalent.
(2) Carefully install camshafts into access holes in rear of cylinder head cover/intake manifold.
(3) Install thrust washer, snapring, and camshaft oil seal (Fig. 21).

CHECKING CAMSHAFT ENDPLAY

(1) After camshafts are properly installed in cylinder head cover check end play of camshafts with a dial indicator. The end play should be between .10 mm – .30 mm.

NOTE: If the camshaft endplay is not within specification, measure thickness of the camshaft spacer. Camshaft spacer thickness should be 2.8 ± .02mm.

(4) Install access hole plugs and gaskets at rear of cylinder head cover/intake manifold. Torque plugs to 80N·m.
(5) Install cylinder head cover/intake manifold on engine block (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
(6) Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

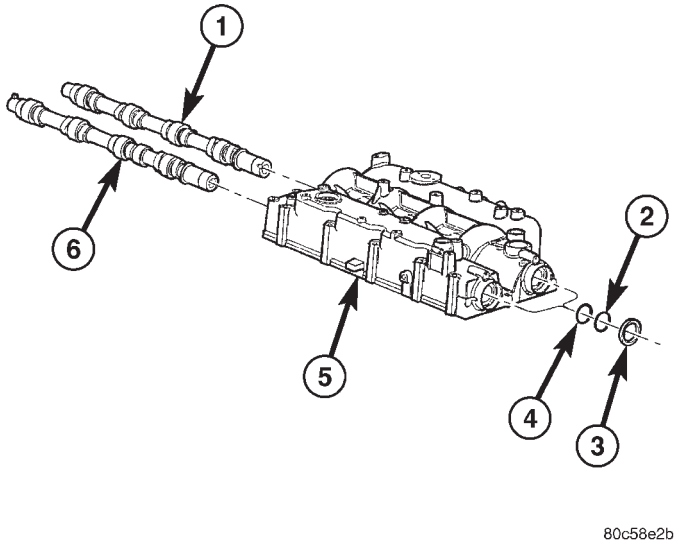

Fig. 21 CAMSHAFT ASSEMBLY

5 - CYLINDER HEAD COVER/INTAKE MANIFOLD
6 - EXHAUST CAMSHAFT

(7) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .
(8) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(9) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).
(10) Install generator (Refer to 8 - ELECTRICAL/ CHARGING/GENERATOR - INSTALLATION).
(11) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(12) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(13) Install air cleaner housing.
(14) Refill cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(15) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).
(16) Connect negative battery cable.

CYLINDER HEAD COVER(S)

DESCRIPTION

The cylinder head cover is made of cast aluminum and is also the intake manifold on this engine (Fig. 22).

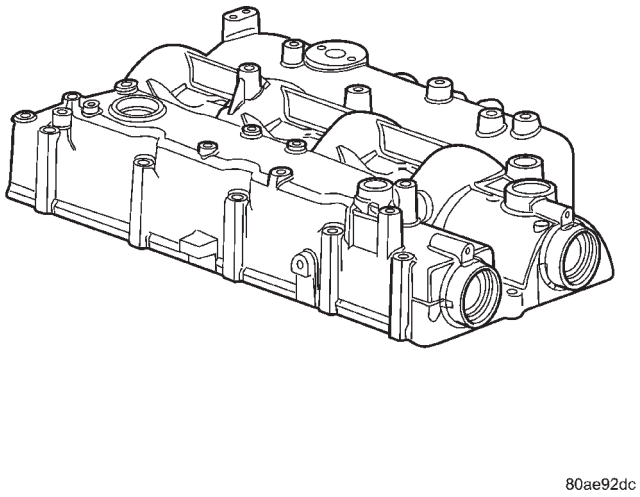

Fig. 22 CYLINDER HEAD COVER/INTAKE MANIFOLD

REMOVAL

CAUTION: Before removing the cylinder head cover/ intake manifold the engine must put at 90° after TDC. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

(1) Disconnect negative battery cable.

(2) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(3) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(4) Drain cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).

(5) Rotate engine until 90° after TDC is reached. Install both camshaft locking pins and the crankshaft locking pin. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

(6) Remove air cleaner housing assembly.

(7) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(8) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(9) Remove generator (Refer to 8 - ELECTRICAL/ CHARGING/GENERATOR - REMOVAL).

(10) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/ RIGHT MOUNT - REMOVAL).

(11) Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(12) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(13) Remove inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(14) Disconnect camshaft position sensor, boost pressure/intake air temperature sensor, EGR solenoid, and fuel pressure sensor electrical connectors (Fig. 23).

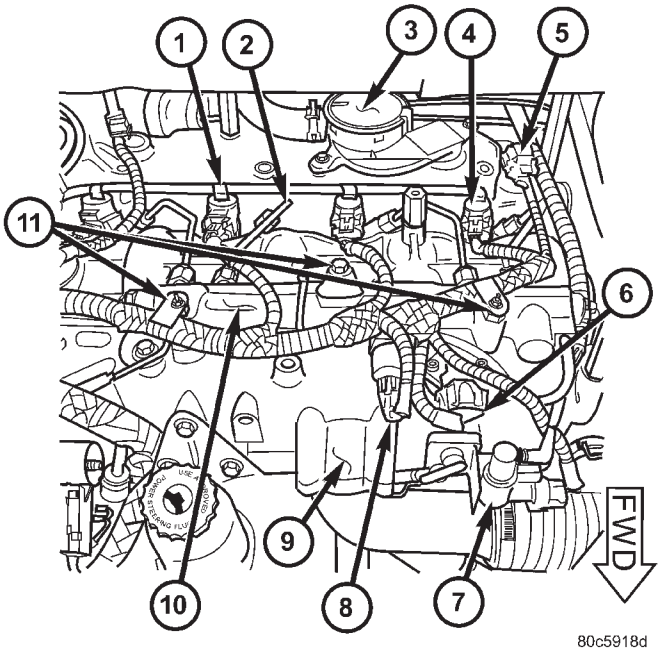

Fig. 23 ENGINE COMPONENT LOCATIONS

CYLINDER HEAD COVER(S) (Continued)

(15) Disconnect vacuum lines at EGR solenoid.
(16) Position electrical harness out of way.
(17) Remove fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).
(18) Remove fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - REMOVAL).
(19) Remove power steering pump reservoir from bracket.
(20) Remove oil dipstick tube retaining bolt at intake manifold inlet.
(21) Disconnect oil separator outlet hose at separator.
(22) Remove turbo inlet tube retaining bolt at intake manifold.
(23) Disconnect EGR tube at intake manifold inlet tube.
(24) Remove cylinder head cover/intake manifold retaining bolts (Fig. 24).
(25) Lift cylinder head cover/intake manifold from cylinder head (Fig. 24).

4 - CYLINDER HEAD COVER/INTAKE MANIFOLD GASKET
5 - CYLINDER HEAD COVER/INTAKE MANIFOLD BOLTS(SHORT)

NOTE: When removing rocker arm and lifter assemblies, be sure to keep them in order as they were removed from the cylinder head. Always keep lifters in an upright position when removed from cylinder head.

(26) Remove rocker arm and lifter assemblies from cylinder head (Fig. 25).

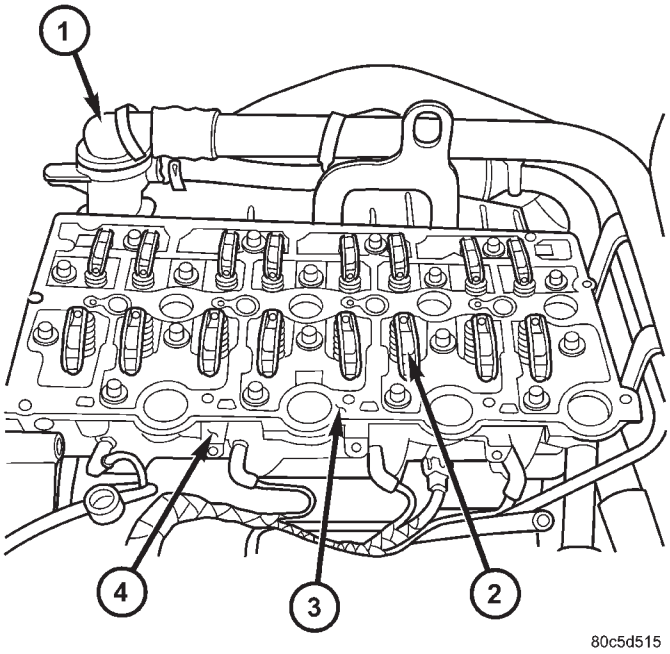

Fig. 25 CYLINDER HEAD COVER/INTAKE MANIFOLD GASKET LOCATION

1 - THERMOSTAT HOUSING
2 - ROCKER ARM AND LIFTER ASSEMBLY
3 - CYLINDER HEAD COVER/INTAKE MANIFOLD
4 - CYLINDER HEAD

(27) Remove cylinder head cover/intake manifold gasket from cylinder head.

INSTALLATION

(1) Clean and inspect sealing surfaces.
(2) Install new gasket on cylinder head.

NOTE: Apply a small amount of grease on each valve stem. This will help hold the rocker arm in position during the cylinder head cover installation.

(3) Install rocker arm and lifter assemblies in cylinder head (Fig. 25).**Be sure to put rocker arm and lifter assemblies in same location as removed.**
(4) Install cylinder head cover/intake manifold alignment studs in cylinder head (Fig. 26).
(5) Install cylinder head cover/intake manifold over alignment stud.

CYLINDER HEAD COVER(S) (Continued)

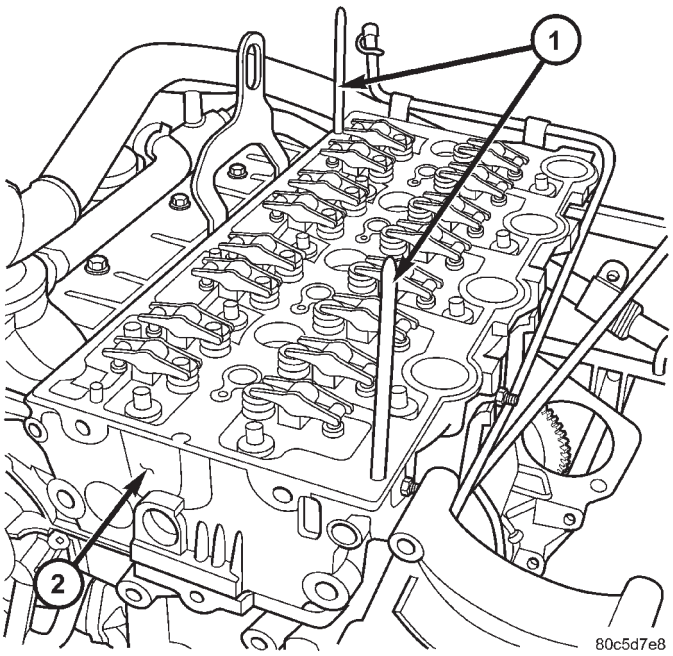

Fig. 26 CYLINDER HEAD COVER/INTAKE MANIFOLD ALIGNMENT STUDS VM.1066

1 - CYLINDER HEAD COVER/INTAKE MANIFOLD ALIGNMENT STUDS VM.1066
2 - CYLINDER HEAD

NOTE: Be sure to lubricate cylinder head cover/intake manifold retaining bolts with engine oil before assembly. If new bolts are being installed, DO NOT lubricate before assembly.

(6) Install two cylinder head cover/intake manifold retaining bolts and tighten finger tight.

(7) Remove alignment studs and install remaining retaining bolts (Fig. 24). Tighten retaining bolts finger tight.

(8) Torque cylinder head cover/intake manifold retaining bolts following procedure below.

CYLINDER HEAD COVER/INTAKE MANIFOLD TIGHTENING PROCEDURE

(1) Coat all bolts being reused with clean engine oil.

(2) Install the M8x35 bolts into holes 1,2,3,4,5, and 12. Install the M8x85 bolts into holes 6,7,8,9,10,11,13,14,15, and 16. Tighten all bolt **hand tight**.

(3) Alternate between bolts #11 and #16 to seat cylinder head cover/intake manifold on cylinder head (Fig. 27). Torque bolts to 7 N·m.

(4) Torque all cylinder head cover/intake manifold retaining bolts to 25 N·m in numerical order starting with #1 and ending with #16 (Fig. 27).

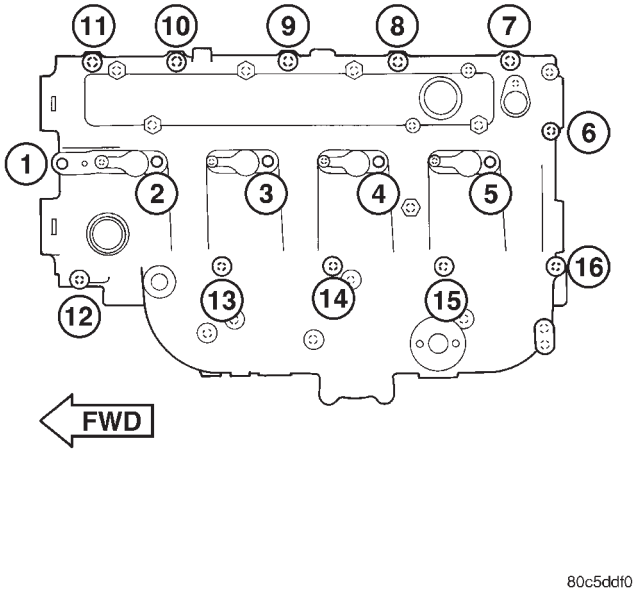

Fig. 27 CYLINDER HEAD COVER/INTAKE MANIFOLD TIGHTENING SEQUENCE

(9) Connect EGR tube at intake manifold inlet tube. Torque clamp to 10.8 N·m.

(10) Install turbo inlet tube retaining bolt at intake manifold. Torque bolt to 27.5 N·m.

(11) Connect oil separator outlet hose at separator.

(12) Install oil dipstick tube retaining bolt at intake manifold inlet. Torque bolt to 10 N·m.

(13) Install power steering pump reservoir in bracket.

(14) Install fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION).

(15) Install fuel injectors and fuel injector supply lines (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).

(16) Connect vacuum lines at EGR solenoid.

(17) Clip wiring harness retainers on studs on fuel rail (Fig. 23).

(18) Connect camshaft position sensor, boost pressure/intake air temperature sensor, EGR solenoid, and fuel pressure sensor electrical connectors (Fig. 23).

(19) Install inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(20) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(21) Install outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

CYLINDER HEAD COVER(S) (Continued)

(22) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).
(23) Install generator (Refer to 8 - ELECTRICAL/ CHARGING/GENERATOR - INSTALLATION).
(24) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(25) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(26) Install air cleaner housing assembly.
(27) Remove crankshaft and both camshaft locking pins (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
(28) Refill cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(29) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).
(30) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).
(31) Connect negative battery cable.

CAMSHAFT OIL SEAL(S)

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove air cleaner housing assembly.
(3) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).
(4) Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

WARNING: Before removing the timing belt the engine must put at 90° after TDC. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

(5) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(6) Using VM.1055, remove both camshaft gears (Fig. 28).
(7) Remove both camshaft oil seals.

INSTALLATION

(1) Install new camshaft oil seal using VM.1057.
(2) Install camshaft sprockets and tighten retaining bolts finger tight.
(3) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

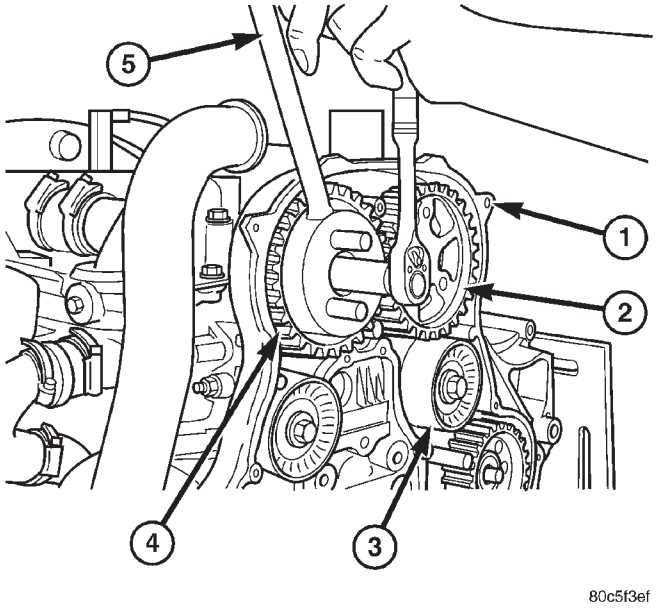

Fig. 28 CAMSHAFT GEAR REMOVAL/INSTALLATION

1 - TIMING BELT INNER COVER
2 - CAMSHAFT SPROCKET
3 - IDLER PULLEYS
4 - CAMSHAFT SPROCKET
5 - VM.1055

(4) Torque camshaft sprockets to 108 N·m using VM.1055 (Fig. 28).
(5) Install outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(6) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).
(7) Install air cleaner housing assembly.
(8) Connect negative battery cable.

ROCKER ARMS

DESCRIPTION

The rocker arms are made of stamped steel (Fig. 29).

OPERATION

The rocker arms are used as a link between the camshaft and valves. As the camshaft rotates the lobes of the camshafts apply downward pressure on the rocker arms. This pressure is then transmitted to the valves which causes the valves to open.

REMOVAL

(1) Disconnect negative battery cable.

ROCKER ARMS (Continued)

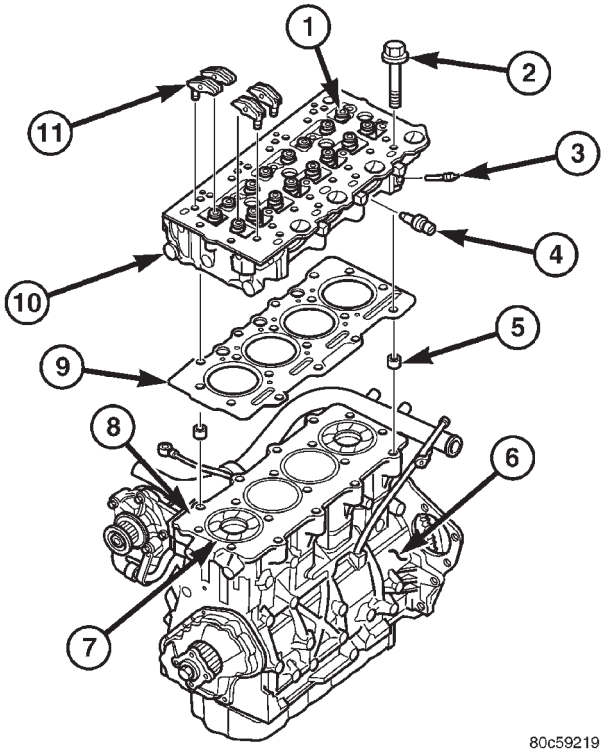

Fig. 29 CYLINDER HEAD ASSEMBLY

(2) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(3) Remove air cleaner housing assembly.

(4) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).

(5) Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(6) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(7) Remove inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(8) Remove cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(9) Remove rocker arm from lifter (Fig. 30).

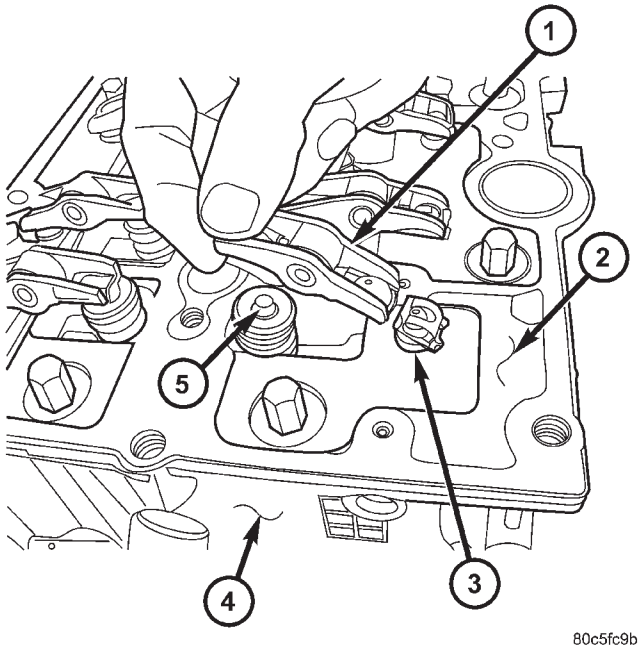

Fig. 30 ROCKER ARM ASSEMBLY

1 - ROCKER ARM ASSEMBLY
2 - CYLINDER HEAD COVER/INTAKE MANIFOLD
3 - HYDRAULIC LIFTER
4 - CYLINDER HEAD
5 - VALVE

INSTALLATION

(1) Clean and inspect gasket sealing surfaces.

(2) Install new gasket on cylinder head.

(3) Lubricate lifter ball end of lifter(s), valve(s), and rocker arm roller(s) with Mopar® Engine Oil Supplement or equivlalent.

(4) Connect rocker arm(s) to lifter and reposition on valve(s) (Fig. 30).

(5) Install cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Install inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(7) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(8) Install outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(9) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(10) Install air cleaner housing assembly.

ROCKER ARMS (Continued)

(11) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(12) Connect negative battery cable.

HYDRAULIC LIFTERS

DESCRIPTION

Valve lash is controlled by hydraulic tappets located inside the cylinder head, in tappet bores below the camshafts (Fig. 31).

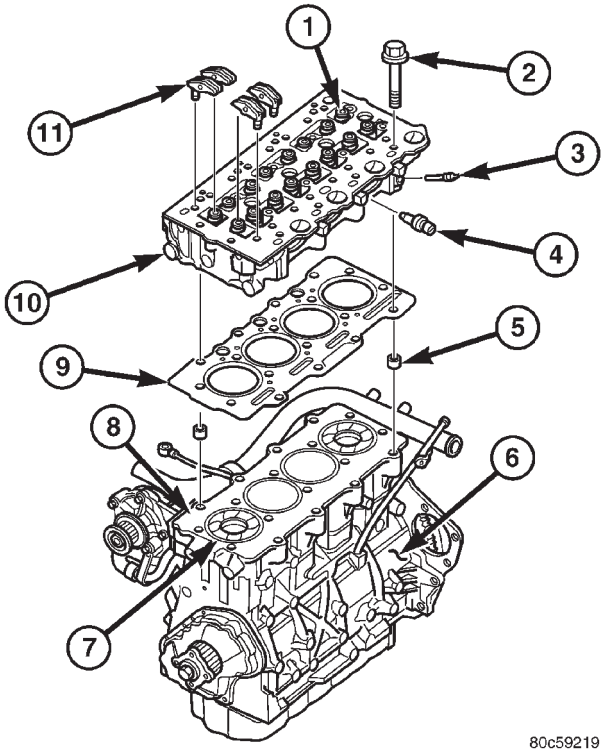

Fig. 31 CYLINDER HEAD ASSEMBLY

1 - VALVE SPRING
2 - CYLINDER HEAD BOLT
3 - GLOW PLUG
4 - COOLANT TEMPERATURE SENSOR
5 - CYLINDER HEAD ALIGNMENT DOWEL
6 - CYLINDER BLOCK
7 - CYLINDER LINER
8 - ENGINE BLOCK DECK
9 - CYLINDER HEAD GASKET
10 - CYLINDER HEAD
11 - ROCKER ARM AND LIFTER ASSEMBLY

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(3) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(4) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).

(5) Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

CAUTION: Before removing the cylinder head cover/ intake manifold or the timing belt the engine must put at 90° after TDC. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

(6) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(7) Remove inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(8) Remove cylinder head cover/intake manifold (Fig. 32)(Refer to 9 - ENGINE/CYLINDER HEAD/ CYLINDER HEAD COVER(S) - REMOVAL).

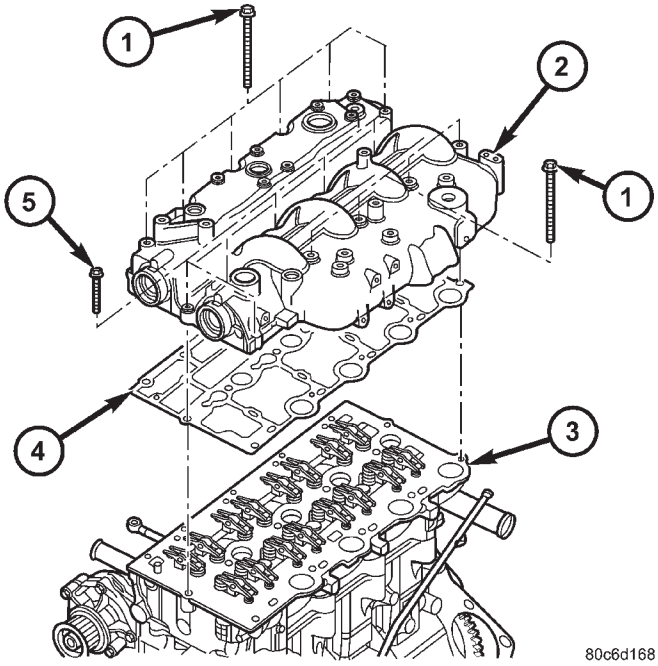

Fig. 32 CYLINDER HEAD COVER/INTAKE MANIFOLD

1 - CYLINDER HEAD COVER/INTAKE MANIFOLD BOLTS(LONG)
2 - CYLINDER HEAD COVER/INTAKE MANIFOLD
3 - CYLINDER HEAD
4 - CYLINDER HEAD COVER/INTAKE MANIFOLD GASKET
5 - CYLINDER HEAD COVER/INTAKE MANIFOLD BOLTS(SHORT)

HYDRAULIC LIFTERS (Continued)

(9) Remove rocker arm and lifter assemblies from lifter bores.

INSPECTION

Clean each lifter assembly in cleaning solvent to remove all varnish and sludge deposits. Inspect for indications of scuffing on the side and base of each lifter body.

INSTALLATION

(1) Install rocker arm and lifter assemblies in lifter bores.

(2) Install cylinder head cover/intake manifold (Fig. 32) (Refer to 9 - ENGINE/CYLINDER HEAD/ CYLINDER HEAD COVER(S) - INSTALLATION).

(3) Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(4) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(5) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(6) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(7) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

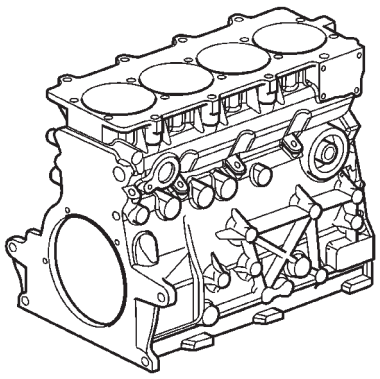
(8) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(9) Connect negative battery cable.

ENGINE BLOCK

DESCRIPTION

The 2.5L CRD Diesel engine uses a cast iron engine block with wet cast iron cylinder liners (Fig. 33).



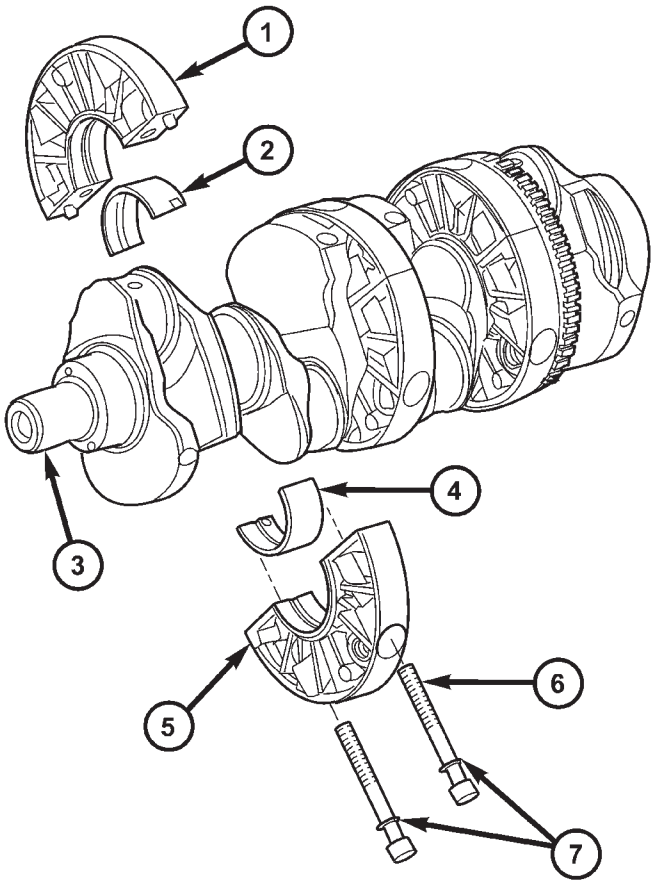
80c6aef8

Fig. 33 ENGINE BLOCK

CRANKSHAFT

DESCRIPTION

The crankshaft is a forged steel type design with five main bearing journals. The crankshaft is located at the bottom of the engine block and is held in place with three main bearing supports (Fig. 34).



80adf230

Fig. 34 CRANKSHAFT ASSEMBLY

1 - CRANKSHAFT SUPPORT HALVE
2 - MAIN BEARING HALVE
3 - CRANKSHAFT
4 - MAIN BEARING HALVE
5 - CRANKSHAFT SUPPORT HALVE
6 - MAIN BEARING SUPPORT BOLTS
7 - WASHERS

OPERATION

The crankshaft transfers force generated by combustion within the cylinder bores to the flywheel or flexplate.

CRANKSHAFT (Continued)

STANDARD PROCEDURE - CHECKING CRANKSHAFT END PLAY

(1) Mount a dial indicator to a stationary point at rear of engine. Locate the probe perpendicular against the flywheel (Fig. 35).

(2) Move the crankshaft all the way to the front of its travel.

(3) Zero the dial indicator.

(4) Move the crankshaft all the way to the rear and read dial indicator. For crankshaft end play clearances (Refer to 9 - ENGINE - SPECIFICATIONS).

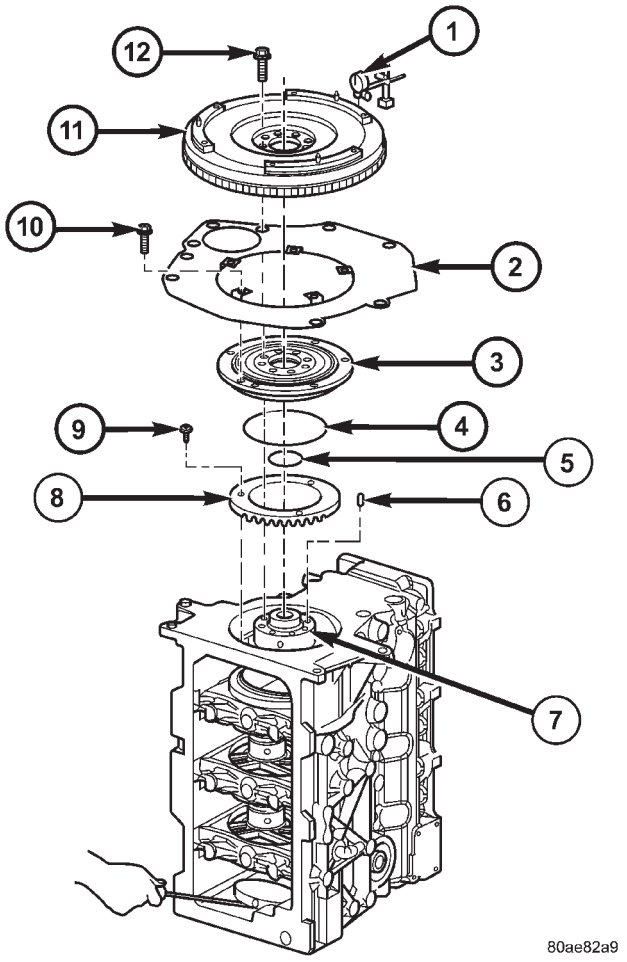


Fig. 35 CHECKING CRANKSHAFT END PLAY

12 - FLYWHEEL BOLTS

REMOVAL

(1) Remove engine from vehicle (Refer to 9 - ENGINE - REMOVAL).

(2) Mount engine on an engine stand.

(3) Drain engine oil and remove oil filter.

(4) Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(5) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(6) Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(7) Remove cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(8) Remove cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).

(9) Remove flywheel.

(10) Remove rear main bearing support/adapter plate retaining bolts and remove adapter plate (Fig. 36).

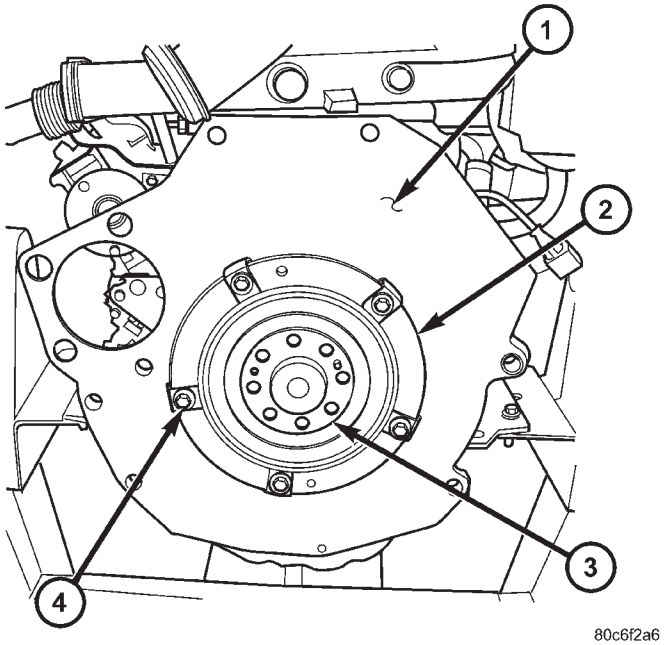

Fig. 36 REAR MAIN BEARING SUPPORT

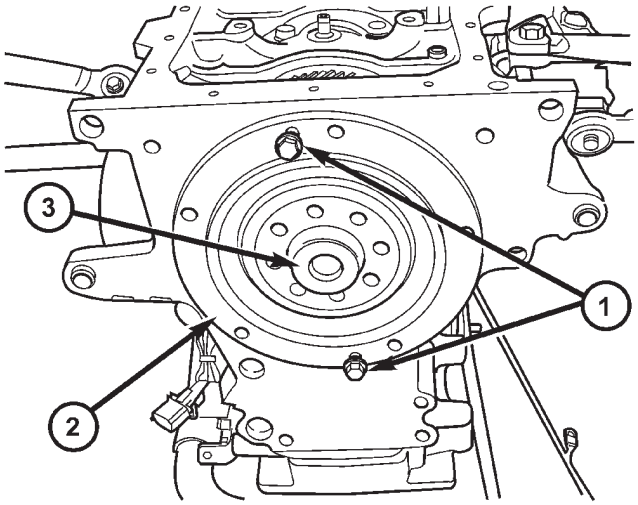
1 - ADAPTER PLATE
2 - REAR MAIN BEARING SUPPORT
3 - CRANKSHAFT
4 - REAR MAIN BEARING SUPPORT RETAINING BOLTS

CRANKSHAFT (Continued)

(11) Remove rear main bearing support by threading two retaining bolts in holes provided. Tighten bolts equally to push main bearing support out of block (Fig. 37).



80c6ea3e

Fig. 37 REAR MAIN BEARING SUPPORT REMOVAL

1 - BOLTS
2 - REAR MAIN BEARING SUPPORT
3 - CRANKSHAFT

(12) Remove front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL).

(13) Remove crankshaft sprocket.

(14) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(15) Remove oil pump pickup tube (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(16) Remove balance shaft assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - REMOVAL).

(17) Remove oil jets (Refer to 9 - ENGINE/LUBRICATION/OIL JET - REMOVAL).

(18) Remove piston and connecting rod assemblies (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - REMOVAL).

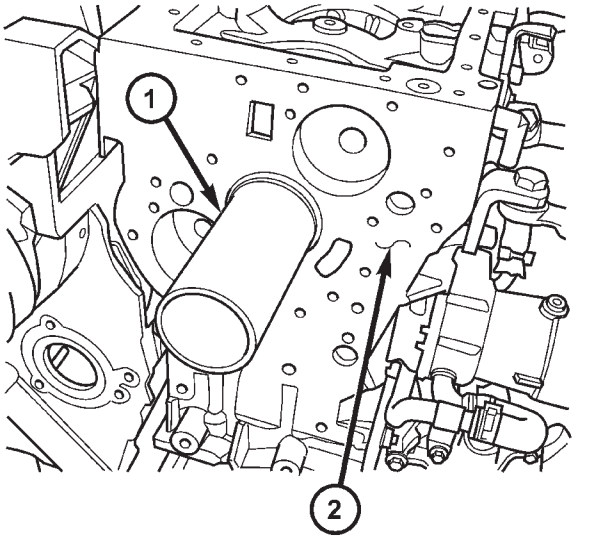
(19) Slide special tool VM.1069 on crankshaft (Fig. 38).

(20) Using special tool VM.1054, remove crankshaft support retainers (Fig. 39).

(21) Slide crankshaft out rear of engine block.

INSTALLATION

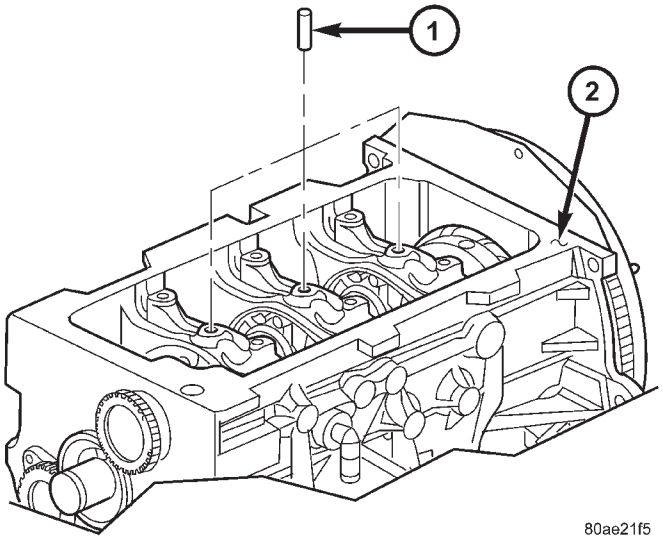
NOTE: Before installing crankshaft in engine block, be sure the notches in the crankshaft supports are facing towards the front of the engine.



80c6ca52

Fig. 38 CRANKSHAFT SLEEVE VM.1069

1 - CRANKSHAFT SLEEVE VM.1069
2 - ENGINE BLOCK



80ae21f5

Fig. 39 CRANKSHAFT SUPPORT RETAINERS/ BALANCE SHAFT OIL FEED

1 - CRANKSHAFT SUPPORT RETAINERS/BALANCE SHAFT OIL FEED
2 - ENGINE BLOCK

(1) Install crankshaft in engine block. **Be sure to align oil holes in crankshaft supports and engine block.**

(2) Install crankshaft support retainers (Fig. 39).

(3) Remove special tool VM.1069 from crankshaft (Fig. 38).

(4) Install crankshaft sprocket.

CRANKSHAFT (Continued)

(5) Install front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).

(6) Install rear main bearing support in engine block. **Be sure to align oil hole in rear main bearing support with hole in block.**

(7) Install adapter plate and retaining bolts (Fig. 36). Torque bolts to 27.5N·m.

(8) Install flywheel.

(9) Install piston and connecting rod assemblies (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSTALLATION).

(10) Install oil jets (Refer to 9 - ENGINE/LUBRICATION/OIL JET - INSTALLATION).

(11) Install balance shaft assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - INSTALLATION).

(12) Install oil pump pickup tube (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(13) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(14) Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(15) Install cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(16) Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(17) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(18) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(19) Install engine in vehicle.

(20) Fill engine oil with proper oil to correct level.

CYLINDER LINERS

DESCRIPTION

The cylinder wall liner used on this engine is of the wet design. O-rings are used to seal the liner to the engine block.

REMOVAL

(1) Remove engine from vehicle.

(2) With engine completely disassembled, use special tool VM.1001 to remove liner assembly (Fig. 40).

(3) Tighten bolt on VM.1001 to remove liner from block (Fig. 41).

(4) Remove shims from cylinder liner or cylinder block recess. Keep shims with each cylinder liner.

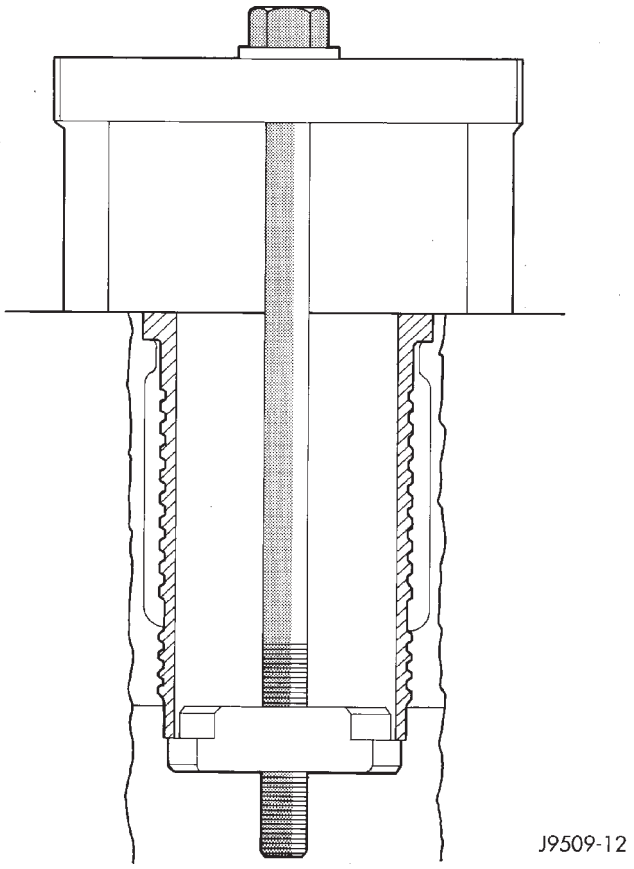


Fig. 40 CYLINDER LINER REMOVER

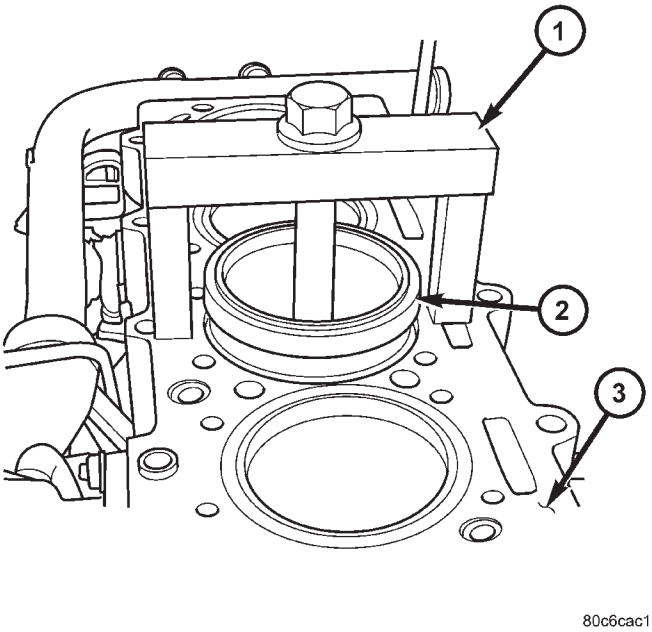

Fig. 41 CYLINDER LINER REMOVAL

1 - SPECIAL TOOL VM.1001
2 - CYLINDER LINER
3 - ENGINE BLOCK

CYLINDER LINERS (Continued)

INSPECTION

The cylinder walls should be checked for out-of-round and taper with a dial bore gauge. The cylinder bore out-of-round is 0.100 mm (.0039 in.) maximum and cylinder bore taper is 0.100 mm (.0039 in.) maximum. If the cylinder walls are badly scuffed or scored, new liners should be installed and honed, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B (Fig. 42). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from the bottom bore.

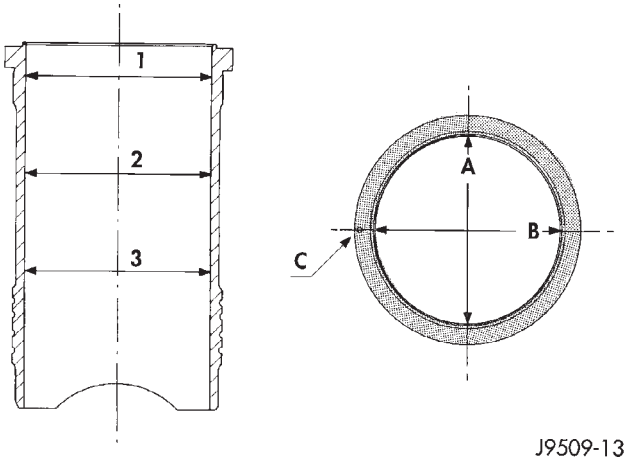

Fig. 42 LINER INSPECTION

INSTALLATION

(1) Carefully clean liner and engine block, and degrease the engine block where it comes into contact with the liners. Install the liners in the engine block as shown, rotating them back and forth by 45° in order to guarantee correct positioning (Fig. 43).

(2) Measure the liner recess relative to block deck with a dial indicator mounted on a special tool VM-1010 A. **All the measurements must be taken on high pressure pump side of engine block.**. Zero dial gauge on block deck.

(3) Move dial gauge to cylinder liner record reading on dial gauge.

(4) Remove liner and special tool.

(5) Then select the correct shim thickness to give proper protrusion (0.01 - 0.06 mm).

(6) Fit the shim and the O-rings onto the liner.

(7) Lubricate the lower liner location in the block.

(8) Fit the liners in the crankcase making sure that the shim is positioned correctly in the seat. Lock the liners in position using special tool (VM.1076) and bolts (Fig. 44). Clean the residual LOCTITE on the upper surface of the block deck.

(9) Recheck the liner protrusion. It should be 0.01 - 0.06 mm.

(10) Reassemble engine.

(11) Install engine in vehicle.

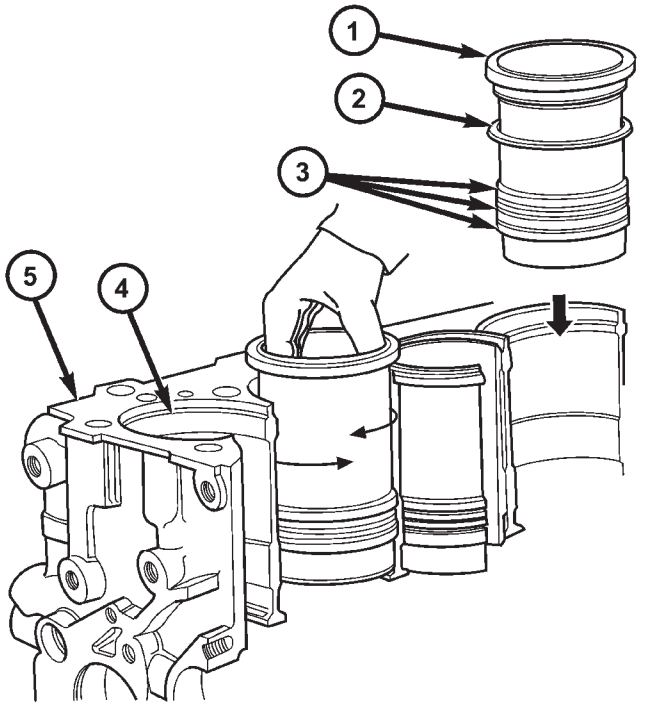

Fig. 43 LINER INSTALLATION

INTERNAL VACUUM PUMP

DESCRIPTION

The diesel engine uses a internal vacuum pump. This vacuum pump is mounted in the front of the engine block under the engine front cover (Fig. 45). The vacuum pump is driven by a sprocket on the crankshaft.

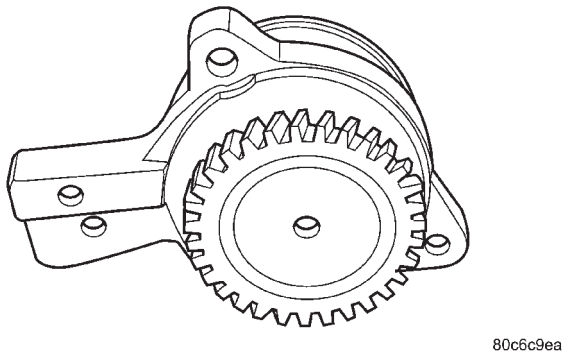

Fig. 45 VACUUM PUMP

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove air cleaner housing.
(3) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(4) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(5) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).
(6) Remove vibration damper/crankshaft pulley (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(7) Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(8) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(9) Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

NOTE: Crankshaft hub has LHD thread.

(10) Remove crankshaft hub.
(11) Remove front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL).
(12) Remove crankshaft sprocket (Fig. 46).
(13) Remove vacuum pump (Fig. 46).

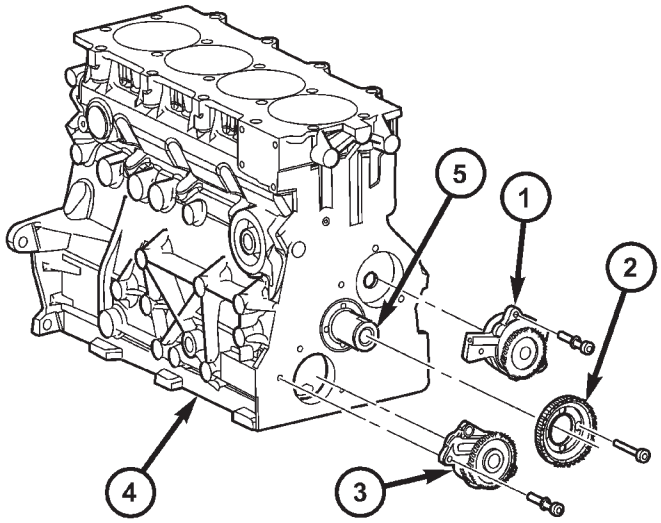

Fig. 46 OIL PUMP AND VACUUM PUMP

1 - VACUUM PUMP
2 - CRANKSHAFT SPROCKET
3 - OIL PUMP
4 - ENGINE BLOCK
5 - CRANKSHAFT

INSTALLATION

(1) Lubricate vacuum pump blades and install in vacuum pump body as shown (Fig. 47).
(2) Install vacuum pump in engine block (Fig. 46). Torque bolts to 10.8N·m.
(3) Install crankshaft sprocket (Fig. 46). Torque bolts to 10.8N·m.
(4) Install front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).
(5) Install front crankshaft hub. Torque bolt to 304N·m.
(6) Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(7) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .
(8) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(9) Install vibration damper/crankshaft pulley.

INTERNAL VACUUM PUMP (Continued)

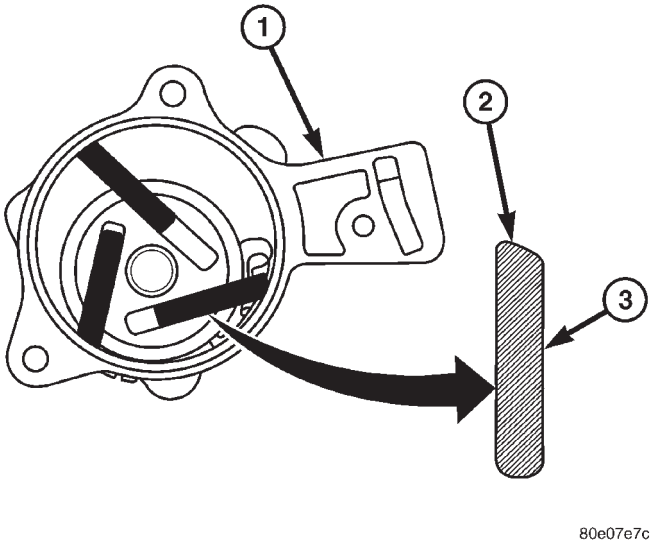

Fig. 47 VACUUM PUMP COMPONENTS

1 - VACUUM PUMP BODY
2 - VACUUM PUMP BLADE TAPERED EDGE
3 - VACUUM PUMP BLADE

(10) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(11) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Install air cleaner housing.

(14) Connect negative battery cable.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons are of a free floating design. Oil jets in the engine block lubricate and cool the piston and pin assembly. The connecting rods have a pressed in place wrist pin bushing which is lubricated by the oil jets (Fig. 48).

STANDARD PROCEDURE - PISTON RING FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 in.) from bottom of cylinder bore (Fig. 49). Check gap with feeler gauge. Top compression ring gap .30 to .45mm (.0118 to .0177 in.). Second compression ring gap .30 to .45mm (.0118 to .0177 in.). Oil control ring gap .25 to .50mm (.0098 to .0196 in.).

(2) If ring gaps exceed dimension given, new rings or cylinder liners must be fitted. Keep piston rings in piston sets.

(3) Check piston ring to groove clearance (Fig. 50). Top compression ring gap .080 to .130mm (.0031 to .0051 in.). Second compression ring gap .070 to .110mm (.0027 to .0043 in.). Oil control ring gap .040 to .080mm (.0015 to .0031 in.).

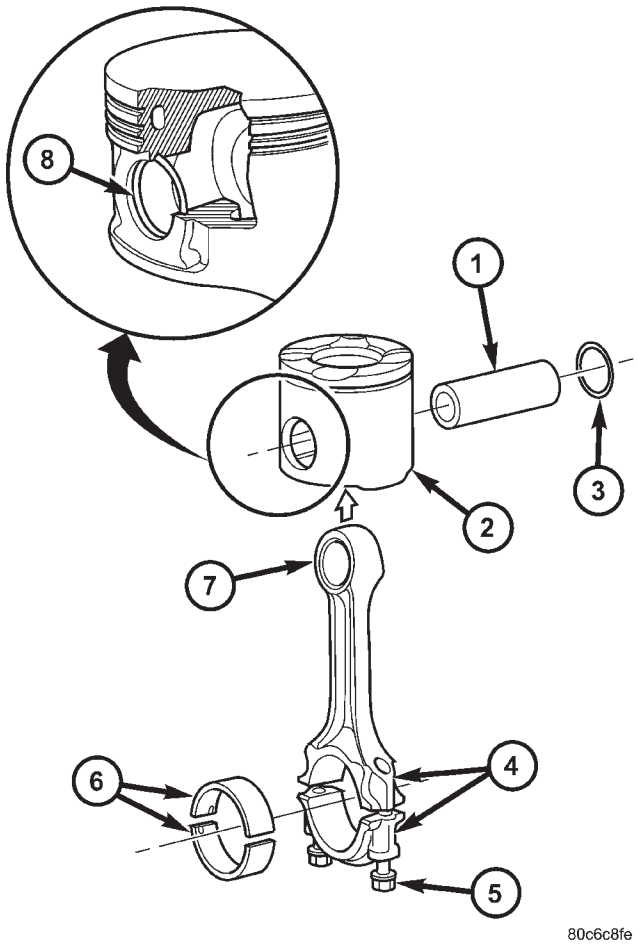

Fig. 48 PISTON AND CONNECTING ROD ASSEMBLY

2 - PISTON
3 - SNAP RING
4 - CONNECTING ROD ALIGNMENT NUMBERS
5 - CONNECTING ROD BOLT
6 - CONNECTING ROD BEARING
7 - CONNECTING ROD
8 - SNAP RING

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).

PISTON & CONNECTING ROD (Continued)

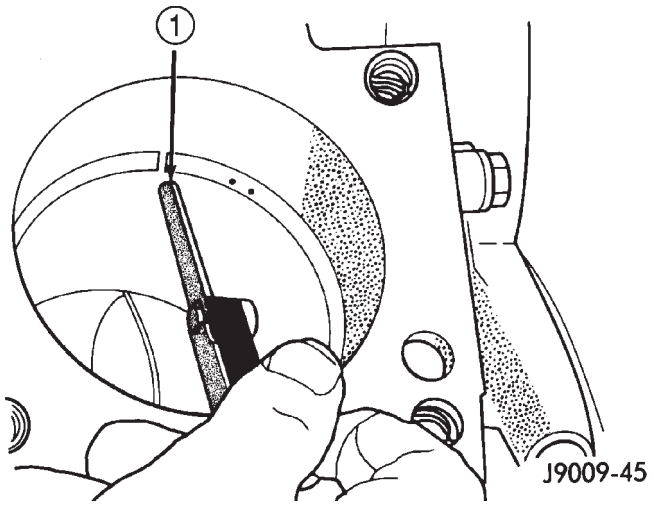

Fig. 49 RING END GAP MEASUREMENT

1 - FEELER GAUGE

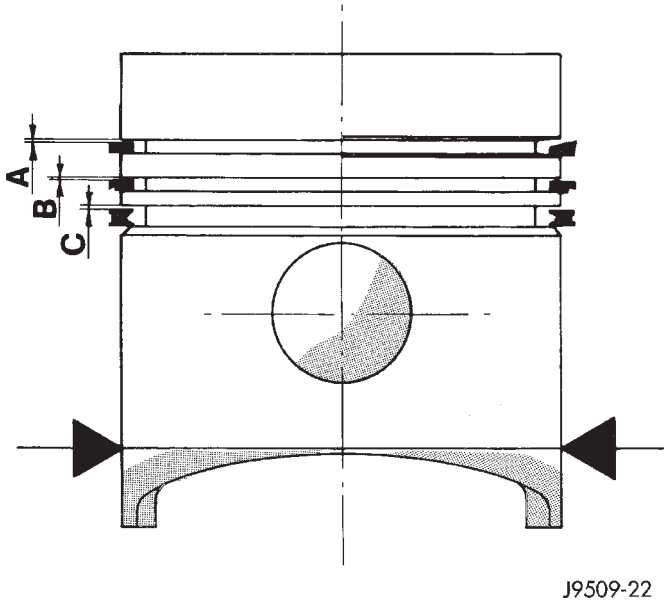

Fig. 50 PISTON RING TO GROOVE CLEARANCE

(3) Raise vehicle on hoist.

(4) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(5) Remove oil pump pickup tube.(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL)

(6) Remove balance shaft assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - REMOVAL).

(7) Remove top ridge of cylinder bores with a ridge reamer before removing pistons from cylinder block. **Be sure to keep top of pistons covered during this operation.**

(8) Piston and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

NOTE: Be careful not to nick or scratch crankshaft journals

(9) After removal, install bearing cap on the mating rod and mark pistons with matching cylinder number when removed from engine block.

PISTON PIN - REMOVAL

(1) Secure connecting rods in a soft jawed vice.

(2) Remove 2 snap rings securing piston pin (Fig. 51).

(3) Push piston pin out of piston and connecting rod (Fig. 51).

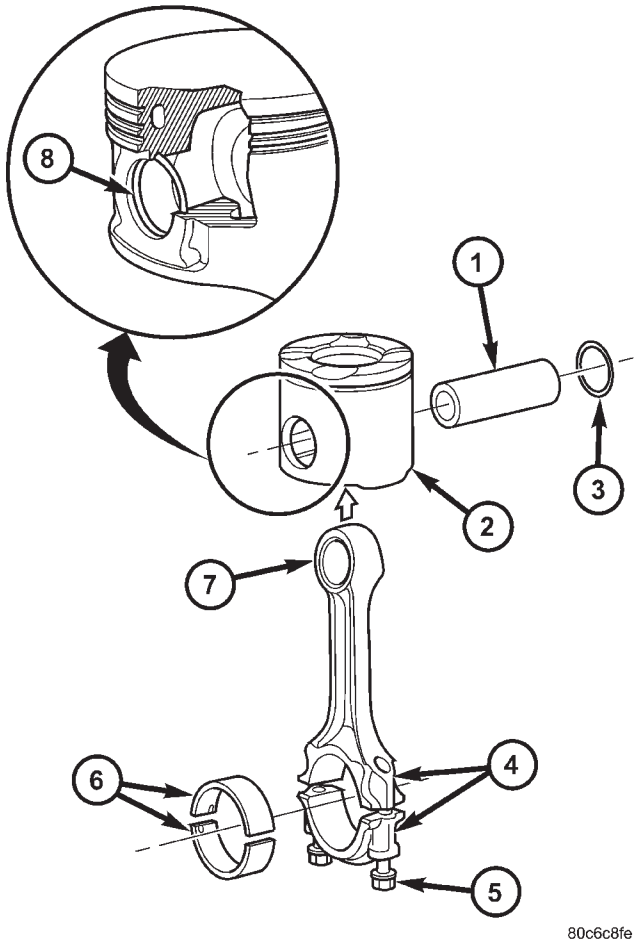

Fig. 51 PISTON AND CONNECTING ROD ASSEMBLY

1 - PISTON PIN
2 - PISTON
3 - SNAP RING
4 - CONNECTING ROD ALIGNMENT NUMBERS
5 - CONNECTING ROD BOLT
6 - CONNECTING ROD BEARING
7 - CONNECTING ROD
8 - SNAP RING

PISTON & CONNECTING ROD (Continued)

PISTON RING - REMOVAL

(1) ID mark on face of top and second piston rings must point toward piston crown.

(2) Using a suitable ring expander, remove top and second piston rings (Fig. 52).

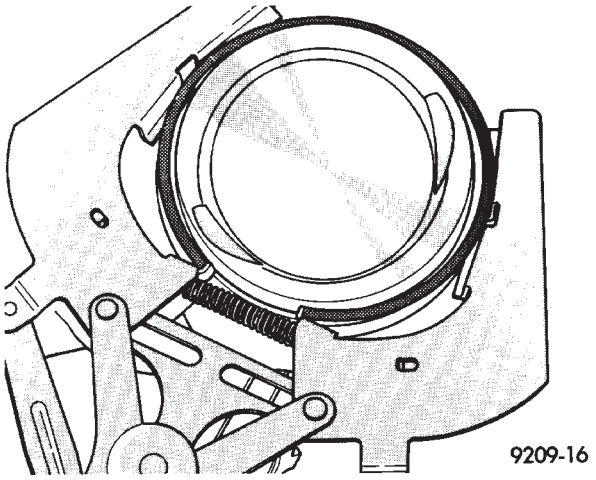

Fig. 52 PISTON RINGS - REMOVAL/INSTALLATION

(3) Remove upper oil ring side rail, lower oil ring side rail and then the oil expander from piston.

(4) Carefully clean carbon from piston crowns, skirts and ring grooves ensuring the 4 oil holes in the oil control ring groove are clear.

INSPECTION

PISTONS

(1) Piston Diameter: Size: 91.912-91.928mm (3.6185-3.6192 in.) Maximum wear limit .05mm (.0019 in.).

(2) Check piston pin bores in piston for roundness. Make 3 checks at 120° intervals. Maximum out of roundness .05mm (.0019in.).

(3) The piston diameter should be measured approximately 15 mm (.590 in.) up from the base.

(4) Skirt wear should not exceed 0.1 mm (.00039 in.).

(5) The clearance between the cylinder liner and piston should not exceed 0.065-0.083 mm (.0025-.0032 in.).

(6) Make sure the weight of the pistons does not differ by more than 5 g.

CONNECTING RODS

(1) Assemble bearing shells and bearing caps to their respective connecting rods ensuring that the serrations on the cap and reference marks are aligned.

(2) Tighten connecting cap bolts to 29 N·m (21 ft. lbs.) plus 60°.

(3) Without loosening connecting rod bolts, tighten all bolts to 88N·m.

(4) Check and record internal diameter of crank end of connecting rod.

NOTE: When changing connecting rods, all four must have the same weight and be stamped with the same number. Replacement connecting rods will only be supplied in sets of four.

Connecting rods are supplied in sets of four since they all must be of the same weight category. Max allowable weight difference is 5 gr.

NOTE: On one side of the big end of the con-rod there is a two-digit number which refers to the weight category. On the other side of the big end there is a four digit number on both the rod and the cap. These numbers must both face the injection pump side of the block (Fig. 53). Lightly heat the piston in oven. Insert piston pin in position and secure it with provided snap rings.

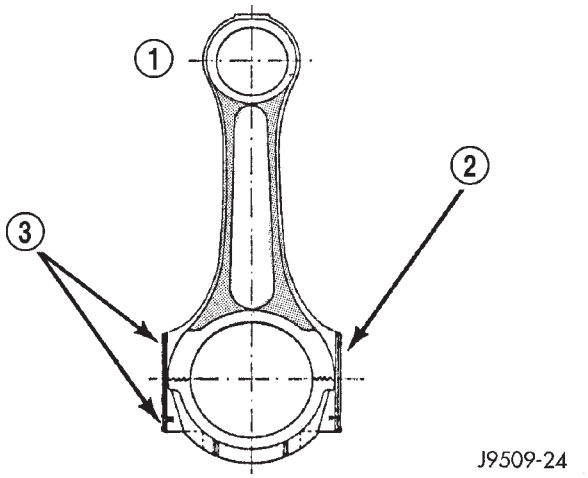

Fig. 53 CONNECTING ROD IDENTIFICATION

1 - SMALL END OF CONNECTING ROD
2 - 2 DIGIT NUMBER LOCATION
3 - 4 DIGIT NUMBER LOCATION

The Four digit numbers marked on con rod big end and rod cap must be on the same side as the injection pump (Fig. 53). After having coated threads with Molyguard, tighten con rod bolts to 29 N·m (21 ft. lbs.) plus 60°.

PISTON PINS

(1) Measure the diameter of piston pin in the center and both ends.

(2) Piston pin diameter is 29.992 to 29.996mm (1.1807 to 1.1809 in.).

PISTON & CONNECTING ROD (Continued)

INSTALLATION

PISTON PIN INSTALLATION

(1) Secure connecting rod in soft jawed vice.
(2) Lubricate piston pin and piston with clean engine oil.
(3) Position piston on connecting rod (Fig. 54).

CAUTION: Ensure arrow on piston crown and the bearing cap numbers on the connecting rod are on the opposite side.

(4) Install piston pin (Fig. 54).
(5) Install clips in piston to retain piston pin (Fig. 54).

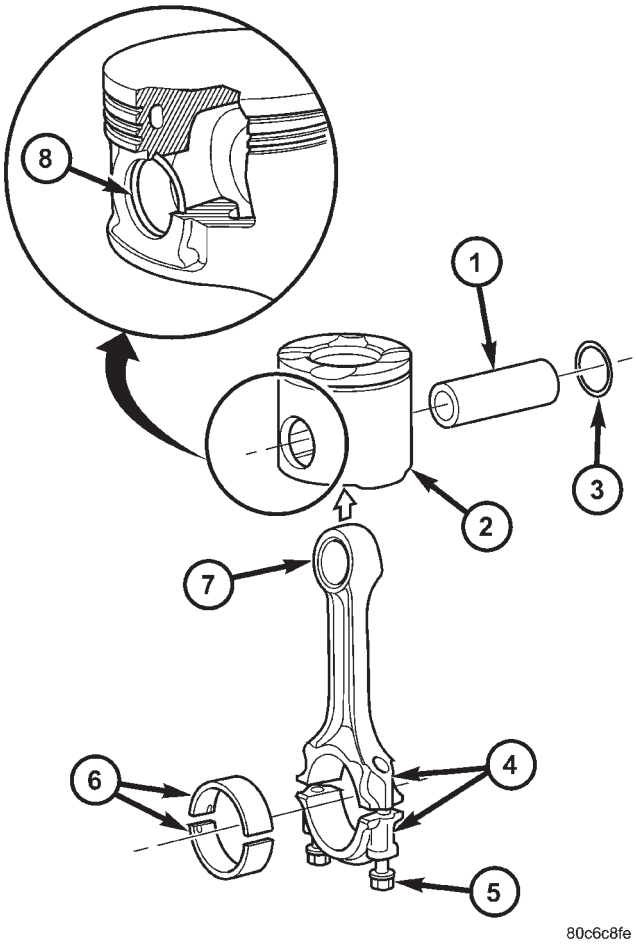

Fig. 54 PISTON AND CONNECTING ROD ASSEMBLY

1 - PISTON PIN
2 - PISTON
3 - SNAP RING
4 - CONNECTING ROD ALIGNMENT NUMBERS
5 - CONNECTING ROD BOLT
6 - CONNECTING ROD BEARING
7 - CONNECTING ROD
8 - SNAP RING

(6) Remove connecting rod from vice.

PISTON RINGS - INSTALLATION

(1) Install rings on the pistons using a suitable ring expander (Fig. 55).

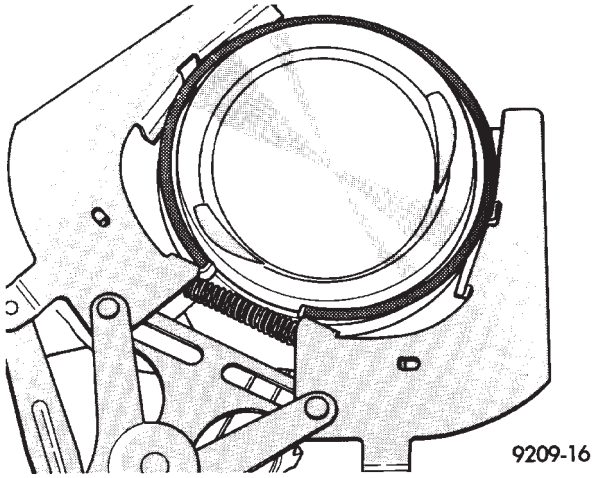

Fig. 55 PISTON RINGS-INSTALLATION

(2) Top compression ring is tapered and chromium plated. The second ring is of the scraper type and must be installed with scraping edge facing bottom of the piston. The third is an oil control ring. Ring gaps must be positioned, before inserting piston into the liners, as follows.
(3) Top ring gap must be positioned at the #3 position (looking at the piston crown from above) (Fig. 56).
(4) Second piston ring gap should be positioned at the #1 position (Fig. 56).
(5) Oil control ring gap should be positioned at the #2 position (Fig. 56).

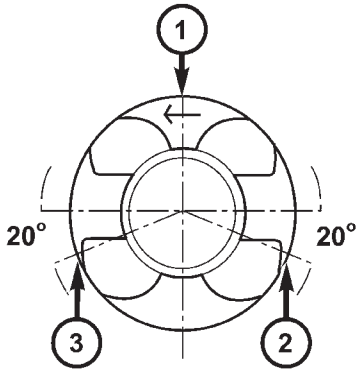

Fig. 56 PISTON RING GAP LOCATION

3 - TOP COMPRESSION RING GAP POSITION
1 - SECOND COMPRESSION RING GAP POSITION
2 - OIL CONTROL RING GAP POSITION

(6) When assembling pistons check that components are installed in the same position as before dis-

PISTON & CONNECTING ROD (Continued)

assembly, determined by the numbers stamped on the crown of individual pistons. Engine cylinders are numbered starting from gear train end of the engine. **Face arrow on top of piston toward front of engine**. Therefore, the numbers stamped on connecting rod big end should face toward the injection pump side of engine. To insert piston into cylinder use a ring compressor (VM.1065) as shown in (Fig. 57).

INSTALLATION

(1) Before installing pistons, and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap (Fig. 56).

(2) Before installing the ring compressor, make sure the oil ring expander ends are butted together.

(3) Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston and tighten (Fig. 57). **Ensure position of rings does not change during this operation**.

NOTE: Be sure arrow on top of piston faces towards front of engine.

NOTE: Be careful not to nick crankshaft journals.

(4) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

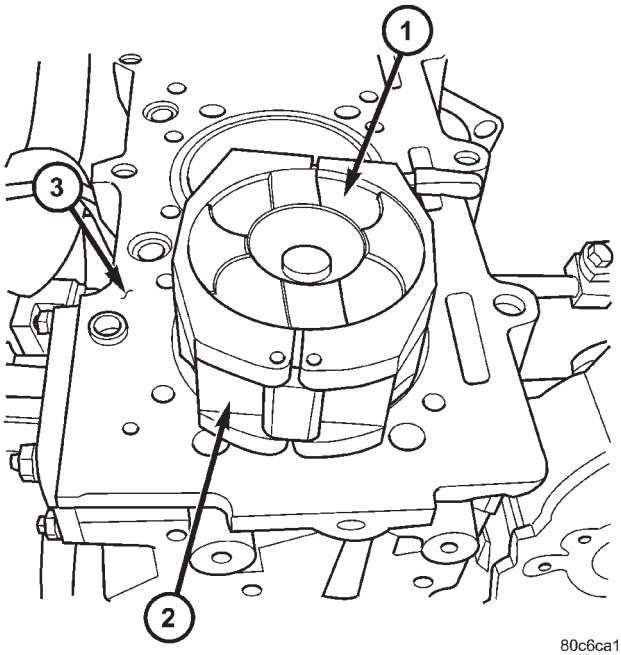

Fig. 57 PISTON INSTALLATION USING VM.1065

(5) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

(6) Install connecting rod caps (Fig. 58). Install rod bolts and tighten to 30N·m (22 ft.lb.) plus 60°. Then torque to 88N·m (65 ft.lb).

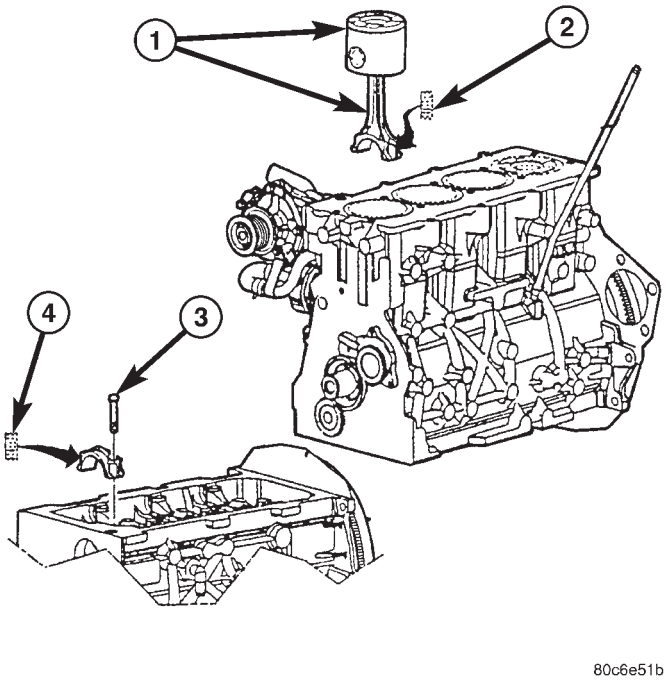

Fig. 58 PISTON AND CONNECTING ROD INSTALLATION

1 - PISTON AND CONNECTING ROD ASSEMBLY
2 - FOUR DIGIT NUMBER
3 - CONNECTING ROD BOLT
4 - FOUR DIGIT NUMBER

(7) Install cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - INSTALLATION).

(8) Install balance shaft assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - INSTALLATION).

(9) Install oil pump pickup tube (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(10) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(11) Connect negative battery cable.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove air cleaner housing.
(3) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).
(4) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(5) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(6) Remove vibration damper/crankshaft pulley (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(7) Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(8) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(9) Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

NOTE: Crankshaft hub retaining bolt has LHD thread.

(10) Remove crankshaft hub.
(11) Remove front engine cover (Fig. 59) (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL).
(12) With cover on work bench, pry out old seal.

INSTALLATION

(1) Clean engine block and front engine cover sealing surfaces.
(2) Install crankshaft oil seal on VM.1061 (Fig. 60).
(3) Place sleeve for VM.1061 on workbench as shown (Fig. 60).

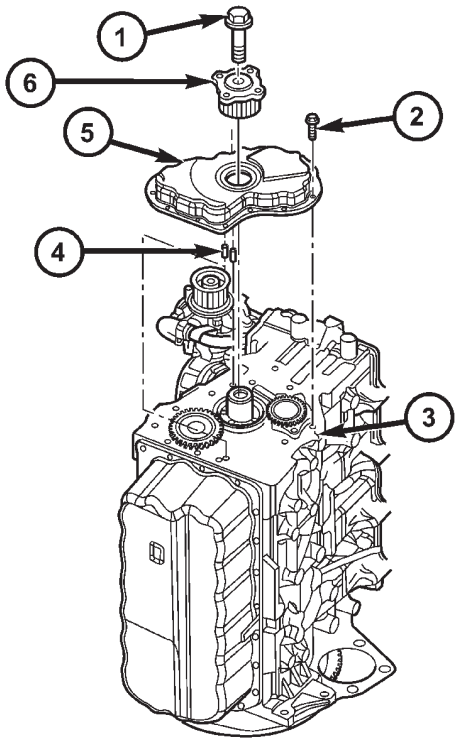

Fig. 59 ENGINE COVER - FRONT

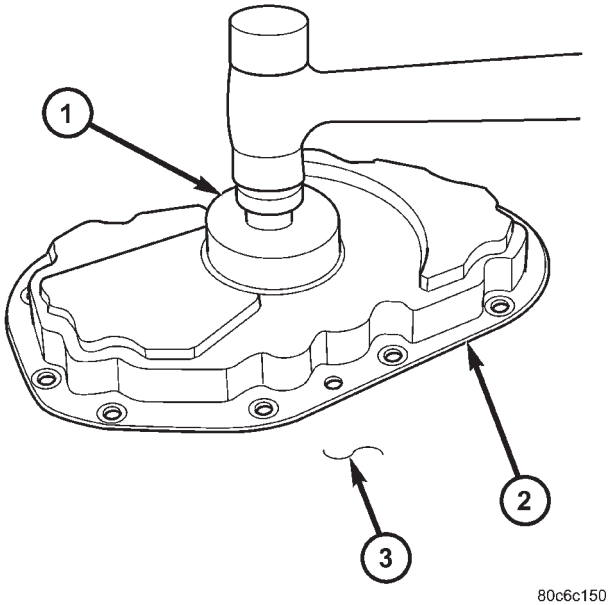

Fig. 61 CRANKSHAFT OIL SEAL INSTALLATION WITH VM.1061

1 - VM.1061
2 - FRONT ENGINE COVER
3 - WORK BENCH

(5) Install front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).

(6) Install crankshaft hub and retaining bolt. Torque bolt to 304N·m.

(7) Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(8) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(9) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(10) Install vibration damper/crankshaft pulley (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(11) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(14) Install air cleaner housing.

(15) Connect negative battery cable.

VIBRATION DAMPER

REMOVAL

(1) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Remove vibration damper retaining bolts and damper (Fig. 62).

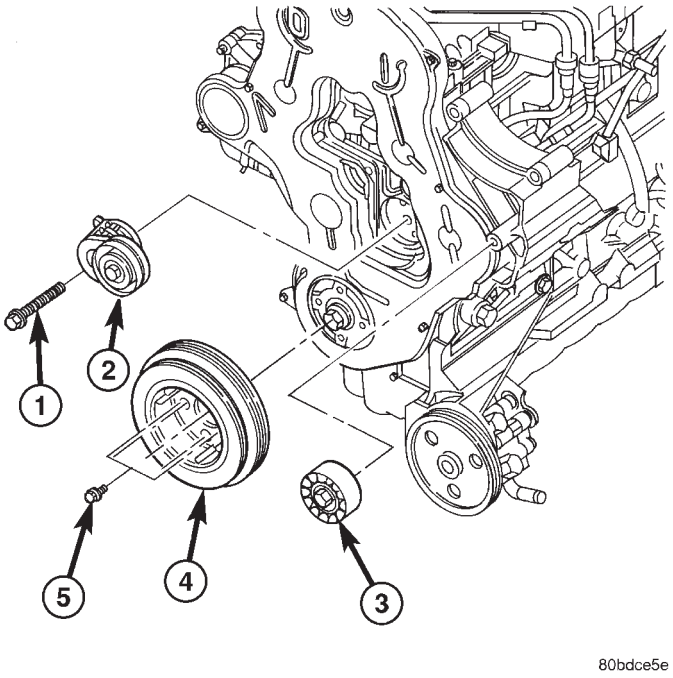

Fig. 62 VIBRATION DAMPER

1 - BELT TENSIONER RETAINING BOLT
2 - BELT TENSIONER
3 - IDLER PULLEY
4 - VIBRATION DAMPER/CRANKSHAFT PULLEY
5 - VIBRATION DAMPER/CRANKSHAFT PULLEY RETAINING BOLTS

INSTALLATION

(1) Install vibration damper and retaining bolts (Fig. 62). Torque bolts to 27.5N·m.

(2) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(3) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

ENGINE COVER - FRONT

DESCRIPTION

The front engine cover on this engine is a stamped steel cover which covers the oil pump and vacuum pump.

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove air cleaner housing.
(3) Support engine and remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).
(4) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(5) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(6) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(7) Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

CAUTION: Before removing the cylinder head cover/ intake manifold or timing belt the engine must put at 90° after TDC. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

(8) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(9) Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

NOTE: Crankshaft hub has LHD thread.

(10) Remove crankshaft hub.
(11) Remove front engine cover (Fig. 63).

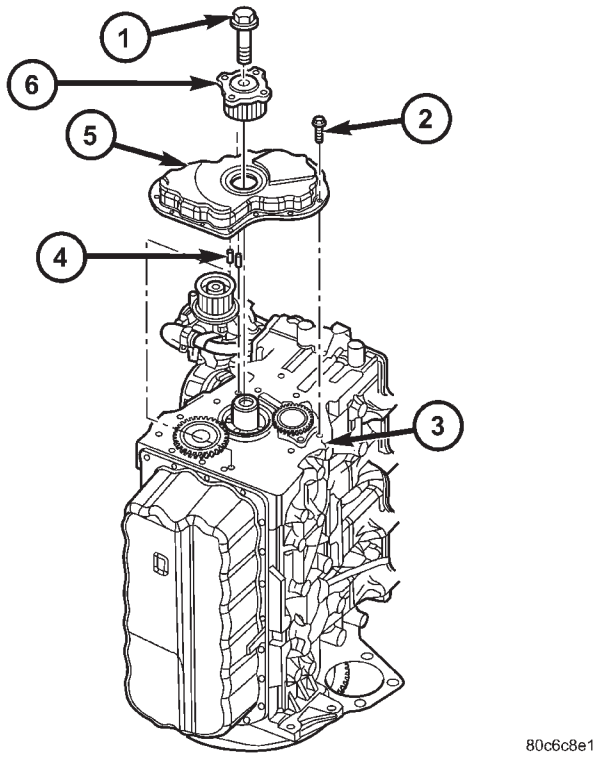

Fig. 63 ENGINE COVER - FRONT

1 - CRANKSHAFT HUB RETAINING BOLT
2 - FRONT ENGINE COVER RETAINING BOLTS
3 - ENGINE BLOCK
4 - FRONT ENGINE COVER ALIGNMENT DOWELS
5 - FRONT ENGINE COVER
6 - CRANKSHAFT HUB

INSTALLATION

(1) Clean engine block and front engine cover sealing surfaces.
(2) Apply a continous 3mm bead of Silicone Sealer to cover, install within 10 minutes (Fig. 63). Torque bolts to 11.8N·m.
(3) Install crankshaft hub (Fig. 63). Torque bolt to 304N·m.
(4) Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(5) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .
(6) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(7) Install vibration damper (Refer to 9 - ENGINE/ ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
(8) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).
(9) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(10) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(11) Install air cleaner housing.
(12) Connect negative battery cable.

CRANKSHAFT MAIN BEARINGS

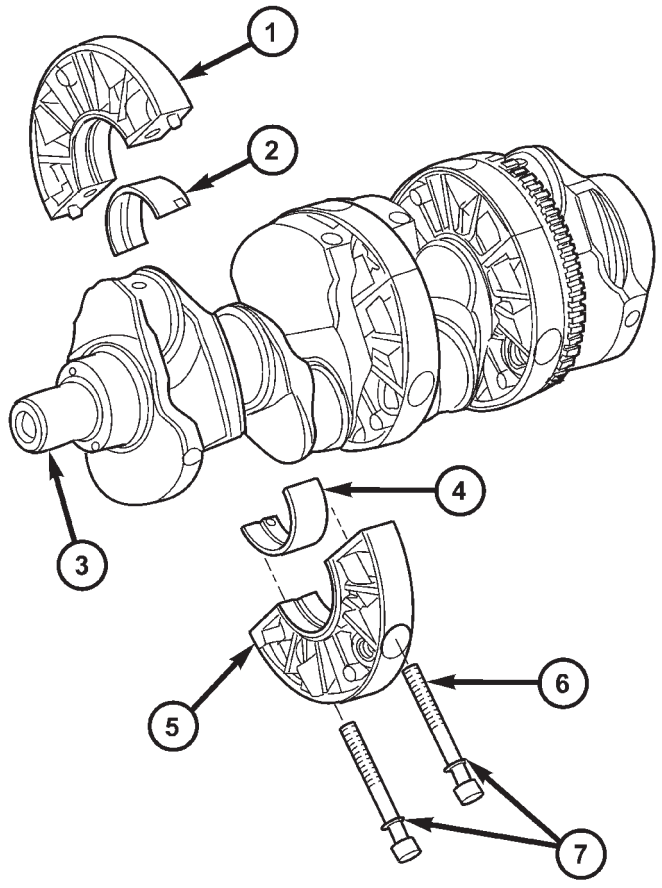
REMOVAL

The engine must be removed from vehicle and completely disassembled to replace the front main bearing.

CRANKSHAFT MAIN BEARINGS

(1) With crankshaft assembly removed from engine.

(2) Remove crankshaft supports from crankshaft and remove bearing halves from supports (Fig. 64).



80adf230

Fig. 64 CRANKSHAFT ASSEMBLY

1 - CRANKSHAFT SUPPORT HALVE

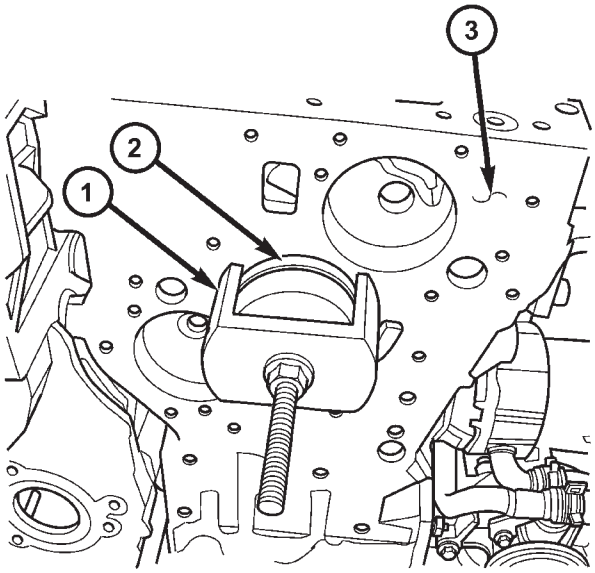
6 - MAIN BEARING SUPPORT BOLTS
7 - WASHERS

CRANKSHAFT FRONT MAIN BEARING

(1) Using special tool VM.1073 push front main bearing out of front of engine block (Fig. 65).



80c6ca73

Fig. 65 FRONT MAIN BEARING REMOVAL

1 - VM.1073
2 - FRONT CRANKSHAFT MAIN BEARING
3 - ENGINE BLOCK

CRANKSHAFT MAIN BEARINGS (Continued)

INSTALLATION

CRANKSHAFT MAIN BEARINGS

(1) Install bearing halves in crankshaft supports.
(2) Lubricate crankshaft and main bearings with clean engine oil.
(3) Install crankshaft supports on crankshaft (Fig. 66). Torque bolts to 44.1N·m.

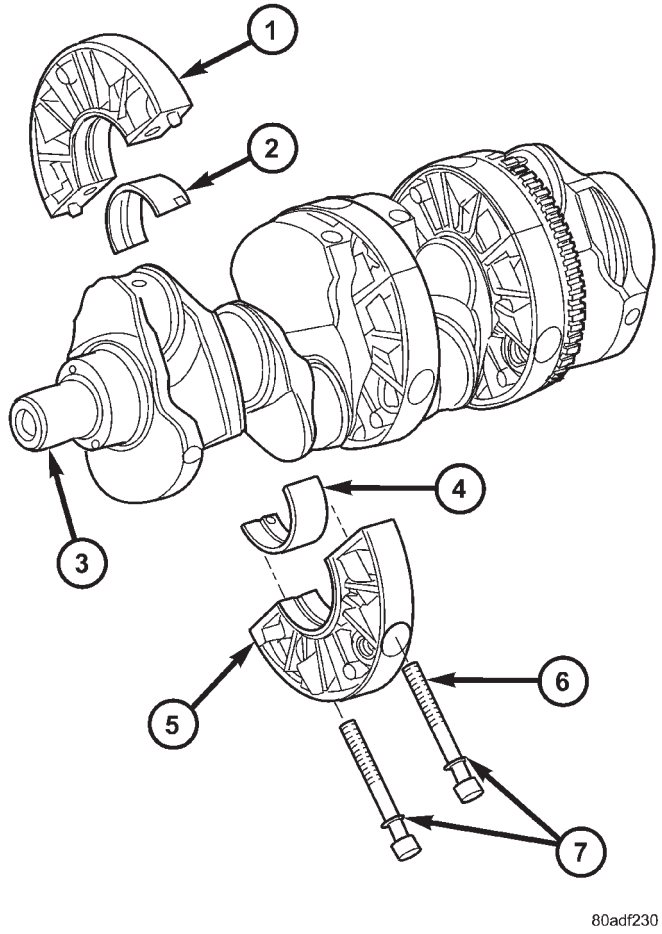


Fig. 66 CRANKSHAFT ASSEMBLY

1 - CRANKSHAFT SUPPORT HALVE
2 - MAIN BEARING HALVE
3 - CRANKSHAFT

3 - FRONT CRANKSHAFT MAIN BEARING

CRANKSHAFT OIL SEAL - REAR

REMOVAL

This must be done with either the engine or transmission removed from vehicle.

(1) Remove flywheel assembly.
(2) Pry out old crankshaft oil seal.

INSTALLATION

(1) Using special tool VM.1050, install rear crankshaft oil seal in rear main bearing support (Fig. 69).

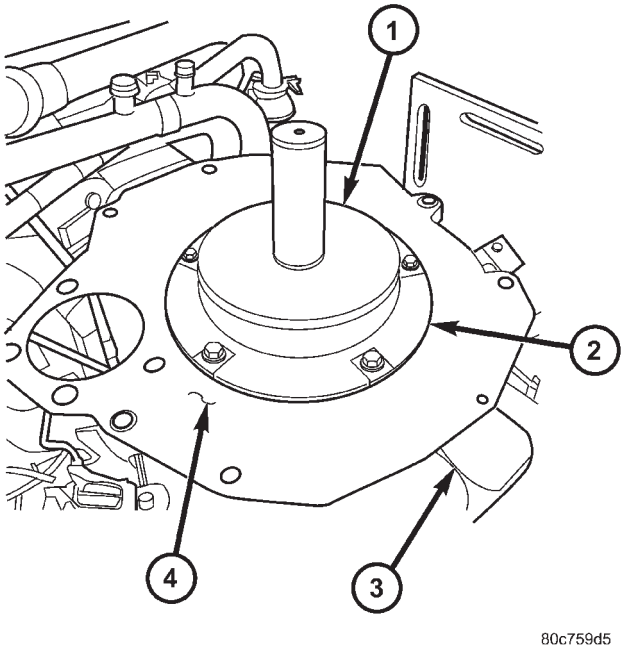

Fig. 69 REAR CRANKSHAFT OIL SEAL INSTALLATION USING VM.1050

1 - SPECIAL TOOL VM.1050
2 - REAR MAIN BEARING SUPPORT
3 - OIL PAN
4 - ENGINE TO TRANSMISSION ADAPTER PLATE

(2) Install engine or tranmission in vehicle.

OIL PAN

REMOVAL

(1) Disconnect negative battery cable.
(2) Raise vehicle on hoist.
(3) Drain engine oil from engine.
(4) Remove all oil pan retaining bolts and oil pan (Fig. 70).

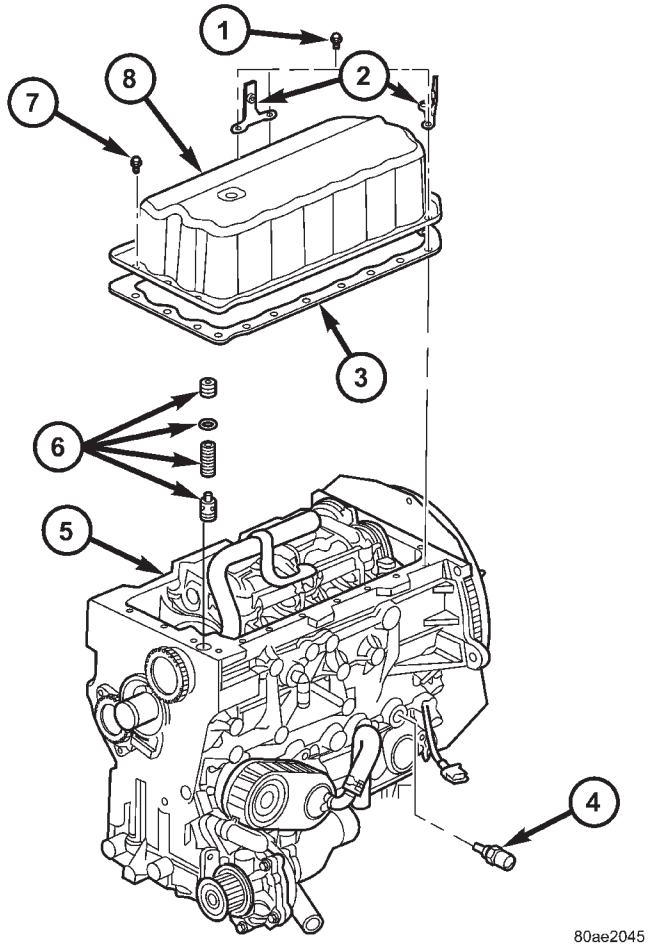

Fig. 70 OIL PAN AND PRESSURE RELIEF VALVE

1 - OIL PAN RETAINING BOLTS
2 - POWER STEERING LINE BRACKETS
3 - OIL PAN GASKET
4 - OIL PRESSURE SENSOR
5 - ENGINE BLOCK
6 - OIL PRESSURE RELIEF VALVE
7 - OIL PAN RETAINING BOLTS
8 - OIL PAN

INSTALLATION

(1) Clean oil pan and sealing surfaces. Inspect oil pan and engine block.
(2) Install oil pan, gasket, and retaining bolts (Fig. 70).
(3) Be sure power steering line brackets are in proper location (Fig. 70).
(4) Torque oil pan bolts to 11.8N·m.
(5) Lower vehicle.
(6) Refill engine oil to proper level.
(7) Connect negative battery cable.

OIL PUMP

REMOVAL

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(3) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(4) Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(5) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(6) Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(7) Remove front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL).
(8) Remove crankshaft sprocket (Fig. 71).
(9) Remove oil pump retaining bolts and remove pump from engine block (Fig. 71).

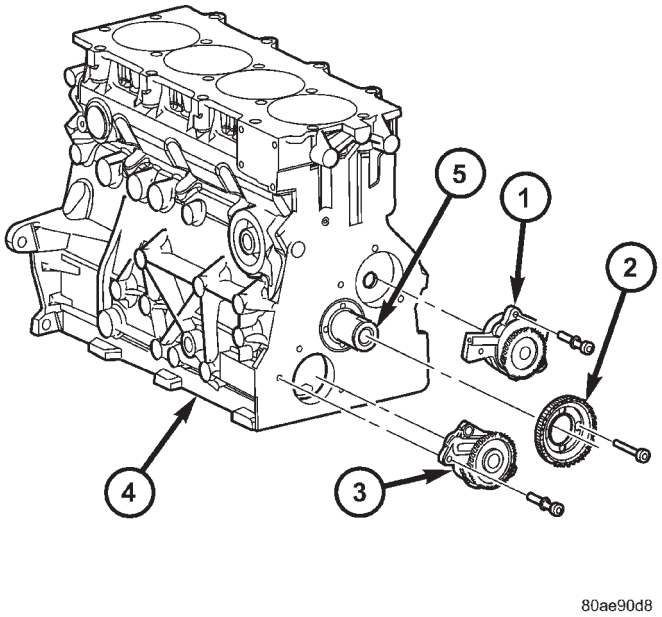

Fig. 71 OIL PUMP AND VACUUM PUMP

1 - VACUUM PUMP
2 - CRANKSHAFT SPROCKET
3 - OIL PUMP
4 - ENGINE BLOCK
5 - CRANKSHAFT

REMOVAL

(1) Disconnect negative battery cable.
(2) Raise vehicle on hoist.
(3) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(4) Remove oil pump pickup tube retaining bolt and pull pickup tube from engine block (Fig. 72).

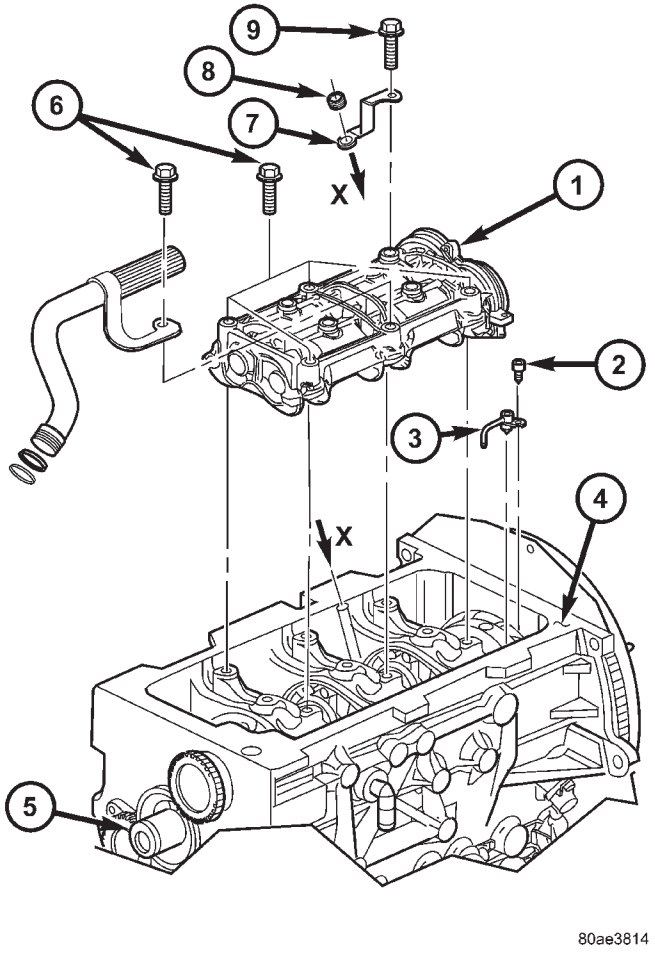

Fig. 72 OIL PUMP PICKUP TUBE ASSEMBLY

1 - BALANCE SHAFT
2 - OIL JET RETAINING BOLT
3 - OIL JET
4 - ENGINE BLOCK
5 - CRANKSHAFT
6 - BALANCE SHAFT RETAINING BOLTS
7 - OIL DIPSTICK TUBE RETAINER
8 - RUBBER BUSHING
9 - RETAINING BOLT

INSTALLATION

INSTALLATION

(1) Lubricate oil pump rotor with engine oil.
(2) Install oil pump in bore in engine block (Fig. 71).

OIL PUMP (Continued)

(3) Install oil pump retaining bolts (Fig. 71). Torque bolts to 10.8N·m.
(4) Install crankshaft sprocket (Fig. 71). Torque bolts to 10.8N·m.
(5) Install front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).
(6) Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(7) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .
(8) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(9) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(10) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(11) Connect negative battery cable.

INSTALLATION

(1) Lubricate o-ring on oil pump pickup tube with engine oil.
(2) Install pickup tube in engine block and install retaining bolt (Fig. 72). Torque bolt to 32.4N·m.
(3) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
(4) Refill engine oil to proper level.
(5) Connect negative battery cable.

OIL PRESSURE SENSOR/ SWITCH

DESCRIPTION

The oil pressure switch is located on the right side of the engine block. The switch screws into the engines main oil gallery (Fig. 73).

REMOVAL

(1) Disconnect negative battery cable.
(2) Raise vehicle on hoist.
(3) Disconnect oil pressure switch electrical connector (Fig. 73).
(4) Remove oil pressure switch from engine block.

INSTALLATION

(1) Apply Mopar® Thread Sealant to the switch threads.
(2) Install oil pressure switch in engine block.
(3) Connect oil pressure switch electrical connector (Fig. 73).

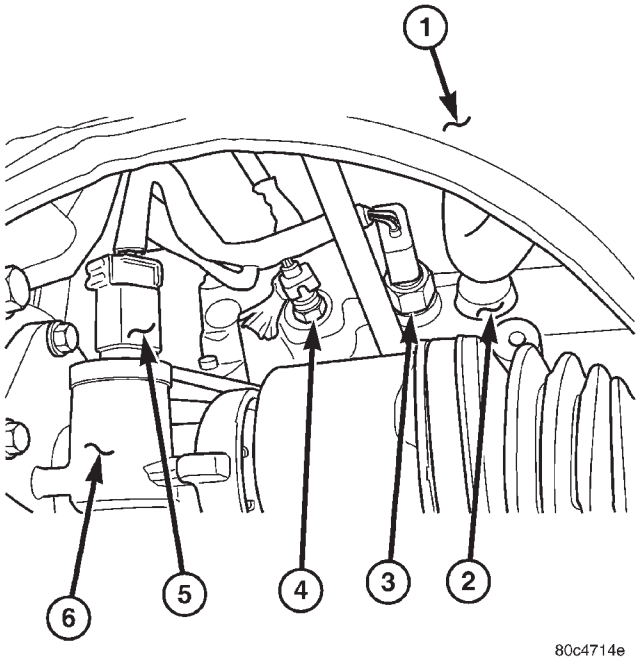

Fig. 73 REAR ENGINE VIEW

1 - SUSPENSION CRADLE
2 - ENGINE BLOCK
3 - OIL PRESSURE SWITCH
4 - OIL TEMPERATURE SENSOR
5 - VEHICLE SPEED SENSOR
6 - TRANSMISSION

(4) Lower vehicle.
(5) Start engine and check for leaks.
(6) Check and adjust oil level as necessary.

OIL TEMPERATURE SENSOR

DESCRIPTION

The oil temperature sensor is located on the right side of the engine block. The sensor screws into the engines main oil gallery (Fig. 74).

REMOVAL

(1) Disconnect negative battery cable.
(2) Raise vehicle on hoist.
(3) Disconnect oil temperature sensor electrical connector (Fig. 74).
(4) Remove oil temperature sensor from engine block.

INSTALLATION

(1) Apply Mopar® Thread Sealant to the sensor threads.
(2) Install oil temperature sensor in engine block.
(3) Connect oil temperature sensor electrical connector (Fig. 74)

OIL TEMPERATURE SENSOR (Continued)

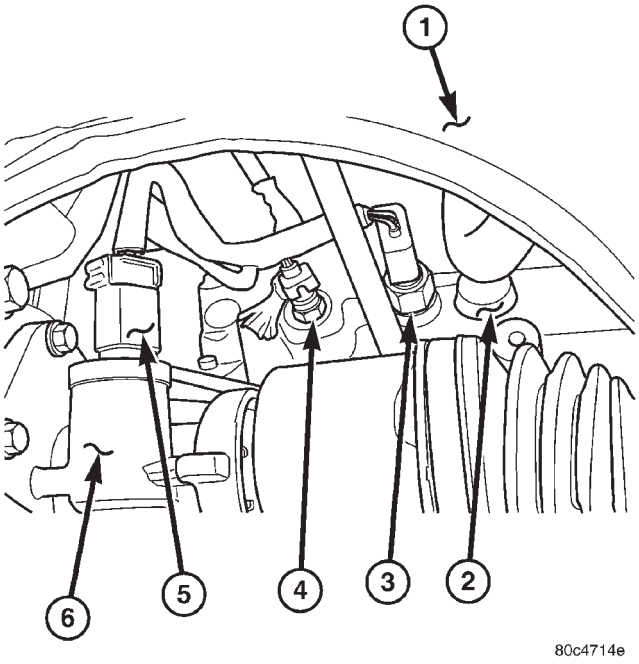

Fig. 74 REAR ENGINE VIEW

1 - SUSPENSION CRADLE
2 - ENGINE BLOCK
3 - OIL PRESSURE SWITCH
4 - OIL TEMPERATURE SENSOR

6 - TRANSMISSION

(4) Lower vehicle.
(5) Start engine and check for leaks.
(6) Check and adjust oil level as necessary.

OIL PRESSURE RELIEF VALVE

DESCRIPTION

The oil pressure relief valve mounts in the front of the engine block and is used to control oil flow through the engines lubrication system (Fig. 75).

REMOVAL

(1) Remove engine oil pan (Refer to 9 - ENGINE/ LUBRICATION/OIL PAN - REMOVAL).
(2) Using special tool VM.1054, remove oil pressure relief valve from engine block (Fig. 76).

INSTALLATION

(1) Thoroughly clean all components and relief valve pocket in cylinder block.
(2) Lubricate all oil pressure relief valve components with engine oil.
(3) Install oil pressure relief valve plunger, spring, and cap.

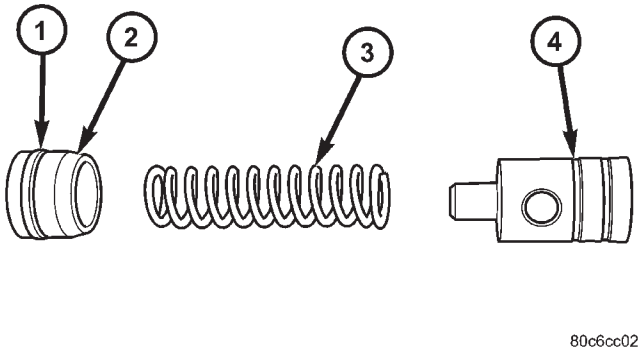

Fig. 75 OIL PRESSURE RELIEF VALVE

1 - O-RING
2 - OIL PRESSURE RELIEF VALVE CAP
3 - OIL PRESSURE RELIEF VALVE SPRING

2 - OIL PRESSURE RELIEF VALVE
3 - ENGINE BLOCK
4 - OIL PUMP

OIL PRESSURE RELIEF VALVE (Continued)

(4) Using special tool VM.1059, push oil pressure relief valve cap in untill flush with engine block (Fig. 77).

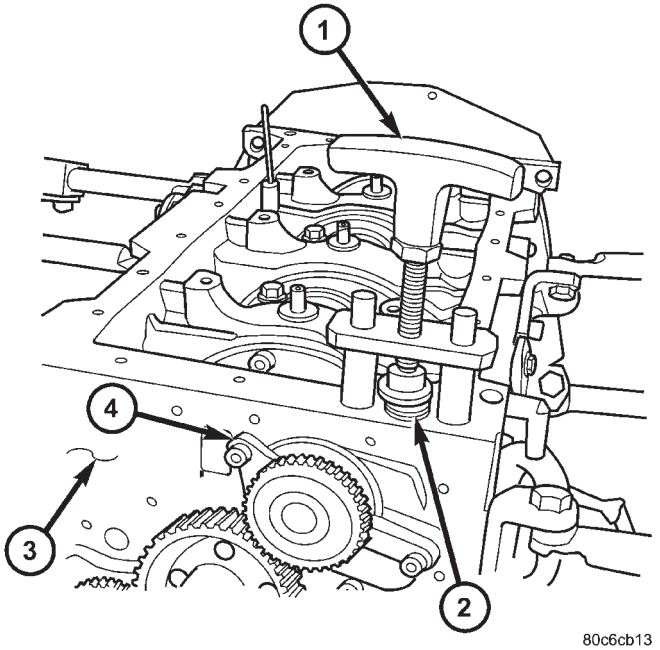

Fig. 77 OIL PRESSURE RELIEF VALVE INSTALLATION

1 - VM.1059
2 - OIL PRESSURE RELIEF VALVE
3 - ENGINE BLOCK
4 - OIL PUMP

(5) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

OIL COOLER & LINES

REMOVAL

(1) Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
(2) Raise vehicle on hoist.
(3) Remove oil filter cap and filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
(4) Remove oil filter housing retaining nut and housing (Fig. 78).
(5) Disconnect coolant hoses at cooler (Fig. 79).
(6) Remove oil cooler retaining bolt at engine block (Fig. 79).
(7) Remove oil cooler retaining stud and remove oil cooler from engine block (Fig. 79).

INSTALLATION

(1) Clean oil cooler and engine block sealing surfaces.

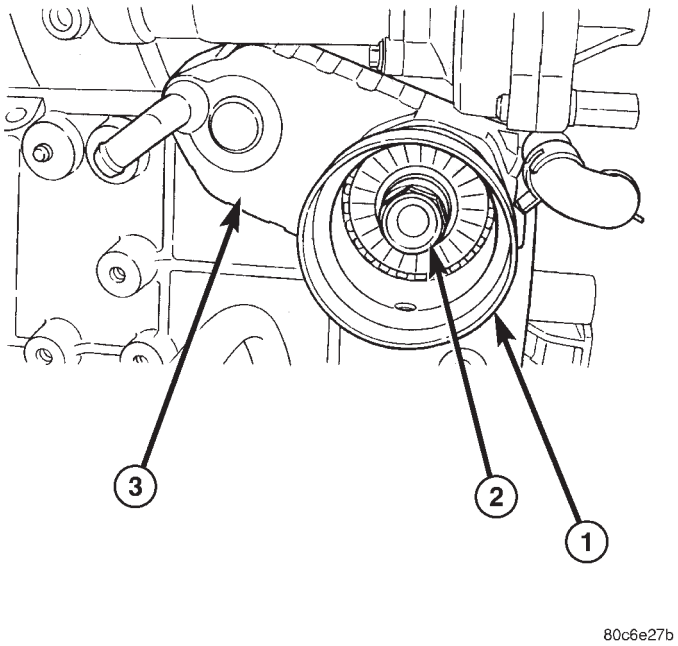

Fig. 78 OIL FILTER HOUSING RETAINING NUT

1 - OIL FILTER HOUSING
2 - OIL FILTER HOUSING RETAINING NUT
3 - OIL COOLER

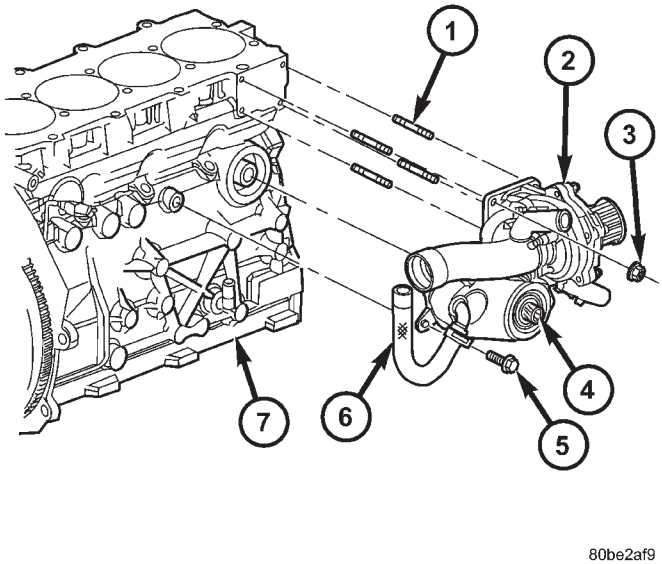

Fig. 79 WATER PUMP AND OIL COOLER ASSEMBLIES

4 - OIL COOLER RETAINING STUD
5 - OIL COOLER TO ENGINE BLOCK RETAINING BOLT
6 - OIL COOLER COOLANT HOSE
7 - ENGINE BLOCK

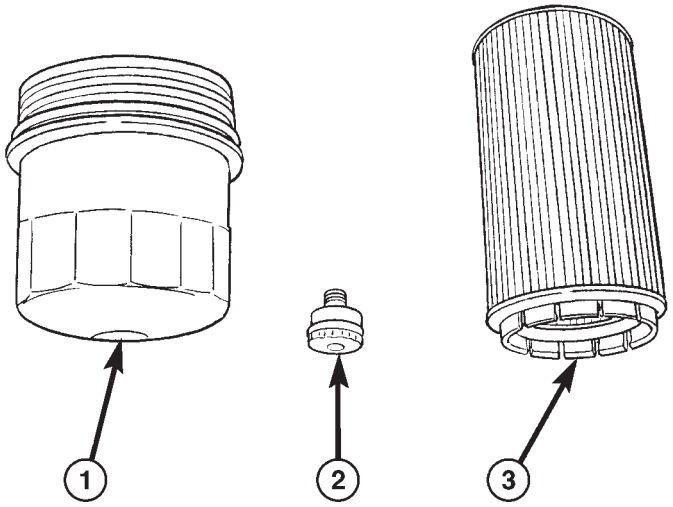
OIL COOLER & LINES (Continued)

(2) Install oil cooler, retaining bolt, and stud (Fig. 79). Torque retaining bolt to 47.1N·m and stud to 50N·m.
(3) Connect coolant hoses at cooler (Fig. 79).
(4) Install oil filter housing and retaining nut (Fig. 78). Torque retaining nut to 3.5 Kg.
(5) Install oil filter cartridge and oil filter cap (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).
(6) Lower vehicle.
(7) Refill cooling system (Refer to 7 - COOLING/ ENGINE/COOLANT - STANDARD PROCEDURE).
(8) Start engine and check for leaks.
(9) Check and adjust oil level as necessary.

OIL FILTER

DESCRIPTION

The oil filter used on this engine is a cartridge style filter (Fig. 80).



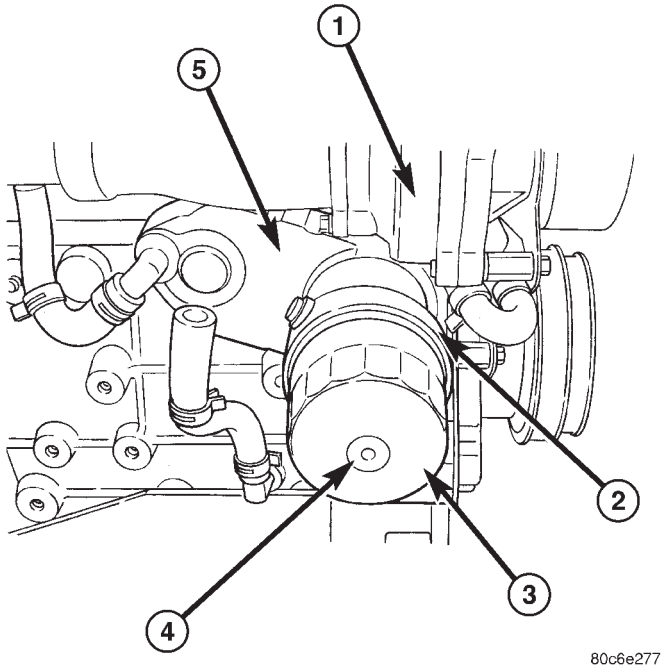
80c6e284

Fig. 80 OIL FILTER ASSEMBLY

1 - OIL FILTER CAP
2 - DRAIN PLUG
3 - OIL FILTER CARTRIDGE

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove oil filter cap drain plug and drain oil from oil filter housing (Fig. 81).
(3) Remove oil filter cap with suitable oil filter wrench (Fig. 81).



80c6e277

Fig. 81 OIL COOLER AND FILTER ASSEMBLY

1 - WATER PUMP HOUSING
2 - OIL FILTER HOUSING
3 - OIL FILTER CAP
4 - OIL FILTER CAP DRAIN PLUG
5 - OIL COOLER

(4) Remove oil filter cartridge from housing.

INSTALLATION

(1) Clean oil filter cap and drain plug with suitable solvent.
(2) Install new oil filter cartridge in oil filter housing.
(3) Install oil filter cap and drain plug
(4) Lower vehicle from hoist.
(5) Start engine and check for leaks.
(6) Check and adjust oil level as necessary.

OIL JET

DESCRIPTION

There are four oil jets installed in the engine block. These oil jets are used to cool and lubricate the piston assemblies (Fig. 82).

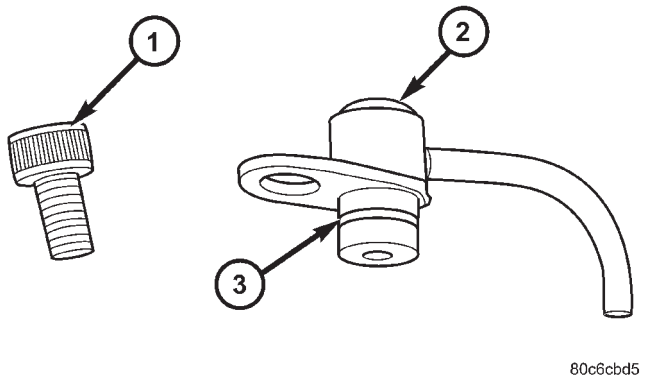


Fig. 82 OIL JET ASSEMBLY

1 - RETAINING BOLT
2 - OIL JET
3 - O-RING

REMOVAL

CAUTION: Use caution when removing and installing oil jets. Damage to oil jet nozzle could cause severe engine damage.

(1) Disconnect negative battery cable.
(2) Raise vehicle on hoist.
(3) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(4) Using special tool VM.1060 to hold oil jet. Remove oil jet retaining bolt and remove oil jet from engine block (Fig. 83).

INSTALLATION

CAUTION: Use caution when removing and installaing oil jets. Damage to oil jet nozzle could cause severe engine damage.

(1) Lubricate o-ring on oil jet.
(2) Using special tool VM.1060, install oil jet in engine block (Fig. 83).
(3) Install oil jet retaining bolt. Torque bolt to 10.8N·m.
(4) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
(5) Refill engine oil to proper level.
(6) Connect negative battery cable.

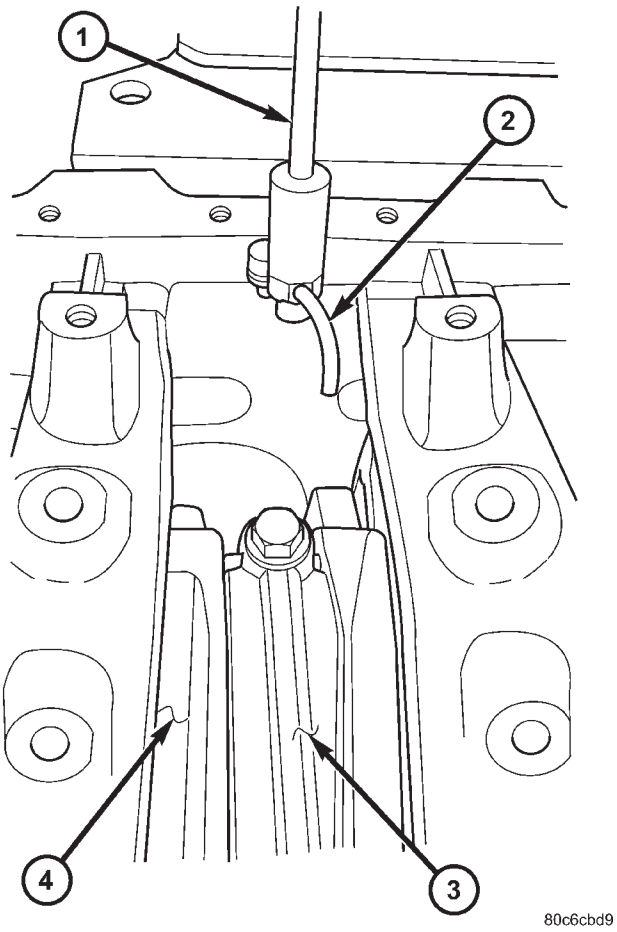

Fig. 83 OIL JET REMOVAL/INSTALLATION

INTAKE MANIFOLD

DESCRIPTION

(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - DESCRIPTION)

REMOVAL

(1) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

INSTALLATION

(1) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

VALVE TIMING

STANDARD PROCEDURE - LOCKING ENGINE 90° AFTER TDC

(1) Disconnect negative battery cable.

(2) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(3) Rotate engine untill notch in hub is in the following position (Fig. 84).

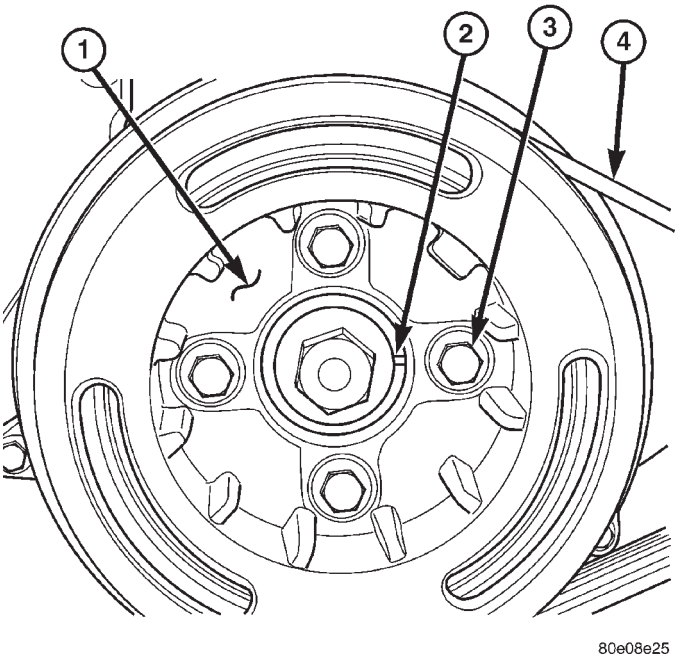

Fig. 84 CRANKSHAFT HUB ALIGNMENT

1 - VIBRATION DAMPER/CRANKSHAFT PULLEY
2 - CRANKSHAFT HUB NOTCH
3 - VIBRATION DAMPER/CRANKSHAFT PULLEY TO CRANKSHAFT HUB BOLTS

(4) Special tool VM.1068 can be install in engine block as shown at this time (Fig. 85). This will lock the engine at 90° after TDC.

(5) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(6) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(7) Remove plug in cylinder head cover/intake manifold and insert VM.1053 to lock exhaust camshaft in position (Fig. 86).

(8) Remove generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

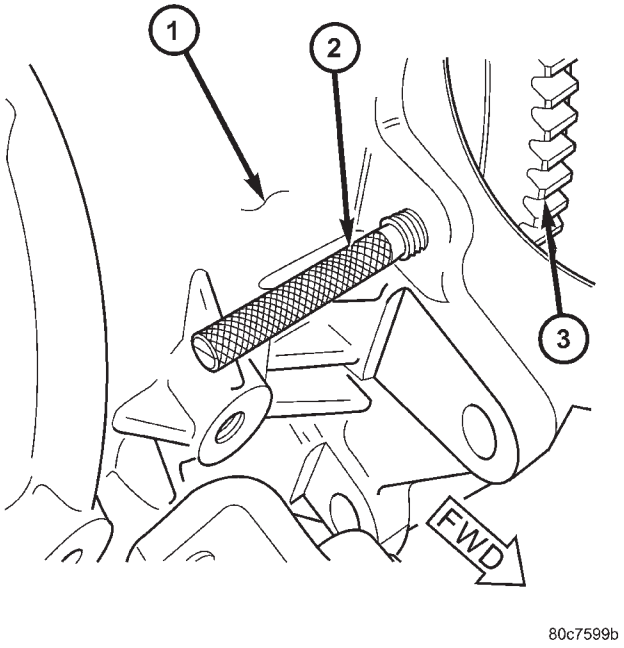

Fig. 85 TDC AND 90 DEGREES AFTER TDC ALIGNMENT PIN LOCATION

4 - CYLINDER HEAD COVER/INTAKE MANIFOLD

VALVE TIMING (Continued)

(9) Remove plug in cylinder head cover/intake manifold and insert VM.1052 to lock intake camshaft in position (Fig. 87).

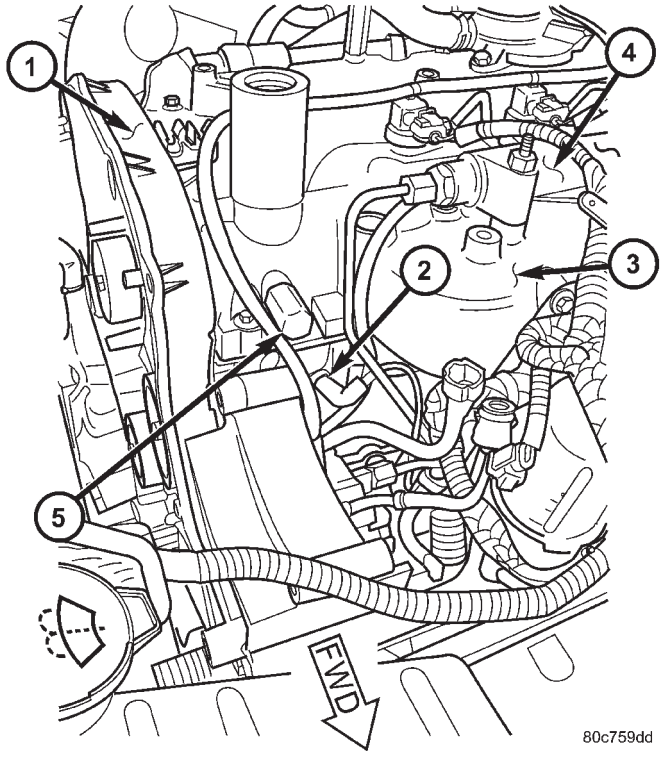

Fig. 87 INTAKE CAMSHAFT LOCKING PIN VM.1052

1 - TIMING BELT INNER COVER
2 - GLOW PLUG ELECTRICAL CONNECTOR
3 - CYLINDER HEAD COVER/INTAKE MANIFOLD
4 - FUEL RAIL
5 - INTAKE CAMSHAFT LOCKING PIN VM.1052

(10) At this point the timing belt can be removed for service.

(11) After engine service is completed and timing belt reinstalled, remove both camshaft locking pins from cylinder head cover/intake manifold.

(12) Install both camshaft access plugs.

(13) Remove 90° after TDC engine locking pin.

(14) Install starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(15) Install generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(16) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

(17) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(18) Connect negative battery cable.

BALANCE SHAFT

DESCRIPTION

The 2.5L Common Rail Diesel engine is equipped with two nodular cast iron balance shafts in a cast aluminum carrier. The balance shaft assembly is mounted to the engine block (Fig. 88).

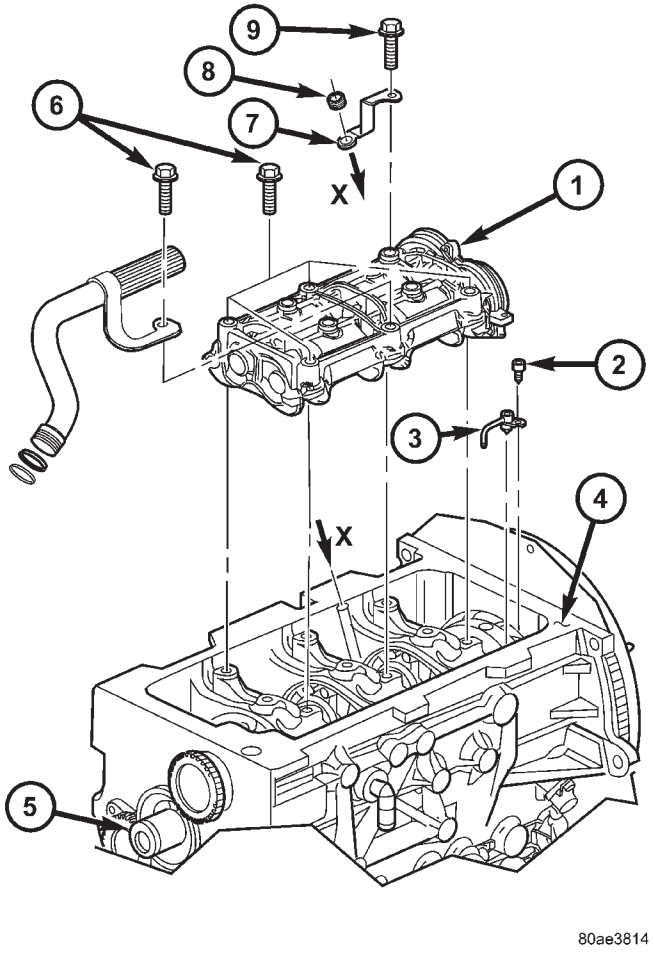

Fig. 88 BALANCE SHAFT ASSEMBLY

1 - BALANCE SHAFT
2 - OIL JET RETAINING BOLT
3 - OIL JET
4 - ENGINE BLOCK
5 - CRANKSHAFT
6 - BALANCE SHAFT RETAINING BOLTS
7 - OIL DIPSTICK TUBE RETAINER
8 - RUBBER BUSHING
9 - RETAINING BOLT

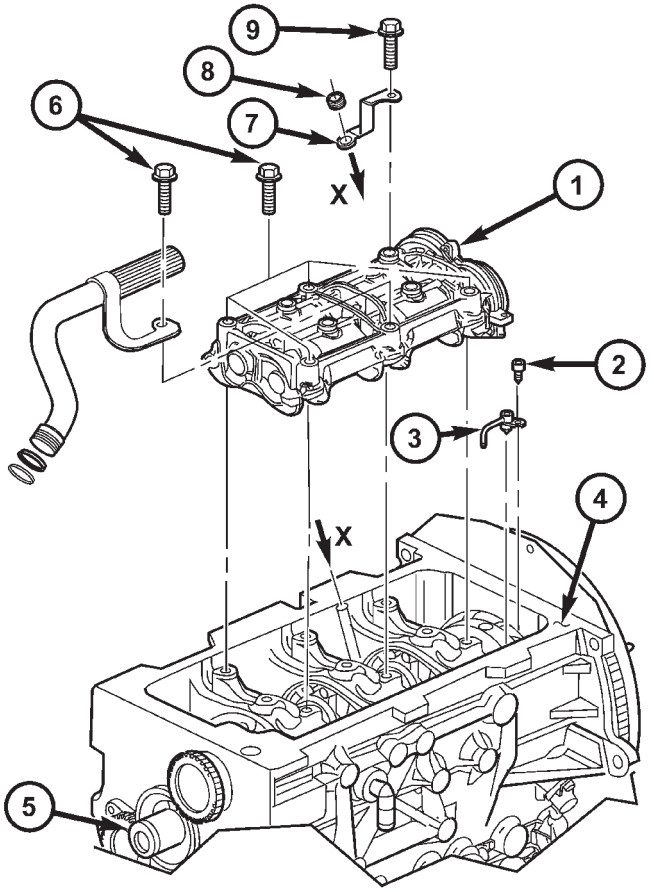
OPERATION

The balance shaft is driven by the crankshaft. The balance shafts are connected by heelical gears. The dual-counter rotating shafts decrease second order vertical shaking forces caused by component movement.

BALANCE SHAFT (Continued)

REMOVAL

(1) Disconnect negative battery cable.
(2) Raise vehicle on hoist.
(3) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
(4) Remove balance shaft assembly (Fig. 89).



80ae3814

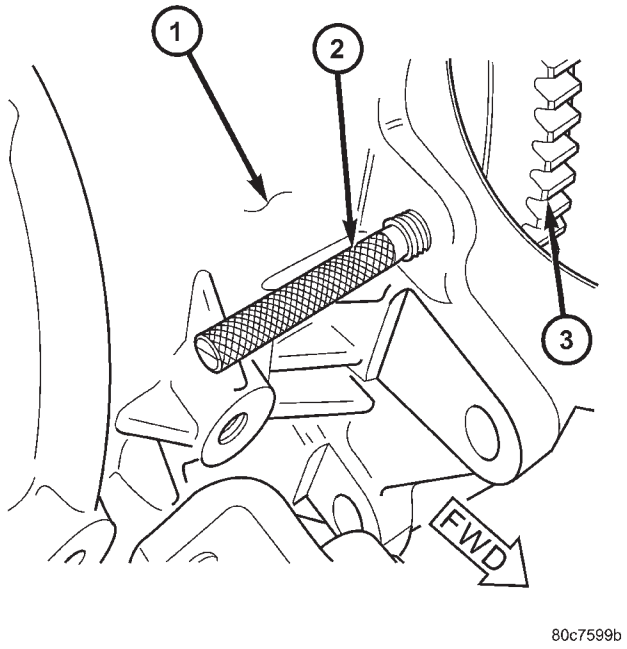
Fig. 89 BALANCE SHAFT ASSEMBLY

1 - BALANCE SHAFT
2 - OIL JET RETAINING BOLT
3 - OIL JET
4 - ENGINE BLOCK
5 - CRANKSHAFT
6 - BALANCE SHAFT RETAINING BOLTS
7 - OIL DIPSTICK TUBE RETAINER
8 - RUBBER BUSHING
9 - RETAINING BOLT

INSTALLATION

(1) Before installation of the balance shaft assembly, the # 1 cylinder must be brought to TDC. Using special tool VM.1051, roll engine over by hand until tool can be inserted into engine block locking flywheel from turning (Fig. 90). Once the # 1 cylinder is brought to TDC, the balance shaft assembly can be installed.

(2) With balance shaft assembly on work bench. Insert special tool VM.1056 into balance shaft assembly (Fig. 91). This will ensure proper balance shaft and crankshaft timing after assembly.



80c7599b

Fig. 90 TDC AND 90 DEGREES AFTER TDC ALIGNMENT PIN LOCATION

BALANCE SHAFT (Continued)

(3) Install balance shaft assembly and retaining bolts (Fig. 89). Torque bolts to 32.4N·m.
(4) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
(5) Refill engine oil to proper level.
(6) Connect negative battery cable.

TIMING BELT / CHAIN COVER(S)

REMOVAL

REMOVAL - TIMING BELT OUTER COVER

(1) Disconnect negative battery cable.
(2) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).
(3) Remove air cleaner housing.
(4) Support engine and remove right engine mount and bracket.
(5) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(7) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(8) Remove timing belt outer cover retaining bolts and remove cover (Fig. 92).

REMOVAL - TIMING BELT INNER COVER

(1) Disconnect negative battery cable.
(2) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).
(3) Remove air cleaner housing.
(4) Support engine and remove right engine mount and bracket.
(5) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(7) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(8) Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(9) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

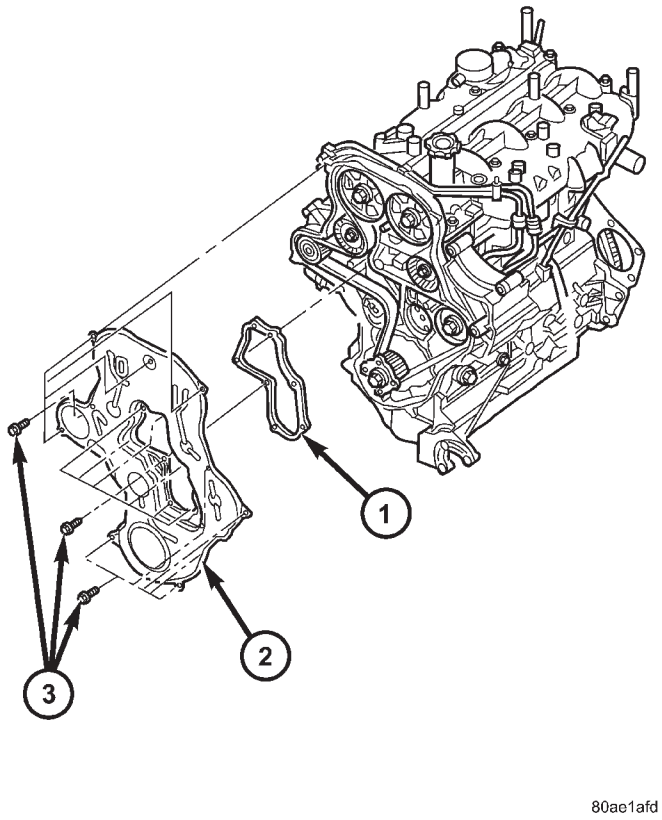

Fig. 92 TIMING BELT COVER (OUTER)

1 - SEAL
2 - TIMING BELT OUTER COVER
3 - RETAINING BOLTS

(10) Remove timing belt idler pulleys (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT IDLER PULLEY - REMOVAL).
(11) Using special tool VM.1055, remove camshaft sprockets (Fig. 93).
(12) Remove timing belt tensioner (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - REMOVAL) .
(13) Remove injection pump sprocket (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - REMOVAL).
(14) Remove timing belt inner cover retaining bolts and remove cover (Fig. 94).

INSTALLATION

INSTALLATION - TIMING BELT OUTER COVER

(1) Install timing belt outer cover seal and cover (Fig. 92). Torque 3mm bolts to 10.8N·m and 8mm bolts to 10.8N·m.
(2) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

TIMING BELT / CHAIN COVER(S) (Continued)

(3) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(4) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(5) Install right engine mount.

(6) Install air cleaner housing.

(7) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

(8) Connect negative battery cable.

INSTALLATION - TIMING BELT INNER COVER

(1) Install timing belt inner cover to engine front cover seal (Fig. 94).

(2) Install timing belt inner cover to cylinder head cover gaskets (Fig. 94).

(3) Install timing belt inner cover and retaining bolts (Fig. 94). Torque 10mm bolts to 47.1N·m and 8mm bolts to 10.8N·m.

(4) Install injection pump sprocket (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - INSTALLATION).

(5) Install camshaft sprockets (Fig. 93). Torque bolts to 108N·m.

(6) Install timing belt idler pulleys (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT IDLER PULLEY - INSTALLATION).

(7) Install timing belt and tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(8) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

TIMING BELT / CHAIN COVER(S) (Continued)

(9) Install vibration damper (Refer to 9 - ENGINE/ ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(10) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(11) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Install right engine mount assembly.

(13) Install air cleaner housing.

(14) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

(15) Connect negative battery cable.

TIMING BELT IDLER PULLEY

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(3) Remove air cleaner housing.

(4) Support engine and remove right engine mount.

(5) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(8) Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(9) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

NOTE: Idler pulley retaining bolts are LHD thread.

(10) Remove timing belt idler pulleys (Fig. 95).

9 - CAMSHAFT SPROCKET RETAINING BOLT

INSTALLATION

(1) Install timing belt idler pulleys (Fig. 95). Torque bolts to 47.1N·m.

(2) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) .

(3) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(4) Install vibration damper (Refer to 9 - ENGINE/ ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(5) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(6) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(7) Install right engine mount.

(8) Install air cleaner housing.

(9) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

(10) Connect negative battery cable.

TMNG BELT/CHAIN TENSIONER

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).
(3) Remove air cleaner housing.
(4) Support engine and remove right engine mount.
(5) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(7) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(8) Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
(9) Loosen and remove timing belt tensioner (Fig. 96).

INSTALLATION

(1) Install timing belt tensioner and retaining bolt (Fig. 96).
(2) Adjust timing belt tensioner (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS) .
(3) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
(4) Install vibration damper (Refer to 9 - ENGINE/ ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
(5) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

7 - TENSIONER ALIGNMENT PIN
8 - IDLER PULLEY
9 - CAMSHAFT SPROCKET RETAINING BOLT

INSTALLATION

(1) With both camshaft alignment pins still installed and the engine locked at 90° after TDC.

(2) Align timing mark on injection pump sprocket with timing mark on timing belt (Fig. 100).

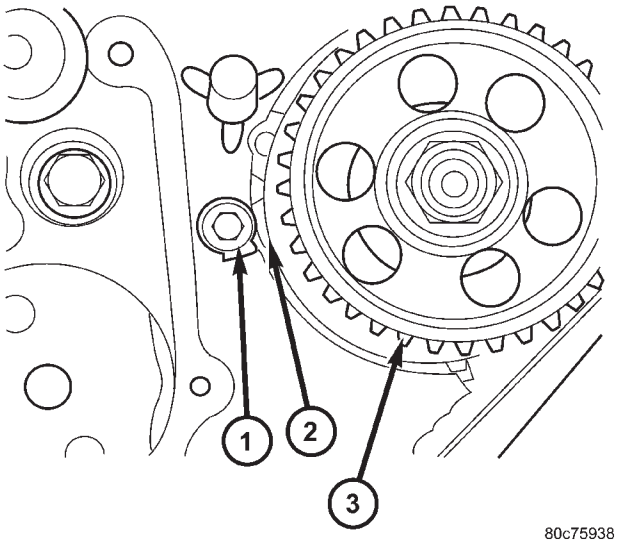

Fig. 100 INJECTION PUMP GEAR TIMING MARKS

1 - TIMING MARK ON COVER
2 - TIMING MARK ON INJECTION PUMP SPROCKET
3 - INJECTION PUMP SPROCKET

(3) Install timing belt.

(4) Adjust the timing belt tensioner (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS) .

(5) Remove both camshaft alignment pins from cylinder head cover/intake manifold and engine locking pin from engine block (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).

(6) Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(7) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(8) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(9) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(10) Install right engine mount.

(11) Install air cleaner housing.

(12) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

(13) Connect negative battery cable.

EXHAUST SYSTEM

DESCRIPTION

The exhaust system consists of a catalytic converter, muffler, and a resonator with connecting pipes in-between (Fig. 1). The system is serviced in two sections; the catalytic converter and pipe, and the muffler and resonator with connecting pipe. A band clamp is used to connect the joint between the two components. Three support hanger rods with rubber isolators are used to support and isolate the exhaust system. A flexible joint, integral to the catalytic converter, allows for engine movement. On vehicles equipped with AWD, an additional heat shield is mounted to the catalytic converter. The exhaust system is tuned for each vehicle/powertrain combination.

EXHAUST SYSTEM (Continued)

OPERATION

The exhaust system contains, quiets, and cleans the exhaust gases generated by the engine.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EXCESSIVE EXHAUST SYSTEM NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE EXHAUST NOISE (UNDER HOOD)	1. Exhaust manifold cracked or broken.	1. Replace manifold.
	2. Manifold to cylinder head leak.	2. Tighten manifold and/or replace gasket.
	3. EGR Valve to manifold gasket leakage.	3. Tighten fasteners or replace gasket.
	4. EGR Valve to EGR tube gasket leakage.	4. Tighten fasteners or replace gasket.
	5. EGR tube to manifold tube leakage.	5. Tighten tube nut.
	6. Exhaust flex-joint to manifold leak.	6. Tighten joint fasteners and/or replace gasket.
	7. Exhaust flex-joint.	7. Replace catalytic converter assembly.
	8. Pipe and shell noise from front exhaust pipe.	8. Characteristic of single wall pipe.
EXCESSIVE EXHAUST NOISE	1. Leak at exhaust pipe joints.	1. Tighten clamps at leaking joints.
	2. Burned or rusted out muffler assembly or exhaust pipe.	2. Replace muffler resonator tailpipe assembly or exhaust pipe with catalytic converter assembly.
	3. Burned or rusted out resonator.	3. Replace muffler resonator tailpipe assembly.
	4. Restriction in exhaust system.	4. Perform Exhaust System Restriction Check. Replace component as necessary.
	5. Converter material in muffler.	5. Replace muffler and converter assemblies. Check fuel injection and ignition systems for proper operation.

DIAGNOSIS AND TESTING - EXHAUST SYSTEM RESTRICTION CHECK

Exhaust system restriction can be checked by measuring back pressure using the DRB III® and PEP module pressure tester.

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

EXHAUST SYSTEM (Continued)

(1) Disconnect and remove the upstream (before catalytic converter) oxygen sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O2 SENSOR - REMOVAL)

(2) Install the Exhaust Back Pressure Fitting Adaptor CH8519.

(3) Connect the Low Pressure Sensor (15 psi) CH7063 to the back pressure fitting.

(4) Following the PEP module instruction manual, connect all required cables to the DRB III® and PEP module. Select the available menu options on the DRBIII® display screen for using the digital pressure gauge function.

(5) Apply the park brake and start the engine.

(6) With transmission in Park or Neutral, raise engine speed to 2000 RPM. Monitor the pressure readings on the DRBIII®. Back pressure should not exceed specified limit. Refer to specification in table below EXHAUST BACK PRESSURE LIMITS .

NOTE: For applications with dual catalytic converters, repeat test on opposite converter using the previous steps.

(7) If pressure exceeds maximum limits, inspect exhaust system for restricted component. For further catalytic converter inspection procedures, (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSPECTION). Replace component(s) as necessary.

EXHAUST BACK PRESSURE LIMITS

Exhaust Back Pressure Limit (Max)	
Vehicle in Park/Neutral (no load) RPM	3.45 Kpa (0.5 psi)

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

NOTE: Slip joint band clamps are spot welded to exhaust system. If a band clamp must be replaced, the spot weld must be ground off.

ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken, damaged or loose components such as; clamps, heat shields, isolators, and hanger brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

(1) Loosen band clamp at catalytic converter pipe to muffler/resonator assembly.

(2) Align the exhaust system by inserting pipe inward or outward until specification is achieved as shown in (Fig. 2).

(3) Tighten band clamp to 54 N·m (40 ft. lbs.).

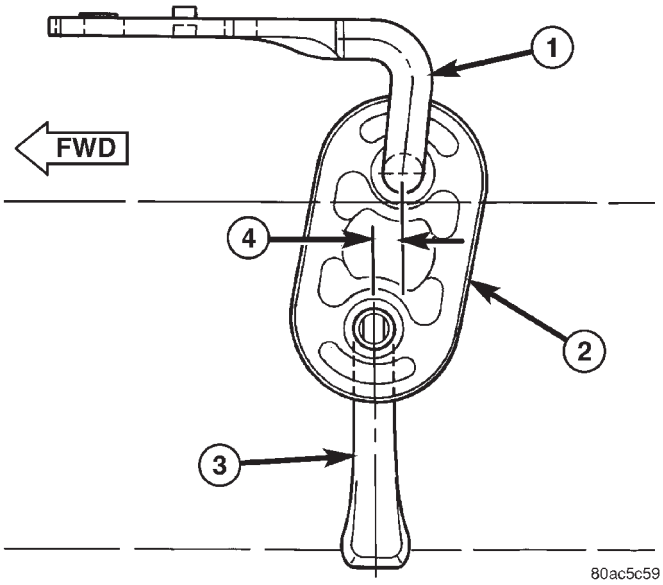

Fig. 2 Exhaust System Alignment

CATALYTIC CONVERTER

DESCRIPTION

The toe board three-way catalytic converter is connected to the exhaust manifold by the use of flex joint and a gasket. The outlet connects to the muffler inlet pipe and is secured with a band type clamp (Fig. 1).

The exhaust flex-joint coupling (Fig. 3) is used to secure the catalytic converter to the exhaust manifold. The flex-joint has four bolts, four flag nuts and a gasket that are separate parts from the exhaust flex-joint. The flex-joint is welded to the catalytic converter.

CAUTION: When servicing, care must be exercised not to dent or bend the bellows or bellows cover of the flex-joint. Should this occur, the flex-joint will eventually fail and require the catalytic converter be replaced.

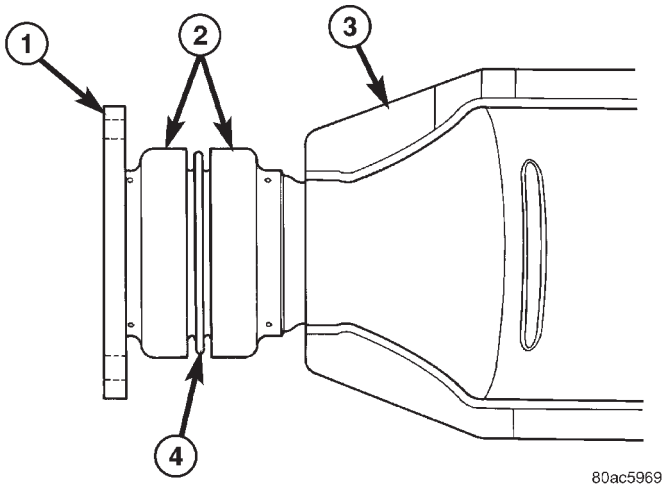

Fig. 3 Flex-joint

1 - FLANGE
2 - END CAPS
3 - CATALYTIC CONVERTER
4 - FLEXIBLE BELLOWS

OPERATION

The three-way catalytic converter simultaneously converts three exhaust emissions into harmless gases. Specifically, HC and CO emissions are converted into water (H2O) and carbon dioxide (CO2). Oxides of Nitrogen (NOx) are converted into elemental Nitrogen (N) and water. The three-way catalyst is most efficient in converting HC, CO and NOx at the stoichiometric air fuel ratio of 14.7:1.

The oxygen content in a catalyst is important for efficient conversion of exhaust gases. When a high oxygen content (lean) air/fuel ratio is present for an extended period, oxygen content in a catalyst can reach a maximum. When a rich air/fuel ratio is present for an extended period, the oxygen content in the catalyst can become totally depleted. When this occurs, the catalyst fails to convert the gases. This is known as catalyst ″punch through.″

CATALYTIC CONVERTER (Continued)

Catalyst operation is dependent on its ability to store and release the oxygen needed to complete the emissions-reducing chemical reactions. As a catalyst deteriorates, its ability to store oxygen is reduced. Since the catalyst's ability to store oxygen is somewhat related to proper operation, oxygen storage can be used as an indicator of catalyst performance. Refer to the appropriate Diagnostic Information for diagnosis of a catalyst related Diagnostic Trouble Code (DTC).

The combustion reaction caused by the catalyst releases additional heat in the exhaust system, causing temperature increases in the area of the reactor under severe operating conditions. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency. **Do not** remove spark plug wires from plugs or by any other means short out cylinders, if exhaust system is equipped with a catalytic converter. Failure of the catalytic converter can occur due to temperature increases caused by unburned fuel passing through the converter. This deterioration of the catalyst core can result in excessively high emission levels, noise complaints, and exhaust restrictions.

Unleaded gasoline must be used to avoid ruining the catalyst core. Do not allow engine to operate above 1200 RPM in neutral for extended periods over 5 minutes. This condition may result in excessive exhaust system/floor pan temperatures because of no air movement under the vehicle.

The flex joint allows flexing as the engine moves, preventing breakage that could occur from the back-and-forth motion of a transverse mounted engine.

CAUTION: Due to exterior physical similarities of some catalytic converters with pipe assemblies, extreme care should be taken with replacement parts. There are internal converter differences required in some parts of the country (particularly vehicles built for States with strict emission requirements) and between model years.

REMOVAL

(1) Loosen clamp and disconnect the muffler/resonator assembly from catalytic converter pipe.

(2) Disconnect downstream oxygen sensor electrical connector (Fig. 4). For removal of downstream oxygen sensor, (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O2 SENSOR - REMOVAL).

(3) Remove catalytic converter to exhaust manifold attaching fasteners (Fig. 5).

(4) Remove catalytic converter and gasket (Fig. 5).

CATALYTIC CONVERTER (Continued)

INSPECTION

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

Check catalytic converter for a flow restriction. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Exhaust System Restriction Check for procedure.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.

INSTALLATION

(1) Position new gasket onto the manifold flange and install catalytic converter (Fig. 5). Tighten fasteners to 37 N·m (325 in. lbs.).

NOTE: Be careful not to twist or kink the oxygen sensor wires.

(2) Install (if removed) and connect the downstream oxygen sensor (Fig. 4).

(3) Install the muffler/resonator assembly. (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION)

CROSS-OVER PIPE - 3.3/3.8L

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the fasteners attaching the left bank manifold connection to cross-over pipe (Fig. 6).

(3) Raise vehicle and remove the left front wheel.

(4) Access the lower right bank pipe connection fastener through the left front wheel opening using a long ratchet extension. Loosen and remove the lower fastener.

(5) Remove the upper right bank pipe connection fastener by accessing though the catalytic converter floor pan tunnel.

(6) Lower the vehicle.

(7) Remove the cross-over pipe (Fig. 6).

(8) Remove gaskets and discard (Fig. 6).

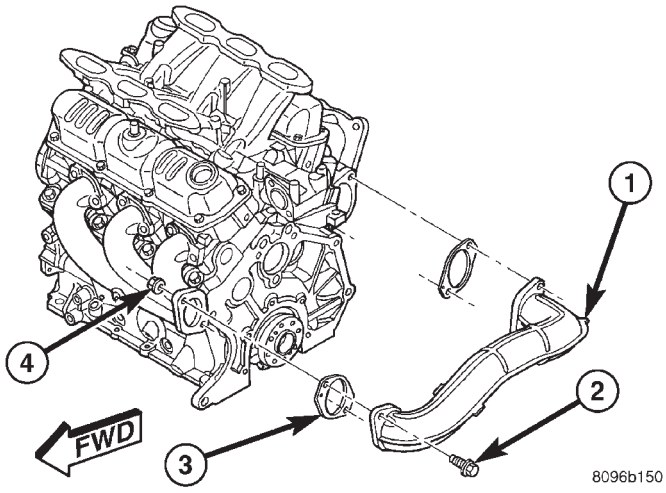

Fig. 6 CROSS-OVER PIPE

1 - CROSS-OVER PIPE
2 - BOLT
3 - GASKET
4 - FLAG NUT

INSTALLATION

(1) Position cross-over pipe to the manifold connections (Fig. 6).

(2) Position new gasket on left bank (front) pipe connection and loosely install fasteners (Fig. 6).

(3) Raise the vehicle.

(4) Position new gasket on the right bank pipe connection and install fasteners.

(5) Tighten right bank upper fastener to 41 N·m (30 ft. lbs.).

(6) Tighten right bank lower fastener to 41 N·m (30 ft. lbs.) using a long ratchet extension accessing through the left wheel opening.

(7) Install the left front wheel and lower vehicle.

(8) Tighten the left bank pipe connection fasteners to 41 N·m (30 ft. lbs.) (Fig. 6).

HEAT SHIELDS

DESCRIPTION

The exhaust system heat shields (Fig. 7), (Fig. 8), or (Fig. 9) are attached to the under body of the vehicle. On vehicles equipped with All Wheel Dive (AWD), an additional heat shield is mounted to the catalytic converter.

HEAT SHIELDS (Continued)

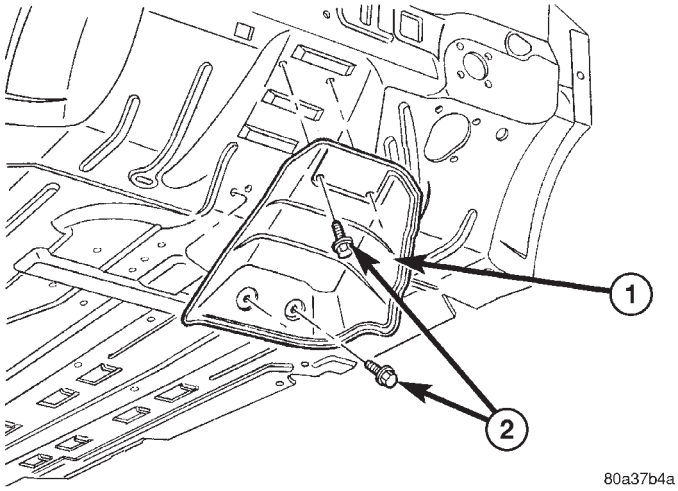

Fig. 7 CATALYTIC CONVERTER HEAT SHIELD

1 - HEAT SHIELD - CATALYTIC CONVERTER
2 - SCREW (QTY. 4)

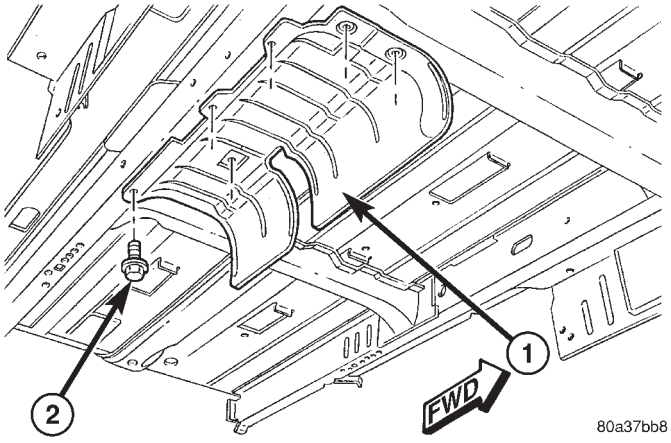

Fig. 8 MUFFLER HEAT SHIELD

1 - HEAT SHIELD - MUFFLER
2 - SCREW (QTY. 6)

OPERATION

Heat shields are needed to protect both the vehicle and the environment from the high temperatures developed near the catalytic converter.

Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shields on cars so equipped. Light over spray near the edges is permitted. Application of coating will greatly reduce the efficiency of the heat shields resulting in excessive floor pan temperatures and objectionable fumes.

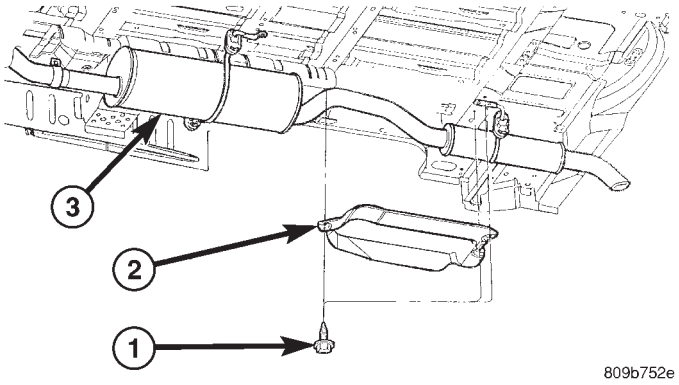

Fig. 9 RESONATOR PIPE HEAT SHIELD

1 - SCREW (QTY. 3)
2 - HEAT SHIELD - RESONATOR PIPE
3 - MUFFLER

REMOVAL

(1) Raise vehicle on hoist.
(2) Remove fasteners attaching applicable heat shield (Fig. 7), (Fig. 8), or (Fig. 9).
(3) Remove heat shield(s).

INSTALLATION

(1) Position heat shield(s) to underbody.
(2) Install heat shield fasteners and tighten to 2.6 N·m (23 in. lbs.) (Fig. 7), (Fig. 8), or (Fig. 9).
(3) Lower vehicle.

MUFFLER

REMOVAL

(1) Raise vehicle on a body contact type hoist.

NOTE: To provide removal clearance between muffler/resonator pipe and rear axle parts, the rear suspension must be relieved of all body weight.

(2) Apply a penetrating oil to clamp nuts of component requiring removal.

CAUTION: When servicing the exhaust system, care must be exercised not to dent or bend the bellows of the flex-joint. Should this occur, the flex-joint will eventually fail, requiring replacement of the catalytic converter.

(3) Disconnect the right side axle half shaft from the rear differential module (AWD equipped only).

MUFFLER (Continued)

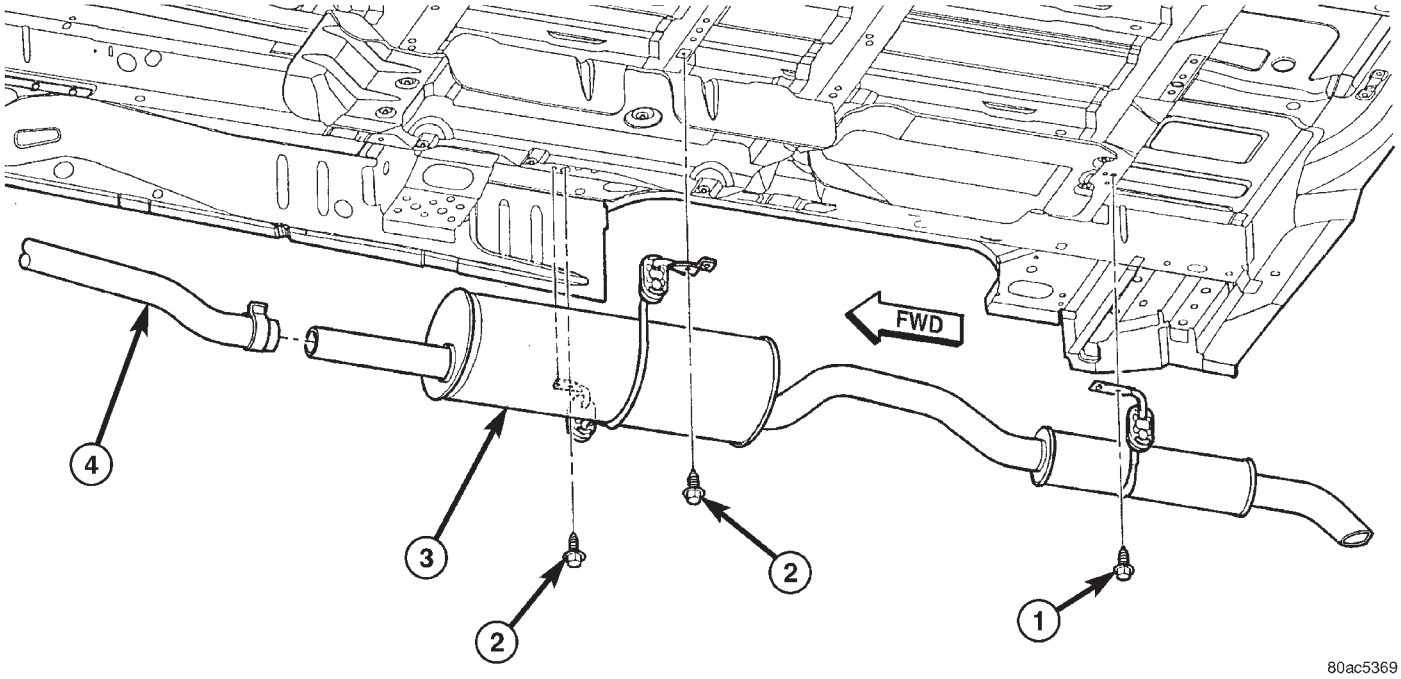

Fig. 10 Exhaust System - Typical (All Vehicles)

1 - SCREW - RESONATOR HANGER TO BODY
2 - SCREW - MUFFLER HANGER TO BODY
3 - MUFFLER & RESONATOR ASSEMBLY
4 - CATALYTIC CONVERTER PIPE

(4) Loosen the band clamp (Fig. 10) at the muffler to converter pipe connection.

(5) Remove the exhaust hangers to body screws (Fig. 10).

(6) Separate muffler pipe from converter pipe.

(7) Remove muffler/resonator assembly by moving assembly forward and guiding the resonator through the rear axle to body opening.

(8) Clean ends of pipes or muffler to assure mating of all parts. Discard broken or worn insulators, rusted clamps, supports and attaching parts. **When replacement is required on any component of the exhaust system, it is important that original equipment parts (or equivalent) be used for the following conditions:**

- Ensure proper alignment with other components in the system.
- Provide acceptable exhaust noise levels.
- Provide proper exhaust system back pressure for maintaining emission and performance levels.

INSTALLATION

(1) Install the muffler/resonator assembly by guiding resonator between the rear axle and body.

(2) Connect the muffler pipe to the converter pipe but do not tighten band clamp (Fig. 10).

(3) Position hangers to body and install screws starting at the resonator working forward (Fig. 10). Tighten hanger screws to 28 N·m (250 in. lbs.).

(4) Insert muffler pipe into catalytic converter pipe until the hangers are positioned as shown in (Fig. 11)

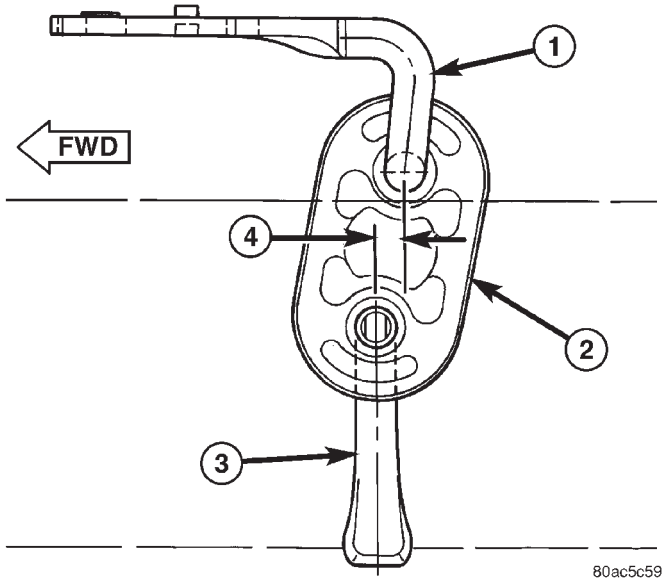

Fig. 11 Exhaust System Alignment

1 - HANGER BRACKET TO BODY
2 - ISOLATOR
3 - HANGER - MUFFLER/RESONATOR SUPPORT
4 - 6 mm (0.25 in.)

MUFFLER (Continued)

CAUTION: Band clamps should never be tightened such that the two sides of the clamps are bottomed out against the center hourglass shaped center block. Once this occurs, the clamp band has been stretched and has lost its clamping force and must be replaced.
To replace the band clamp; remove the nut and peel back the ends of the clamp until spot weld breaks. Clean remaining spot weld from the pipe using a file or grinder until surface is smooth.

NOTE: Maintain proper clamp orientation when replacing with new clamp.

(5) Tighten the band clamp to 55 N·m (40 ft. lbs.) (Fig. 12).
(6) Connect the right side half shaft to the rear differential module (AWD equipped only).

EXHAUST SYSTEM AND TURBOCHARGER

DESCRIPTION

The basic exhaust system consists of an engine exhaust manifold, turbocharger, exhaust down pipe, exhaust pipe, exhaust heat shield(s), muffler and exhaust tailpipe

The exhaust system uses a single muffler.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. If the system contacts any body panel, it will transfer objectionable noises originating from the engine to the body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or equivalent). This will assure proper alignment and provide acceptable exhaust noise levels.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

TURBOCHARGER SYSTEM

DESCRIPTION

CAUTION: The turbocharger is a performance part and must not be tampered with. The wastegate bracket is an integral part of the turbocharger. Tampering with the wastegate components can reduce durability by increasing cylinder pressure and thermal loading due to incorrect inlet and exhaust manifold pressure. Poor fuel economy and failure to meet regulatory emissions laws may result. Increasing the turbocharger boost WILL NOT increase engine power.

The turbocharger is an exhaust-driven supercharger which increases the pressure and density of the air entering the engine. With the increase of air entering the engine, more fuel can be injected into the cylinders, which creates more power during combustion.

The turbocharger assembly consists of four (4) major component systems (Fig. 1) (Fig. 2):

- Turbine section
- Compressor section
- Bearing housing
- Wastegate

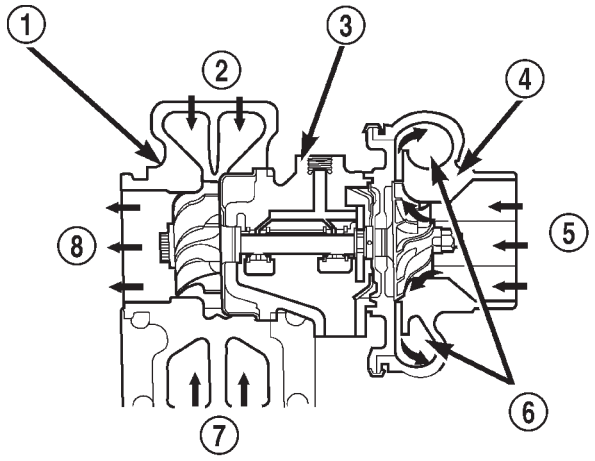

Fig. 1 Turbocharger Operation

7 - EXHAUST GAS
8 - EXHAUST GAS TO EXHAUST PIPE

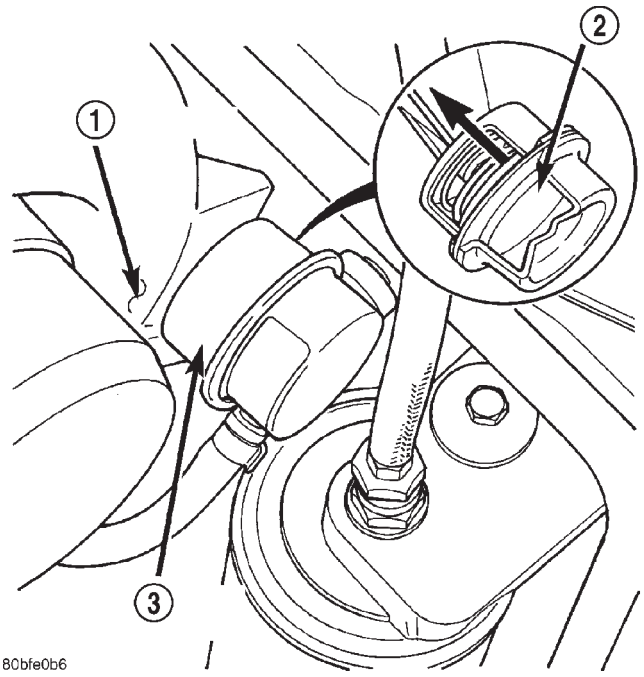

Fig. 2 Turbocharger Wastegate Actuator

1 - TURBOCHARGER
2 - DIAPHRAGM
3 - WASTE GATE ACTUATOR

OPERATION

Exhaust gas pressure and energy drive the turbine, which in turn drives a centrifugal compressor that compresses the inlet air, and forces the air into the engine through the charge air cooler and plumbing. Since heat is a by-product of this compression, the air must pass through a charge air cooler to cool the incoming air and maintain power and efficiency.

Increasing air flow to the engine provides:

- Improved engine performance
- Lower exhaust smoke density
- Improved operating economy
- Altitude compensation
- Noise reduction.

The turbocharger also uses a wastegate (Fig. 3), which regulates intake manifold air pressure and prevents over boosting at high engine speeds. When the wastegate valve is closed, all of the exhaust gases flow through the turbine wheel. As the intake manifold pressure increases, the wastegate actuator opens the valve, diverting some of the exhaust gases away from the turbine wheel. This limits turbine shaft speed and air output from the impeller.

The turbocharger is lubricated by engine oil that is pressurized, cooled, and filtered. The oil is delivered to the turbocharger by a supply line that is tapped into the oil filter head. The oil travels into the bearing housing, where it lubricates the shaft and bearings (Fig. 4). A return pipe at the bottom of the

bearing housing, routes the engine oil back to the crankcase.

The most common turbocharger failure is bearing failure related to repeated hot shutdowns with inadequate “cool-down” periods. A sudden engine shut down after prolonged operation will result in the transfer of heat from the turbine section of the turbocharger to the bearing housing. This causes the oil to overheat and break down, which causes bearing and shaft damage the next time the vehicle is started.

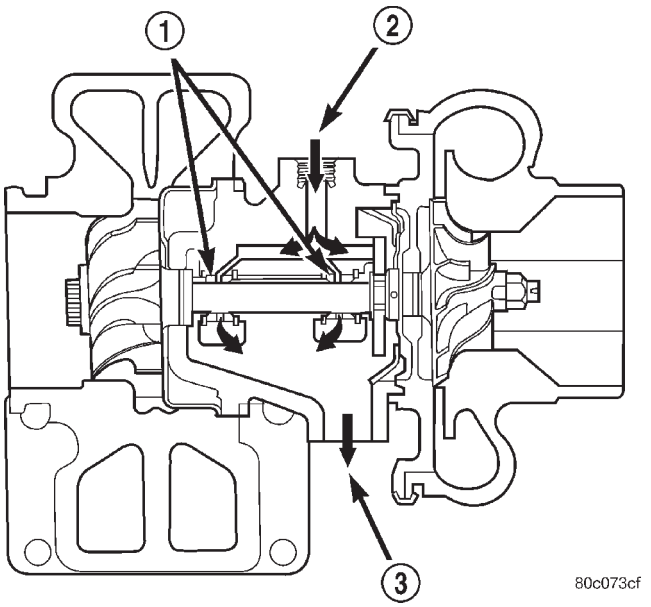

Fig. 4 Turbocharger Oil Supply and Drain

1 - BEARINGS
2 - OIL SUPPLY (FROM ENGINE BLOCK)
3 - OIL RETURN (TO OIL PAN)

Letting the engine idle after extended operation allows the turbine housing to cool to normal operating temperature. The following chart should be used as a guide in determining the amount of engine idle time required to sufficiently cool down the turbocharger before shut down, depending upon the type of driving and the amount of cargo.

TURBOCHARGER ″COOL DOWN″ CHART			
Driving Condition	**Load**	**Turbocharger Temperature**	**Idle Time (in minuetes) Before Shut Down**
Stop & Go	Empty	Cool	Less than 1
Stop & Go	Medium	Warm	1
Highway Speeds	Medium	Warm	2

Uphill Grade	Max. GCWR	Hot	5

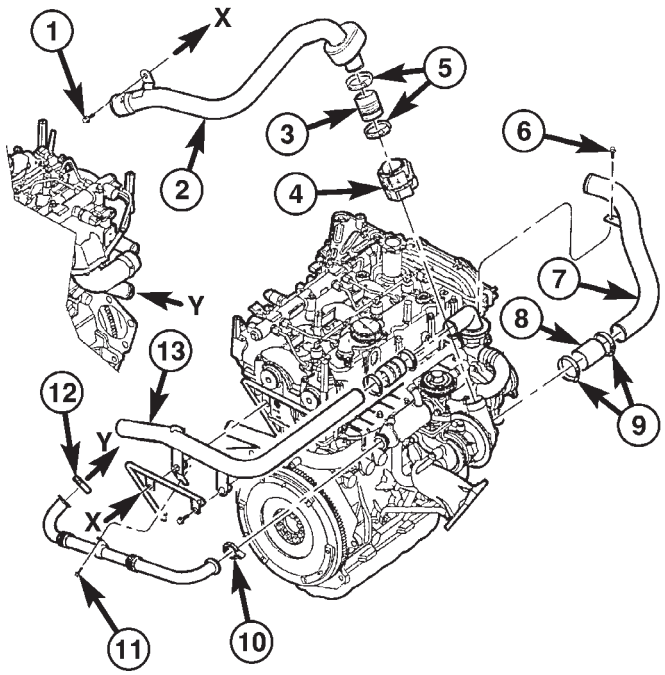
TURBOCHARGER

REMOVAL

The exhaust manifold and turbocharger cannot be remove with the engine in vehicle.

(1) Remove engine from vehicle and mount on engine stand (Refer to 9 - ENGINE - REMOVAL).

(2) Remove thermostat to upper radiator hose pipe (Fig. 5).



80c67730

TURBOCHARGER (Continued)

(8) With exhaust manifold and turbocharger assembly on work bench, remove turbocharger to exhaust manifold retaining bolts. Separate exhaust manifold and turbocharger.

CLEANING

All old gaskets should be inspected for any tears or signs of prior leakage. If any gaskets show such indications, they should be replaced with new gaskets. All gasket mating surfaces must be cleaned of old gasket material to produce a smooth and dirt free sealing surface for the new gasket.

INSTALLATION

(1) Connect exhaust manifold and turbocharger. Torque nuts to 32.4N·m.

(2) Position new exhaust manifol gasket on exhaust manifol studs (Fig. 6).

(3) Install exhaust manifold and turbocharger on engine (Fig. 6). Torque nuts to 32.4N·m.

(4) Connect turbocharger oil supply and return lines at turbocharger (Fig. 6). Torque oil supply line to 24.5N·m.

(5) Install exhaust manifold shield (Fig. 6). Torque bolts to 27.5N·m.

(6) Install engine lift hook (Fig. 6). Torque bolts to 32.4N·m.

(7) Install thermostat to upper radiator hose tube and turbocharger outlet tube (Fig. 5).

(8) Install engine in vehicle (Refer to 9 - ENGINE - INSTALLATION).

HEAT SHIELDS

REMOVAL

(1) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(2) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(3) Partially drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(4) Remove thermostat housing to upper radiator hose tube (Fig. 7).

(5) Remove exhaust manifold heat shield retaining bolts and remove shield (Fig. 8).

SPECIFICATIONS - TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Front bumper reinforcement attaching nut	54	40	—
Rear bumper reinforcement attaching nut	27	20	—

FRONT FASCIA

REMOVAL

(1) Release hood latch and open hood.
(2) Remove the headlamp assemblies (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ HEADLAMP - REMOVAL).
(3) Hoist vehicle and support with safety stands.
(4) Remove the five bolts attaching bottom of fascia/air dam to radiator closure panel.
(5) Remove front wheels.
(6) Remove front wheelhouse splash shields fasteners as necessary to gain access to bolts attaching front fascia to fender. (Refer to 23 - BODY/EXTERIOR/ WHEELHOUSE SPLASH SHIELD - REMOVAL).
(7) Remove the two bolts and two nuts attaching fascia to the front fenders (Fig. 1).
(8) Disconnect fog lamp wire connectors, if necessary.
(9) Lower vehicle.
(10) Remove two bolts attaching the upper grille support to the headlamp mounting panel at each side of the grille.
(11) Remove bumper fascia from vehicle.

INSTALLATION

(1) Position front bumper fascia on vehicle.
(2) Install the two bolts attaching fascia to headlamp mounting panel at each side of grille.
(3) Hoist vehicle and support with safety stands.
(4) Install the two bolts and two nuts attaching fascia to the front fenders (Fig. 1). The fascia should be flush to fender.
(5) Install front wheelhouse splash shields fasteners. (Refer to 23 - BODY/EXTERIOR/ WHEELHOUSE SPLASH SHIELD - INSTALLATION).
(6) Install front wheels.
(7) Connect fog lamp wire connectors, if necessary.
(8) Install the five bolts attaching bottom of fascia to radiator closure panel.
(9) Lower the vehicle.

FRONT FASCIA (Continued)

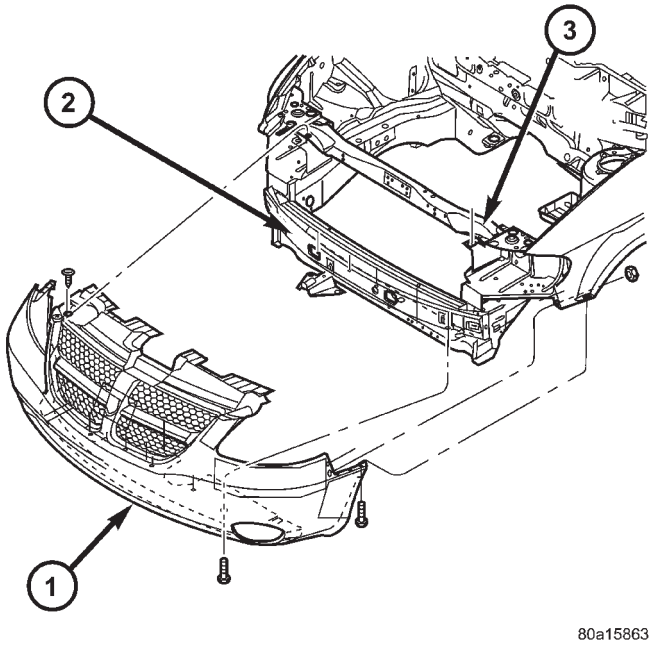

Fig. 1 FRONT BUMPER FASCIA

1 - FRONT BUMPER FASCIA
2 - FRONT BUMPER REINFORCEMENT
3 - RADIATOR ENCLOSURE

(10) Install the headlamp assemblies. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ HEADLAMP - INSTALLATION).

FRONT BUMPER REINFORCEMENT

REMOVAL

(1) Remove front bumper fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)

(2) Support front bumper reinforcement on a suitable lifting device.

(3) Remove the four nuts attaching front bumper reinforcement to frame rail (Fig. 2).

(4) Remove front bumper reinforcement from vehicle.

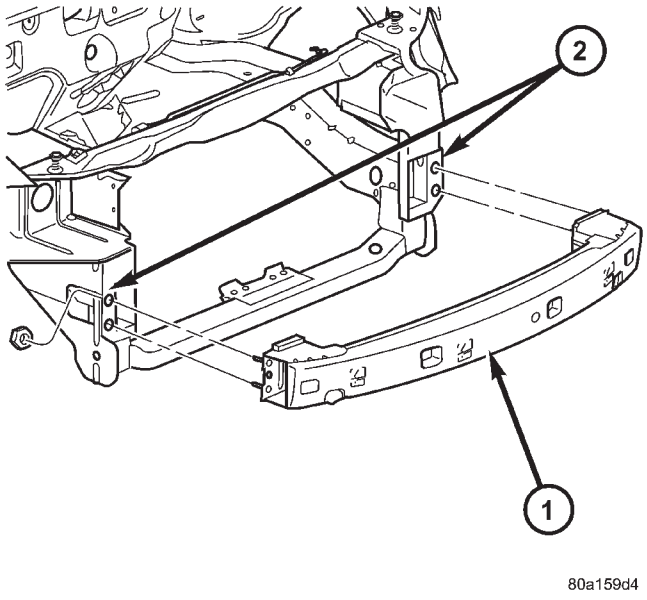

Fig. 2 FRT BUMPER REINFORCEMENT

1 - FRONT BUMPER REINFORCEMENT
2 - FRAME RAILS

INSTALLATION

NOTE: Check position of the arrows molded into the foam for correct orientation.

(1) Support front bumper reinforcement using a suitable lifting device and lift into position.

(2) Install the four nuts attaching reinforcement to frame rails. Tighten nuts to 54 N·m (40 ft. lbs.) torque.

(3) Install front fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

REAR FASCIA

REMOVAL

(1) Open liftgate.
(2) Remove the two screws attaching the upper fascia to the fascia support.
(3) Hoist and support vehicle with safety stands.
(4) Remove the six screws attaching rear fascia to rear fascia brackets (Fig. 3).
(5) Remove the four plastic push pin attaching bottom of rear fascia to fascia support.
(6) Remove rear fascia from vehicle by lifting sides of fascia up and outboard to release from rear fascia brackets.

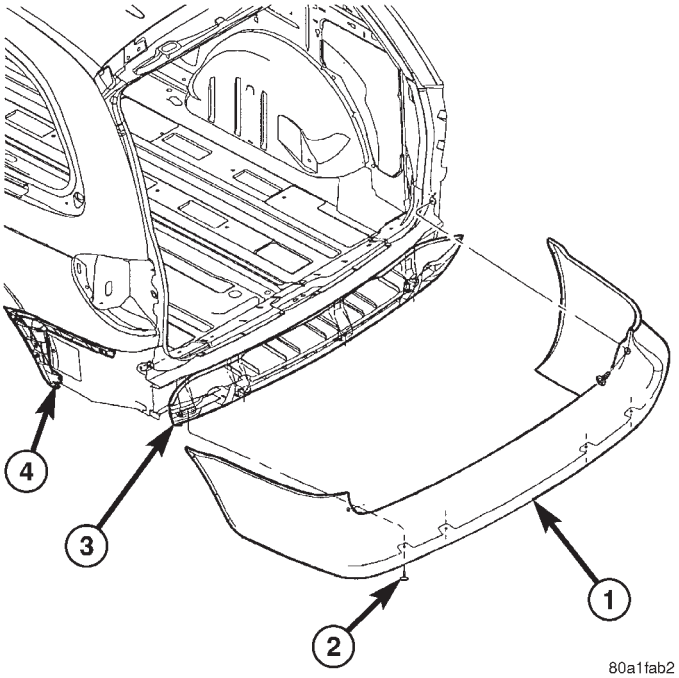

Fig. 3 REAR BUMPER FASCIA

1 - REAR FASCIA
2 - PUSH PINS
3 - REAR BUMPER REINFORCEMENT
2 - REAR FASCIA BRACKET

INSTALLATION

(1) Hoist and support vehicle with safety stands.
(2) Position rear fascia on vehicle.
(3) Engage front edge of fascia under the fascia support flange.
(4) Engage sides of fascia to top and front edge of the rear fascia brackets.

NOTE: Verify fascia is still engaged under the liftgate. Ensure acceptable and consistent gap between liftgate and fascia.

(5) Install the six screws attaching rear fascia to rear fascia brackets.
(6) Install the four plastic push pins attaching bottom of rear fascia to fascia support.
(7) Lower vehicle.
(8) Install the two screws attaching the upper fascia to the fascia support.

REAR BUMPER REINFORCEMENT

REMOVAL

(1) Remove rear bumper fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL)
(2) Support rear bumper reinforcement on a suitable lifting device.
(3) Remove the six nuts attaching rear bumper reinforcement to frame rail extensions (Fig. 4).
(4) Remove rear bumper reinforcement from vehicle.

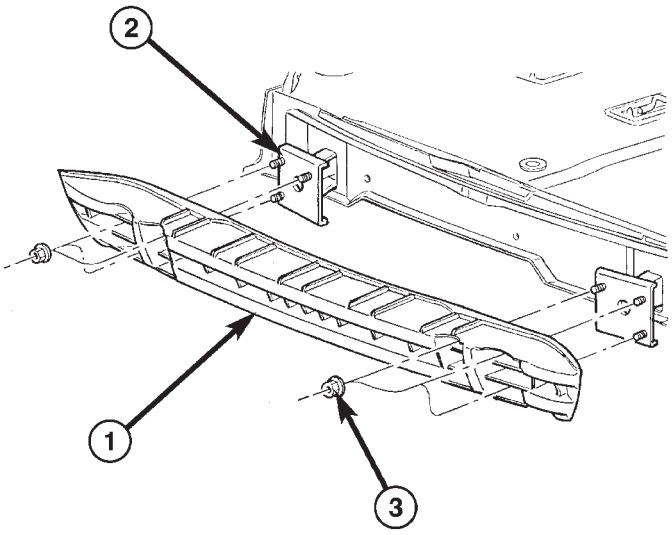

Fig. 4 REAR BUMPER REINFORCEMENT

1 - REAR BUMPER REINFORCEMENT
2 - FRAME RAIL EXTENSIONS
3 - NUTS

INSTALLATION

(1) Support rear bumper reinforcement using a suitable lifting device to lift into position.
(2) Position rear bumper reinforcement on vehicle.

REAR BUMPER REINFORCEMENT (Continued)

(3) Install the six nuts attaching rear bumper reinforcement to frame rail extensions and tighten to 27 N·m (20 ft. lbs.) torque (Fig. 4).

(4) Install rear bumper fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).

REAR FASCIA - SCUFF PAD

REMOVAL

The scuff pad may not be salvageable during the removal process. The scuff pad should be replaced if damaged or broken. Check availability before servicing. The scuff pad serviceability is improved if the rear fascia is to be removed for service.

NOTE: If the rear fascia is to be removed for other service issues or If the scuff pad is to be reused use the steps below.

(1) Remove rear bumper fascia.(Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL)

(2) Using a trim stick, pry up the rear edge of the scuff pad while squeezing the rear locking tabs from underneath the fascia to release the rear edge of scuff pad from the rear bumper fascia. Pull the scuff pad up and squeeze the remaining tabs to release the remaining of the scuff pad. (Fig. 5).

NOTE: If the rear fascia is to not to be removed for other service issues use the step below.

(3) Using a trim stick, pry up the rear edge of the scuff pad to release tabs from the rear bumper fascia and pull scuff pad to release the forward tabs (Fig. 5).

INSTALLATION

(1) Verify that there are fifteen slots in the fascia.

(2) Place scuff pad in position (Fig. 5).

(3) Align and insert the center forward tab.

(4) Align the remaining tabs and press into the slots, starting in the center and working outboard.

(5) Assure all tabs are fully engaged into the fascia.

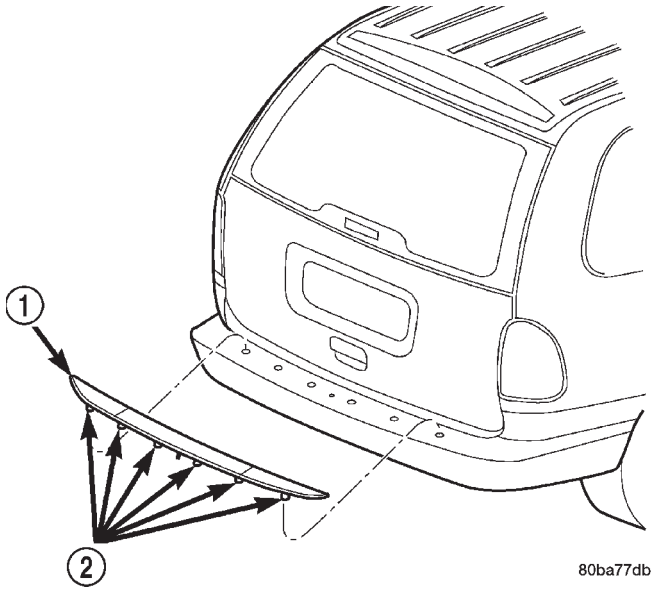

Fig. 5 SCUFF PAD

1 - SCUFF PAD
2 - TABS

(6) If rear bumper fascia has been removed install. (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).

FRAME

SPECIFICATIONS

FRAME DIMENSIONS

Frame dimensions are listed in metric scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a frame alignment rack, refer to instructions provided with equipment being used. Adjust the vehicle PLP heights to the specified dimension above the work surface (datum line). Vertical dimensions can be taken from the datum line to the locations indicated were applicable.

FRONT CRADLE CROSSMEMBER

DESCRIPTION

DESCRIPTION - FRONT CRADLE CROSSMEMBER

This vehicle uses a one piece cast aluminum cradle for the front cradle crossmember. The cradle crossmember is used as the attaching points for the lower control arms, stabilizer bar and steering gear. The cradle also has the power steering hoses and the chassis brake tubes attached to it.

WARNING: If a threaded hole in the suspension cradle needs to be repaired, only use the type of thread insert and installation procedure specified for this application.

The threaded holes in the front cradle crossmember that are used for attachment of the lower control arm rear bushing retainer, power steering hose and chassis brake tubes can be repaired. The repair is done by the installation of a Heli-Coil® thread insert which has been specifically developed for this application. Refer to the Mopar Parts Catalog for the specified Heli-Coil® thread insert to be used for this application. The procedure for installing the Heli-Coil® thread insert is detailed in the Service Procedures section in this group of the service manual.

DESCRIPTION - FRONT CRADLE CROSSMEMBER THREAD REPAIR

WARNING: When performing this procedure use only the thread inserts which are specified in the Mopar Parts Catalog for this repair procedure. These thread inserts have been specifically developed for this application and use of other types of thread inserts can result in an inferior long term repair.

The threaded holes in the front cradle crossmember, if damaged, can repaired by installing a Heli-Coil® thread insert.

The threaded holes that are repairable using the thread insert, are the lower control arm rear bushing retainer mounting bolt holes, routing bracket attaching locations for the power steering hoses, and brake hose attachment holes.

This repair procedure now allows the threaded holes in the cradle crossmember to be repaired, eliminating the need to replace the cradle crossmember if damage occurs to one of the threaded holes.

The thread inserts for this application are specified by part number in the Mopar Parts Catalog. **Do not use a substitute thread insert.**

The specific tools and equipment required to install the thread insert are listed below. Refer to the instructions included with the thread insert for the detailed procedure used for the installation of the thread insert.

NOTE: The thread inserts for this application are for the repair of M8x1.25 and M10x1.5 threads. Be sure the correct tools are used for the required thread insert size.

TOOL REQUIREMENT FOR M8x1.25 Thread

- 8.3mm (5/16 in.) Drill Bit
- 120° Countersink
- Heli-Coil® Tap #4863-8
- Heli-Coil® Gage #4624-8
- Heli-Coil® Hand Inserting Tool 7751-8
- Needle Nose Pliers – For Removal Of Thread Insert Driving Tang

TOOL REQUIREMENT FOR M10x1.5 Thread

- 10.5mm (25/64 in.) Drill Bit
- 120° Countersink
- Heli-Coil® Tap #4863-10
- Heli-Coil® Gage #4624-10
- Heli-Coil® Hand Inserting Tool 7751-10
- Needle Nose Pliers – For Removal Of Thread Insert Driving Tang

FRONT CRADLE CROSSMEMBER (Continued)

REMOVAL

The front cradle crossmember must be installed in the design location to achieve proper front end suspension alignment. If the cradle crossmember is removed without applying reference marks on the frame rails, align the cradle crossmember according to the dimensions provided in this group.

NOTE: If the caged nuts in the frame rails become damaged and cannot be reused, a replacement nut can be obtained through Mopar®.

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove steering column lower cover from instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(3) Remove steering column cover backing plate (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN COVER BACKING PLATE - REMOVAL).

(4) Position steering so front wheels are straight ahead.

CAUTION: Do not rotate steering wheel after disengaging lower coupling from steering gear, damage to air bag clock spring can result.

(5) Remove clinch bolt attaching steering column coupling to steering gear shaft (Fig. 10).

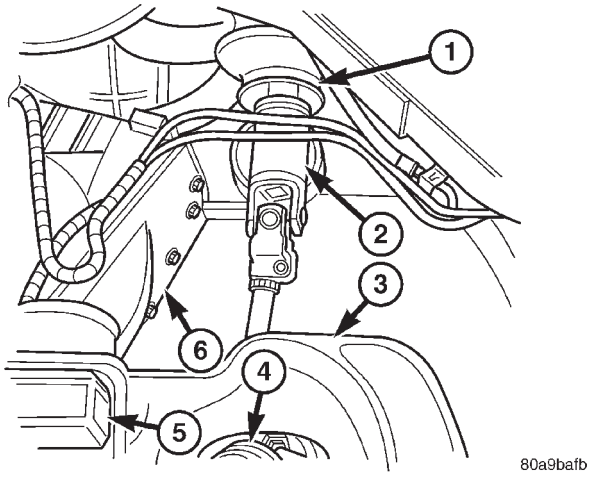

Fig. 10 STEERING COUPLING

1 - STEERING SHAFT BOOT
2 - STEERING SHAFT
3 - CROSSMEMBER
4 - STEERING GEAR
5 - MOUNT
6 - TRANSAXLE

(6) Remove steering column coupling from telescoping steering gear shaft.

(7) Hoist vehicle and support on safety stands.

(8) Position a drain pan under power steering pump and oil return hose coupling.

(9) Using a hose pinch-off pliers (C-4390), pinch power steering oil return hose off between the crossmember coupling and the pump.

(10) Loosen hose clamp at the cradle crossmember coupling.

(11) Disconnect return hose from metal tube.

(12) While holding pressure relief valve nut on back of power steering pump, Remove flare nut attaching high pressure hose to back of pump.

(13) Remove high pressure hose from pump.

(14) Allow power steering fluid to drain into pan.

(15) Remove bolts attaching anti-lock brake sensor leads to cradle crossmember.

(16) Position anti-lock brake leads out of the way.

(17) Disconnect stabilizer bar links from ends of stabilizer bar.

(18) Disconnect lower ball joints from lower steering knuckles (Refer to 2 - SUSPENSION/FRONT/LOWER BALL JOINT - REMOVAL).

(19) Remove the rear engine mount heat shield (Fig. 11).

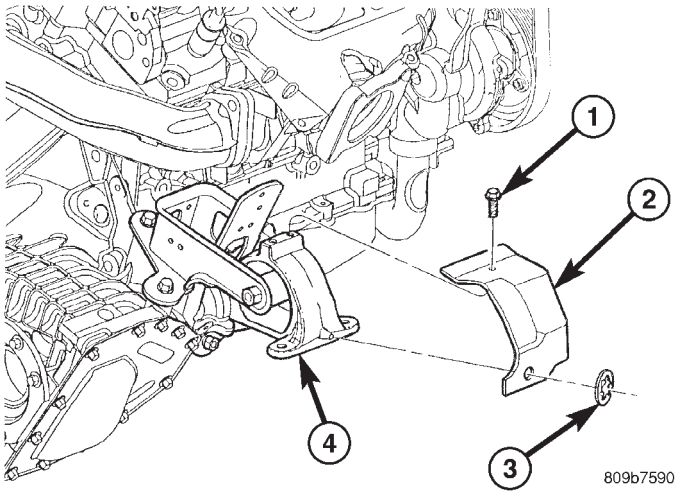

Fig. 11 REAR MOUNT HEAT SHIELD

1 - BOLT
2 - HEAT SHIELD
3 - CLIP
4 - REAR ENGINE MOUNT

(20) Remove through bolt attaching rear engine mount to cradle crossmember (Fig. 12).

(21) Using paint or grease pencil, mark outline of cradle crossmember on frame rails to aid installation.

(22) Support cradle crossmember on suitable lifting device (Fig. 14).

(23) Remove bolts attaching crossmember to front frame rails (Fig. 13).

FRONT CRADLE CROSSMEMBER (Continued)

(24) Remove cradle crossmember from vehicle (Fig. 14).

5 - LIFT DEVICE
6 - SPINDLE

FRONT CRADLE CROSSMEMBER (Continued)

INSTALLATION

NOTE: If cradle crossmember requires replacement. Refer to Group 2, Suspension, to transfer suspension components and Group 19, Steering, to transfer steering components.

(1) Support crossmember on suitable lifting device (Fig. 14).
(2) Position crossmember to vehicle.
(3) Loosely install bolts attaching cradle crossmember to front frame rails.
(4) Align crossmember to previously made marks on frame rails.
(5) Tighten bolts attaching cradle crossmember to frame rails.
(6) Install through bolt attaching rear engine mount to cradle crossmember (Fig. 12) and tighten to 68 N·m (50 ft. lbs.) torque.
(7) Install the rear mount heat shield (Fig. 11).
(8) Connect lower ball joints to steering knuckles (Refer to 2 - SUSPENSION/FRONT/LOWER BALL JOINT - INSTALLATION)
(9) Connect stabilizer bar links to ends of stabilizer bar.
(10) Install bolts attaching anti-lock brake sensor leads to cradle crossmember.
(11) Install high pressure hose to pump.
(12) Connect return hose to metal tube.
(13) Tighten hose clamp at the cradle crossmember coupling.
(14) Remove pinch-off pliers.
(15) Position steering so front wheels are straight ahead.
(16) Install steering column coupling to telescoping steering gear shaft.
(17) Install clinch bolt attaching steering column coupling to steering gear shaft.
(18) Install steering column cover backing plate (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN COVER BACKING PLATE - INSTALLATION)
(19) Install steering column lower cover from instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).
(20) Connect battery negative cable.

FRONT CROSSMEMBER MOUNT BUSHINGS

REMOVAL

(1) Using paint or grease pencil, mark outline of cradle crossmember on frame rails.
(2) Loosen bolts attaching crossmember to frame rails.
(3) Remove bolt on bushing that requires replacement.
(4) Allow cradle crossmember to drop down enough to gain clearance for bushing removal.
(5) Remove bushing from vehicle.

INSTALLATION

(1) Apply rubber lubrication or soap to replacement bushing.
(2) Insert lower half of bushing into square hole in cradle crossmember.
(3) Place upper half of bushing on top of crossmember aligned to receive square tube protruding upward from lower bushing half.
(4) Squeeze bushing halves together to ensure they are properly mated.
(5) Lift cradle crossmember upward to close gap between the bushing and frame.
(6) Verify that lower bushing is fully seated into cradle crossmember and upper bushing.
(7) Install bolt attaching bushing and crossmember to frame rail hand tight.
(8) Align cradle crossmember to reference marks on frame rails.
(9) Tighten cradle crossmember to frame rails attaching bolts to 163 N·m (120 ft. lbs.) torque.

FUEL DELIVERY

DESCRIPTION

DESCRIPTION

The front wheel drive car uses a plastic fuel tank located rear center of the vehicle.

The Fuel Delivery System consists of: the following items:

- Electric fuel pump module
- Fuel filter
- Tubes/lines/hoses
- Fuel injectors

The in-tank fuel pump module contains the fuel pump. The pump is serviced as part of the fuel pump module. Refer to Fuel Pump Module.

The fuel filter is replaceable, it is mounted on the outside, on top of, the fuel tank. Refer to the Maintenance Schedules in the Introduction section of this manual for recommended fuel filter replacement intervals.

DESCRIPTION - FFV REPLACEMENT PARTS

Many components in a Flexible Fuel Vehicle (FFV) are designed to be compatible with ethanol. Always be sure that the vehicle is serviced with correct ethanol compatible parts.

CAUTION: Replacing fuel system components with non-ethanol compatible components can damage your vehicle and may void the warranty.

OPERATION

The fuel system provides fuel pressure by an in-tank pump module. The PCM controls the operation of the fuel system by providing battery voltage to the fuel pump through the fuel pump relay. The PCM requires only three inputs and a good ground to operate the fuel pump relay. The three inputs are:

- Ignition voltage
- Crankshaft Position (CKP) sensor
- Camshaft Position (CMP) sensor

DIAGNOSIS AND TESTING - FUEL DELIVERY SYSTEM

(Refer to Appropriate Diagnostic Information)

STANDARD PROCEDURE

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE PROCEDURE

(1) Remove Fuel Pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.

(2) Start and run engine until it stalls.

(3) Attempt restarting engine until it will no longer run.

(4) Turn ignition key to OFF position.

(5) Return fuel pump relay to PDC.

(6) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB III® scan tool must be used to erase a DTC.

STANDARD PROCEDURE - DRAINING FUEL TANK

(1) Release fuel system pressure, refer to the Fuel System Release Procedure in this section.

(2) Insert a 1/4 inch siphon (max. O. D. 5/16) hose from a portable fuel siphoning tank through the fuel filler neck opening into the fuel tank. Hose most have a 30 degree angle cut on the end to bypass the check valve in the end of the filler neck. Refer to the siphoning tank's Manufacturing Instructions.

(3) Drain fuel from fuel tank into siphoning tank.

FUEL DELIVERY (Continued)

SPECIFICATIONS

FUEL SYSTEM PRESSURE

400 kpa ±34 kpa (58 psi ± 5 psi)

TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.

O2S(Oxygen Sensor) Remover/Installer - 8439

FUEL FILTER

REMOVAL

(1) Release fuel pressure, refer to the Fuel release procedure in this section.
(2) Disconnect the negative battery cable.
(3) Raise vehicle and support.
(4) Support the fuel tank with a transmission jack.
(5) Remove fuel line from the front of the tank.
(6) Remove ground strap
(7) Remove the inboard side of the fuel tank straps and front T strap fastner.
(8) Lower the tank about 6 inches (Fig. 1).

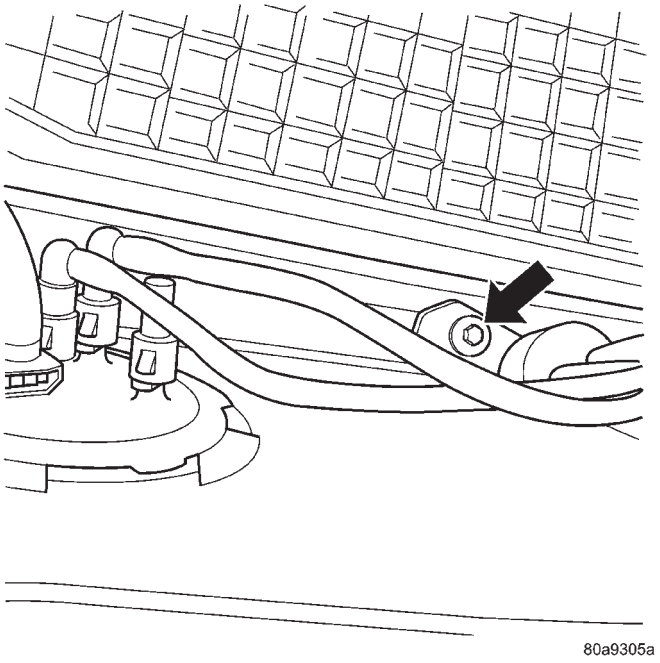

Fig. 1 FUEL FILTER

(9) Remove fuel lines from the fuel pump module.
(10) Remove fuel filter from tank.

INSTALLATION

(1) Install fuel filter to tank. Tighten bolt to 4.5 N·m (40 in. lbs.)
(2) Install fuel lines to the fuel pump module (Fig. 1).
(3) Raise tank into position.
(4) Install the fuel tank straps.Tighten bolt for main straps to 54 N·m (40 ft. lbs.) and the T strap bolt to 28.2 N·m (250 in. lbs.)
(5) Install the ground strap
(6) Connect the fuel line at the front of the tank.
(7) Lower vehicle.
(8) Connect the negative battery cable.
(9) Pressurize the fuel system with the DRBIII® and check for leaks.

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge level sending unit is attached to the side of fuel pump module. The level sensor is a variable resistor.

OPERATION

Its resistance changes with the amount of fuel in the tank. The float arm attached to the sensor moves as the fuel level changes.

The fuel level input is used as an input for OBD II. If the fuel level is below 15% or above 85% of total tank capacity several monitors are disabled. There are diagnostics for the level circuit open and shorted.

REMOVAL

Remove fuel pump module. Refer to Fuel Pump Module in this section.

(1) Depress retaining tab and remove the fuel pump/level sensor connector from the **BOTTOM** of the fuel pump module electrical connector (Fig. 2) .

NOTE: The pump module harness on TOP of flange is not serviceable or removable.

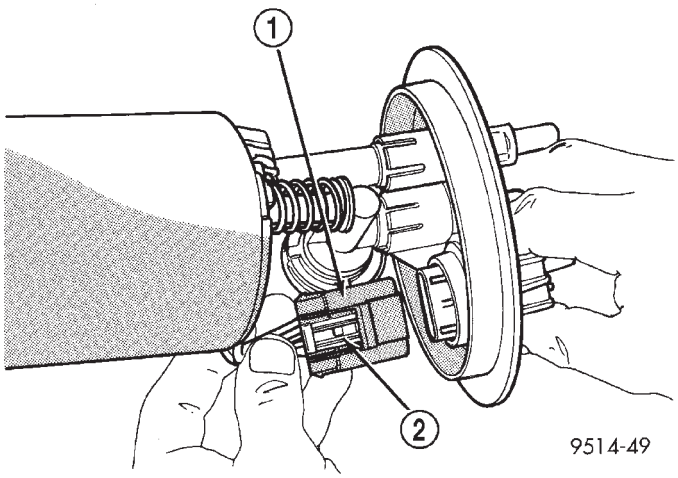

Fig. 2 Fuel Pump/Level Sensor Electrical Connector

1 - ELECTRICAL CONNECTOR

FUEL LEVEL SENDING UNIT / SENSOR (Continued)

INSTALLATION

(1) Insert level sensor wires into bottom of opening in module.

(2) Wrap wires into groove in back of level sensor (Fig. 7) .

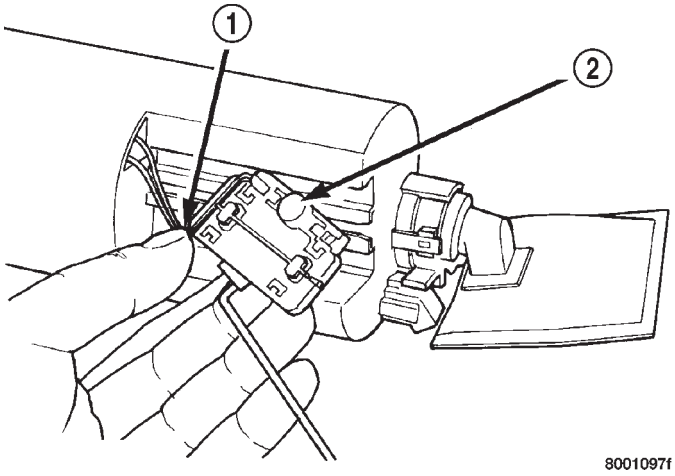

Fig. 7 Groove in Back Side of Level Sensor

1 - WRAP WIRES IN GROOVE
2 - REAR VIEW OF LEVEL SENSOR

(3) While feeding wires into guide grooves, slide level sensor up into channel until it snaps into place (Fig. 8) . Ensure tab at bottom of sensor locks in place.

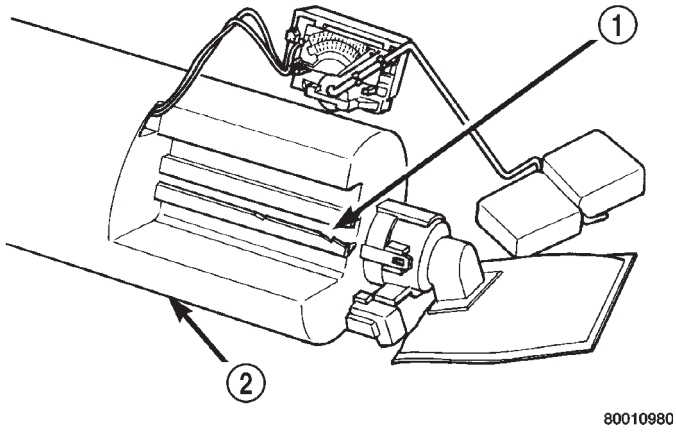

Fig. 8 Installation Channel

1 - CHANNEL FOR LEVEL SENSOR
2 - PUMP MODULE

(4) Install level sensor wires in connector. Push the wires up through the connector and then pull them down until they lock in place. Ensure signal and ground wires are installed in the correct position.

(5) Install locking wedge on connector.

(6) Push connector up into bottom of fuel pump module electrical connector.

(7) Install fuel pump module. Refer to Fuel Pump Module in this section.

FUEL LINES

DESCRIPTION - FUEL LINES/HOSES AND CLAMPS

Also refer to Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

STANDARD PROCEDURE - HOSES AND CLAMP

Inspect all hose connections (clamps and quick connect fittings) for completeness and leaks. Replace cracked, scuffed, or swelled hoses. Replace hoses that rub against other vehicle components or show sign of wear.

Fuel injected vehicles use specially constructed hoses. When replacing hoses, only use hoses marked EFM/EFI.

When installing hoses, ensure that they are routed away from contact with other vehicle components that could rub against them and cause failure. Avoid contact with clamps or other components that cause abrasions or scuffing. Ensure that rubber hoses are properly routed and avoid heat sources.

The hose clamps have rolled edges to prevent the clamp from cutting into the hose. Only use clamps that are original equipment or equivalent. Other types of clamps may cut into the hoses and cause high pressure fuel leaks. Tighten hose clamps to 1 N·m (10 in. lbs.) torque.

Inspect all hose connections such as clamps, couplings and fittings to make sure they are secure and

FUEL LINES (Continued)

leaks are not present. The component should be replaced immediately if there is any evidence of degradation that could result in failure.

Never attempt to repair a plastic fuel line/tube. Replace as necessary.

Avoid contact of any fuel tubes/hoses with other vehicle components that could cause abrasions or scuffing. Be sure that the plastic fuel lines/tubes are properly routed to prevent pinching and to avoid heat sources.

FUEL PRESSURE REGULATOR

OPERATION

The fuel system uses a nonadjustable pressure regulator that maintains fuel system pressure at approximately 400 ±34 kPa (58 ±5 psi). The fuel pressure regulator contains a diaphragm, calibrated spring and a fuel return valve. The spring pushes down on the diaphragm and closes off the fuel return port. System fuel pressure reflects the amount of fuel pressure required to open the return port.

The pressure regulator is a mechanical device that is NOT controlled by the PCM or engine vacuum.

REMOVAL

The fuel pressure regulator is part of the fuel pump module (Fig. 9). Remove the fuel pump module from the fuel tank to access the fuel pressure regulator. Refer to the Fuel Pump Module removal in this section.

(1) Spread tangs on pressure regulator retainer.

(2) Pry fuel pressure regulator out of housing.

(3) Ensure both upper and lower O-rings were removed with regulator.

INSTALLATION

The fuel pressure regulator is part of the fuel pump module. Remove the fuel pump module from the fuel tank to access the fuel pressure regulator. Refer to the Fuel Pump Module removal in this section.

(1) Lightly lubricate the O-rings with clean engine oil and place them into opening in pump module (Fig. 9).

(2) Push regulator into opening in pump module.

(3) Fold tangs on regulator retainer over tabs on housing.

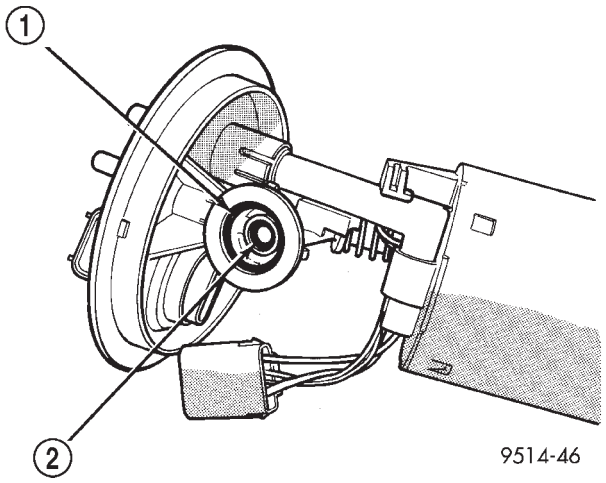

Fig. 9 Fuel Pressure Regulator O-rings

1 - UPPER O-RING
2 - LOWER 0-RING

FUEL PUMP

DESCRIPTION

The electric fuel pump is located in and is part of the fuel pump module. It is a positive displacement, gerotor type, immersible pump with a permanent magnet electric motor. The fuel pump module is suspended in fuel in the fuel tank.

OPERATION

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains a check valve. The valve, in the pump outlet, maintains pump pressure during engine off conditions, for a short while. It is normal for fuel pressure to drop to zero after cooldown. The fuel pump relay provides voltage to the fuel pump. The fuel pump has a maximum deadheaded pressure output of approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 kpa ±34 kpa (58 psi ± 5 psi).

NOTE: Checkvalve maintains volume of fuel in the rail and lines, not pressure.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module is installed in the top of the fuel tank (Fig. 10) .

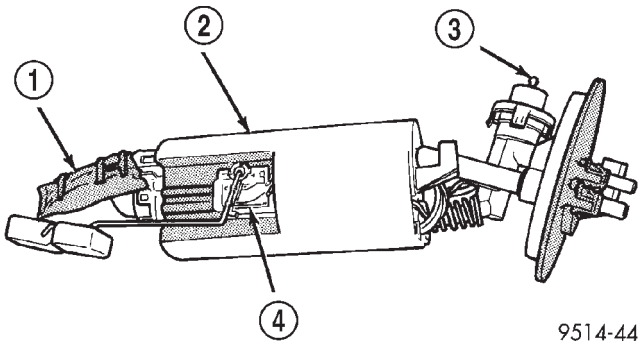

Fig. 10 Fuel Pump Module

1 - INLET STRAINER
2 - FUEL RESERVOIR
3 - FUEL PRESSURE REGULATOR
4 - FUEL LEVEL SENSOR

The fuel pump module contains the following:

- Electric fuel pump
- Fuel pump reservoir
- Inlet strainer
- Fuel pressure regulator
- Fuel gauge sending unit
- Fuel supply line connection

The inlet strainer, fuel pressure regulator and fuel level sensor are the only serviceable items. If the fuel pump or electrical wiring harness requires service, replace the fuel pump module.

The electric fuel pump is located in and is part of the fuel pump module. It is a positive displacement, gerotor type, immersible pump with a permanent magnet electric motor.

OPERATION

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains one check valve. The check valve, in the pump outlet, maintains pump pressure during engine off conditions. The fuel pump relay provides voltage to the fuel pump.

The fuel pump has a maximum deadheaded pressure output of approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 ±34 kPa (58 ±5 psi).

FUEL PUMP ELECTRICAL CONTROL

Voltage to operate the electric pump is supplied through the fuel pump relay. For an electrical operational description of the fuel pump refer to fuel Pump Relay—PCM Output.

ELECTRICAL PUMP REPLACEMENT

The electric fuel pump is not serviceable. If the fuel pump or electrical wiring harness needs replacement, the complete fuel pump module must be replaced. Perform the Fuel System Pressure Release procedure before servicing the fuel pump.

REMOVAL

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

(1) Remove fuel filler cap and perform Fuel System Pressure Release procedure.
(2) Disconnect negative cable from auxiliary jumper terminal.
(3) Drain fuel tank, refer to the Fuel Tank procedure in the Fuel Delivery section.
(4) Remove fuel tank, refer to the Fuel Tank removal section.
(5) Clean top of tank to remove loose dirt and debris.
(6) Using a brass punch and hammer remove locknut to release pump module (Fig. 11).

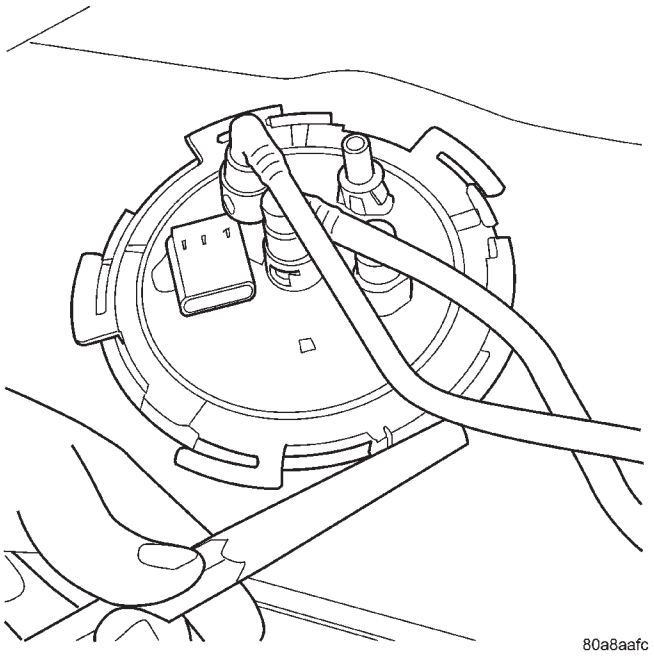

Fig. 11 FUEL PUMP MODULE LOCKING RING

FUEL PUMP MODULE (Continued)

WARNING: THE FUEL RESERVOIR OF THE FUEL PUMP MODULE DOES NOT EMPTY OUT WHEN THE TANK IS DRAINED. THE FUEL IN THE RESERVOIR MAY SPILL OUT WHEN THE MODULE IS REMOVED.

(7) Remove fuel pump module and O-ring from tank (Fig. 12). Discard O-ring.

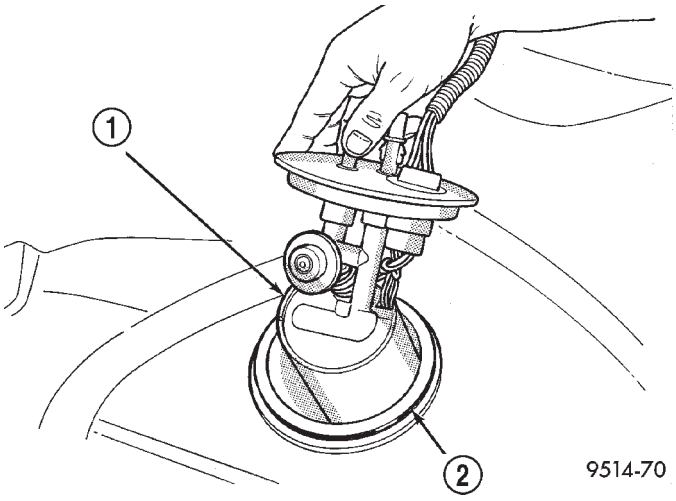

Fig. 12 Fuel Pump Module Removal

1 - FUEL PUMP MODULE
2 - O-RING

INSTALLATION

(1) Wipe seal area of tank clean and place a new O-ring seal in position on pump.
(2) Position fuel pump module in tank.
(3) Tighten locknut using a brass punch and hammer to install the locknut (Fig. 11).
(4) Install fuel tank, refer to the Fuel Tank installation section.
(5) Lower vehicle.
(6) Connect negative cable battery.
(7) Fill fuel tank. Check for leaks.
(8) Install fuel filler cap.

FUEL RAIL

REMOVAL

REMOVAL - 2.4L

(1) Perform fuel system pressure release procedure **before servicing or starting repairs.** Refer to Fuel System Pressure Release Procedure in this section.
(2) Disconnect negative cable from battery.
(3) Disconnect the wiring connectors for fuel injectors harness (Fig. 13).
(4) Remove wiring harness from brackets.

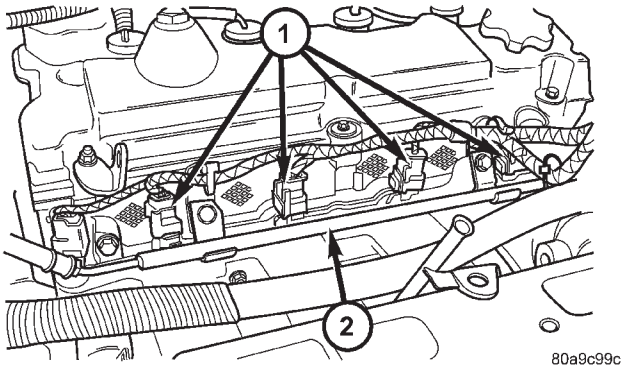

Fig. 13 FUEL RAIL AND INJECTORS 2.4L

1 - Fuel Injectors
2 - Fuel Rail

(5) Disconnect the connectors from the fuel injectors.
(6) Remove harness from vehicle.
(7) Remove fuel hose quick connect fitting from the chassis tube. **Refer to Fuel Hoses, Clamps and Quick Connect Fittings in this Section.** Place a shop towel under the connections to absorb any fuel spilled from the fitting.

WARNING: WRAP A SHOP TOWEL AROUND HOSES TO CATCH ANY GASOLINE SPILLAGE.

(8) Remove fuel rail attaching bolts.
(9) Remove fuel rail. Be careful not to damage the injector O-rings upon removal from their ports.

REMOVAL - 3.3/3.8L

(1) Perform fuel system pressure release procedure **before servicing or starting repairs.** Refer to Fuel System Pressure Release Procedure in this section.
(2) Disconnect negative cable from battery.
(3) Remove upper intake manifold, refer to the Engine/Manifolds/Upper Intake for more information..
(4) Cover intake manifold with suitable cover when servicing.
(5) Remove the fuel hose quick connect fitting from the chassis tube. **Refer to Fuel Hoses, Clamps and Quick Connect Fittings in this Section.**

WARNING: WRAP A SHOP TOWEL AROUND HOSES TO CATCH ANY GASOLINE SPILLAGE.

(6) Remove the fuel rail attaching bolts (Fig. 14).
(7) Remove fuel rail. Be careful not to damage the injector O-rings upon removal from their ports.

FUEL RAIL (Continued)

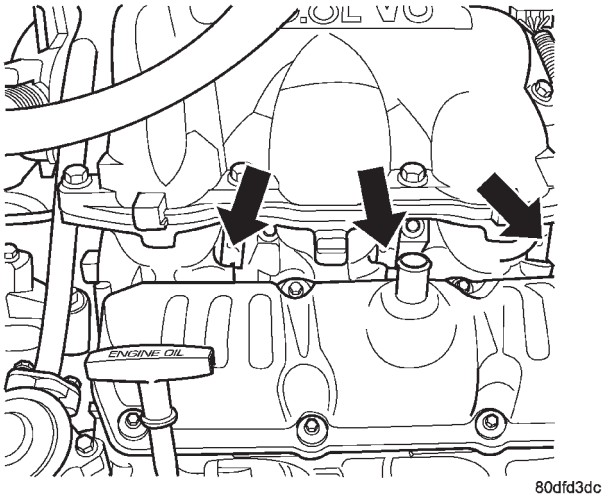

Fig. 14 FUEL INJECTORS 3.3/3.8L

INSTALLATION

INSTALLATION - 2.4L

(1) Ensure injector holes are clean. Replace O-rings if damaged.

(2) Lubricate injector O-rings with a drop of clean engine oil to ease installation.

(3) Put the tip of each injector into their ports. Push the assembly into place until the injectors are seated in the ports.

(4) Install the fuel rail mounting bolts. Tighten bolts to 22 N·m (200 in. lbs.) torque.

(5) Connect the connectors to the fuel injectors.

(6) Install wiring harness to brackets.

(7) Connect the wiring connectors to fuel injectors harness (Fig. 13).

(8) Connect negative battery cable.

(9) Use the DRBIII® scan tool to pressurize the fuel system. Check for leaks.

INSTALLATION - 3.3/3.8L

(1) Ensure injector holes are clean. Replace O-rings if damaged.

(2) Lubricate injector O-rings with a drop of clean engine oil to ease installation.

(3) Put the tip of each injector into their ports. Push the assembly into place until the injectors are seated in the ports.

(4) Install the fuel rail mounting bolts. Tighten bolts to 22 N·m (200 in. lbs.) torque.

(5) Remove covering on lower intake manifold and clean surface.

(6) Install the Upper Intake Manifold, refer to Engine/Manifolds/Upper Intake for more information.

(7) Install fuel hose quick connector fitting to chassis tubes. **Refer to Fuel Hoses, Clamps and Quick Connect Fittings in this Section.** Push the fitting onto the chassis tube until it clicks into place. Pull on the fitting to ensure complete insertion.

(8) Connect negative cable to battery.

(9) Use the DRBIII® scan tool to pressurize the fuel system. Check for leaks.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module. The tank is made from High density Polyethylene (HDPE) material.If equipped with ORVR (Onboard Refueling Vapor Recovery) it has been added to the fuel tank to control refueling vapor emissions.

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

All models are equipped with either one or two rollover valves mounted into the top of the fuel tank (or pump module).

An evaporation control system is connected to the rollover valve(s)/control valve(Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/ ORVR - OPERATION) to reduce emissions of fuel vapors into the atmosphere, when the tank is vented due to vapor expansion in the tank. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. In addition, fuel vapors produced during vehicle refueling are allowed to pass through the vent hoses/tubes to the charcoal canister(s) for temporary storage (prior to being drawn into the intake manifold). All models are equipped with a self-diagnosing system using a Leak Detection Pump (LDP). Refer to the Emission Control System for additional information.

INLET CHECK VALVE

All vehicles have an inlet check valve on the inside of the fuel tank at the filler inlet

The valve prevents fuel from splashing back on customer during vehicle refueling. The valve is a non-serviceable item.

FUEL TANK (Continued)

REMOVAL

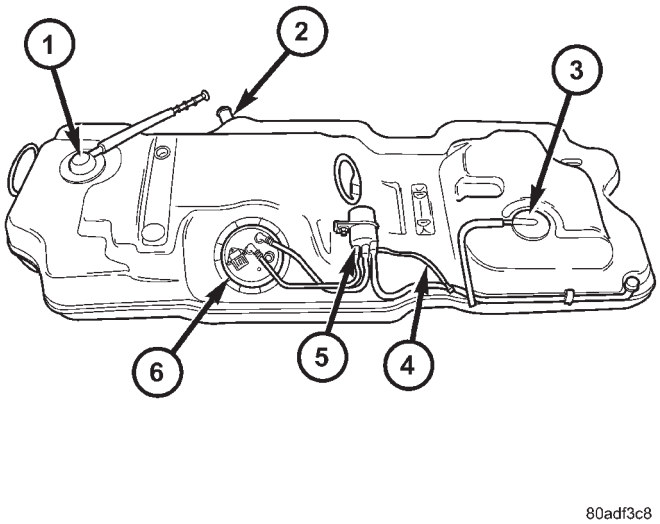

Fig. 15 Fuel Tank

1 - ROLLOVER VALVE
2 - FUEL FILLER INLET
3 - ROLLOVER VALVE
4 - GROUND STRAP
5 - FUEL FILTER
6 - FUEL PUMP MODULE

(1) Remove fuel filler cap and perform Fuel System Pressure Release procedure (Fig. 15).

(2) Disconnect negative cable from battery.

(3) Insert fuel siphon hose into fuel filler neck and push it into the tank.

(4) Drain fuel tank dry into holding tank or a properly labeled **GASOLINE** safety container.

(5) Raise vehicle on hoist and support.

(6) Use a transmission jack to support fuel tank. Remove bolts from fuel tank straps.

(7) Lower tank slightly.

(8) Disconnect the fuel filler vent tube. Squeeze tabs and pull apart (Fig. 16).

(9) Disconnect the fuel fill hose at the fuel tank filler metal tube **NOT AT THE FUEL TANK** (Fig. 16).

(10) Disconnect fuel line and vapor line at the front of the fuel tank.

The fuel pump module electrical connector has a retainer that locks it in place.

(11) Slide fuel pump module electrical connector lock to unlock (Fig. 17).

(12) Push down on connector retainer (Fig. 18) and pull connector off module.

(13) Lower tank from vehicle. Remove fuel filler vent tube from frame (Fig. 19).

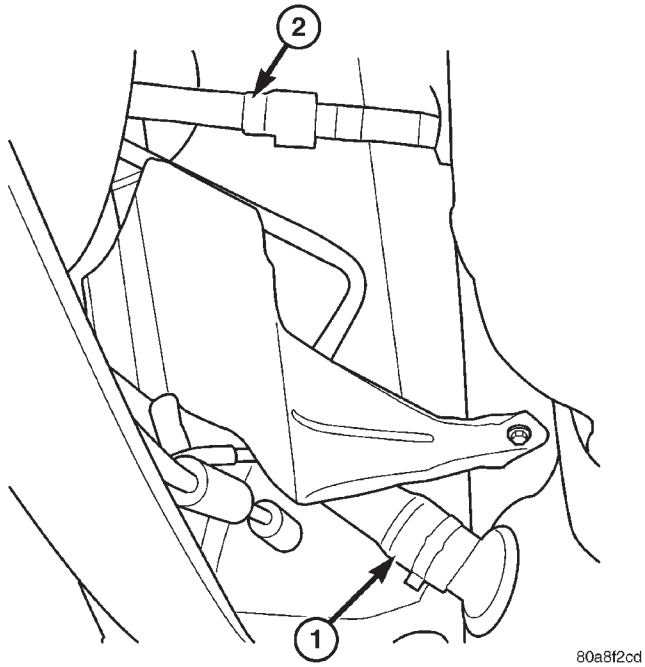

Fig. 16 FUEL FILLER AND VENT TUBE

1 - Filler Tube
2 - Vent Tube

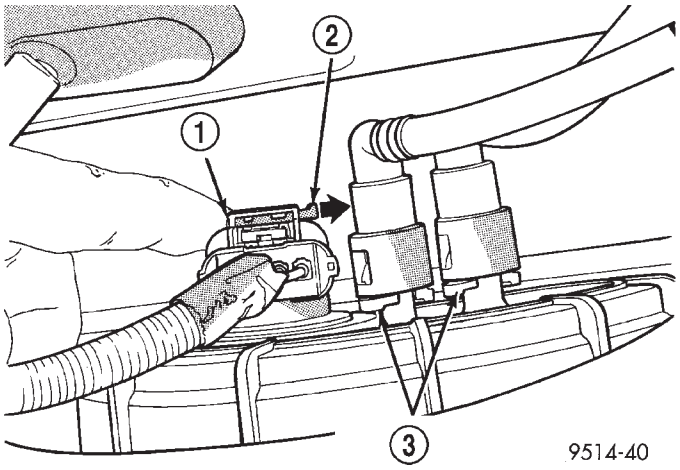

Fig. 17 Fuel Line Retainers and Pump Connector Lock

1 - PUSH
2 - CONNECTOR LOCK
3 - QUICK CONNECT RETAINERS

INSTALLATION

(1) Position fuel tank on transmission jack. Connect rollover valve hose. Connect fuel filler tube vent hose and tighten clamp.

(2) Raise tank into position and carefully work filler metal tube into the rubber hose on fuel tank. A light coating of clean engine oil on the tube end may be used to aid assembly.

FUEL TANK (Continued)

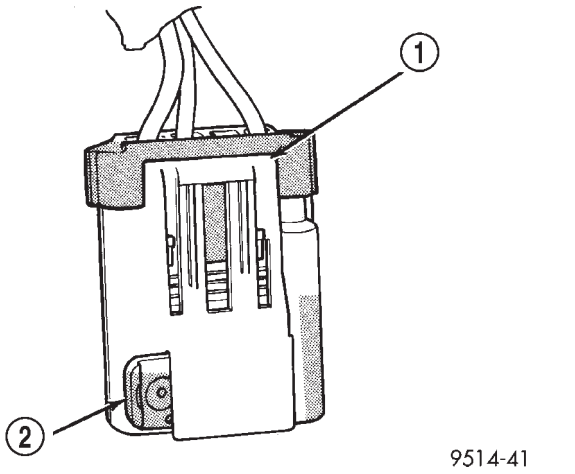

Fig. 18 Pump Module Connector Retainer and Lock

1 - PUSH DOWN ON RETAINER
2 - CONNECTOR LOCK

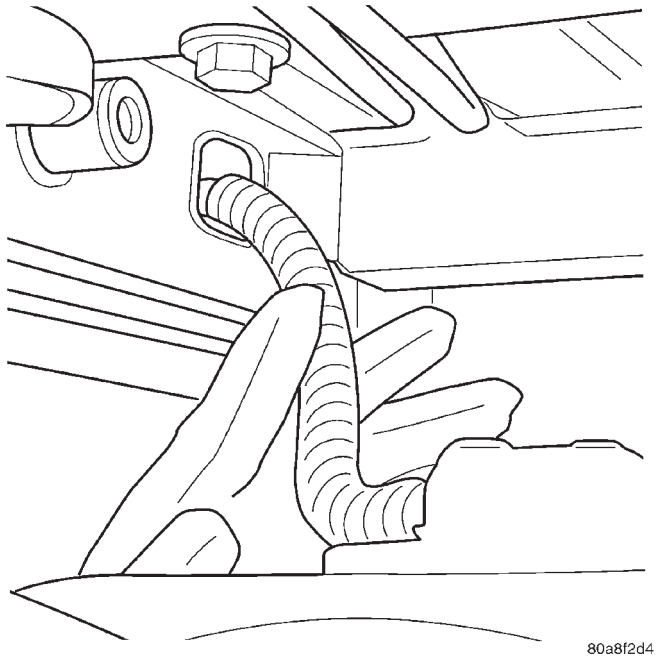

Fig. 19 VENT HOSE

(3) Feed filler vent line thru frame rail. Careful not to cross lines.

(4) Tighten strap bolts to 54 N·m (40 ft. lbs.) torque. Tighten T strap bolt to 28.2 N·m (250 in. lbs.). Remove transmission jack.

(5) Tighten filler hose clamp to 3.3 N·m (30 in. lbs.).

CAUTION: Ensure straps are not twisted or bent before or after tightening strap nuts.

(6) Connect fuel pump/module electrical connector. Place retainer in locked position.

(7) Lubricate the fuel supply line with clean 30 weight engine oil, install the quick connect fuel fitting. Refer to Tube/Fitting Assembly in the Fuel Delivery section of this section.

(8) Attach filler vent line to filler tube. Pull on connector to make sure of connection.

(9) Fill fuel tank, replace cap, and connect battery negative cable.

(10) Use the DRBIII® scan tool to pressurize the fuel system. Check for leaks.

FUEL TANK FILLER TUBE

REMOVAL

(1) Disconnect the negative battery cable.
(2) Remove the 3 screws at the filler door.
(3) Raise and support vehicle
(4) Remove the left rear tire.
(5) Remove the splash shield (Fig. 20).

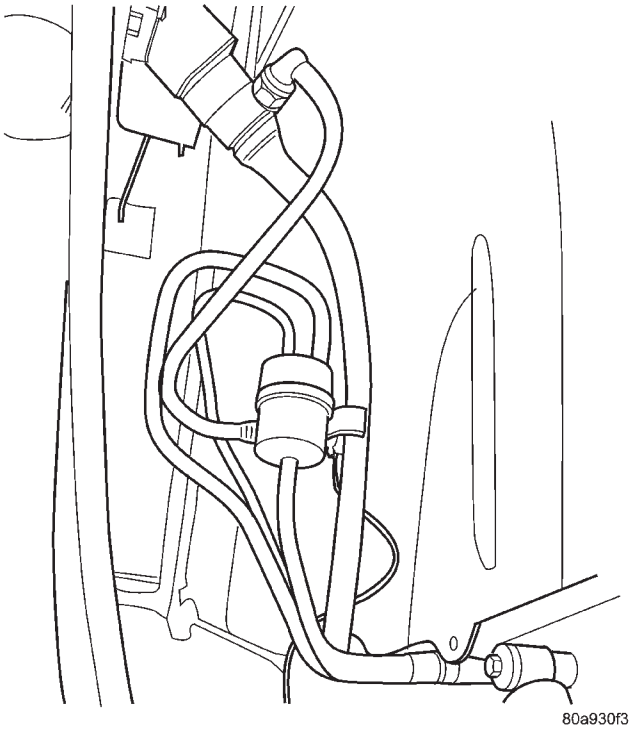

Fig. 20 FUEL FILLER TUBE AND VENT TUBE

(6) Remove the canister from filler tube (Fig. 21).
(7) Disconnect the vent at the top of the filler tube.
(8) Remove the ground strap.
(9) Remove filler tube at tank.

INSTALLATION

(1) Install filler tube to tank (Fig. 20).
(2) Install the ground strap.
(3) Connect the vent at the top of the filler tube.

FUEL TANK FILLER TUBE (Continued)

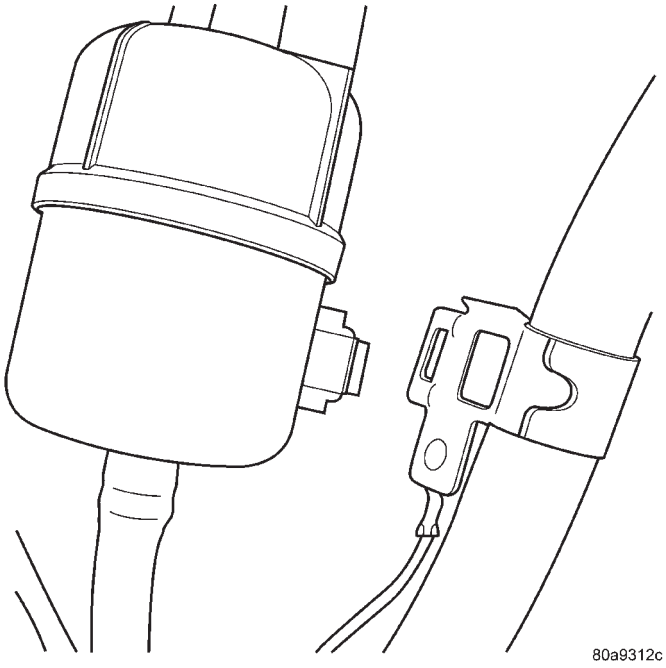

Fig. 21 FUEL TUBE VENT CANISTER

(4) Install the 3 screws at the filler door.
(5) Install the canister from filler tube (Fig. 21).
(6) Install the splash shield.
(7) Install the left rear tire.
(8) lower vehicle.
(9) Connect the negative battery cable.

INLET FILTER

REMOVAL

(1) Remove fuel pump module. Refer to Fuel Pump Module Removal in this section.
(2) Using a thin straight blade screwdriver, pry back the locking tabs on fuel pump reservoir and remove the strainer (Fig. 22).
(3) Remove strainer O-ring from the fuel pump reservoir body.
(4) Remove any contaminants in the fuel tank by washing the inside of the fuel tank.

INSTALLATION

(1) Lubricate the strainer O-ring with clean engine oil.
(2) Insert strainer O-ring into outlet of strainer so that it sits evenly on the step inside the outlet.
(3) Push strainer onto the inlet of the fuel pump reservoir body. Make sure the locking tabs on the reservoir body lock over the locking tangs on the strainer.
(4) Install fuel pump module. Refer to Fuel Pump Module Installation in this section.

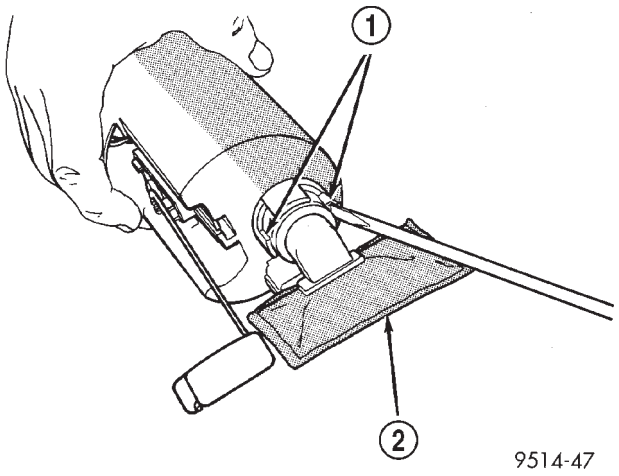

Fig. 22 Inlet

1 - TABS
2 - INLET STRAINER

QUICK CONNECT FITTING

STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

REMOVAL

When disconnecting a quick-connect fitting, the retainer will remain on the fuel tube nipple.

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE DISCONNECTING A QUICK-CONNECT FITTINGS. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE.

(1) Perform Fuel Pressure Release Procedure. Refer to the Fuel Pressure Release Procedure in this section.
(2) Disconnect negative cable from battery or auxiliary jumper terminal.
(3) Squeeze retainer tabs together and pull fuel tube/quick-connect fitting assembly off of fuel tube nipple. The retainer will remain on fuel tube.

INSTALLATION

CAUTION: Never install a quick-connect fitting without the retainer being either on the fuel tube or already in the quick-connect fitting. In either case, ensure the retainer locks securely into the quick-connect fitting by firmly pulling on fuel tube and fitting to ensure it is secured.

(1) Using a clean lint free cloth, clean the fuel tube nipple and retainer.
(2) Prior to connecting the fitting to the fuel tube, coat the fuel tube nipple with clean engine oil.

QUICK CONNECT FITTING (Continued)

(3) Push the quick-connect fitting over the fuel tube until the **retainer seats and a click is heard.**

(4) The plastic quick-connect fitting has windows in the sides of the casing. When the fitting completely attaches to the fuel tube, the retainer locking ears and the fuel tube shoulder are visible in the windows. If they are not visible, the retainer was not properly installed (Fig. 23). **Do not rely upon the audible click to confirm a secure connection.**

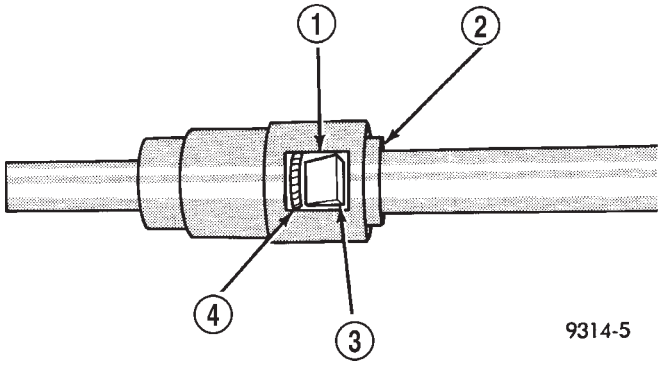

Fig. 23 Plastic Quick-Connect Fitting/Fuel Tube Connection

1 - WINDOW
2 - TAB (2)
3 - EAR
4 - SHOULDER (ON TUBE)

(5) Connect negative cable to battery or auxiliary jumper terminal.

CAUTION: When using the ASD Fuel System Test, the Auto Shutdown (ASD) Relay remains energized for several minutes, until the test is stopped, or until the ignition switch is turned to the Off position.

(6) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

TWO-TAB TYPE FITTING

This type of fitting is equipped with tabs located on both sides of the fitting (Fig. 24). These tabs are supplied for disconnecting the quick-connect fitting from component being serviced.

CAUTION: The interior components (O-rings, spacers) of this type of quick-connect fitting are not serviced separately, but new plastic retainers are available. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

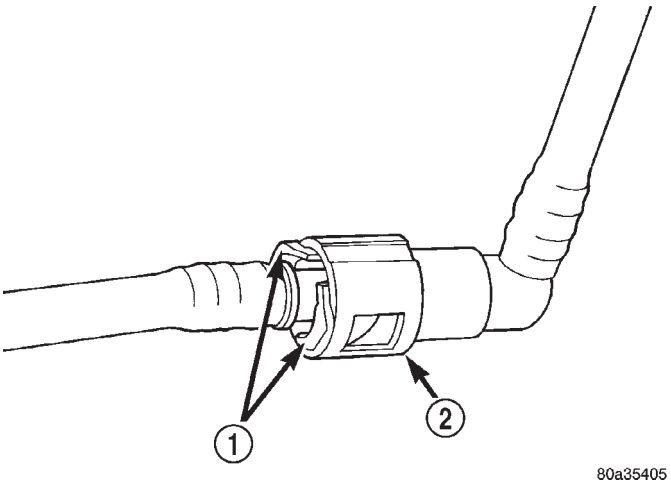

Fig. 24 Typical Two-Tab Type Quick-Connect Fitting

1 - TAB(S)
2 - QUICK-CONNECT FITTING

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE IN THIS GROUP.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.

(2) Disconnect negative battery cable from battery or auxiliary jumper terminal.

(3) Clean fitting of any foreign material before disassembly.

(4) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 24) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer. Pull fitting from fuel system component being serviced. The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.

(5) Inspect quick-connect fitting body and component for damage. Replace as necessary.

CAUTION: When the quick-connect fitting was disconnected, the plastic retainer will remain on the component being serviced. If this retainer must be removed, very carefully release the retainer from the component with two small screwdrivers. After removal, inspect the retainer for cracks or any damage.

QUICK CONNECT FITTING (Continued)

(6) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(7) Insert quick-connect fitting to component being serviced and into plastic retainer. When a connection is made, a click will be heard.

(8) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(9) Connect negative cable to battery or auxiliary jumper terminal.

(10) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

PLASTIC RETAINER RING TYPE FITTING

This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 25) usually black in color.

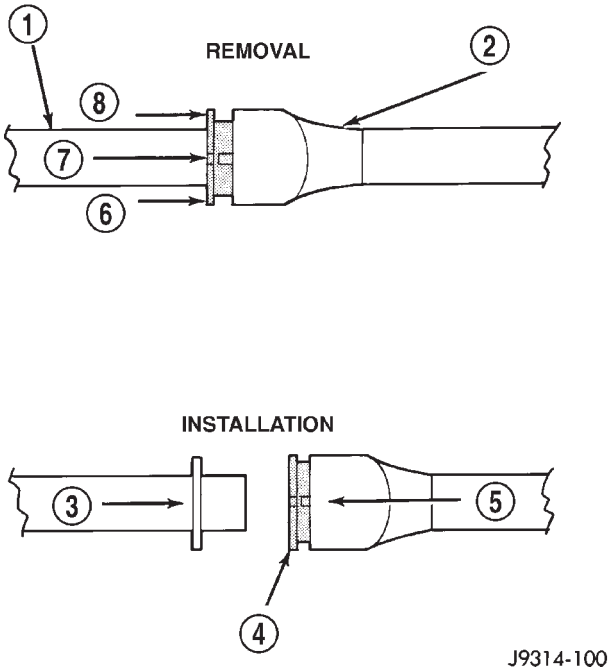

Fig. 25 Plastic Retainer Ring Type Fitting

1 - FUEL TUBE
2 - QUICK CONNECT FITTING
3 - PUSH
4 - PLASTIC RETAINER
5 - PUSH
6 - PUSH
7 - PUSH
8 - PUSH

CAUTION: The interior components (O-rings, spacers, retainers) of this type of quick-connect fitting are not serviced separately. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this section.

(2) Disconnect negative battery cable from battery or auxiliary jumper terminal.

(3) Clean fitting of any foreign material before disassembly.

(4) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 25). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(5) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(6) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(7) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(8) Insert quick-connect fitting into component being serviced until a click is felt.

(9) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(10) Connect negative battery cable to battery or auxiliary jumper terminal.

(11) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

OPERATION

OPERATION - INJECTION SYSTEM

All engines used in this section have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

OPERATION - MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two different areas of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP modes the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP modes, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP modes the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

(1) Engine coolant temperature must be over 35°F.

- If the coolant is over 35°F the PCM will wait 38 seconds.
- If the coolant is over 50°F the PCM will wait 15 seconds.
- If the coolant is over 167°F the PCM will wait 3 seconds.

(2) For other temperatures the PCM will interpolate the correct waiting time.

(3) O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.

(4) The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration
- Deceleration
- Wide Open Throttle
- Ignition switch OFF

(5) The engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle modes are OPEN LOOP modes. Under most operating conditions, the acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** are CLOSED LOOP modes.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately

1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° degree falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within ±64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor
- Throttle position
- A/C switch
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content
- A/C control positions
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.
- All monitored components (refer to the Emission section for On-Board Diagnostics).

FUEL INJECTION (Continued)

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C sense
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C sense
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position sensor
- IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to the Emission section for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

FUEL CORRECTION or ADAPTIVE MEMORIES

DESCRIPTION

In Open Loop, the PCM changes pulse width without feedback from the O2 Sensors. Once the engine warms up to approximately 30 to 35° F, the PCM goes into closed loop **Short Term Correction** and utilizes feedback from the O2 Sensors. Closed loop **Long Term Adaptive Memory** is maintained above 170° to 190° F unless the PCM senses wide open throttle. At that time the PCM returns to Open Loop operation.

OPERATION

Short Term

The first fuel correction program that begins functioning is the short term fuel correction. This system corrects fuel delivery in direct proportion to the readings from the Upstream O2 Sensor.

The PCM monitors the air/fuel ratio by using the input voltage from the O2 Sensor. When the voltage reaches its preset high or low limit, the PCM begins to add or remove fuel until the sensor reaches its switch point. The short term corrections then begin.

The PCM makes a series of quick changes in the injector pulse-width until the O2 Sensor reaches its opposite preset limit or switch point. The process then repeats itself in the opposite direction.

Short term fuel correction will keep increasing or decreasing injector pulse-width based upon the upstream O2 Sensor input. The maximum range of authority for short term memory is 25% (+/-) of base pulse-width. Short term is violated and is lost when ignition is turned OFF.

FUEL INJECTION (Continued)

Long Term

The second fuel correction program is the long term adaptive memory. In order to maintain correct emission throughout all operating ranges of the engine, a cell structure based on engine rpm and load (MAP) is used.

Ther number of cells varies upon the driving conditions. Two cells are used only during idle, based upon TPS and Park/Neutral switch inputs. There may be two other cells used for deceleration, based on TPS, engine rpm, and vehicle speed. The other twelve cells represent a manifold pressure and an rpm range. Six of the cells are high rpm and the other six are low rpm. Each of these cells is a specific MAP voltage range Typical Adaptive Memory Fuel Cells .

As the engine enters one of these cells the PCM looks at the amount of short term correction being used. Because the goal is to keep short term at 0 (O2 Sensor switching at 0.5 volt), long term will update in the same direction as short term correction was moving to bring the short term back to 0. Once short term is back at 0, this long term correction factor is stored in memory.

The values stored in long term adaptive memory are used for all operating conditions, including open loop and cold starting. However, the updating of the long term memory occurs after the engine has exceeded approximately 170°-190° F, with fuel control in closed loop and two minutes of engine run time. This is done to prevent any transitional temperature or start-up compensations from corrupting long term fuel correction.

Long term adaptive memory can change the pulse-width by as much as 25%, which means it can correct for all of short term. It is possible to have a problem that would drive long term to 25% and short term to another 25% for a total change of 50% away from base pulse-width calculation.

TYPICAL ADAPTIVE MEMORY FUEL CELLS

	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Idle	Decel
Vacuum	20	17	13	9	5	0		
Above 1,984 rpm	1	3	5	7	9	11	13 Drive	15
Below 1,984 rpm	0	2	4	6	8	10	12 Neutral	14
MAP volt =	0	1.4	2.0	2.6	3.3	3.9		

Fuel Correction Diagnostics

There are two fuel correction diagnostic routines:

- Fuel System Rich
- Fuel System Lean

A DTC is set and the MIL is illuminated if the PCM detects either of these conditions. This is determined based on total fuel correction, short term times long term.

PROGRAMMABLE COMMUNICATIONS INTERFACE (PCI) BUS

DESCRIPTION

The Programmable Communication Interface Multiplex system (PCI Bus) consist of a single wire. The Body Control Module (BCM) acts as a splice to connect each module and the Data Link Connector (DLC) together. Each module is wired in parallel to the data bus through its PCI chip set and uses its ground as the bus reference. The wiring is a minimum 20 gage wire.

OPERATION

Various modules exchange information through a communications port called the PCI Bus. The Powertrain Control Module (PCM) transmits the Malfunction Indicator Lamp (Check Engine) On/Off signal and engine RPM on the PCI Bus. The PCM receives the Air Conditioning select input, transaxle gear position inputs over the PCI Bus. The PCM also receives the air conditioning evaporator temperature signal from the PCI Bus.

The following components access or send information on the PCI Bus.

- Instrument Panel
- Body Control Module
- Air Bag System Diagnostic Module
- Full ATC Display Head (if equipped)
- ABS Module
- Transmission Control Module
- Powertrain Control Module
- Travel Module
- SKIM

FUEL INJECTION (Continued)

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) .

ACCELERATOR PEDAL

REMOVAL

(1) Hold the throttle body throttle lever in the wide open position. Remove the throttle cable from the throttle body cam (Fig. 1).

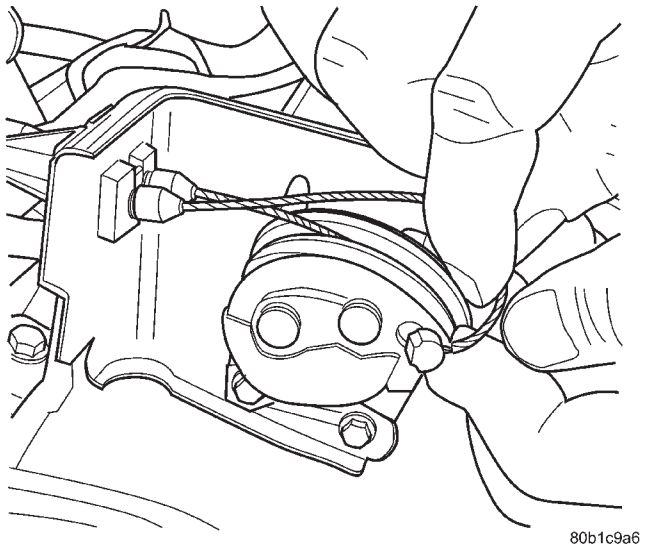

Fig. 1 THROTTLE CABLE RELEASE

(2) From inside the vehicle, hold up the pedal and remove the pedal retainer and throttle cable from the upper end of the pedal lever (Fig. 2).

(3) Remove nuts from accelerator pedal attaching studs. Remove assembly from vehicle (Fig. 3).

ACCELERATOR PEDAL (Continued)

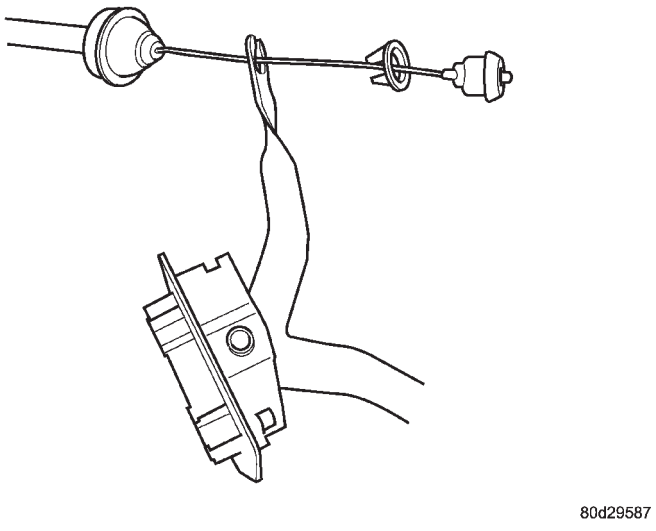

Fig. 2 CABLE CLIP

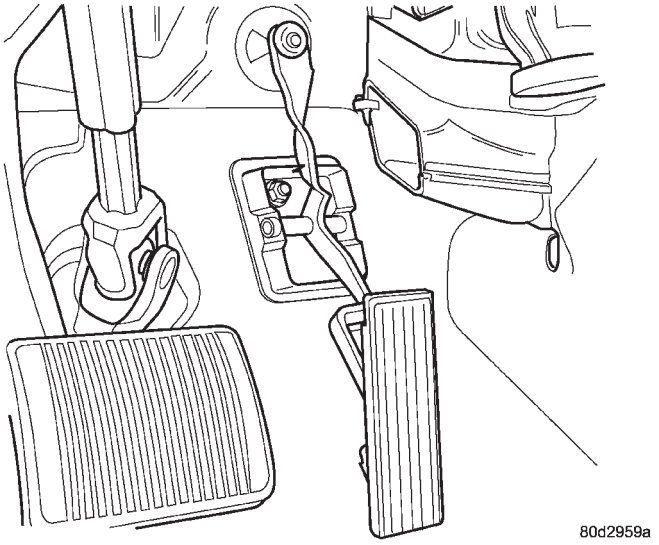

Fig. 3 ACCELERATOR PEDAL

INSTALLATION

(1) Position accelerator pedal assembly on dash panel. Install retaining nuts. Tighten retaining nuts to 12 N·m (105 in. lbs.) torque (Fig. 3).

(2) From inside the vehicle, hold up the pedal and install the throttle cable and pedal retainer in the upper end of the pedal lever (Fig. 2).

(3) From the engine compartment, hold the throttle body lever in the wide open position and install the throttle cable (Fig. 1).

CRANKSHAFT POSITION SENSOR

DESCRIPTION

The 2.4L crankshaft sensor is located on the rear of the engine near the accessory drive belt (Fig. 4). The 3.3/3.8L crankshaft sensor is located on the rear of the transmission housing, above the differential housing (Fig. 5). The bottom of the sensor is positioned next to the drive plate.

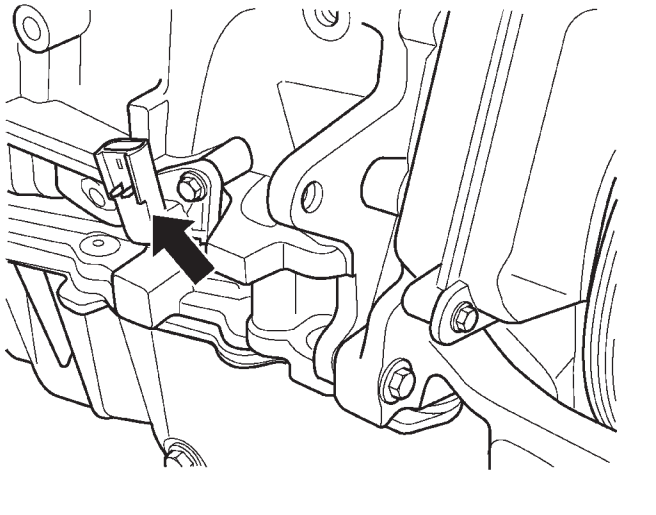

Fig. 4 CRANKSHAFT SENSOR 2.4L

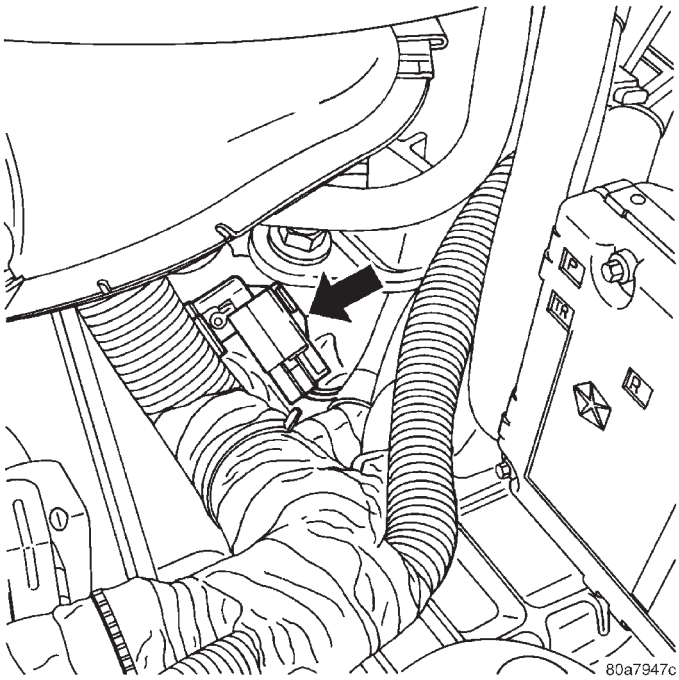

Fig. 5 CRANKSHAFT SENSOR 3.3/3.8L

CRANKSHAFT POSITION SENSOR (Continued)

OPERATION

The crankshaft position sensor detects slots cut into the transmission driveplate extension (Fig. 6). There are 3 sets of slots. Each set contains 4 slots, for a total of 12 slots (Fig. 7). Basic timing is set by the position of the last slot in each group. Once the Powertrain Control Module (PCM) senses the last slot, it determines crankshaft position (which piston will next be at TDC) from the camshaft position sensor input. The 4 pulses generated by the crankshaft position sensor represent the 69°, 49°, 29°, and 9° BTDC marks. It may take the PCM one engine revolution to determine crankshaft position.

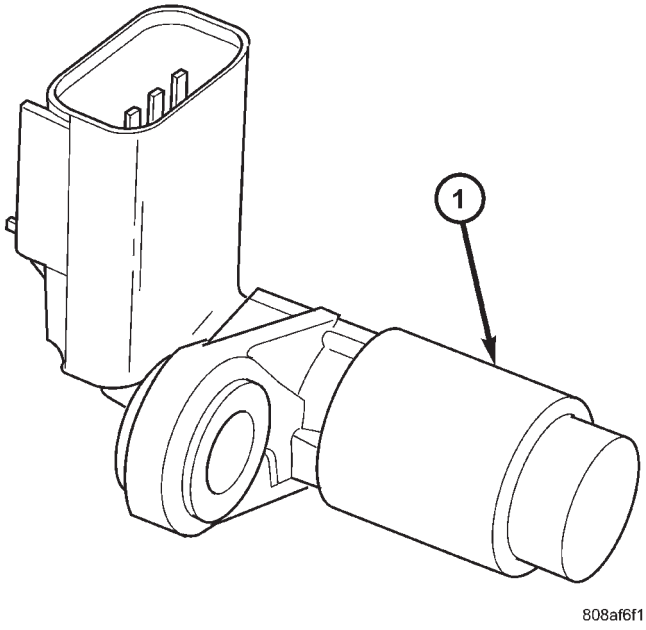

Fig. 6 Crankshaft Position Sensor

1 - CRANKSHAFT POSITION SENSOR

The PCM uses crankshaft position reference to determine injector sequence, ignition timing and the presence of misfire. Once the PCM determines crankshaft position, it begins energizing the injectors in sequence.

REMOVAL

(1) Disconnect the negative battery cable.
(2) Raise vehicle and support.
(3) Disconnect the electrical connector (Fig. 8).
(4) Remove crankshaft sensor bolt.
(5) Remove the crankshaft sensor.

INSTALLATION - 2.4L

(1) Install the crankshaft sensor.
(2) Install crankshaft sensor bolt and tighten.
(3) Connect the electrical connector (Fig. 8).

ENGINE SPEED SENSOR

DESCRIPTION

The PCM receives a signal from the TCM and the transaxle output speed sensor over the bus communication line to indicate vehicle speed on automatic transmission cars. On Manual transmission cars (if equipped) vehicle, a dedicated vehicle speed sensor is connected to the PCM.

ENGINE SPEED SENSOR (Continued)

OPERATION

The Transmission Control Module (TCM) supplies the road speed and distance traveled inputs to the PCM. From these inputs and the throttle position sensor input, the PCM determines when a deceleration condition occurs.

FUEL INJECTOR

DESCRIPTION

The injectors are positioned in the intake manifold or cylinder head with the nozzle ends directly above the intake valve port (Fig. 9).

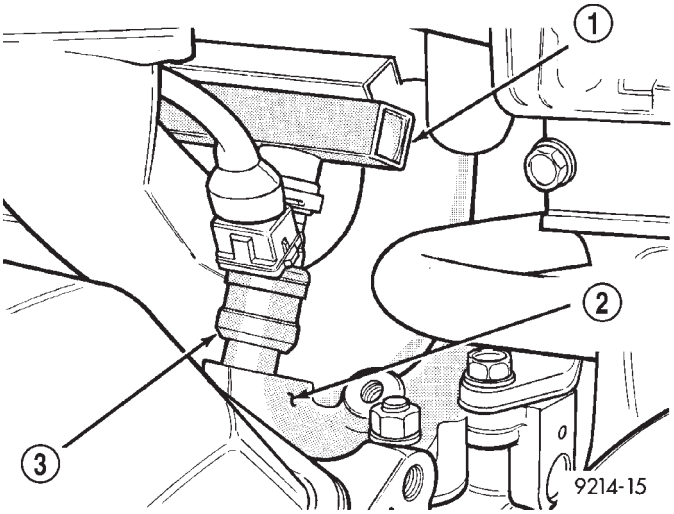

Fig. 9 Fuel Injector Location - Typical

1 - FUEL RAIL
2 - INTAKE MANIFOLD
3 - FUEL INJECTORS

OPERATION

The fuel injectors are 12 volt electrical solenoids (Fig. 10). The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a hollow cone or two streams. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber. Fuel injectors are not interchangeable between engines.

The PCM provides battery voltage to each injector through the ASD relay. Injector operation is controlled by a ground path provided for each injector by the PCM. Injector on-time (pulse-width) is variable, and is determined by the PCM processing all the data previously discussed to obtain the optimum injector pulse width for each operating condition. The pulse width is controlled by the duration of the ground path provided.

prevent damage. Replace the injector clip if it is damaged.

(5) Repeat for remaining injectors.

REMOVAL - 3.3/3.8L

(1) Disconnect the negative battery cable.

(2) Remove the Intake Manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

(3) Disconnect injector wiring connector from injector.

(4) Position fuel rail assembly so that the fuel injectors are easily accessible (Fig. 12).

(5) Rotate injector and pull injector out of fuel rail. The clip will stay on the injector.

(6) Check injector O-ring for damage. If O-ring is damaged, it must be replaced. If injector is reused, a protective cap must be installed on the injector tip to prevent damage. Replace the injector clip if it is damaged.

(7) Repeat for remaining injectors.

INSTALLATION

INSTALLATION - 2.4L

The fuel rail must be removed first. Refer to Fuel Injector Rail Removal in this section.

(1) Before installing an injector the rubber O-ring must be lubricated with a drop of clean engine oil to aid in installation.

(2) Install injector clip by sliding open end into the top slot of the injector. The edge of the receiver cup will slide into the side slots of clip.

(3) Install injector top end into fuel rail receiver cap. Be careful not to damage O-ring during installation (Fig. 13).

(4) Repeat steps for remaining injectors.

(5) Connect fuel injector wiring.

INSTALLATION - 3.3/3.8L

(1) Before installing an injector the rubber O-ring must be lubricated with a drop of clean engine oil to aid in installation.

(2) Install injector clip by sliding open end into the top slot of the injector. The edge of the receiver cup will slide into the side slots of clip (Fig. 12).

(3) Install injector top end into fuel rail receiver cap. Be careful not to damage O-ring during installation (Fig. 12).

(4) Repeat steps for remaining injectors.

(5) Install fuel rail, refer to Fuel Rail in the Fuel Delivery section.

(6) Connect fuel injector wiring.

(7) Install the Intake Manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(8) Connect the negative battery cable.

FUEL PUMP RELAY

DESCRIPTION

The fuel pump relay is located in the PDC. The inside top of the PDC cover has a label showing relay and fuse location.

OPERATION

The fuel pump relay supplies battery voltage to the fuel pump. A buss bar in the Power Distribution Center (PDC) supplies voltage to the solenoid side and contact side of the relay. The fuel pump relay power circuit contains a fuse between the buss bar in the PDC and the relay. The fuse is located in the PDC. Refer to the Wiring Diagrams for circuit information.

The PCM controls the fuel pump relay by switching the ground path for the solenoid side of the relay on and off. The PCM turns the ground path off when the ignition switch is in the Off position. When the ignition switch is in the On position, the PCM energizes the fuel pump. If the crankshaft position sensor does not detect engine rotation, the PCM de-energizes the relay after approximately one second.

IDLE AIR CONTROL MOTOR

DESCRIPTION

The idle air control motor is mounted on the throttle body. The PCM operates the idle air control motor (Fig. 14) or (Fig. 15).

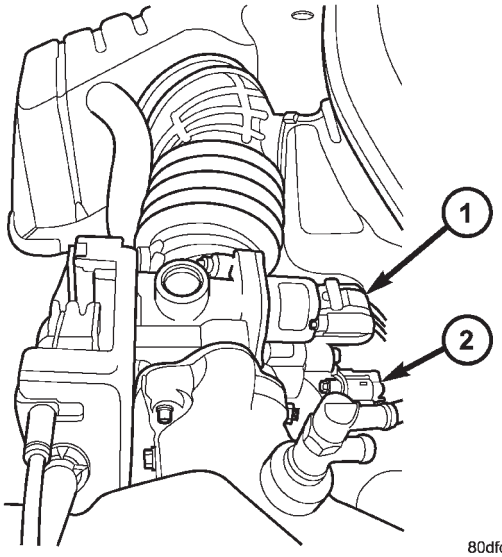

Fig. 14 TPS/IAC 2.4L

1 - Idle Air Control Motor
2 - Throttle Position Sensor

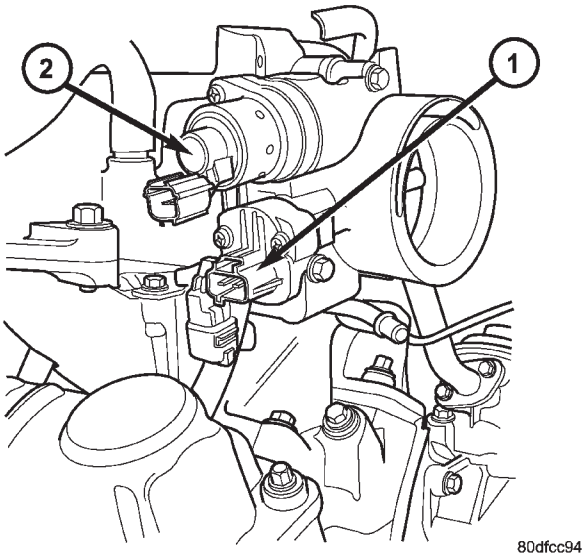

Fig. 15 TPS/IAC 3.3/3.8L

1 - Idle Air Control Motor
2 - Throttle Position Sensor

OPERATION

The PCM adjusts engine idle speed through the idle air control motor to compensate for engine load, coolant temperature or barometric pressure changes.

The throttle body has an air bypass passage that provides air for the engine during closed throttle idle. The idle air control motor pintle protrudes into the air bypass passage and regulates air flow through it.

The PCM adjusts engine idle speed by moving the IAC motor pintle in and out of the bypass passage. The adjustments are based on inputs the PCM receives. The inputs are from the throttle position sensor, crankshaft position sensor, coolant temperature sensor, MAP sensor, vehicle speed sensor and various switch operations (brake, park/neutral, air conditioning).

When engine rpm is above idle speed, the IAC is used for the following functions:

- Off-idle dashpot
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)

Target Idle

Target idle is determined by the following inputs:

- Gear position
- ECT Sensor
- Battery voltage
- Ambient/Battery Temperature Sensor
- VSS
- TPS
- MAP Sensor

IDLE AIR CONTROL MOTOR (Continued)

REMOVAL

When servicing throttle body components, always reassemble components with new O-rings and seals where applicable. Never use lubricants on O-rings or seals, damage may result. If assembly of component is difficult, use water to aid assembly. Use care when removing hoses to prevent damage to hose or hose nipple.

(1) Disconnect negative cable from battery.

(2) Remove electrical connector from idle air control motor.

(3) Remove idle air control motor mounting screws.

(4) Remove motor from throttle body. Ensure the O-rings is removed with the motor.

INSTALLATION

When servicing throttle body components, always reassemble components with new O-rings and seals where applicable. Never use lubricants on O-rings or seals, damage may result. If assembly of component is difficult, **a light coat of engine oil may be applied to the O-RINGS ONLY (Fig. 16)** to aid assembly. Use care when removing hoses to prevent damage to hose or hose nipple.

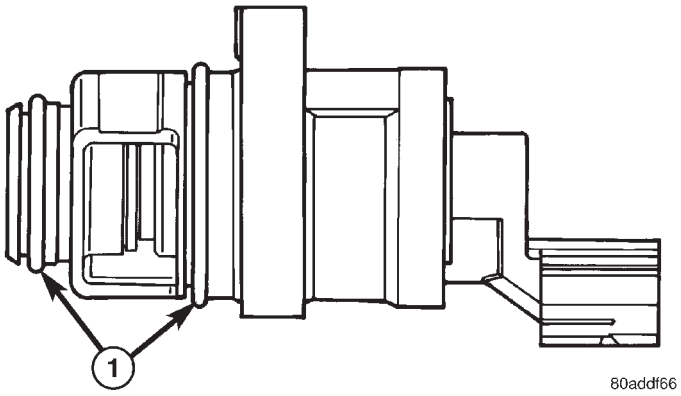

Fig. 16 O-RINGS

1 - O-rings

(1) The new idle air control motor has a new O-ring installed on it. For 2.4L only, if pintle measures more than 1 inch (25 mm) it must be retracted. Use the DRB Idle Air Control Motor Open/Close Test to retract the pintle (battery must be connected.)

(2) Carefully place idle air control motor into throttle body.

(3) Install mounting screw(s). Tighten screws to 2 N·m (17 in. lbs.) torque.

(4) Connect electrical connector to idle air control motor.

(5) Connect negative cable to battery.

INLET AIR TEMPERATURE SENSOR

DESCRIPTION

The IAT Sensor is a Negative Temperature Coefficient (NTC) Sensor that provides information to the PCM regarding the temperature of the air entering the intake manifold (Fig. 17).

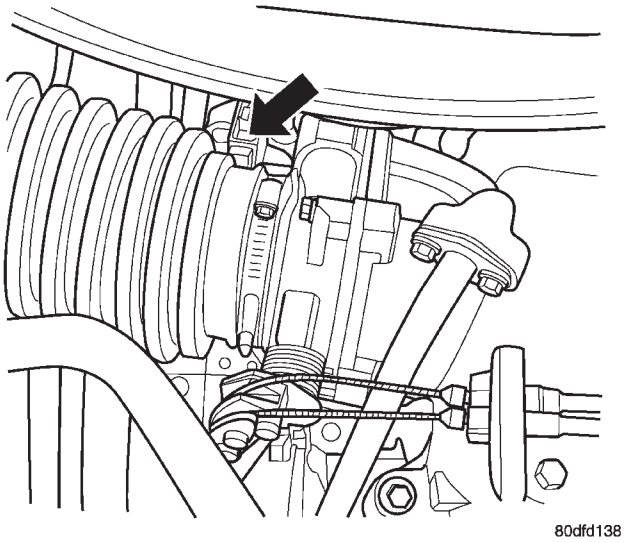

Fig. 17 3.3/3.8L IAT SENSOR

OPERATION

Inlet/Intake Air Temperature

The inlet air temperature sensor replaces the intake air temperature sensor and the battery temperature sensor. The PCM uses the information from the inlet air temperature sensor to determine values to use as an intake air temperature sensor and a battery temperature sensor.

The Intake Air Temperature (IAT) sensor value is used by the PCM to determine air density.

The PCM uses this information to calculate:

- Injector pulse width
- Adjustment of ignition timing (to prevent spark knock at high intake air temperatures)

Battery Temperature

The inlet air temperature sensor replaces the intake air temperature sensor and the battery temperature sensor. The PCM uses the information from the inlet air temperature sensor to determine values for the PCM to use as an intake air temperature sensor and a battery temperature sensor.

The battery temperature information along with data from monitored line voltage (B+), is used by the PCM to vary the battery charging rate. System volt-

age will be higher at colder temperatures and is gradually reduced at warmer temperatures.

The battery temperature information is also used for OBD II diagnostics. Certain faults and OBD II monitors are either enabled or disabled depending upon the battery temperature sensor input (example: disable purge, enable LDP). Most OBD II monitors are disabled below 20°F.

MAP SENSOR

DESCRIPTION

The MAP sensor (Fig. 18) or (Fig. 19) mounts to the intake manifold. The sensor is connects electrically to the PCM.

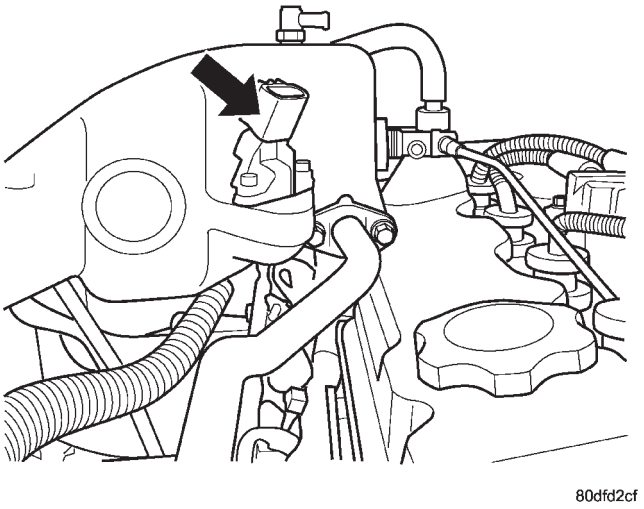

Fig. 18 MAP SENSOR - 2.4L

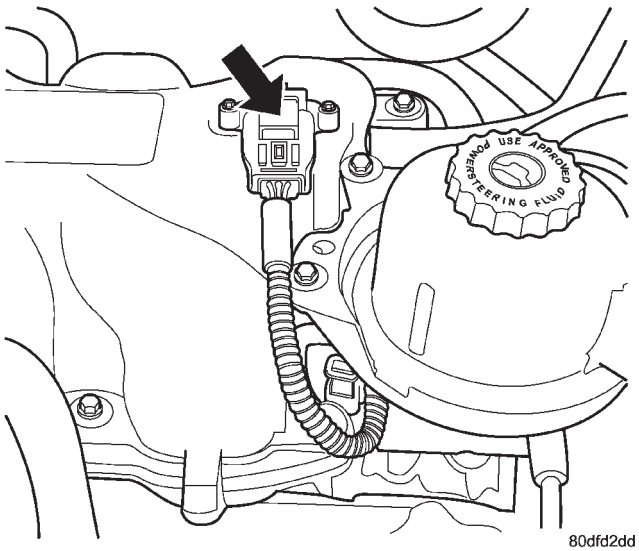

Fig. 19 MAP SENSOR - 3.3/3.8L

OPERATION

The MAP serves as a PCM input, using a silicon based sensing unit, to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When MAP equals Barometric pressure, the pulse width will be at maximum.

Also like the cam and crank sensors, a 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0 — 15 psi the voltage changes 4.0V. The sensor is supplied a regulated 4.8 to 5.1 volts to operate the sensor. Like the cam and crank sensors ground is provided through the sensor return circuit.

The MAP sensor input is the number one contributor to pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or is it in Denver at 5000 feet above sea level, because the air density changes with altitude. It will also help to correct for varying weather conditions. If a hurricane was coming through the pressure would be very, very low or there could be a real fair weather, high pressure area. This is important because as air pressure changes the barometric pressure changes. Barometric pressure and altitude have a direct inverse correlation, as altitude goes up barometric goes down. The first thing that happens as the key is rolled on, before reaching the crank position, the PCM powers up, comes around and looks at the MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure relative to altitude. Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key on. The difference between current and what it was at key on is manifold vacuum.

During key On (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring known good sensor in you work area.

As the altitude increases the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key On the barometric pressure needs to be updated. Any time the PCM sees Wide Open throttle, based upon TPS angle and RPM it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor to aid in calculating the following:

- Barometric pressure
- Engine load

MAP SENSOR (Continued)

- Manifold pressure
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (F4AC1 transmissions only, via the PCI bus)
- Idle speed
- Decel fuel shutoff

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is 29.92 in Hg. For every 100 feet of altitude barometric pressure drops .10 in. Hg. If a storm goes through it can either add, high pressure, or decrease, low pressure, from what should be present for that altitude. You should make a habit of knowing what the average pressure and corresponding barometric pressure is for your area.

REMOVAL

REMOVAL - 2.4L

(1) Disconnect the negative battery cable.
(2) Disconnect electrical connector and vacuum hose from MAP sensor (Fig. 18).
(3) Remove two screws holding sensor to the intake manifold.

REMOVAL - 3.3/3.8L

(1) Disconnect the negative battery cable.
(2) Remove vacuum hose and mounting screws from manifold absolute pressure (MAP) sensor (Fig. 19).
(3) Disconnect electrical connector from sensor. Remove sensor.

INSTALLATION

INSTALLATION - 2.4L

(1) Install sensor.
(2) Install two screws and tighten.
(3) Connect the electrical connector and vacuum hose to the MAP sensor (Fig. 18).
(4) Connect the negative battery cable.

INSTALLATION - 3.3/3.8L

(1) Install sensor (Fig. 19).
(2) Install screws and tighten to **PLASTIC MANIFOLD 1.7 N·m (15 in. lbs.) ALUMINUM MANIFOLD 3.3 N·m (30 in. lbs.)** .
(3) Connect the electrical connector to the sensor. Install vacuum hose.
(4) Connect the negative battery cable.

O2 SENSOR

DESCRIPTION

The upstream oxygen sensor threads into the outlet flange of the exhaust manifold (Fig. 20) or (Fig. 21).

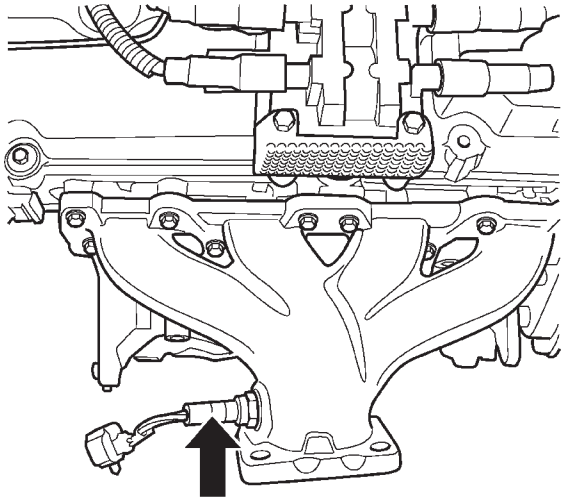

Fig. 20 O2 SENSOR UPSTREAM 1/1 - 2.4L

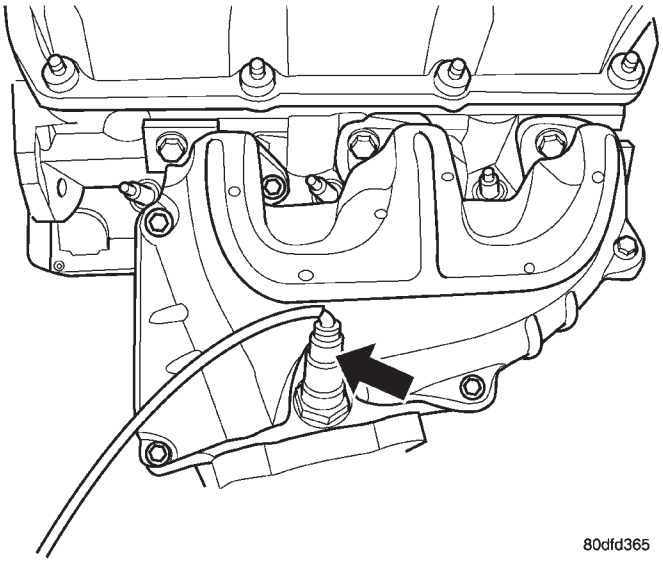

Fig. 21 O2 SENSOR UPSTREAM 1/1 - 3.3/3.8L

O2 SENSOR (Continued)

The downstream heated oxygen sensor threads into the outlet pipe at the rear of the catalytic convertor (Fig. 22).

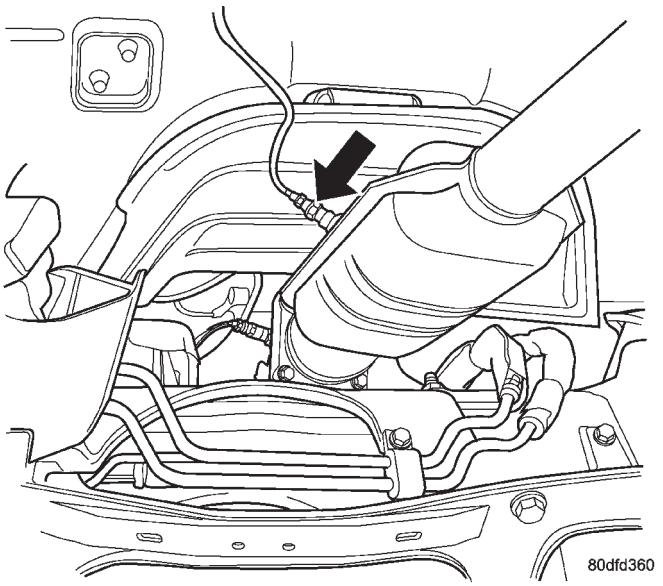

Fig. 22 O2 SENSOR DOWNSTREAM 1/2 - 2.4/3.3/ 3.8L

OPERATION

A single sensor ground is used for all O2 sensors (2 senors on 4 cyl. vehicles and 4 sensors on 6 cyl. vehicles).

As vehicles accumulate mileage, the catalytic convertor deteriorates. The deterioration results in a less efficient catalyst. To monitor catalytic convertor deterioration, the fuel injection system uses two heated oxygen sensors. One sensor upstream of the catalytic convertor, one downstream of the convertor. The PCM compares the reading from the sensors to calculate the catalytic convertor oxygen storage capacity and converter efficiency. Also, the PCM uses the upstream heated oxygen sensor input when adjusting injector pulse width.

When the catalytic converter efficiency drops below emission standards, the PCM stores a diagnostic trouble code and illuminates the malfunction indicator lamp (MIL).

The O2 sensors produce voltages from 0 to 1 volt, depending upon the oxygen content of the exhaust gas. When a large amount of oxygen is present (caused by a lean air/fuel mixture, can be caused by misfire and exhaust leaks), the sensors produces a low voltage. When there is a lesser amount of oxygen present (caused by a rich air/fuel mixture, can be caused by internal engine problems) it produces a higher voltage. By monitoring the oxygen content and converting it to electrical voltage, the sensors act as a rich-lean switch.

The oxygen sensors are equipped with a heating element that keeps the sensors at proper operating temperature during all operating modes. Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation the PCM monitors the O2 sensors input (along with other inputs) and adjusts the injector pulse width accordingly. During Open Loop operation the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

The Automatic Shutdown (ASD) relay supplies battery voltage to both the upstream and downstream heated oxygen sensors. The oxygen sensors are equipped with a heating element. The heating elements reduce the time required for the sensors to reach operating temperature. The PCM uses pulse width modulation to control the ground side of the heater to regulate the temperature on 4 cyl. upstream O2 heater only. All other 4 cyl. and 6 cyl. O2 heaters do not use pulse width modulation.

UPSTREAM OXYGEN SENSOR

The input from the upstream heated oxygen sensor tells the PCM the oxygen content of the exhaust gas. Based on this input, the PCM fine tunes the air-fuel ratio by adjusting injector pulse width.

The sensor input switches from 0 to 1 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold. When a large amount of oxygen is present (caused by a lean air-fuel mixture), the sensor produces voltage as low as 0.1 volt. When there is a lesser amount of oxygen present (rich air-fuel mixture) the sensor produces a voltage as high as 1.0 volt. By monitoring the oxygen content and converting it to electrical voltage, the sensor acts as a rich-lean switch.

The heating element in the sensor provides heat to the sensor ceramic element. Heating the sensor allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop, the PCM adjusts injector pulse width based on the upstream heated oxygen sensor input along with other inputs. In Open Loop, the PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

DOWNSTREAM OXYGEN SENSOR

The downstream heated oxygen sensor input is used to detect catalytic convertor deterioration. As the convertor deteriorates, the input from the down-

O2 SENSOR (Continued)

stream sensor begins to match the upstream sensor input except for a slight time delay. By comparing the downstream heated oxygen sensor input to the input from the upstream sensor, the PCM calculates catalytic convertor efficiency. Also used to establish the upstream O2 goal voltage (switching point).

REMOVAL

REMOVAL - UPSTREAM 1/1 - 2.4L

(1) Disconnect the negative battery cable.
(2) Raise and support the vehicle.
(3) Disconnect the electrical connector (Fig. 21).
(4) Use a socket such as the Snap-On® YA8875 or equivalent to remove the sensor
(5) When the sensor is removed, the threads must be cleaned with an 18 mm X 1.5 + 6E tap. If using the original sensor, coat the threads with Loctite 771–64 anti-seize compound or equivalent.

REMOVAL - UPSTREAM 1/1 - 3.3/3.8L

(1) Remove battery, refer to the Battery section for more information.
(2) Remove the battery tray, refer to the Battery section for more information.
(3) Disconnect the speed control vacuum harness from servo.
(4) Disconnect the electrical connector from servo.

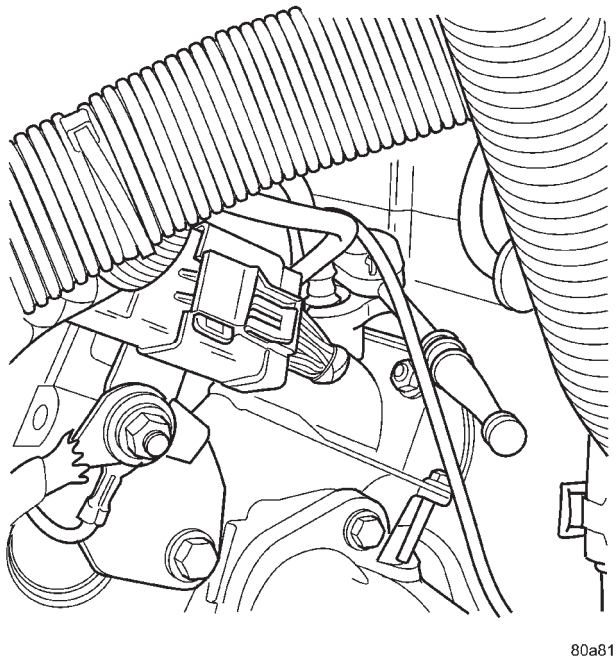

Fig. 23 O2 SENSOR 1/1

(5) Remove the speed control servo and bracket and reposition.
(6) Use a socket such as the Snap-On® YA8875 or equivalent to remove the sensor (Fig. 23).
(7) When the sensor is removed, the threads must be cleaned with an 18 mm X 1.5 + 6E tap. If using the original sensor, coat the threads with Loctite 771–64 anti-seize compound or equivalent.

REMOVAL - DOWNSTREAM 1/2 - 2.4/3.3/3.8L

(1) Disconnect the negative battery cable.
(2) Raise and support the vehicle.
(3) Disconnect the electrical connector (Fig. 24).

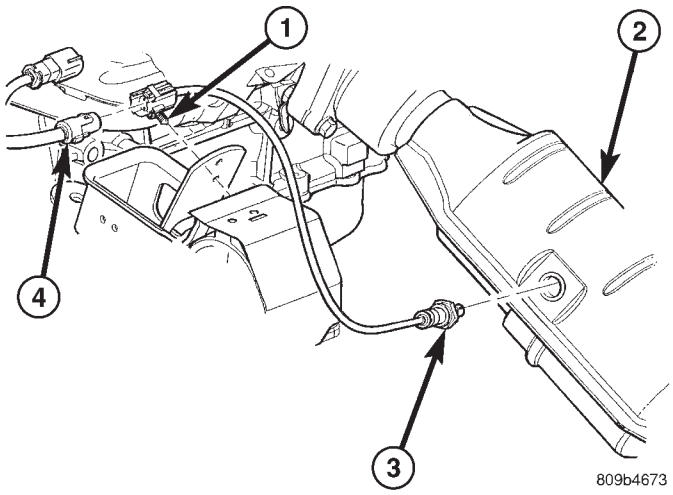

Fig. 24 Downstream Oxygen Sensor (1/2)

1 - OXYGEN SENSOR CONNECTOR
2 - CATALYTIC CONVERTER
3 - DOWNSTREAM OXYGEN SENSOR
4 - ENGINE HARNESS CONNECTOR

(4) Use a socket such as the Snap-On® YA8875 or equivalent to remove the sensor (Fig. 25).
(5) When the sensor is removed, the threads must be cleaned with an 18 mm X 1.5 + 6E tap. If using the original sensor, coat the threads with Loctite 771–64 anti-seize compound or equivalent.

INSTALLATION

INSTALLATION - UPSTREAM 1/1 - 2.4L

The engines uses two heated oxygen sensors.
(1) After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating.
(2) Install sensor and tighten to 27 N·m (20 ft. lbs.) (Fig. 21).
(3) Connect the electrical connector for the O2 sensor and install onto bracket.
(4) Lower vehicle.
(5) Connect the negative battery cable.

O2 SENSOR (Continued)

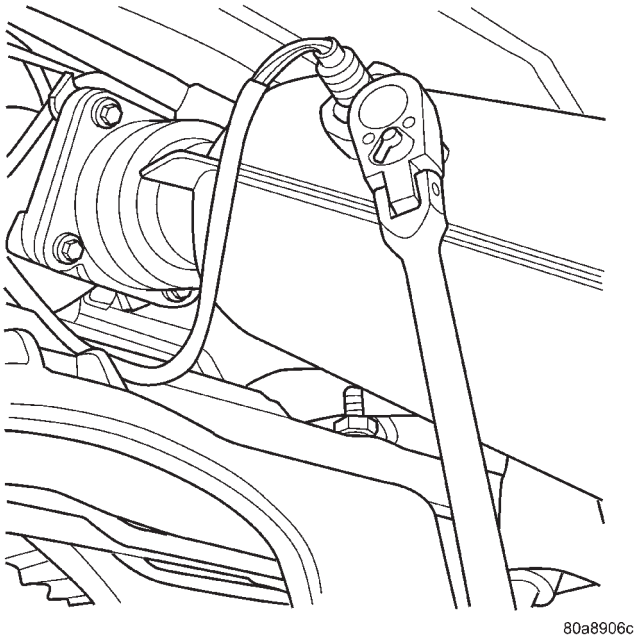

Fig. 25 DOWNSTREAM 2/1 O2 SENSOR

INSTALLATION - UPSTREAM 1/1 - 3.3/3.8L

The engines uses two heated oxygen sensors.

(1) After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating.

(2) Install sensor and tighten to 27 N·m (20 ft. lbs.).

(3) Connect the electrical connector for the O2 sensor and install onto bracket.

(4) Connect the electrical connector for the speed control servo.

(5) Install the speed control servo and bracket refer to the Speed Control Servo for more information.

(6) Connect the speed control vacuum harness to servo.

(7) Install the battery tray, refer to the Battery section for more information.

(8) Install battery, refer to the Battery section for more information.

INSTALLATION DOWNSTREAM 2/1 - 2.4/3.3/3.8L

The O2S is located on the side of the catalytic converter.

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to the threads of a new oxygen sensor.**

(1) Install sensor and tighten to 27 N·m (20 ft. lbs.).

(2) Connect the electrical connector.

(3) Lower vehicle.

(4) Install the negative battery cable.

THROTTLE BODY

DESCRIPTION

The throttle body is located on the intake manifold (Fig. 26) or (Fig. 27). Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

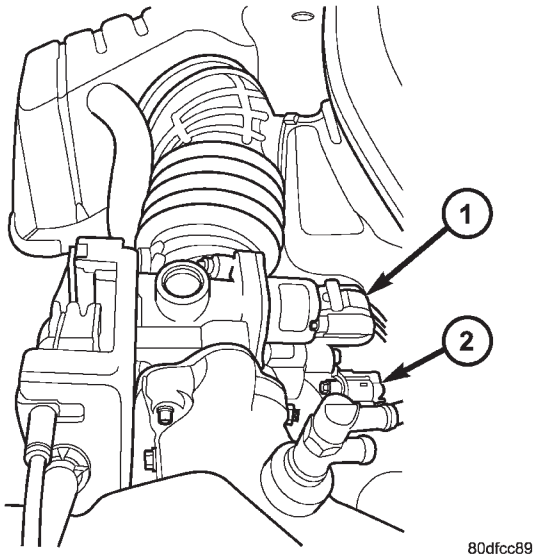

Fig. 26 IAC MOTOR 2.4L

1 - Idle Air Control Motor
2 - Throttle Position Sensor

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

THROTTLE BODY (Continued)

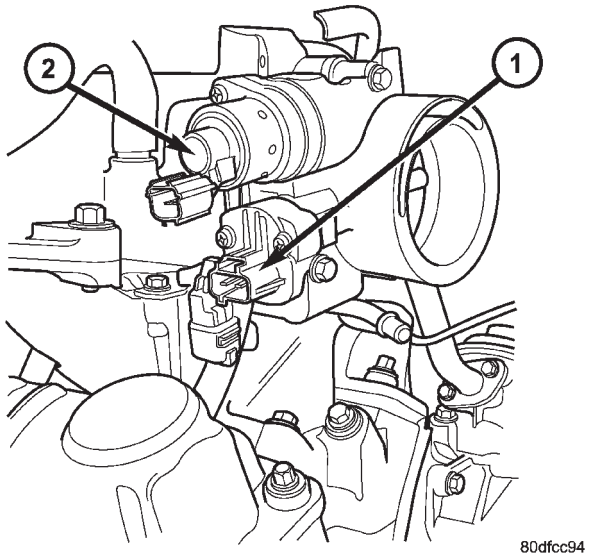

Fig. 27 IAC MOTOR LOCATION 3.3/3.8L

1 - Idle Air Control Motor
2 - Throttle Position Sensor

REMOVAL

(1) Disconnect negative cable from battery cable.
(2) Remove air inlet to throttle body hose clamp.
(3) Remove throttle and the speed control (if equipped) cables from lever and bracket.
(4) Disconnect electrical connectors from the idle air control motor and throttle position sensor (TPS) (Fig. 26) or (Fig. 27).
(5) Remove throttle body to intake manifold attaching bolts.
(6) Remove throttle body and gasket.

INSTALLATION

(1) Install a new gasket.
(2) Install throttle body.
(3) Tighten throttle body mounting bolts. The 2.4L to 28.2 N·m (250 ±50 in. lbs.) torque, The 3.3/3.8L to 11.6 N·m (105 ±20 in. lbs.) torque.
(4) Connect electrical connectors to the idle air control motor and throttle position sensor (TPS) (Fig. 26) or (Fig. 27).
(5) Install air inlet to throttle body hose clamp and tighten.
(6) Connect negative cable to battery cable.

THROTTLE CONTROL CABLE

REMOVAL

(1) Working from the engine compartment, hold the throttle body throttle lever in the wide open position.
(2) Remove the throttle cable from the throttle body cam.
(3) From inside the vehicle, hold up the pedal and remove the cable retainer and throttle cable from the upper end of the pedal shaft.
(4) Remove retainer clip from throttle cable and grommet at dash panel.
(5) From the engine compartment, pull the throttle cable and gromment out of the dash panel.
(6) Remove the throttle cable from throttle bracket by carefully compressing both retaining ears simultaneously then gently pull the throttle cable from throttle bracket or if it is the slide snap design you have to slide the locking tab out of the hole and then slide the cable assembly out of the bracket.

INSTALLATION

(1) From the engine compartment, push the housing end fitting and grommet into the dash panel.Install gromment into the dash panel.
(2) Install the cable housing (throttle body end) into the cable mounting bracket on the engine.
(3) From inside the vehicle, hold up the pedal and install throttle cable and cable retainer in the upper end of the pedal shaft.
(4) At the dash panel, install the cable retainer clip between the end of the throttle cable fitting and grommet
(5) From the engine compartment, rotate the throttle lever wide open and install the throttle cable.

THROTTLE POSITION SENSOR

DESCRIPTION

The throttle position sensor mounts to the side of the throttle body (Fig. 28) or (Fig. 29).The sensor connects to the throttle blade shaft. The TPS is a variable resistor that provides the Powertrain Control Module (PCM) with an input signal (voltage).

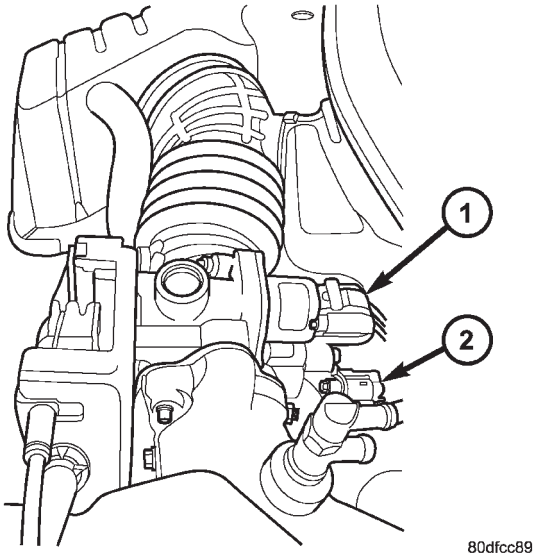

Fig. 28 Throttle Position Sensor—2.4L Engine

1 - Idle Air Control Motor
2 - Throttle Position Sensor

OPERATION

The signal represents throttle blade position. As the position of the throttle blade changes, the resistance of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the powertrain control module) represents throttle blade position. The TPS output voltage to the PCM varies from approximately 0.6 volt at minimum throttle opening (idle) to a maximum of 4.5 volts at wide open throttle.

Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. The PCM also adjusts fuel injector pulse width and ignition timing based on these inputs.

REMOVAL - 3.3/3.8L

(1) Disconnect the negative battery cable.
(2) Remove the electrical connector from the Inlet Air Temperature sensor.

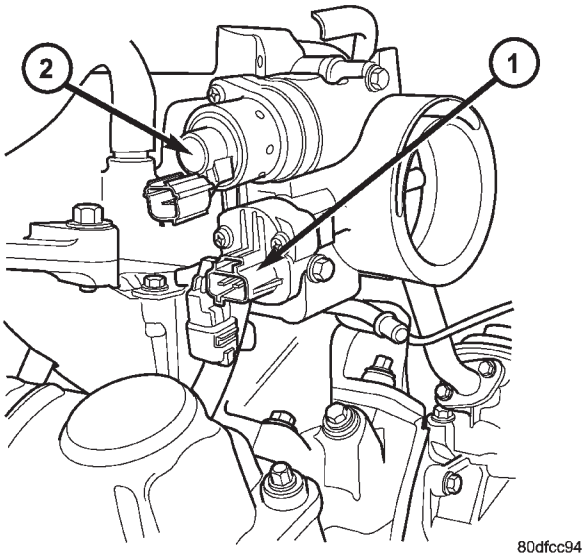

Fig. 29 Throttle Position Sensor—3.3/3.8L Engine

1 - Idle Air Control Motor
2 - Throttle Position Sensor

(3) Remove the air cleaner box lid. Remove hose from throttle body.
(4) Disconnect the electrical connector at TPS.
(5) Disconnect the electrical connector at IAC.
(6) Remove the throttle and speed control cables from throttle body.
(7) Remove 3 mounting bolts from throttle body.
(8) Remove throttle body.
(9) Disconnect the purge vacuum line from the throttle body.
(10) Remove TPS from throttle body.

INSTALLATION - 3.3/3.8L

(1) Install TPS to throttle body.
(2) Disconnect the purge vacuum line from the throttle body.
(3) Install throttle body.
(4) Install 3 mounting bolts from throttle body. Tighten bolts.
(5) Install the throttle and speed control cables to throttle body.
(6) Connect the electrical connector at TPS.
(7) Connect the electrical connector at IAC.
(8) Install the air cleaner box lid. Install hose to throttle body.
(9) Install the electrical connector to the Inlet Air Temperature sensor.
(10) Connect the negative battery cable.

FUEL SYSTEM 2.5L TURBO DIESEL

DESCRIPTION - DIESEL FUEL DELIVERY SYSTEM

The fuel system on the 2.5L Common Rail Diesel Engine uses a fuel injection pump and an Electronic Control Module (ECM).

The fuel delivery system consists of the:

- Accelerator pedal
- Air cleaner housing/element
- Fuel filter/water separator
- Fuel heater
- Fuel heater relay
- Fuel transfer (lift) pump
- Fuel injection pump
- Fuel injectors
- Fuel tank
- Fuel tank filler/vent tube assembly
- Fuel tank filler tube cap
- Fuel tank module containing the rollover valve and a fuel gauge sending unit (fuel level sensor).
- Fuel tubes/lines/hoses
- High-pressure fuel injector lines
- Low-pressure fuel supply lines
- Low-pressure fuel return line
- Overflow valve
- Quick-connect fittings
- Water draining

WARNING - HIGH FUEL SYSTEM PRESSURE

WARNING:: THE INJECTION PUMP SUPPLIES HIGH-PRESSURE FUEL TO EACH INDIVIDUAL INJECTOR THROUGH HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AIR IN FUEL SYSTEM

Air will enter the fuel system whenever fuel supply lines, separator filters, injection pump, high-pressure lines or injectors are removed or disconnected. Air trapped in the fuel system can result in hard starting, a rough running engine, engine misfire, low power, excessive smoke and fuel knock. After service is performed, air must be bled from the system before starting the engine.

Inspect the fuel system from the fuel tank to the injectors for loose connections. Leaking fuel is an indicator of loose connections or defective seals. Air can also enter the fuel system between the fuel tank and the transfer pump. Inspect the fuel tank and fuel lines for damage that might allow air into the system.

DIAGNOSIS AND TESTING - FUEL SUPPLY RESTRICTIONS

LOW-PRESSURE LINES

Fuel supply line restrictions or a defective fuel transfer pump can cause starting problems and prevent engine from accelerating. The starting problems include; low power and/or white fog like exhaust.

FUEL SYSTEM 2.5L TURBO DIESEL (Continued)

Test all fuel supply lines for restrictions or blockage. Flush or replace as necessary. Bleed fuel system of air once a fuel supply line has been replaced. Refer to Air Bleed Procedure for procedures.

To test for fuel line restrictions, a vacuum restriction test may be performed.

HIGH-PRESSURE LINES

Restricted (kinked or bent) high-pressure lines can cause starting problems, poor engine performance, engine mis-fire and white smoke from exhaust.

Examine all high-pressure lines for any damage. Each radius on each high-pressure line must be smooth and free of any bends or kinks.

Replace damaged, restricted or leaking high-pressure fuel lines with correct replacement line.

CAUTION: High pressure lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If line is kinked or bent, it must be replaced. Use only recommended lines when replacement of high-pressure fuel line is necessary.

STANDARD PROCEDURE

STANDARD PROCEDURES - DRAINING WATER FROM FUEL FILTER

Refer to Fuel Filter/Water Separator removal/installation for procedures.

STANDARD PROCEDURE - FUEL SYSTEM AIR PURGE

(1) Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).

(2) Remove cap from air purge fitting on the fuel supply line. This fitting is located just behind the alternator (Fig. 1).

(3) Attach a hose of about 1 or 2 meters to this fitting using an appropriate connector.

(4) Direct the end of the hose into an appropriate fuel container.

(5) Turn the ignition to the “ON” position,**Do not crank the engine.** Keep key on until about 1 liter of fuel has been pumped into the container.

(6) While keeping end of hose below fuel level in conatiner, turn the ignition “OFF”.

(7) Remove hose from air purge fitting on the fuel supply line and replace cap.

(8) Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).

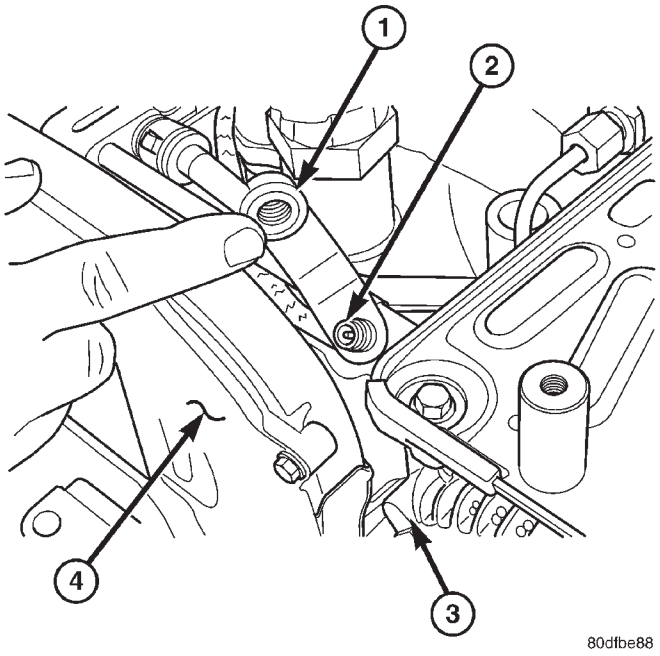

Fig. 1 AIR PURGE VALVE

1 - AIR PURGE VALVE CAP
2 - AIR PURGE VALVE
3 - ALTERNATOR
4 - ENGINE FRONT COVER

STANDARD PROCEDURES - CLEANING FUEL SYSTEM COMPONENTS

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines, fuel rail, and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

FUEL RAIL

DESCRIPTION

The fuel rail is mounted to the cylinder head cover/ intake manifold (Fig. 1).

OPERATION

The fuel rail stores the fuel for the injectors at high pressure. At the same time, the pressure oscillations which are generated due to the high-pressure pump delivery and the injection of fuel are dampened by the rail volume.

The fuel rail is common to all cylinders, hence it's name "common rail". Even when large quantities of fuel are extracted, the fuel rail maintains a constant inner pressure. This ensures that the injection pressure remains constant from the moment the injector opens.

REMOVAL - FUEL RAIL

(1) Disconnect negative battery cable.

(2) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(3) Disconnect fuel injector high pressure lines.

(4) Disconnect fuel rail supply line. (Fig. 2)

(5) Disconnect fuel rail return line. (Fig. 2)

(6) Disconnect fuel rail high pressure sensor connector. (Fig. 2)

(7) Remove engine electrical harness retainers from the fuel rail retaining bolts/studs. (Fig. 2)

(8) Remove fuel rail retaining bolts and remove fuel rail (Fig. 2).

(8) Connect negative battery cable.

FUEL FILTER / WATER SEPARATOR

DESCRIPTION

The fuel filter/water separator assembly is located under the vehicle in front of the rear axle assembly (Fig. 3). The assembly also includes the fuel heater and Water-In-Fuel (WIF) sensor.

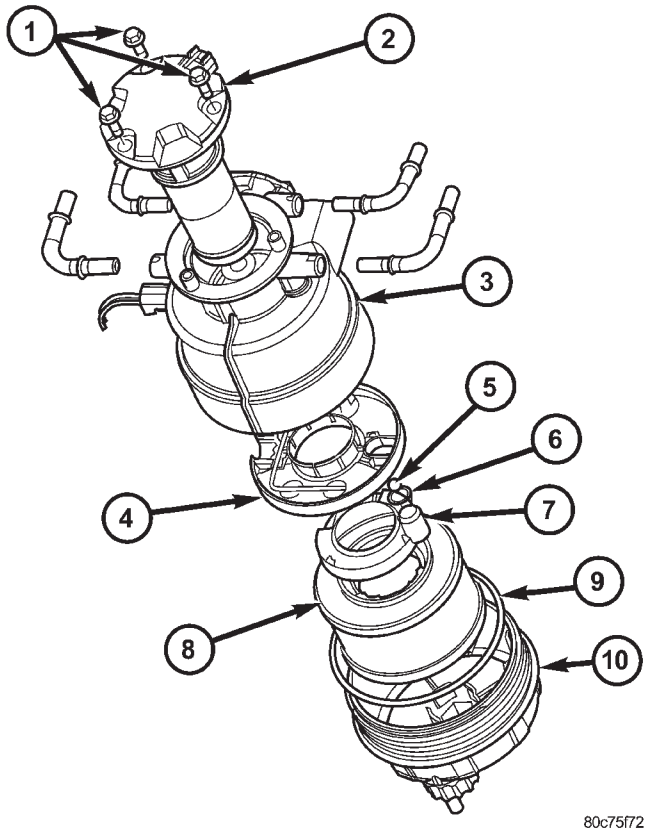

Fig. 3 FUEL FILTER/WATER SEPARATOR

1 - LIFT PUMP RETAINING BOLTS

4 - FUEL HEATER
5 - CHECK BALL
6 - O-RING
7 - FLOW DIVERTER
8 - FUEL FILTER
9 - O-RING
10 - FUEL FILTER BOWL ASSEMBLY

OPERATION

The fuel filter/water separator protects the fuel injection pump by removing water and contaminants from the fuel. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the canister.

FUEL FILTER / WATER SEPARATOR (Continued)

Refer to the maintenance schedules for the recommended fuel filter replacement intervals.

For draining of water from canister, refer to Fuel Filter/Water Separator Removal/Installation section.

A Water-In-Fuel (WIF) sensor is part of the fuel filter cap. Refer to Water-In-Fuel Sensor Description/Operation.

The fuel heater is installed into the filter/separator housing above the fuel filter. Refer to Fuel Heater Description/Operation.

FUEL LINES

DESCRIPTION

DESCRIPTION

All fuel lines up to the fuel injection pump are considered low-pressure. This includes the fuel lines from: the fuel tank to the fuel transfer pump, and the fuel transfer pump to the fuel injection pump. The fuel return lines and the fuel drain lines are also considered low-pressure lines. High-pressure lines are used between the fuel injection pump and the fuel injectors. Also refer to High-Pressure Fuel Lines Description/Operation.

DESCRIPTION - HIGH PRESSURE FUEL LINES

The high-pressure fuel lines are the 4 lines located between the fuel injection pump and the fuel injectorsctor tubes. All other fuel lines are considered low-pressure lines.

OPERATION - HIGH PRESSURE FUEL LINES

CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If lines are ever kinked or bent, they must be replaced. Use only the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel under extremely high pressure from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

WARNING: USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DIAGNOSIS AND TESTING - HIGH PRESSURE FUEL LINES

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: DUE TO EXTREME FUEL PRESSURES, USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. DO NOT GET YOUR HAND NEAR A SUSPECTED LEAK. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

Start the engine. Move the cardboard over the high-pressure fuel lines and check for fuel spray onto the cardboard (Fig. 4). If a high-pressure line connection is leaking, bleed the system and tighten the connection. Refer to the Air Bleed Procedure in this group for procedures. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

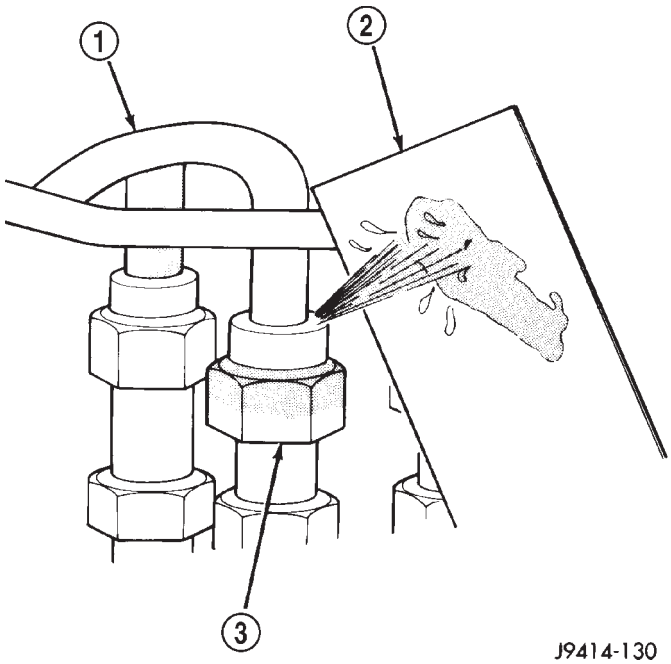

Fig. 4 Typical Test for Leaks with Cardboard

1 - HIGH-PRESSURE LINE
2 - CARDBOARD
3 - FITTING

FUEL LINES (Continued)

CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

FUEL TRANSFER PUMP

DESCRIPTION

The fuel transfer pump (fuel lift pump) is located under the vehicle in front of the rear axle assembly (Fig. 5). The 12–volt electric vane-type pump is operated and controlled by the Engine Control Module (ECM).

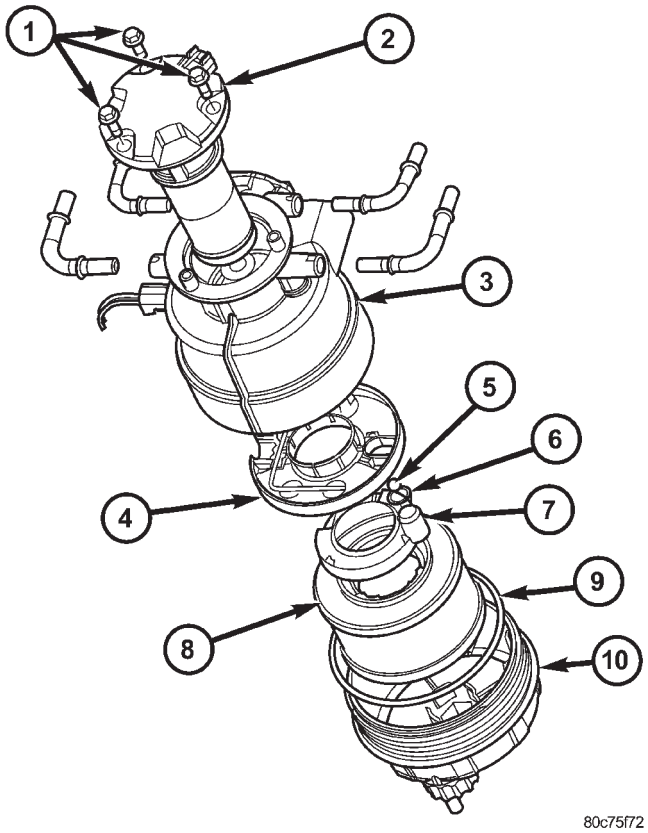

Fig. 5 FUEL TRANSFER(LIFT) PUMP LOCATION

1 - LIFT PUMP RETAINING BOLTS
2 - LIFT PUMP
3 - FUEL FILTER/WATER SEPARATOR HOUSING
4 - FUEL HEATER
5 - CHECK BALL
6 - O-RING
7 - FLOW DIVERTER
8 - FUEL FILTER
9 - O-RING
10 - FUEL FILTER BOWL ASSEMBLY

OPERATION

The purpose of the fuel transfer pump is to supply (transfer) a low-pressure fuel source: **from** the fuel tank, **through** the fuel filter/water separator and **to** the fuel injection pump. Here, the low-pressure is raised to a high-pressure by the fuel injection pump for operation of the high-pressure fuel injectors.

The fuel transfer pump is controlled by the Engine Control Module(ECM). The ECM turns the fuel transfer pump on for 30 seconds when the ignition ket is turned “ON”.

With the ignition “ON” and fuel tranfer pump running, the low-pressure fuel pressure should be 13-17 psi.

FUEL INJECTION PUMP

DESCRIPTION

A radial-piston pump is used as the high pressure pump for fuel pressure generation (Fig. 6).

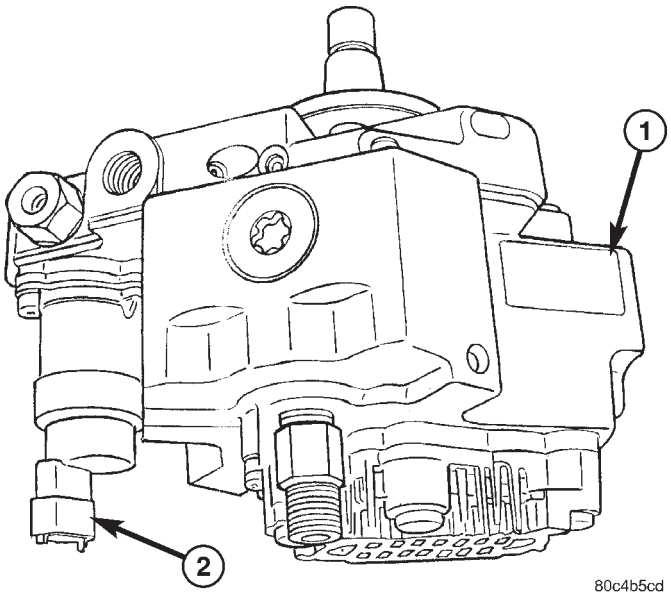

Fig. 6 FUEL INJECTION PUMP

1 - FUEL INJECTION PUMP
2 - INJECTION PUMP PRESSURE SOLENOID

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove engine cover (Refer to 9 - ENGINE - REMOVAL)

(3) Remove air cleaner housing assembly.

(4) Remove power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(5) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

FUEL INJECTION PUMP (Continued)

(6) Support engine and remove right engine mount assembly.

(7) Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(8) Using special tool VM.1055, remove injection pump sprocket retaining nut (Fig. 7).

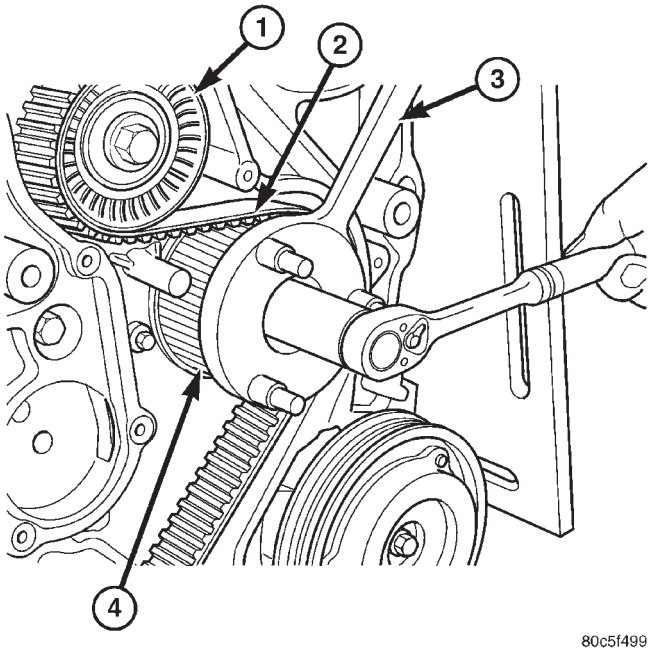

Fig. 7 INJECTION PUMP SPROCKET RETAINING NUT REMOVAL/INSTALLATION

1 - IDLER PULLEY
2 - TIMING BELT
3 - VM.1055
4 - INJECTION PUMP SPROCKET

NOTE: The use of special tool VM.1067 will allow you to remove the injection pump without removing the timing belt from the engine. This will allow you to remove and install the injection pump without altering injection pump timing.

(9) Install feet from VM.1067 in injection pump sprocket as shown (Fig. 8).

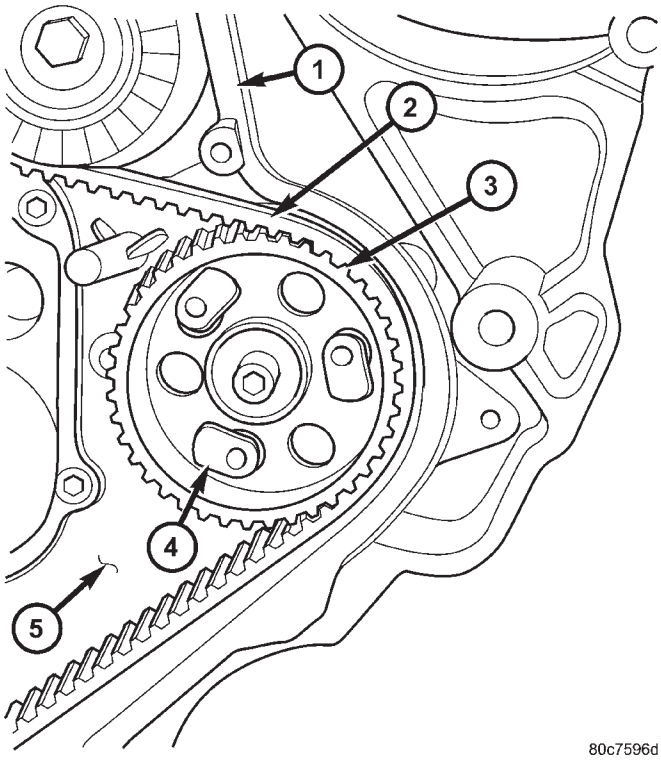

Fig. 8 VM.1067 FEET INSTALLATION

(6) Using special tool VM.1055 (Fig. 7), torque injection pump sprocket retaining nut to 88.3N·m.

(7) Connect fuel pressure solenoid electrical connector (Fig. 11).

(8) Connect fuel supply and return lines at injection pump (Fig. 11).

(9) Install generator (Fig. 11)(Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(10) Install outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(11) Install right engine mount assembly.

(12) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Install power steering belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(14) Install air cleaner housing assembly.

(15) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

(16) Connect negative battery cable.

WATER IN FUEL SENSOR

DESCRIPTION

The WIF sensor is located in the bowl assembly of the fuel filter/water separator.

OPERATION

The sensor sends an input to the Engine Control Module (ECM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the ECM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the ECM will activate the water-in-fuel warning lamp through CCD bus circuits. This all takes place when the ignition key is initially put in the ON position. The ECM continues to monitor the input at the end of the intake manifold air heater post-heat cycle.

FUEL INJECTOR

DESCRIPTION

FUEL INJECTOR

There are individual fuel injectors for all four cylinders. These fuel injectors are used to spray fuel into the combustion chamber (Fig. 1).

OPERATION

The injector operation can be subdivided into four operating states with the engine running and the high-pressure pump generating pressure:

- Injector closed (with high pressure applied)
- Injector opens (start of injection)
- Injector opened fully
- Injector closes (end of injection)

Injector closed (with high pressure applied)

With the injector closed (at-rest state), the solenoid valve is not energized and is therefore closed. With the bleed orifice closed, the valve spring forces the armature's ball onto the bleed-orifice seat. The rail's high pressure build up in the valve control chamber, and the same pressure is also present in the nozzle's chamber volume. The rail pressure applied at the control plunger's end face, together with the force of

11 - NOZZLE NEEDLE

the nozzle spring, maintain the nozzle in the closed position against the opening forces applied to its pressure stage (Fig. 2).

Injector opens (start of injection)

The solenoid valve is energized with the pickup current which serves to ensure that it open quickly. The force exerted by the triggered solenoid now exceeds that of the valve spring and the armature opens the bleed orifice. Almost immediately, the high-level pick-up current is reduced to the lower holding current required for the electromagnet. This is possible due to the magnetic circuit's air gap now being smaller. When the bleed orifice opens, fuel can flow from the valve control chamber into the cavity situated above it, and from there via the fuel return to the tank. The bleed orifice prevents complete pressure balance, and the pressure in the valve control chamber sinks as a result. This leads to the pressure in the valve-control chamber being lower than that in the nozzle's chamber volume which is still at the same pressure level as the rail. The reduced pressure in the valve-control chamber causes a reduction in the force exerted on the control plunger, the nozzle needle open as a result, and injection starts (Fig. 2).

Injector opens fully

The control plunger reaches its upper stop where it remains supported by a cushion of fuel which is generated by the flow of fuel between the bleed and feed orifices. The injector nozzle has now opened fully, and the fuel is injected into the combustion chamber at a pressure almost equal to that in the fuel rail (Fig. 2).

Injector closes (end of injection)

As soon as the solenoid valve is no longer triggered, the valve spring forces the armature downwards and the ball closes the bleed orifice. The armature is a 2–piece design. Here, although the armature plate is guided by a driver shoulder in its downward movement, it can “overspring” with the return spring so that it exerts no downwards-acting forces on the armature and the ball. The closing of the bleed orifice lead to pressure build up in the control chamber via the input from the feed orifice. This pressure is the same as that in the rail and exerts an increased force on the control plunger through its end face. This force, together with that of the spring, now exceeds the force exerted by the chamber volume and the nozzle needle closes. Injection ceases as soon as the nozzle needle comes up against its bottom stop again (Fig. 2).

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
(3) Disconnect injector electrical connector.
(4) Remove fuel return line from injector (Fig. 3).
(5) Remove fuel injector high pressure line (Fig. 3).
(6) Remove fuel injector retainer and retaining bolt (Fig. 3).

(7) Remove fuel injector from cylinder head (Fig. 3).

INSTALLATION

NOTE: Be sure the copper washer is installed on end of injector before installing in cylinder head.

(1) Install fuel injector in cylinder head.

(2) Install fuel injector retainer and bolt (Fig. 3). Torque bolt to 32.4 N·m.

(3) Install fuel injector high pressure line (Fig. 3).

(4) Install fuel return line to injector (Fig. 3).

(5) Connect fuel injector electrical connector.

(6) Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).

(7) Connect negative battery cable.

ACCELERATOR PEDAL POSITION SENSOR

DESCRIPTION

The accelerator pedal position sensor mounts to the accelerator pedal bracket (Fig. 4).

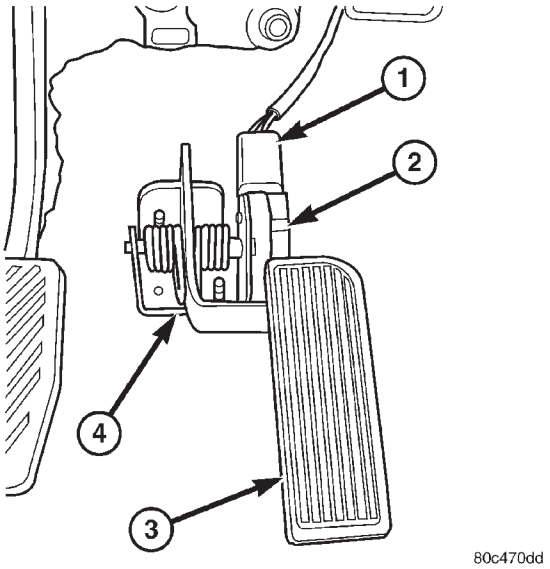

Fig. 4 ACCELERATOR PEDAL POSITION SENSOR LOCATION (TYPICAL)

1 - ACCELERATOR PEDAL POSITION SENSOR ELECTRICAL CONNECTOR
2 - ACCELERATOR PEDAL POSITION SENSOR
3 - ACCELERATOR PEDAL
4 - ACCELERATOR PEDAL MOUNTING BRACKET

OPERATION

The accelerator pedal position sensor contains a potentiometer that is operated by the accelerator pedal. As the accelerator pedal is depressed and released, the sensor provides a variable voltage signal to the engine control module. This voltage signal is directly proportional to accelerator pedal position. When the pedal is fully depressed, the voltage signal is high.

ACCELERATOR PEDAL POSITION SENSOR (Continued)

REMOVAL

REMOVAL - PEDAL POSITION SENSOR (LHD)

(1) Disconnect negative battery cable.
(2) Disconnect pedal position sensor electrical connector (Fig. 4).
(3) Remove 2 pedal position sensor retaining nuts (Fig. 4).
(4) Remove pedal position sensor from vehicle.

REMOVAL - PEDAL POSITION SENSOR (RHD)

(1) Disconnect negative battery cable.
(2) Disconnect pedal position sensor electrical connector (Fig. 4).
(3) Remove 2 pedal position sensor retaining nuts (Fig. 4).
(4) Remove pedal position sensor from vehicle.

INSTALLATION

INSTALLATION - PEDAL POSITION SENSOR (LHD)

(1) Position pedal position sensor in vehicle.
(2) Install pedal position sensor retaining nuts (Fig. 4).
(3) Connect pedal position sensor electrical connector (Fig. 4).
(4) Connect negative battery cable.

INSTALLATION - PEDAL POSITION SENSOR (RHD)

(1) Position pedal position sensor in vehicle.
(2) Install 2 pedal position sensor retaining nuts (Fig. 4).
(3) Connect pedal position sensor electrical connector (Fig. 4).
(4) Connect negative battery cable.

BOOST PRESSURE SENSOR

DESCRIPTION

The boost pressure/ intake air temperature sensor is mounted to the top of the intake manifold. The sensor allows the ECM to monitor air pressure within the intake manifold. This sensor is also used to monitor the intake air temperature (Fig. 5).

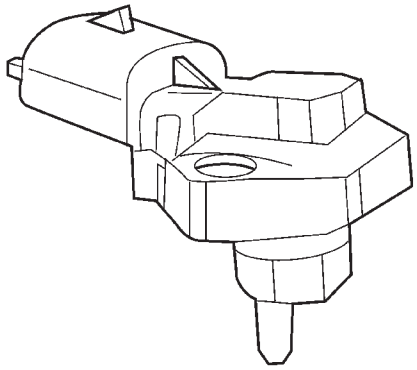

Fig. 5 BOOST PRESSURE SENSOR/INTAKE AIR TEMPERATURE SENSOR

OPERATION

When the intake manifold pressure is low (high vacuum) sensor voltage output is 0.25-1.8 volts at the ECM. When the intake manifold pressure is high due to turbo boost, sensor voltage output is 2.0-4.7 volts. The sensor receives a 5-volts reference from the ECM. Sensor ground is also provides by the ECM. The ECM uses boost pressure combined with intake air temerature to determine the volume of air entering the engine.

DIAGNOSIS AND TESTING - BOOST PRESSURE/INTAKE AIR TEMPERATURE SENSOR

If the boost pressure sensor fails, the ECM records a DTC into memory and continues to operate the engine in one of the three limp-in modes. When the ECM is operating in this mode, a loss of power will be present, as if the turbocharger was not operating. The best method for diagnosing faults with the boost pressure sensor is with the DRB III® scan tool. Refer to the Diesel Powertrain Diagnostic Manual for more information.

Refer to On-Board Diagnostics in Emissions Control System for a list of Diagnostic Trouble Codes (DTC's) for certain fuel system components.

INTAKE AIR TEMPERATURE SENSOR

DESCRIPTION

The boost pressure sensor/intake air temperature sensor is located in the top of the intake manifold (Fig. 6). The intake air temperature sensor is used to measure the intake air temperature. The intake air temperture sensor is a dual purpose sensor. It is also used as a boost pressure sensor.

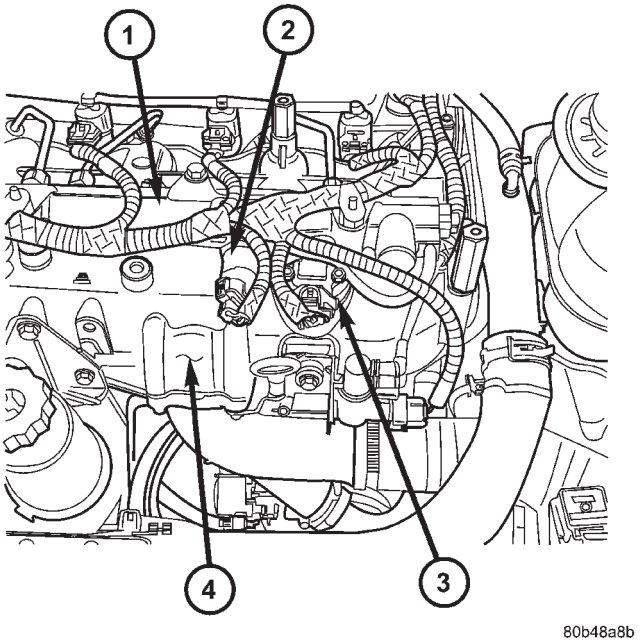

Fig. 6 BOOST PRESSURE SENSOR/INTAKE AIR TEMPERATURE SENSOR LOCATION

1 - FUEL RAIL
2 - FUEL PRESSURE SENSOR
3 - INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR
4 - CYLINDER HEAD COVER/INTAKE MANIFOLD

OPERATION

The intake air temperature sensor is a negative temperature coefficient (NTC) thermistor (resistance varies inversly with temperature). This means at cold air temperature its resistance is high, sothe voltage signal will be high. As intake air temperature increases, sensor resistance decreases and the signal voltage will be low. This allows the sensor to provide an analog voltage signal (0.2-4.8 volts) to the ECM.

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove engine cover retaining bolts and cover-(Refer to 9 - ENGINE COVER - REMOVAL).
(3) Disconnect intake air temperature electrical connector.
(4) Remove intake air temperature sensor retaining screws and sensor (Fig. 6).

INSTALLATION

(1) Install intake air temperature sensor and retaining bolts (Fig. 6). Torque to 5.4 N·m.
(2) Connect intake air temperature sensor.
(3) Install engine cover and retaining bolts (Refer to 9 - ENGINE COVER - INSTALLATION).

CRANKSHAFT POSITION SENSOR

DESCRIPTION

The crankshaft position sensor is mounted in the right rear of the engine block below the turbocharger (Fig. 7). This sensor is used to detect engine speed.

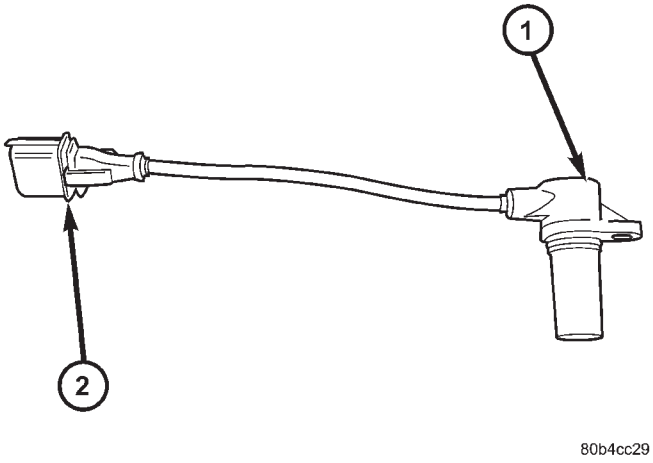

Fig. 7 CRANKSHAFT POSITION SENSOR

1 - CRANKSHAFT POSITION SENSOR
2 - CRANKSHAFT POSITION SENSOR ELECTRICAL CONNECTOR

OPERATION

The crankshaft position sensor is a magnetic pickup type sensor that generates an ac signal. The sensor contains a permanent magent and a coil of wire. The sensor generates an ac signal each time a notch in the reluctor wheel on the crankshaft passes across the permanent magnet. The ECM calculates engine speed based on the frequency of the ac signal. The ECM supplies the sensor ground.

MASS AIR FLOW (MAF) SENSOR

DESCRIPTION

The Mass Air Flow (MAF) Sensor is mounted inline in the air intake between the air filter and the turbocharger (Fig. 8).

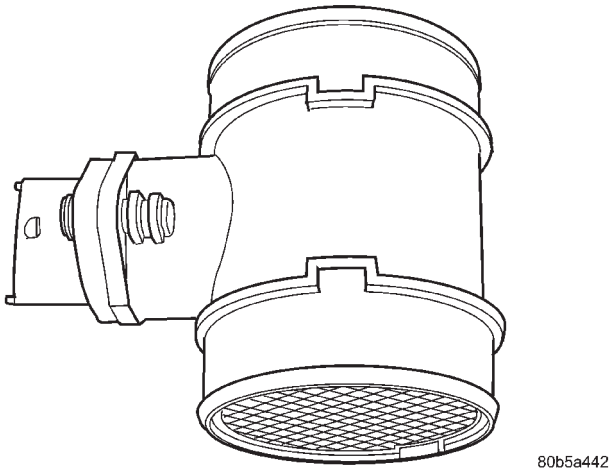

Fig. 8 MASS AIR FLOW (MAF) SENSOR

OPERATION

The ECM uses the mass air flow (MAF) sensor to measure air density. The MAF sensor contains a ceramic element. A signal voltage is provided to the element. As engine speed increases, airflow across the ceramic element increases. Changes in air flow and air density cause the temperature of the ceramic element to fluxuate. The ceramic element changes resistance respectively to changes in temperature. The change in resistance varies the signal voltage output to the ECM. The diesel power relay supplies battery power the to MAF sensor. Ground is provided by the ECM. The MAF sensor signal is provided by the ECM.

REMOVAL

(1) Disconnect negative battery cable.
(2) Disconnect MAF sensor electrical connector (Fig. 9).
(3) Loosen MAF sensor retaining clamps (Fig. 9).
(4) Remove MAF sensor from airduct (Fig. 9).

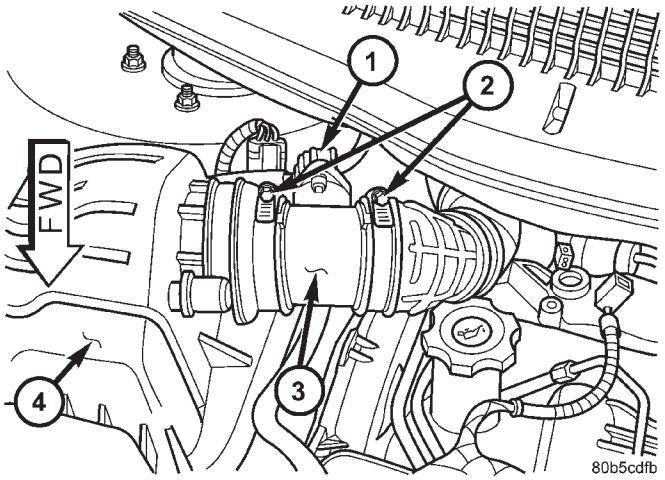

Fig. 9 MASS AIR FLOW (MAF) SENSOR LOCATION

1 - MAF SENSOR ELECTRICAL CONNECTOR
2 - RETAINING CLAMPS
3 - MASS AIR FLOW (MAF) SENSOR
4 - AIR CLEANER HOUSING

INSTALLATION

(1) Install MAF sensor in airduct (Fig. 9).
(2) Tighten retaining clamps (Fig. 9).
(3) Connect MAF sensor electrical connector (Fig. 9).
(4) Connect negative battery cable.

STEERING

DESCRIPTION - POWER STEERING SYSTEM

This vehicle comes with power steering as standard equipment. The power steering system consists of these major components:

- POWER STEERING PUMP
- POWER STEERING GEAR
- POWER STEERING FLUID
- POWER STEERING FLUID COOLER
- POWER STEERING FLUID RESERVOIR
- POWER STEERING FLUID SUPPLY HOSE
- POWER STEERING FLUID PRESSURE HOSE
- POWER STEERING FLUID RETURN HOSE

For information on the first two components, refer to their respective sections within this service manual group. Information on all other components can be found in POWER STEERING PUMP.

OPERATION - POWER STEERING SYSTEM

Turning of the steering wheel is converted into linear (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth within the steering gear. The lateral travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist steering is provided by a belt driven rotary type pump. It directs fluid through power steering fluid hoses to the power steering gear where it is used to assist the driver's turning effort.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER STEERING SYSTEM FLOW AND PRESSURE TEST

ALL ENGINES

The following procedure is to be used to test the operation of the power steering system on this vehicle. This test will provide the flow rate of the power steering pump along with the maximum relief pressure. This test is to be performed to determine if the power steering pump or power steering gear is not functioning properly. The following flow and pressure test is performed using the Power Steering Analyzer Kit, Special Tool 6815 (Fig. 1), hoses, Special Tools 6905 and 6959, and fittings from adapter kit, Special Tool 6893.

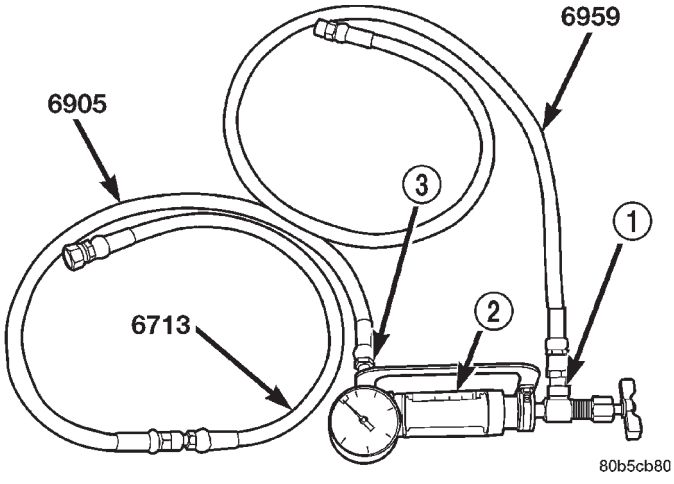

Fig. 1 Power Steering Analyzer With Hoses Installed

1 - OUTLET
2 - SPECIAL TOOL 6815
3 - INLET

STEERING (Continued)

Assemble hoses on Power Steering Analyzer, Special Tool 6815, as shown. Install Pressure Hose, Special Tool 6905 (in 6893 kit), in the inlet fitting on Power Steering Analyzer. Install Pressure Hose, Special Tool 6713 (in 6815 kit) on Pressure Hose, Special Tool 6905. Install Pressure Hose, Special Tool 6959, in the outlet fitting on Power Steering Analyzer.

Install the following adapters from Adapter Set, Special Tool 6893 (Fig. 2), on the analyzer hose ends: Install Adapter Fitting, Special Tool 6844, on Pressure Hose, Special Tool 6713. Install Adapter Fitting, Special Tool 6826, on Pressure Hose, Special Tool 6959.

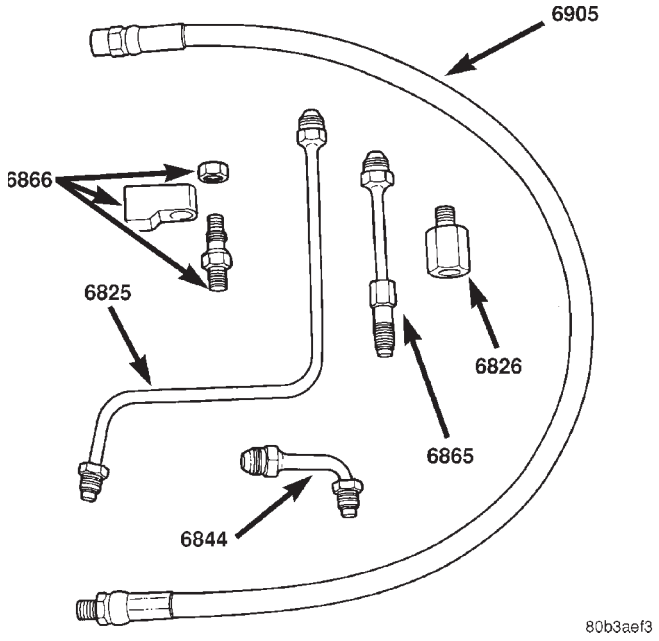

Fig. 2 Power Steering Analyzer Adapters 6893

CAUTION: To prevent personal injury, safety goggles should be worn at all times when performing any test procedures on the power steering pump or power steering gear.

The following procedure is to be used to test the operation of the power steering system on the vehicle.

(1) Check belt tension and adjust as necessary.

(2) Disconnect the power steering fluid pressure hose from the power steering pump (Fig. 3) (Fig. 4).

(3) Connect Adapter Fitting, Special Tool 6844, attached to pressure hose from inlet (gauge end) of Power Steering Analyzer to the pressure fitting on the power steering pump.

(4) Connect vehicle power steering fluid pressure hose to Adapter Fitting, Special Tool 6826, which should be already installed in the outlet hose (valve end) of Power Steering Analyzer.

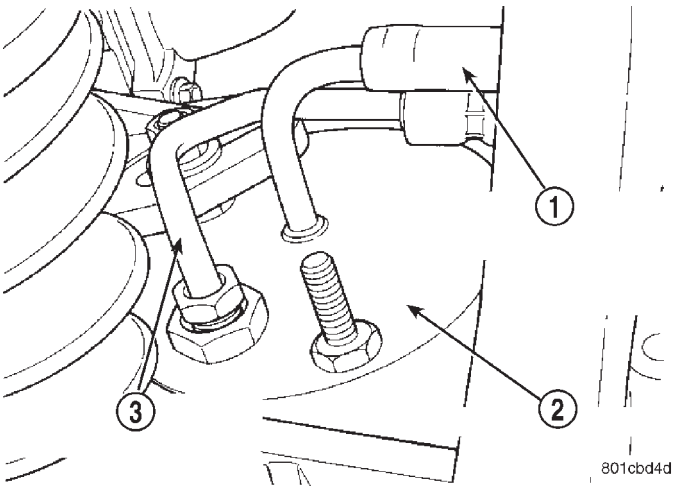

Fig. 3 Pressure Hose Connection To Power Steering Pump - 2.4L Engine

1 - POWER STEERING FLUID RETURN HOSE
2 - POWER STEERING PUMP
3 - POWER STEERING FLUID PRESSURE HOSE

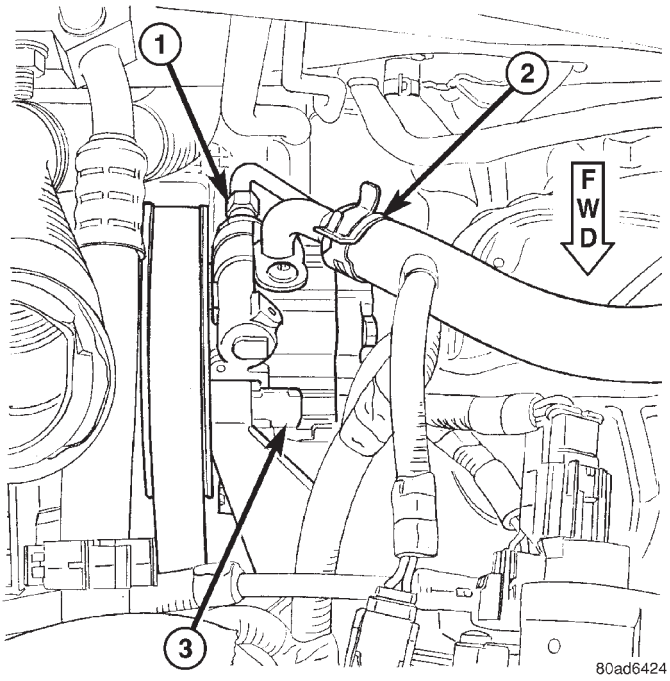

Fig. 4 Supply & Pressure Hoses At Pump - 3.3L/3.8L Engine

1 - PRESSURE HOSE AND FITTING
2 - SUPPLY HOSE AND CLAMP
3 - POWER STEERING PUMP

NOTE: During the next few steps, do not steer vehicle as air will be forced into the steering gear.

(5) Completely open valve on Power Steering Analyzer.

(6) Start engine and let idle just long enough to circulate power steering fluid through the analyzer and hoses. Shut off engine.

(7) Check power steering fluid level and add fluid as necessary. Start engine again and let idle until the air is out of the fluid.

(8) Gauge should read below 300 psi (2068 kPa). If above, inspect the hoses for restrictions and repair as necessary. The initial pressure should be in the range of 100-275 psi (689-1896 kPa) depending on fluid temperature. The flow meter should read above 1.5 GPM.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than four seconds as the pump could be damaged.

NOTE: Power steering pump maximum pressure for 2.4L engines is 1,200 – 1,350 psi (8,274 – 9,308 kPa). Power steering pump maximum pressure for all other engines is 1,400 – 1,500 psi (9,653 – 10,342 kPa).

(9) Close analyzer valve fully three times and record highest pressure indicated each time. All three readings must be within specifications. If any of the three power steering pump pressures are above or below specifications, replace pump. (Refer to 19 - STEERING/PUMP - REMOVAL)

CAUTION: Do not force the steering to operate against the stops for more than 4 seconds at a time because pump damage can result.

(10) Once the pump has been verified as working correctly, completely open the valve on the Power Steering Analyzer. Turn the steering wheel to the extreme left until the stop in the steering gear is met. Hold it there for 2–4 seconds, then release it. Now turn the steering wheel to the right until the right stop is met. Hold it there for 2–4 seconds, then release it. Record the stabilized pressure at each position. Compare the recorded readings to the specifications. If the output pressures are not within 100 psi (689 kPa) of one another against either stop or are below specifications, the steering gear is leaking internally and must be replaced. (Refer to 19 - STEERING/GEAR - REMOVAL)

DIAGNOSIS AND TESTING - STEERING SYSTEM DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover POWER STEERING NOISE, STEERING WHEEL FEEL, and POWER STEERING FLUID.

POWER STEERING NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONABLE HISS OR WHISTLE*	1. Damaged or mispositioned steering column shaft/coupling dash panel seal.	1. Reposition or replace steering column shaft/coupling dash panel seal.
	2. Noisy valve in power steering gear.	2. Replace power steering gear.
	3. Mis-routed power steering hose.	3. Check routing of power steering hoses. Ensure hoses do not come in unwanted contact with other components and objects.
RATTLE OR EXCESSIVE CLUNK**	1. Power steering gear loose on front suspension crossmember.	1. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque.
	2. Front suspension crossmember mounting fasteners loose at frame.	2. Tighten the front suspension crossmember mounting fasteners to the specified torque.
	3. Loose tie rod (outer or inner).	3. Check tie rod pivot points for wear. Replace worn/loose parts as required.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Loose lower control arm mounting bolts at front suspension crossmember.	4. Tighten control arm mounting bolts to the specified torques.
	5. Lower control arm pivot bushing worn.	5. Replace lower control arm pivot bushing.
	6. Loose strut assembly mounting fasteners at tower or knuckle.	6. Tighten strut assembly fasteners to the specified torque.
	7. Power steering fluid hose touching the body of the vehicle.	7. Adjust hose to proper position by loosening, repositioning, and tightening attachments to specified torque. Do not bend tubing.
	8. Internal power steering gear noise.	8. Replace power steering gear.
	9. Damaged front suspension crossmember.	9. Replace front suspension crossmember.
	10. Stabilizer bar link ball joints worn.	10. Replace stabilizer bar link.
	11. Lug nuts loose.	11. Tighten lug nuts to specifications.
	12. Excessive Wheel bearing free-play.	12. Verify correct driveshaft hub nut torque. Replace bearing if torque is okay.
POPPING NOISE	1. Worn outer tie rod.	1. Check ball joint for free-play; Replace outer tie rod.
	2. Loose inner tie rod.	2. Replace power steering gear.
CHIRP OR SQUEAL (POWER STEERING PUMP)	1. Loose power steering pump drive belt.	1. Check and adjust power steering pump drive belt to specifications or replace automatic tensioner where applicable. Replace belt if worn or glazed.
	2. Malfuctioning belt auto-tensioner	2. Replace belt auto-tensioner.
WHINE, GROWL, MOAN OR GROAN (POWER STEERING PUMP)***	1. Low fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
	2. Power steering hose touching vehicle body or frame.	2. Adjust hose to proper position by loosening, repositioning, and tightening fitting to specified torque. Do not bend tubing. Replace hose if damaged.
	3. Extreme wear of power steering pump internal components.	3. Replace power steering pump and flush system as necessary.
	4. Extremely low ambient temperature.	4. Some noise can be expected, but will go away as vehicle warms. Replace pump if noise is excessive.
SUCKING AIR SOUND	1. Loose clamp on power steering fluid return hose.	1. Tighten or replace hose clamp.
	2. Missing O-Ring on power steering hose connection.	2. Inspect connection and replace O-Ring as required.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Low power steering fluid level.	3. Fill power steering fluid reservoir to proper level and check for leaks.
	4. Loose clamp on fluid supply hose.	4. Tighten or replace hose clamp.
SQUEAK OR RUBBING SOUND	1. Steering column shroud rubbing.	1. Realign shrouds as necessary.
	2. Steering column shaft rubbing.	2. Move or realign item rubbing shaft.
	3. Clockspring noisy.	3. Remove clockspring. Reinstall wheel. If noise is gone, replace clockspring.
	4. Seal lubrication inadequate.	4. Lube seal (if external).
	5. Steering gear internally noisy.	5. Replace steering gear (if no other cause can be found).
SCRUBBING OR KNOCKING NOISE.	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with size used as original equipment.
	2. Interference between steering gear and other vehicle components.	2. Check for bent or misaligned components and correct as necessary.
	3. Steering gear internal stops worn excessively allowing tires to be steered excessively far.	3. Replace steering gear.

NOTE: * There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: ** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This movement may be felt in the steering components during steering wheel reversal.

NOTE: * Power steering pump growl/moan/groan results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.**

STEERING WHEEL FEEL

CONDITION	POSSIBLE CAUSES	CORRECTION
STEERING WHEEL/ COLUMN CLICKING, CLUNKING OR RATTLING.	1. Loose steering coupling pinch bolt.	1. Replace pinch bolt and torque to specifications.
	2. Steering column bearings.	2. Replace steering column.
	3. Excessive intermediate shaft coupling free-play.	3. Replace intermediate shaft.
STEERING WHEEL HAS FORE AND AFT LOOSENESS.	1. Steering wheel retaining nut not properly tightened and torqued.	1. Tighten the steering wheel retaining nut to its specified torque.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	2. Steering column lower bearing spring retainer slipped on steering column shaft.	2. Replace steering column.
	3. Loose steering column to instrument panel fasteners.	3. Tighten fasteners to specified torque.
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING LOW SPEED OR STANDSTILL STEERING MANEUVERS.	1. Air in the fluid of the power steering system.	1. Bleed air from system following the power steering pump initial operation service procedure.*
	2. Tires not properly inflated.	2. Inflate tires to the specified pressure.
	3. Excessive engine vibration.	3. Ensure that the engine is tuned properly.
	4. Loose tie rod end jam nut.	4. Tighten the inner to outer tie rod jam nut to the specified torque.
	5.Overcharged air conditioning system.	5.Check air conditioning pump head pressure and correct as necessary.
	6. Grounded engine mount.	6. Repair as necessary.
	7. Loose outer tie rod.	7. Replace outer tie rod.
STEERING CATCHES, SURGES OR STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN. ***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to specified level and check for leaks.
	2. Tires not inflated to specified pressure.	2. Inflate tires to the specified pressure.
	3. Lack of lubrication in front lower control arm ball joints.	3. Lubricate ball joints if ball joints are not a lubricated-for-life type ball joint. If ball joint is a lubricated-for-life ball joint, replace ball joint.
	4. Worn or binding lower control arm ball joint.	4. Replace lower control arm ball joint.
	5. Lack of lubrication in steering gear outer tie rod ends.	5. Lubricate tie rod ends if they are not a lubricated-for-life type. If tie rod end is a lubricated-for-life type, replace tie rod end.
	6. Loose power steering pump drive belt.	6. Tighten the power steering pump drive belt to specifications or replace automatic tensioner where applicable. If drive belt is worn or glazed, replace belt.
	7. Faulty power steering pump (Perform Power Steering Flow and Pressure Test).	7. Replace power steering pump.
	8. Faulty power steering gear (Perform Power Steering Flow and Pressure Test).	8. Replace power steering gear.
	9. Excessive friction in steering column or intermediate shaft/coupler.	9. Isolate and correct condition.
	10. Excessive friction in power steering gear.	10. Replace power steering gear.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	11. Worn or binding seat and bearing in front strut assembly.	11. Replace seat and bearing in front strut assembly.
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION.	1. Tires not inflated properly.	1. Inflate tires to specified pressure.
	2. Improper front wheel alignment.	2. Check and adjust wheel alignment as necessary.
	3. Lack of lubrication causing binding in front lower control arm ball joints.	3. Lubricate ball joints if ball joints are not a lubricated for life type of ball joint, then inspect ball joint for wear, replace lower control arm as necessary. If ball joint is a lubricated for life ball joint, replace lower control arm ball joint.
	4. Steering column coupling joints misaligned.	4. Realign steering column coupling joints.
	5. Steering wheel rubbing.**	5. Adjust steering column shrouds to eliminate rubbing condition.
	6. Damaged, mispositioned or unlubricated steering column coupler to dash seal.**	6. Replace, reposition, or lubricate dash seal.
	7. Binding mount bearing in front strut assembly.	7. Replace mount bearing in front strut assembly.
	8. Binding shaft bearing in steering column.	8. Replace the steering column.
	9. Excessive friction in steering column coupling.	9. Replace steering column coupling.
	10. Excessive friction in power steering gear.	10. Replace power steering gear.
EXCESSIVE STEERING WHEEL KICKBACK OR TOO MUCH STEERING WHEEL FREE PLAY.	1. Air in the fluid of the power steering system.	1. Bleed air from system following the the power steering pump initial operation service procedure.*
	2. Power steering gear loose on cradle/crossmember.	2. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque.
	3. Steering column coupling or intermediate shaft worn, broken or loose.	3. Replace steering column coupling or intermediate shaft.
	4. Free play in steering column.	4. Check all components of the steering column and repair or replace as required.
	5. Worn lower control arm ball joints.	5. Replace lower control arm ball joints as required.
	6. Loose steering knuckle-to-ball joint stud pinch bolt.	6. Inspect pinch bolt, replace as necessary, and tighten to specified torque.
	7. Front wheel bearing loose or worn.	7. Replace hub and bearing as necessary.
	8. Loose outer tie rod end.	8. Replace outer tie rod end that has excessive free play.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	9. Loose inner tie rod.	9. Replace power steering gear.
	10. Defective steering gear rotary valve.	10. Replace power steering gear.

NOTE: * Steering shudder can be expected in new vehicles and vehicles with recent steering system repairs. Shudder should dissipate after the vehicle has been driven several weeks.

NOTE: ** To evaluate this condition, it may be necessary to disconnect the coupling at the base of the steering column. Turn the steering wheel and feel or listen for internal rubbing in steering column. To avoid damaging the column clockspring, note the following. Before disconnecting coupling, place tires in the straight-ahead position and center steering wheel. Once disconnected, DO NOT rotate steering wheel more than one revolution in either direction and place steering wheel in original location before reconnecting coupling. If this position is lost, the steering column clockspring must be recentered following the procedure found within the procedure for steering column installation in the steering column section.

NOTE: * Increased low speed or stationary steering effort can be expected if the steering fluid is at a high temperature. High fluid temperature usually results from high engine rpm due to trailer towing, ascending grades, or racing the engine for prolonged periods of time.**

POWER STEERING FLUID

CONDITION	POSSIBLE CAUSES	CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK.	1. Loose power steering hose fittings.	1. Tighten the fitting to its specified torque.
	2. Damaged or missing fitting seal, gasket, or O-ring.	2. Replace as necessary.
	3. Power steering component leaking.	3. Repair or replace the leaking component as required.
AERATED FLUID.*	1. Low fluid level.	1. Fill power steering fluid reservoir to proper level.
	2. Air leak at supply hose, power steering fluid reservoir or pump.	2. Inspect for proper sealing. Repair as necessary.
	3. Cracked power steering pump housing.	3. Replace the power steering pump.
RESERVOIR FLUID OVERFLOW AND FLUID THAT IS MILKY IN COLOR	1. Water contamination of power steering fluid.	1. Drain the power steering fluid from the system. Flush the system with fresh clean power steering fluid, drain, then refill to the proper level.

NOTE: * Extremely cold temperatures may cause power steering fluid aeration. Aeration should subside as fluid warms.

COLUMN

DESCRIPTION - STEERING COLUMN

The steering column has been designed to be serviced as a complete assembly (Fig. 1), except for the components listed here. They are the key cylinder, ignition switch, lock cylinder housing, multi-function switch, clockspring, halo lamp, speed control switches, driver airbag, trim shrouds, steering wheel and steering column intermediate shaft (Fig. 2). These replaceable components of the steering column can be serviced without requiring removal of the steering column from the vehicle.

WARNING

WARNINGS AND CAUTIONS

(Refer to 8 - ELECTRICAL/RESTRAINTS - WARNING)

WARNING: BEFORE BEGINNING ANY SERVICE PROCEDURES THAT INVOLVES REMOVING THE AIR BAG. REMOVE AND ISOLATE THE NEGATIVE (-) BATTERY CABLE (GROUND) FROM THE VEHICLE BATTERY. THIS IS THE ONLY SURE WAY TO DISABLE THE AIR BAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIR BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: THE AIR BAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIR BAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIR BAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIR BAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIR BAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

WARNING: SAFETY GOGGLES SHOULD BE WORN AT ALL TIMES WHEN WORKING ON STEERING COLUMNS.

CAUTION: Disconnect negative (ground) cable from the battery before servicing any column component.

CAUTION: Do not attempt to remove the pivot pins to disassemble the tilting mechanism. Damage will occur.

DIAGNOSIS AND TESTING - STEERING COLUMN

For diagnosis of conditions relating to the steering column (Refer to 19 - STEERING - DIAGNOSIS AND TESTING) and (Refer to 19 - STEERING - DIAGNOSIS AND TESTING).

REMOVAL

NOTE: Before proceeding, (Refer to 19 - STEERING/COLUMN - WARNING).

(1) Make sure the front wheels of the vehicle are in the STRAIGHT AHEAD position before beginning the column removal procedure.
(2) Disconnect negative (ground) cable from the battery and isolate cable from battery terminal.
(3) Remove the lower shroud (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - REMOVAL).
(4) Remove the traction off switch.
(5) Remove the upper shroud.
(6) Remove the cluster trim bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
(7) Remove the knee blocker (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
(8) Remove the parking brake handle link.
(9) Remove the knee blocker reinforcement (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).
(10) Remove the airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
(11) Remove the steering wheel retaining nut.
(12) Remove the vibration damper weight.
(13) Remove the steering wheel (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL). (Fig. 3)
(14) Disconnect the wiring harness connectors from the clockspring, multi-function switch, halo lamp, SKIM module, ignition switch and BTSI solenoid.

(15) Disconnect the shift cable at the lever. (Fig. 4)

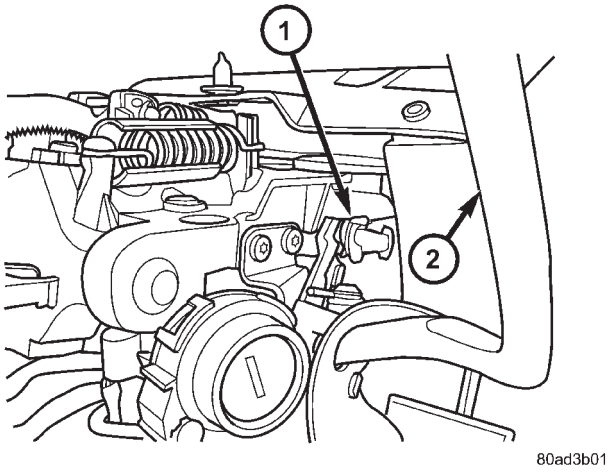

Fig. 4 SHIFT CABLE MOUNTING

1 - SHIFT CABLE MOUNT
2 - SHIFT LEVER

(16) Remove the pinch side clip, then remove the cable from the bracket on the column.

(17) Remove the pinch bolt coupling. (Fig. 5)

(18) Loosen the two lower mounting nuts.

(19) Remove the two upper mounting nuts

(20) Remove the steering column.

(21) Remove the clockspring (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL). (Fig. 6)

(22) Remove the mounting plate with the multifunction switch.

(23) Remove the halo-lamp.

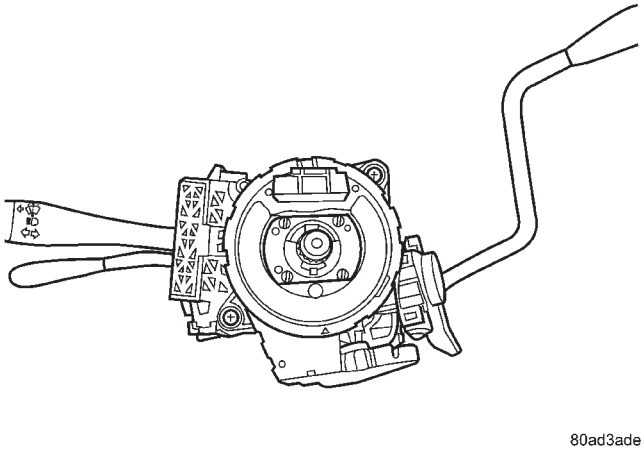

Fig. 6 CLOCKSPRING

(24) Remove the ignition key cylinder (Refer to 19 - STEERING/COLUMN/KEY/LOCK CYLINDER - REMOVAL).

(25) Remove the BTSI.

INSTALLATION

To service the steering wheel components or the airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL). Follow all WARNINGS AND CAUTIONS.

(1) Make sure the front wheels of the vehicle are still in the STRAIGHT AHEAD position before beginning the column installation procedure.

(2) Install the BTSI.

(3) Install the ignition key cylinder (Refer to 19 - STEERING/COLUMN/KEY/LOCK CYLINDER - INSTALLATION).

(4) Install the halo-lamp.

COLUMN (Continued)

(5) Install the mounting plate with the multi-function switch.

(6) Install the clockspring (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

(7) Install the steering column to the vehicle.

(8) Install the two upper mounting nuts

(9) Tighten the two lower mounting nuts and the two upper mounting nuts. Tighten to 12 N·m (105 in. lbs.).

(10) Install the coupling onto the intermediate shaft and install the pinch bolt. Tighten the pinch bolt to 28 N·m (250 in. lbs.).

(11) Install the cable from the bracket on the column, then install the pinch side clips.

(12) Reconnect the shift cable at the lever.

(13) Reconnect the wiring harness connectors to the clockspring, multi-function switch, halo lamp, SKIM module, ignition switch and BTSI solenoid.

(14) Install the steering wheel (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).

(15) Install the vibration damper weight.

(16) Install the steering wheel retaining nut. Tighten the nut to 61 N·m (45 ft. lbs.)

(17) Install the airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

(18) Install the knee blocker reinforcement (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION).

(19) Install the parking brake handle link.

(20) Install the knee blocker (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(21) Install the cluster trim bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(22) Install the upper shroud (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - INSTALLATION).

(23) Install the traction off switch.

(24) Install the lower shroud.

IGNITION SWITCH

REMOVAL

The ignition switch attaches to the lock cylinder housing on the end opposite the lock cylinder (Fig. 7). For ignition switch terminal and circuit identification, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

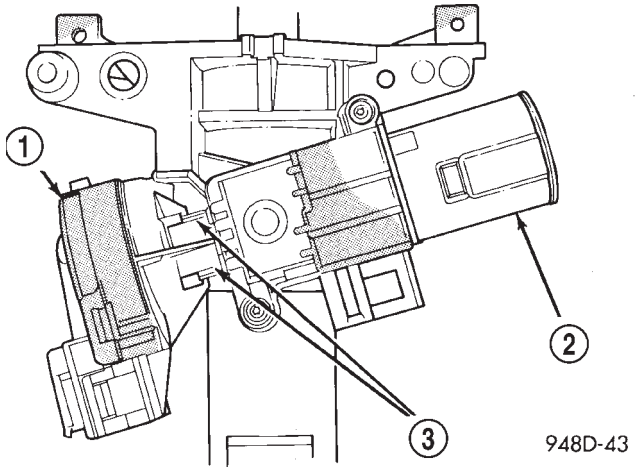

Fig. 7 Ignition Switch—Viewed From Below Column

(7) Depress retaining tab (Fig. 8) or (Fig. 13) and gently pry ignition switch from steering column (Fig. 14).

(8) Disconnect electrical connectors from ignition switch and remove switch (Fig. 15).

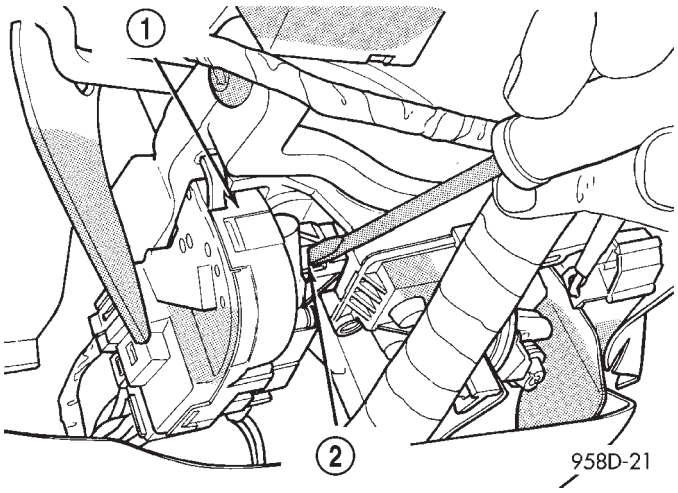

Fig. 13 Ignition Switch Retaining Tab

1 - IGNITION SWITCH
2 - RETAINING TAB

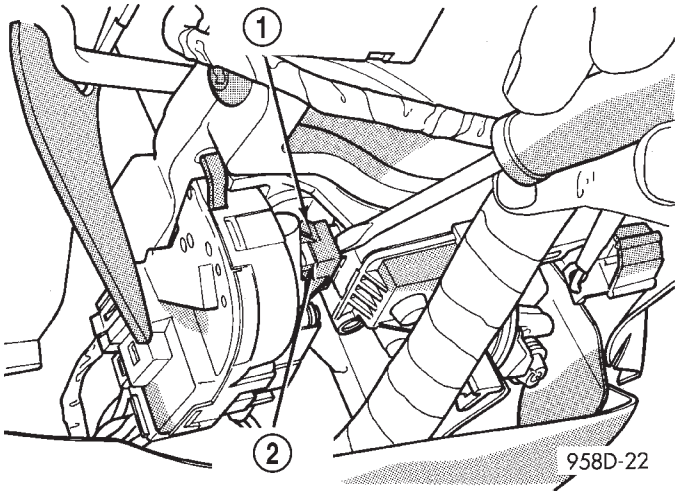

Fig. 14 Removing Ignition Switch

1 - IGNITION SWITCH
2 - RETAINING TAB

INSTALLATION

The ignition switch attaches to the lock cylinder housing on the end opposite the lock cylinder (Fig. 7) . For ignition switch terminal and circuit identification, refer to the Wiring Diagrams section.

(1) Ensure the ignition switch is in the RUN position and the actuator shaft in the lock housing is in the RUN position.

(2) Install electrical connectors to ignition switch.

IGNITION SWITCH (Continued)

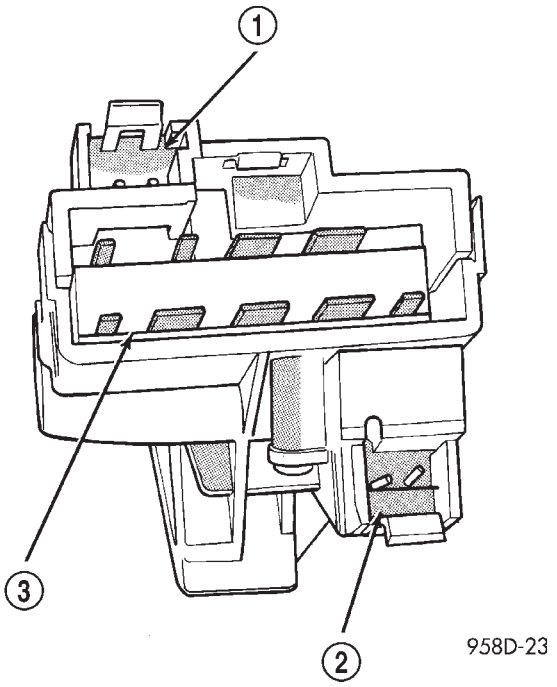

Fig. 15 Ignition Switch Connectors

1 - KEY IN SWITCH
2 - PRNDL SWITCH
3 - IGNITION SWITCH

(3) Carefully install the ignition switch. The switch will snap over the retaining tabs (Fig. 16) . Install mounting screw (Fig. 12).

(4) Install upper and lower shrouds.

(5) Install key cylinder (cylinder retaining tab will depress only in the RUN position).

(6) Connect negative cable to battery.

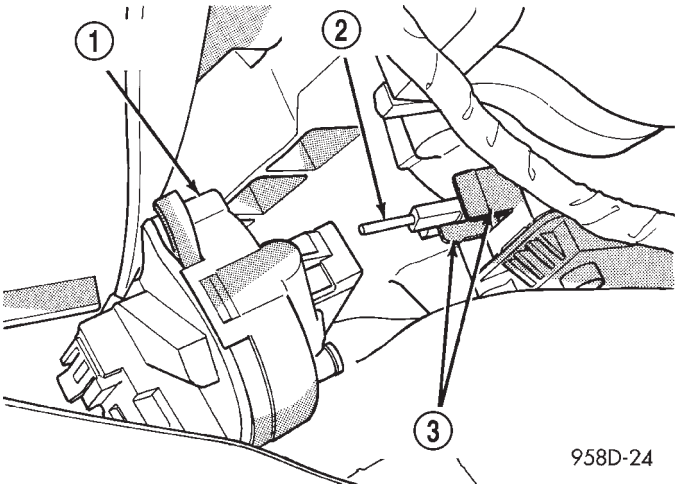

Fig. 16 Ignition Switch Installation

1 - IGNITION SWITCH
2 - ACTUATOR SHAFT
3 - RETAINING TABS

(7) Check for proper operation of ignition switch and key-in warning switch.

LOCK CYLINDER HOUSING

DESCRIPTION - IGNITION INTERLOCK

All vehicles equipped with automatic transaxles have an interlock system. The system prevents shifting the vehicle out of Park unless the ignition lock cylinder is in the Unlock, Run or Start position. In addition, the operator cannot rotate the key to the lock position unless the shifter is in the park position. On vehicles equipped with floor shift refer to the - Transaxle for Automatic Transmission Shifter/ Ignition Interlock.

REMOVAL

(1) Disconnect negative (ground) cable from the battery and isolate cable from battery terminal.

(2) Remove the screws attaching the lower steering column cover to the instrument panel (Fig. 17), then remove the cover from the lower instrument panel.

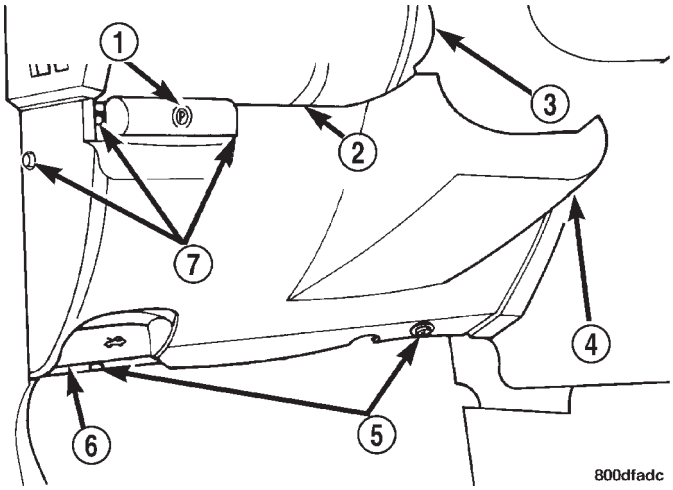

Fig. 17 Lower Steering Column Cover Attachment

2 - SHROUD

LOCK CYLINDER HOUSING (Continued)

(8) Remove the two screws holding the metal cover in place below the shifter/ignition interlock linkage (Fig. 22), then remove the cover.

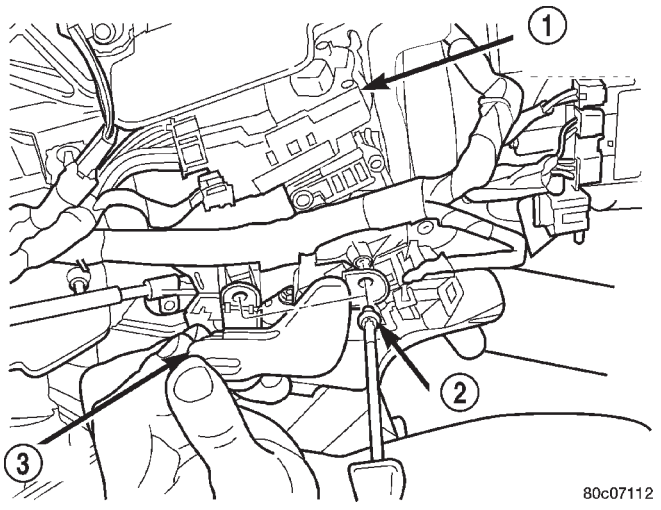

Fig. 22 Cover Removal/Installation

1 - IGNITION SWITCH
2 - SCREW
3 - COVER

(9) Disconnect the shifter/ignition interlock link from the lever on the lock cylinder housing (Fig. 23).

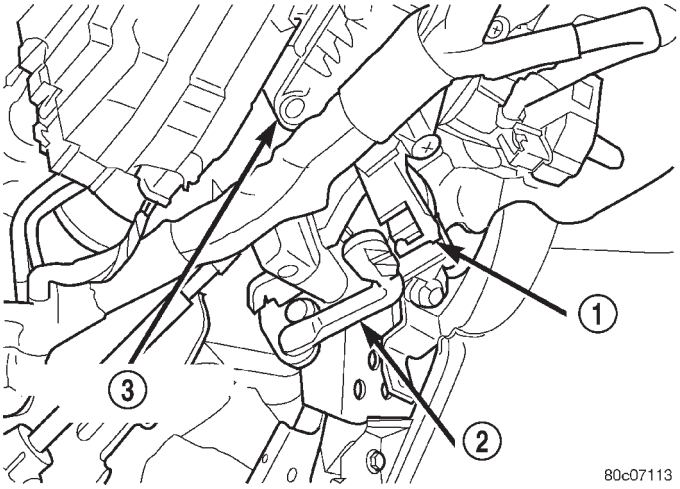

Fig. 23 Shifter/Ignition Interlock Linkage Disconnected

1 - LEVER
2 - LINK
3 - LOCK CYLINDER HOUSING

(10) Remove the key cylinder. To do this:

- Turn the key placing the key cylinder in the ON position.
- Depress and hold the retaining tab on the bottom of the lock cylinder housing (Fig. 24).
- Pull the key cylinder straight out of the lock cylinder housing.

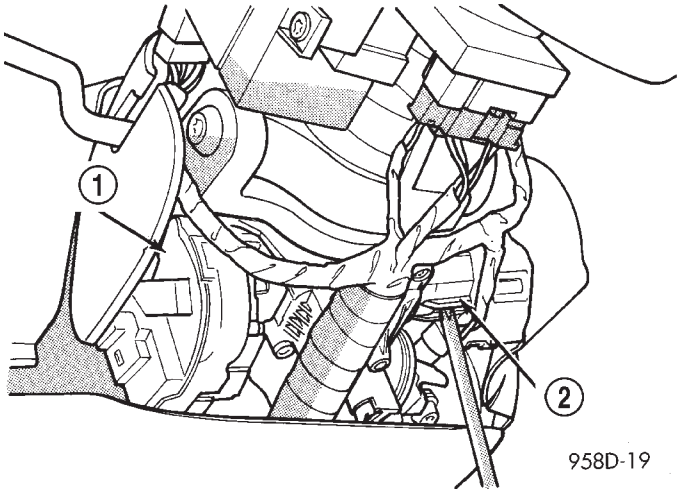

Fig. 24 Cylinder Retaining Tab

1 - IGNITION SWITCH
2 - RETAINING TAB

(11) Remove the vehicle wiring harness connector from the key cylinder halo lamp (Fig. 25).

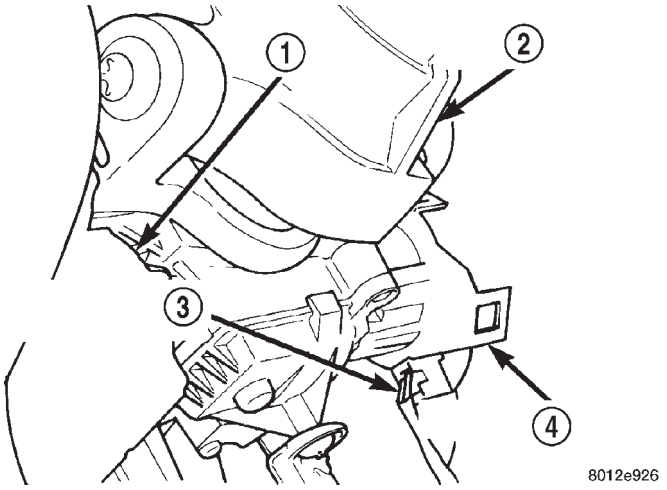

Fig. 25 Wiring Harness Connection To Halo Lamp

2 - STEERING COLUMN ASSEMBLY
3 - WIRING HARNESS CONNECTOR
4 - IGNITION SWITCH HALO LIGHT

(12) Remove the key cylinder halo lamp from the lock cylinder housing.

LOCK CYLINDER HOUSING (Continued)

(13) Remove the ignition switch mounting screw (Fig. 26).

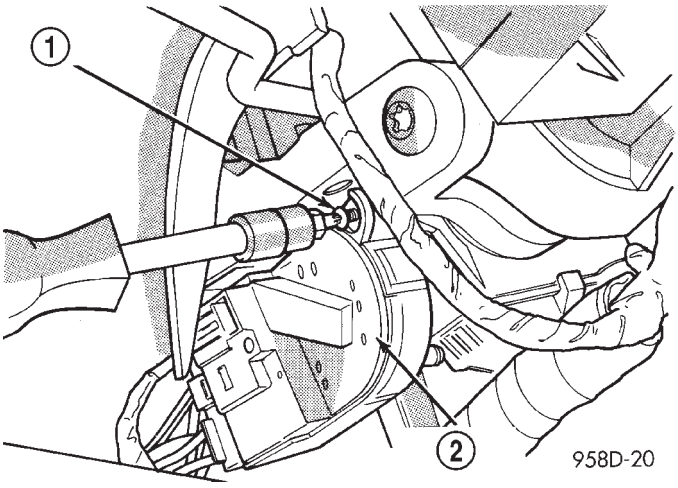

Fig. 26 Ignition Switch Mounting Screw

1 - MOUNTING SCREW
2 - IGNITION SWITCH

(14) Depress the two retaining tabs (Fig. 27), then remove the ignition switch from the lock cylinder housing.

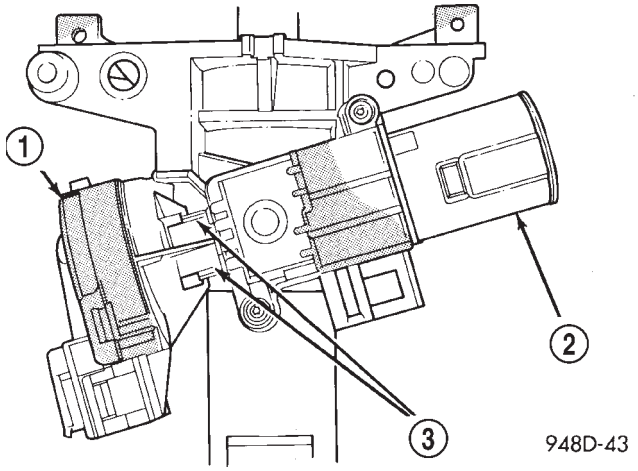

Fig. 27 Ignition Switch Retaining Tabs

1 - IGNITION SWITCH
2 - LOCK CYLINDER HOUSING
3 - RETAINING TABS

(15) Disconnect both tilt mechanism springs from their mounting posts on the tilt housing (Fig. 28), then move them to the side out of the way (Fig. 29).

(16) While supporting the lock cylinder housing, remove both mounting screws securing the lock cylinder housing to the column (Fig. 29).

(17) Remove the lock cylinder housing from the bottom of the steering column.

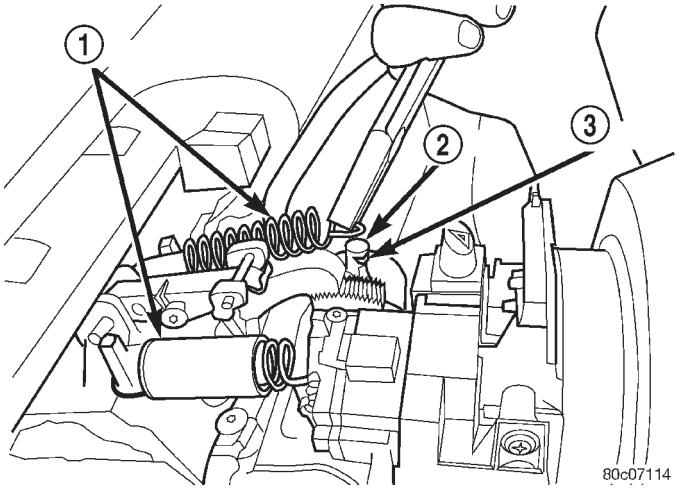

Fig. 28 Tilt Mechanism Spring Removal/Installation

1 - SPRINGS
2 - POST
3 - GROOVE

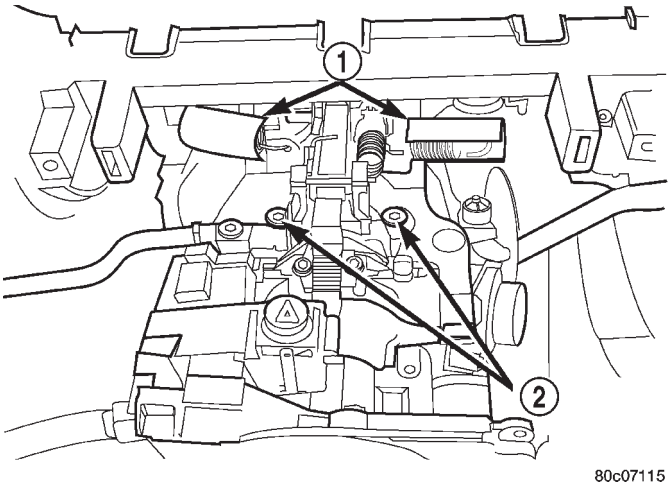

Fig. 29 Lock Cylinder Housing Mounting Screw Location

1 - SPRINGS
2 - MOUNTING SCREWS

INSTALLATION

(1) Install the lock cylinder housing in the bottom of the steering column lining up the mounting holes.

(2) Install the self-tapping lock cylinder housing mounting screws through the top of the column into the housing (Fig. 29) . Tighten the two mounting screws to a torque of 11 N·m (100 in. lbs.).

(3) Connect both tilt mechanism springs back onto their mounting posts making sure the spring hooks engage the grooves in the posts (Fig. 28) .

(4) Ensure that the ignition switch and the actuator shaft in the lock cylinder housing are in the ON position.

LOCK CYLINDER HOUSING (Continued)

(5) Carefully install the ignition switch over the actuator shaft (Fig. 30) . The switch will snap over the retaining tabs on the housing.

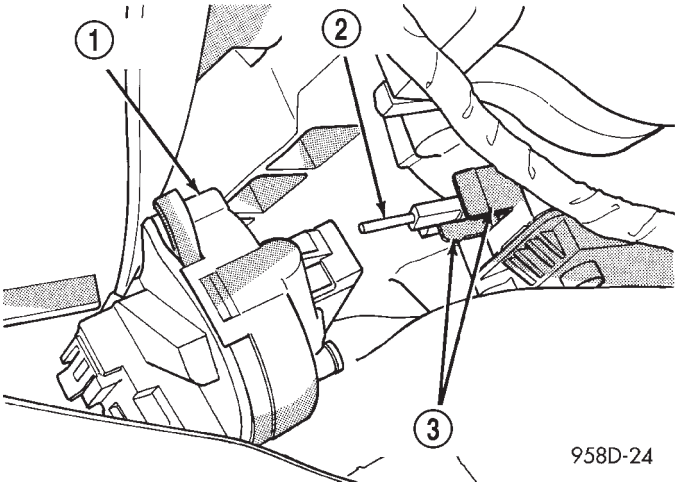

Fig. 30 Ignition Switch Installation

1 - IGNITION SWITCH
2 - ACTUATOR SHAFT
3 - RETAINING TABS

(6) Install the ignition switch mounting screw (Fig. 26) .

(7) Install the key cylinder halo lamp on the lock cylinder housing.

(8) Install the vehicle wiring harness connector onto the key cylinder halo lamp (Fig. 25) .

(9) Install the key cylinder (with key in it turned to the ON position) by sliding it straight into the lock cylinder housing aligning the retaining tab on the key cylinder with the hole in the lock cylinder housing.

(10) Turn the key to the OFF position and remove the key.

(11) Connect the shifter/ignition interlock link to the lever on the lock cylinder housing by aligning the retaining tab on the lever with the ramp on the link (Fig. 23) , then pushing the two together.

(12) Install the metal cover in place below the shifter/ignition interlock linkage using the two screws (Fig. 22) .

(13) Install the steering column fixed shroud on the steering column (Fig. 21) using its 2 mounting screws.

(14) Install the trim bezel on the instrument panel above the steering column. The trim bezel is mounted to the instrument panel using 2 screws (one on each side of the column) and retaining clips.

(15) Install the lower steering column shroud on the steering column. Install and securely tighten the center screw attaching the lower shroud to the tilt head on the column (Fig. 20) .

(16) Install the upper steering column shroud over the tilt head of the steering column snapping it into place on the lower shroud. Install and securely tighten the 2 remaining screws attaching the upper shroud to the lower shroud (Fig. 20) .

(17) Install the steering column cover liner on the instrument panel below the steering column (Fig. 19) . Install and securely tighten the 10 bolts attaching the steering column cover liner to the instrument panel.

(18) Install the parking brake pedal release cable on the parking brake release lever in the lower steering column cover (Fig. 18) .

(19) Install the lower steering column trim cover on the instrument panel below the steering column. Install and securely the screws attaching the lower steering column cover to the instrument panel (Fig. 17) .

(20) Connect the negative (ground) cable on the battery terminal.

KEY/LOCK CYLINDER

DESCRIPTION

The lock cylinder is inserted in the end of the housing opposite the ignition switch.

OPERATION

The ignition key rotates the cylinder to 5 different detents (Fig. 31) :

- Accessory
- Off (lock)
- Unlock
- On/Run
- Start

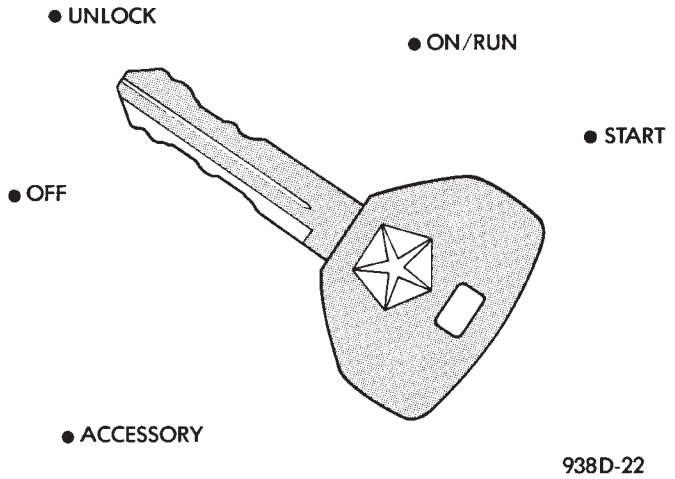

Fig. 31 Ignition Lock Cylinder Detents

KEY/LOCK CYLINDER (Continued)

REMOVAL

(1) Disconnect negative cable from battery.
(2) Remove steering column cover retaining screws.
(3) Remove screws holding steering column shrouds and remove lower shroud.
(4) Place key cylinder in RUN position. Depress lock cylinder retaining tab on the bottom of the lock housing and remove key cylinder.

INSTALLATION

(1) Install key in lock cylinder. Turn key to run position (retaining tab on lock cylinder can be depressed).
(2) The shaft at the end of the lock cylinder aligns with the socket in the end of the housing. To align the socket with the lock cylinder, ensure the socket is in the Run position (Fig. 32) .

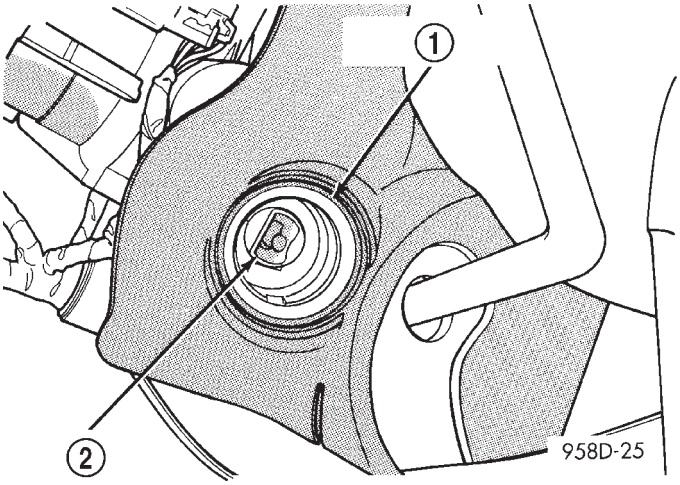

Fig. 32 Socket in Lock Cylinder Housing

1 - LOCK CYLINDER HOUSING
2 - SOCKET

(3) Align the lock cylinder with the grooves in the housing. Slide the lock cylinder into the housing until the tab sticks through the opening in the housing.
(4) Turn the key to the Off position. Remove the key.
(5) Install lower steering column shroud.
(6) Install steering column cover.
(7) Connect negative cable to battery.

GEAR SHIFT LEVER

REMOVAL

(1) Remove the knee blocker (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
(2) Remove the knee blocker reinforcement (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).
(3) Remove the upper and lower shrouds (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - REMOVAL).
(4) Remove the cluster trim bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
(5) Remove the fixed shroud from the column.
(6) Disconnect the electrical connector to the BTSI.
(7) Remove the two screws securing the BTSI to the steering column. (Fig. 33)

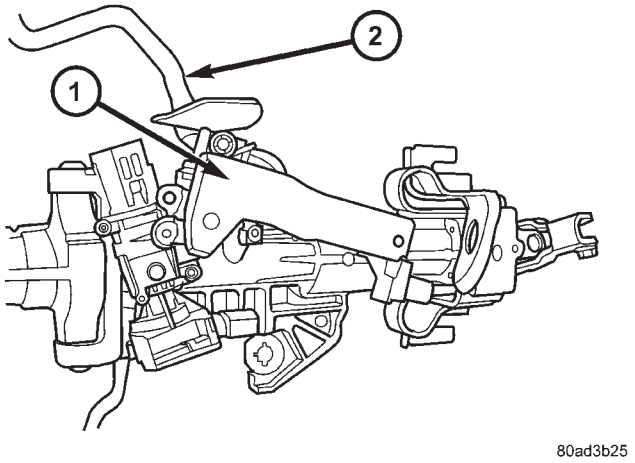

Fig. 33 SHIFT LEVER / B.T.S.I

1 - B.T.S.I.
2 - SHIFT LEVER

(8) Disconnect the SKIM electrical wire connector.
(9) Remove the SKIM from the steering column.
(10) Disconnect the autostick wiring connector (if equipped with autostick).
(11) Disconnect the shifter cable at the shifter.
(12) Remove the three screws securing the shifter to the steering column. (Fig. 34)
(13) Remove the shift lever from the column.

INSTALLATION

(1) Install the shifter cable to the shifter.
(2) Install the three screws securing the shifter to the steering column.
(3) Install the shifter cable at the handle.
(4) Install the SKIM to the steering column.
(5) Reconnect the SKIM electrical wire connector.
(6) Reconnect the autostick wiring connector (if equipped with autostick).
(7) Install the two screws securing the BTSI to the steering column.
(8) Reconnect the electrical connector to the BTSI.
(9) Install the fixed shroud to the column.

GEAR SHIFT LEVER (Continued)

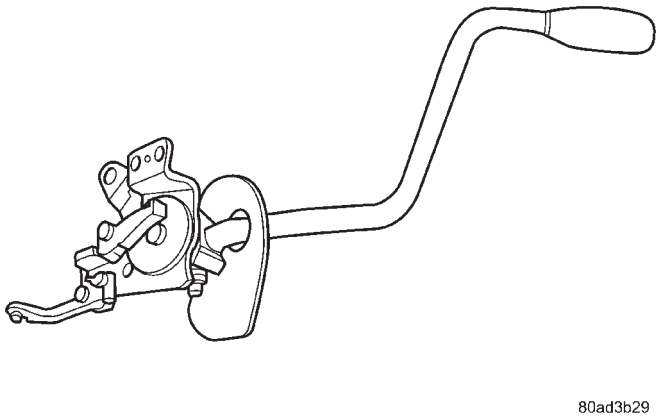

Fig. 34 SHIFT LEVER

(10) Install the cluster trim bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(11) Install the upper and lower shrouds (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - INSTALLATION).

(12) Install the knee blocker reinforcement (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION).

(13) Install the knee blocker (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

SHROUD

REMOVAL

(1) Remove the three screws from the lower shroud.

(2) Unsnap and remove the lower shroud.

(3) Lift off upper shroud from the steering column. (Fig. 35)

INSTALLATION

(1) Install the upper shroud in place over the steering column.

(2) Snap the lower shroud to the upper shroud.

(3) Install and tighten the three retaining screws. Tighten the screws to 11 N·m (100 in. lbs.). (Fig. 35)

STEERING WHEEL

REMOVAL

NOTE: Before proceeding, (Refer to 19 - STEERING/COLUMN - WARNING).

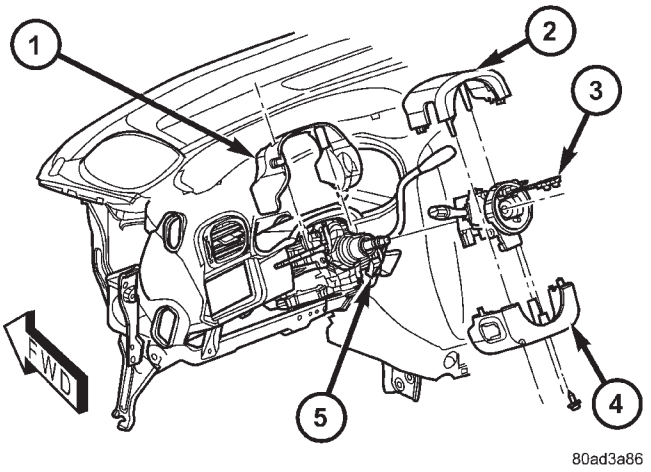

Fig. 35 UPPER AND LOWER SHROUDS

1 - FIXED SHROUD
2 - UPPER SHROUD
3 - CLOCKSPRING
4 - LOWER SHROUD
5 - STEERING COLUMN

(1) Rotate key cylinder to the lock position and remove key. Rotate the steering wheel a half turn to the left until the steering column lock engages keeping the steering column in the locked position (Fig. 36).

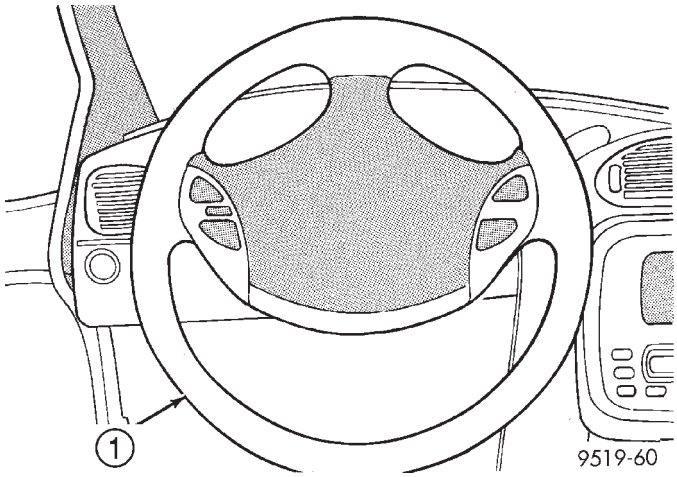

Fig. 36 Steering Wheel In Locked Position

1 - STEERING WHEEL

(2) Remove the 3 bolts (one in each spoke of the steering wheel) attaching the airbag module to the steering wheel. Lift the airbag module from the steering wheel.

(3) Disconnect wiring connectors from the airbag, horn switch wire, and speed control switches (Fig. 37). Remove the wiring harness routing clip from the airbag module studs.

STEERING WHEEL (Continued)

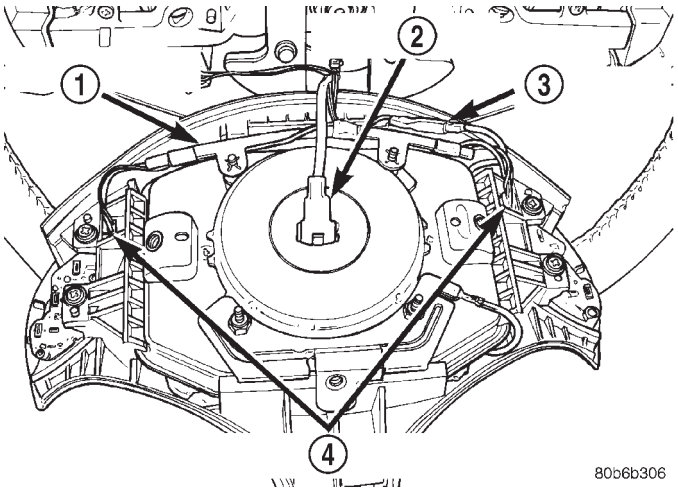

Fig. 37 Airbag Module Wiring Connections

1 - WIRING HARNESS ROUTING CLIP
2 - AIRBAG MODULE CONNECTOR
3 - HORN SWITCH CONNECTOR
4 - SPEED CONTROL SWITCH CONNECTORS

If the steering wheel is equipped with remote radio controls, disconnect the connector from the clockspring. Release the connector by depressing the tang as shown (Fig. 38), then slide the connector apart.

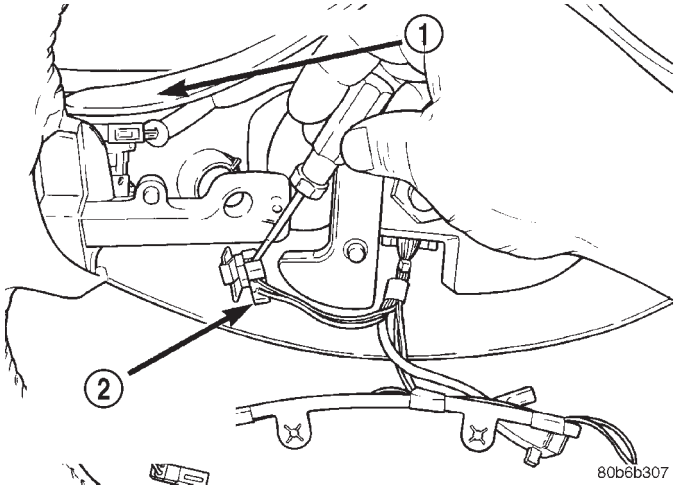

Fig. 38 Releasing Remote Radio Control Connector

1 - STEERING WHEEL
2 - REMOTE RADIO CONTROL CONNECTOR

(4) Remove the steering wheel retaining nut (Fig. 39) from the steering column shaft.

(5) Remove the steering wheel damper (Fig. 39) from the steering wheel.

CAUTION: Do not bump or hammer on steering column or steering column shaft when removing steering wheel from steering column shaft.

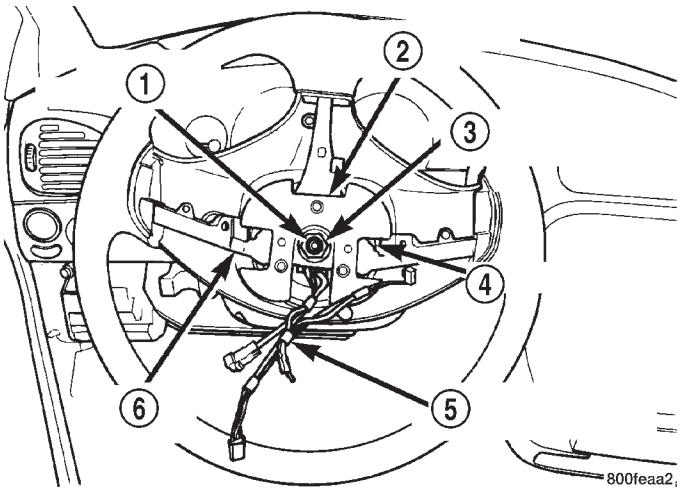

Fig. 39 Steering Wheel Retaining Nut

1 - STEERING COLUMN SHAFT

3 - STEERING WHEEL RETAINING NUT
4 - CLOCKSPRING
5 - CLOCKSPRING WIRING HARNESS
6 - STEERING WHEEL

CAUTION: When installing steering wheel puller bolts in steering wheel, (Fig. 40) do not thread bolt into steering wheel more than a half inch. If bolts are threaded into the steering wheel more than a half inch they will contact and damage the clockspring.

(6) Remove the steering wheel from steering column shaft using a steering wheel puller (Fig. 40).

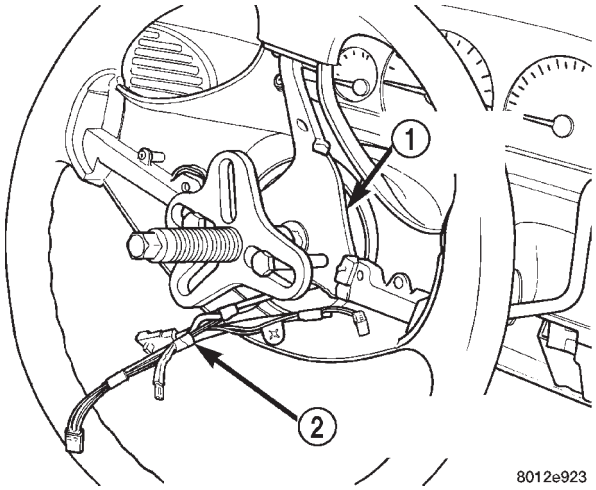

Fig. 40 Removing Steering Wheel From Steering Column Shaft

1 - STEERING WHEEL
2 - CLOCK SPRING WIRING HARNESS

STEERING WHEEL (Continued)

INSTALLATION

CAUTION: Do not force steering wheel onto steering column shaft by driving it on. Pull steering wheel down onto shaft using only the steering wheel retaining nut.

(1) Align master splines on steering wheel and steering shaft, and flats on steering wheel with formations on clockspring. Install the steering wheel on the steering column shaft. All wiring leads from the clockspring must be routed as shown (Fig. 41).

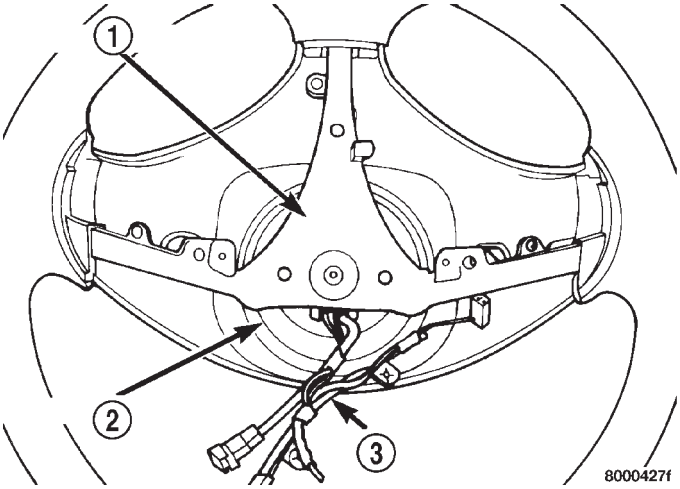

Fig. 41 Steering Wheel And Clock Spring Wire Routing

1 - STEERING WHEEL
2 - CLOCK SPRING
3 - CLOCK SPRING WIRING LEADS

NOTE: Before installing the damper on the steering wheel, inspect the damper to ensure the rubber isolator on the damper is not deteriorated or damaged. If the damper is installed with a damaged isolator a buzz, squeak or rattle condition may develop.

(2) Install the steering wheel damper on the steering wheel. When damper is installed, it must be positioned on the steering wheel as shown in (Fig. 39).

(3) Install the steering wheel retaining nut. Tighten the steering wheel retaining nut to a torque of 61 N·m (45 ft. lbs.).

(4) Connect the wiring lead from the clockspring to the remote radio control connector (Fig. 38).

(5) Install the wiring leads from the clockspring on the airbag, horn switch wire, and speed control switches (Fig. 37). Attach the wire routing clip to the studs on the airbag module.

(6) Install the airbag module in the steering wheel.

(7) Install the 3 bolts (1 in each spoke of the steering wheel) attaching the airbag module to the steering wheel. Tighten the 3 airbag module attaching nuts to a torque of 11 N·m (100 in. lbs.).

GEAR

DESCRIPTION

This vehicle is equipped with a rack and pinion power steering gear (Fig. 1). It is mounted to the underside of the front suspension cradle/crossmember.

The steering column is attached to the gear through the use of an intermediate shaft and couplers. The outer ends of the power steering gear's outer tie rods connect to the steering knuckles.

NOTE: The power steering gear should NOT be serviced or adjusted unless DaimlerChrysler Corporation authorizes. If a malfunction or oil leak occurs, the complete steering gear should be replaced. Only the outer tie rods may be replaced separately from the rest of the gear.

OPERATION

Turning of the steering wheel is converted into linear (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth in the steering gear. This travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist steering provided by the power steering pump is controlled by an open center, rotary type control valve which directs oil from the pump to either side of the integral rack piston upon demand.

Road feel is controlled by the diameter of a torsion bar which initially steers the vehicle. As required steering effort increases, as in a turn, the torsion bar twists, causing relative rotary motion between the rotary valve body and the valve spool. This movement directs oil behind the integral rack piston which, in turn, builds hydraulic pressure and assists in the turning effort.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

WARNING

WARNINGS AND CAUTIONS

WARNING: POWER STEERING FLUID, ENGINE PARTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES. DO NOT ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT PERSONAL INJURY FROM MOVING PARTS.

CAUTION: When the system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

REMOVAL

REMOVAL - LHD GEAR

(1) Remove cap from power steering fluid reservoir.

(2) Using a siphon pump, remove as much fluid as possible from the power steering fluid reservoir. **Use care not to damage the filter mesh below the fluid surface.**

GEAR (Continued)

10 - STEERING GEAR BOOT BREATHER TUBE
11 - BOOT/BELLOWS
12 - OUTER TIE ROD

CAUTION: Locking the steering column in the straight-ahead position will prevent the clockspring from being accidentally over-extended when the steering column is disconnected from the intermediate steering coupler.

(3) Position the steering wheel in the STRAIGHT-AHEAD position. Lock the steering wheel in place using a steering wheel holding tool.

(4) With the vehicle on the ground, disconnect the steering column shaft coupler from the steering gear intermediate coupler (Fig. 2).

(5) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(6) Remove front wheel and tire assemblies.

(7) Remove front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - REMOVAL)

(8) Remove a single hose at power steering cooler and allow fluid to drain.

(9) Remove 2 bolts attaching power steering cooler to cradle crossmember reinforcement (Fig. 3).

(11) Remove bolts fastening leak detection pump to cradle crossmember reinforcement. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/LEAK DETECTION PUMP - REMOVAL)

(12) Remove both outer tie rods from steering knuckles, using Puller, Special Tool C-3894–A (Fig. 5).

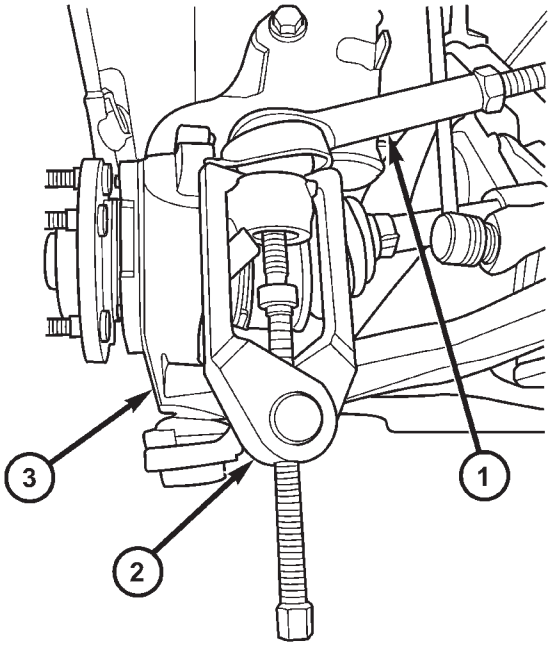

Fig. 5 Tie Rod Removal With Tool C-3894-A

1 - OUTER TIE ROD
2 - SPECIAL TOOL C-3894-A
3 - STEERING KNUCKLE

(13) Remove the lower control arm rear bushing retainer bolts located on each side of each lower control arm rear bushing.

NOTE: The bolts fastening the cradle crossmember reinforcement are of two different thread sizes. Note the location of the various sizes.

(14) Remove the bolts attaching the cradle crossmember reinforcement to the front suspension cradle crossmember (Fig. 6). Remove the 2 bolts fastening the reinforcement and rear of cradle crossmember to the body of the vehicle. Remove lower rear bushings, then the reinforcement.

(15) If the vehicle is equipped with All-Wheel-Drive, remove the power transfer unit (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).

(16) Remove tube nuts and power steering pressure and return hoses from the power steering gear (Fig. 7).

GEAR (Continued)

2 - RIGHT LOWER CONTROL ARM
3 - LEFT LOWER CONTROL ARM
4 - CRADLE CROSSMEMBER REINFORCEMENT
5 - REAR CRADLE CROSSMEMBER ISOLATOR BUSHING
6 - STABILIZER BAR
7 - CRADLE CROSSMEMBER

(17) Remove the 3 bolts and nuts mounting the steering gear to the front suspension cradle (Fig. 8).

NOTE: The next step must be done to allow the removal of the steering gear from the front suspension cradle. The steering gear can not be removed from the vehicle with the intermediate coupler attached to the steering gear.

(18) Lower steering gear from suspension cradle enough to allow access to the intermediate coupler roll pin (Fig. 9). Install Remover/Installer Special Tool 6831A through the center of the roll pin, securing with the knurled nut (Fig. 9). Hold threaded rod stationary while turning nut, this will pull the roll pin out of the intermediate coupler.

(19) Separate the coupler from the shaft of the steering gear.

(20) Remove the power steering gear from the vehicle.

REMOVAL - RHD GEAR

(1) Remove cap from power steering fluid reservoir.

(2) Using a siphon pump, remove as much fluid as possible from the power steering fluid reservoir.

CAUTION: Locking the steering column in the straight-ahead position will prevent the clockspring from being accidentally over-extended when the steering column is disconnected from the intermediate steering coupler.

(3) Position the steering wheel in the STRAIGHT-AHEAD position. Lock the steering wheel in place using a steering wheel holding tool.

(4) With the ignition key in the locked position turn the steering wheel to the left until the steering wheel is in the locked position.

(5) With the vehicle on the ground, disconnect the steering column shaft coupler from the steering gear intermediate coupler (Fig. 2).

(6) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(7) Remove front wheel and tire assemblies.

(8) If power steering cooler equipped, remove a hose at power steering cooler and allow fluid to drain.

(9) Remove 2 bolts attaching power steering cooler to cradle crossmember reinforcement (Fig. 3).

(10) On both sides of vehicle, remove nut attaching outer tie rod end to steering knuckle (Fig. 4). **Remove nut by holding tie rod end stud with a socket while loosening and removing nut with wrench.**

(11) Remove both tie rod ends from steering knuckles using Puller, Special Tool C-3894–A (Fig. 5).

(12) Remove the lower control arm rear bushing retainer bolts located on each side of each lower control arm rear bushing.

NOTE: The bolts fastening the cradle crossmember reinforcement are of two different thread sizes. Note the location of the various sizes.

(13) Remove the bolts attaching the cradle crossmember reinforcement to the front suspension cradle crossmember (Fig. 6). Remove the 2 bolts fastening the reinforcement and rear of cradle crossmember to the body of the vehicle. Remove the reinforcement.

(14) If the vehicle is equipped with All-Wheel-Drive, remove the power transfer unit (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).

(15) Remove the power steering fluid pressure and return hoses from the power steering gear (Fig. 10).

(16) Remove the routing clamp bolt securing the power steering fluid hoses to the rear of the cradle crossmember (Fig. 11). Allow the hoses to hang down out of the way.

(17) Remove the heat shield from the steering gear (Fig. 10).

(18) Remove the 2 bolts and nuts mounting the steering gear to the front suspension cradle.

NOTE: The next step must be done to allow the removal of the steering gear from the front suspension cradle. The steering gear cannot be removed from the vehicle with the intermediate coupler attached to the steering gear.

(19) Lower steering gear from suspension cradle enough to allow access to the intermediate coupler roll pin (Fig. 9). Install Remover/Installer, Special Tool 6831A, through the center of the roll pin, securing with the knurled nut (Fig. 9). Hold threaded rod stationary while turning nut, this will pull the roll pin out of the intermediate coupler.

(20) Separate the coupler from the steering gear shaft.

(21) Remove the power steering gear from the vehicle.

GEAR (Continued)

INSTALLATION

INSTALLATION - LHD GEAR

(1) Install the power steering gear up in the front suspension cradle, leaving room to install intermediate coupler.

(2) Start the roll pin into the intermediate coupler before installing coupler on steering gear shaft. Start roll pin into coupler, using a hammer and tapping it into the coupler. Then install the intermediate coupler on the shaft of the steering gear.

(3) Install Remover/Installer Special Tool 6831A through the center of the roll pin, securing it with the knurled nut (Fig. 12). Hold threaded rod stationary while turning nut, this will pull the roll pin into the intermediate coupler.

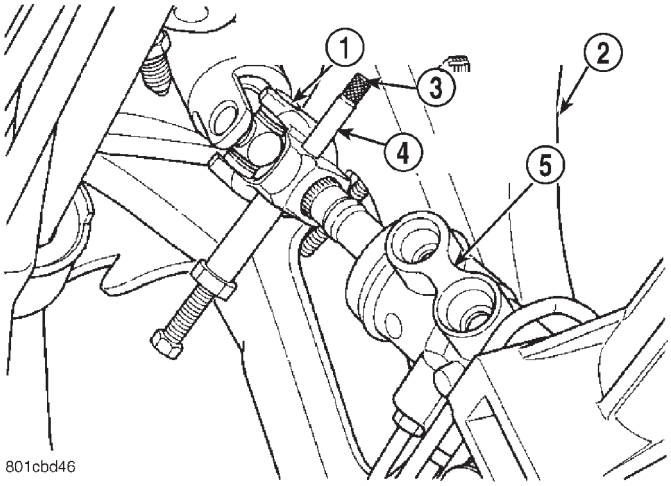

Fig. 12 Installing Roll Pin In Intermediate Coupler

1 - INTERMEDIATE SHAFT COUPLER
2 - SUSPENSION CRADLE CROSSMEMBER
3 - KNURLED NUT
4 - ROLL PIN
5 - POWER STEERING GEAR

CAUTION: Proper torque on the steering gear to suspension cradle mounting bolts is very important.

(4) Install steering gear on the front suspension cradle. Install the 3 steering gear mounting bolts and nuts (Fig. 8). Tighten the 3 mounting bolts to the following torque values:

- 14 mm bolt – 183 N·m (135 ft. lbs.) torque
- 12 mm bolt – 95 N·m (70 ft. lbs.) torque

(5) Attach the power steering fluid pressure and return hoses to the correct ports on the power steering gear (Fig. 7). Tighten the hose tube nuts at the gear to a torque of 31 N·m (275 in. lbs.).

(6) If the vehicle is equipped with All-Wheel-Drive, install the power transfer unit (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - INSTALLATION).

CAUTION: Proper torque on the cradle reinforcement to suspension cradle mounting bolts is very important.

(7) Install the reinforcement on the front suspension cradle crossmember and install the bolts attaching the reinforcement to the cradle crossmember (Fig. 6). Tighten the M-14 size bolts to a torque of 153 N·m (113 ft. lbs.). Tighten the M-12 size bolts to a torque of 106 N·m (78 ft. lbs.).

(8) Install the lower control arm rear bushing retainer bolts (M-10 size) through reinforcement on each side of each lower control arm rear bushing. Tighten bolts to a torque of 61 N·m (45 ft. lbs.).

(9) Install the two bolts and bushings attaching the reinforcement and rear of cradle crossmember to body of vehicle (Fig. 6). Tighten bolts to a torque of 163 N·m (120 ft. lbs.).

(10) Install outer tie rod end into steering knuckle. Start outer tie rod to steering knuckle attaching nut onto stud of tie rod end. While holding stud of tie rod end stationary using a socket (Fig. 4), tighten tie rod end to steering knuckle attaching nut. Then using a crowfoot and socket (Fig. 13), tighten the tie rod end attaching nut to a torque of 75 N·m (55 ft. lbs.).

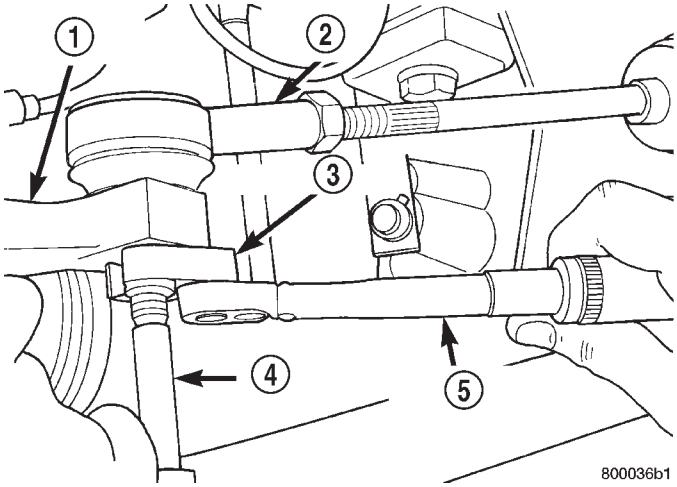

Fig. 13 Torquing Tie Rod End Attaching Nut

1 - STEERING KNUCKLE
2 - TIE ROD END
3 - CROWFOOT
4 - SOCKET
5 - TORQUE WRENCH

(11) Install leak detection pump on cradle crossmember reinforcement. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/LEAK DETECTION PUMP - INSTALLATION)

GEAR (Continued)

(12) Install the power steering fluid cooler on the cradle crossmember reinforcement (Fig. 3). Install the mounting bolts and tighten to 11 N·m (100 in. lbs.). When installing mounting bolts, include pressure hose routing clamp.

(13) Reconnect previously disconnected hose at power steering cooler and install clamp.

(14) Install the front tire and wheel assemblies on vehicle. Install the wheel lug nuts and torque to 135 N·m (100 ft. lbs.).

(15) Install front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - INSTALLATION)

(16) Lower the vehicle to a level where the interior of vehicle is accessible.

(17) With the wheels pointed approximately STRAIGHT-AHEAD, align the intermediate shaft with the steering column coupler. Assemble the steering column shaft coupler onto the steering gear intermediate coupler (Fig. 2). Install steering column coupler to intermediate shaft retaining pinch bolt. Tighten the pinch bolt nut to a torque of 28 N·m (250 in. lbs.).

(18) Remove the steering wheel holding tool.

(19) Fill and bleed the power steering system using the Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(20) Inspect system for leaks.

(21) Adjust front toe (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

INSTALLATION - RHD GEAR

(1) Install the steering gear up in the front suspension cradle crossmember, leaving room to install intermediate coupler.

(2) Start the roll pin into the intermediate coupler before installing coupler on steering gear shaft. Start roll pin into coupler, using a hammer and tapping it into the coupler. Then install the intermediate coupler on the shaft of the steering gear.

(3) Install Remover/Installer Special Tool 6831A through the center of the roll pin, securing it with the knurled nut (Fig. 12). Hold threaded rod stationary while turning nut. This will pull the roll pin into the intermediate coupler.

(4) Install power steering gear on the front suspension cradle. Install the 2 steering gear mounting bolts and nuts. Tighten the M-14 size steering gear to suspension cradle mounting bolt to a torque of 183 N·m (135 ft. lbs.). Tighten the M-12 size steering gear to suspension cradle mounting bolt to a torque of 95 N·m (70 ft. lbs.).

CAUTION: Proper torque on the steering gear to suspension cradle mounting bolts is very important.

(5) Install the heat shield on the steering gear (Fig. 10).

(6) Attach the power steering fluid pressure and return hoses to the proper fittings on the steering gear (Fig. 10). Do not fully tighten the fittings at this time.

(7) Install the routing clamp with the bolt securing the power steering fluid hoses to the rear of the cradle crossmember (Fig. 11).

(8) Using a crowfoot wrench on a torque wrench, tighten the power steering fluid hose tube nuts at the gear to a torque of 31 N·m (275 in. lbs.).

(9) Install tie rod end into steering knuckle. Start tie rod end to steering knuckle attaching nut onto stud of tie rod end. While holding stud of tie rod end stationary using a socket (Fig. 4), tighten tie rod end to steering knuckle attaching nut. Then using a crowfoot and socket (Fig. 13), tighten the tie rod end attaching nut to a torque of 75 N·m (55 ft. lbs.).

(10) If the vehicle is equipped with All-Wheel-Drive, install the power transfer unit (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - INSTALLATION).

CAUTION: Proper torque on the cradle reinforcement to suspension cradle mounting bolts is very important.

(11) Install the reinforcement on the front suspension cradle crossmember and install the bolts attaching the reinforcement to the cradle crossmember (Fig. 6). Tighten the M-14 size bolts to a torque of 163 N·m (120 ft. lbs.). Tighten the M-12 size bolts to a torque of 108 N·m (80 ft. lbs.).

(12) Install the lower control arm rear bushing retainer bolts through reinforcement on each side of each lower control arm rear bushing. Tighten bolts to a torque of 61 N·m (45 ft. lbs.).

(13) Install the two bolts and bushings attaching the reinforcement and rear of cradle crossmember to body of vehicle (Fig. 6). Tighten bolts to a torque of 163 N·m (120 ft. lbs.).

(14) If power steering cooler equipped, install the previously disconnected power steering cooler hose on the cooler. Install the clamp.

(15) If power steering cooler equipped, install the power steering fluid cooler on the cradle crossmember reinforcement (Fig. 3). Install the mounting bolts and tighten to 11 N·m (100 in. lbs.).

(16) Install the front tire and wheel assemblies on vehicle. Install the wheel mounting lug nuts and tighten to a torque to 135 N·m (100 ft. lbs.).

GEAR (Continued)

(17) Lower the vehicle to a level were the interior of vehicle is accessible (keeping tires off the ground).

(18) With the wheels pointed approximately STRAIGHT-AHEAD, align the intermediate shaft with the steering column coupler. Assemble the steering column shaft coupler onto the steering gear intermediate coupler (Fig. 2). Install steering column coupler to intermediate shaft retaining pinch bolt. Tighten the pinch bolt nut to a torque of 28 N·m (250 in. lbs.).

(19) Remove the steering wheel holding tool.

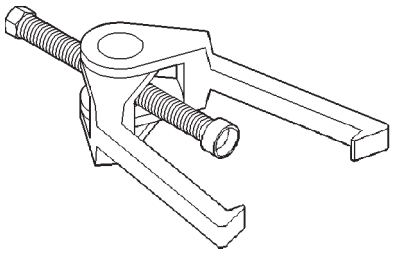
(20) Perform the POWER STEERING PUMP INITIAL OPERATION procedure to properly fill and bleed the power steering system. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(21) Inspect for leaks.

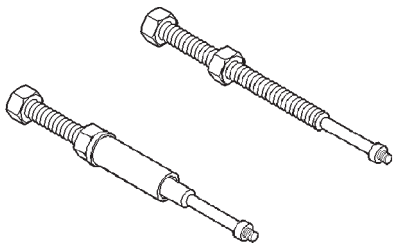
(22) Adjust front wheel toe (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

SPECIAL TOOLS

POWER STEERING GEAR



Puller C-3894A



Remover/Installer Steering Shaft Roll Pin 6831A

OUTER TIE ROD

REMOVAL

(1) Loosen inner tie rod to outer tie rod jam nut (Fig. 14).

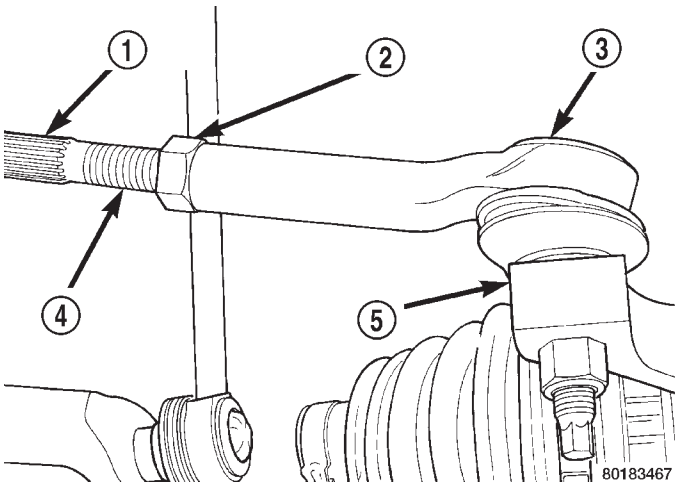


Fig. 14 Inner To Outer Tie Rod Jam Nut

1 - INNER TIE ROD SERRATION
2 - OUTER TIE ROD JAM NUT
3 - OUTER TIE ROD END
4 - INNER TIE ROD
5 - STEERING KNUCKLE

(2) Remove nut attaching outer tie rod end to steering knuckle (Fig. 15). The nut is to be removed from tie rod end by holding tie rod end stud with a 11/32 socket while loosening and removing nut with a wrench.

(3) Remove the tie rod end stud from steering knuckle arm, using Remover, Special Tool C-3894–A (Fig. 16).

(4) Remove outer tie rod end by un-threading it from the inner tie rod.

INSTALLATION

NOTE: Before installing the outer tie rod, make sure the jam nut is on inner tie rod (Fig. 14).

OUTER TIE ROD (Continued)

2 - SPECIAL TOOL C-3894-A
3 - STEERING KNUCKLE

(1) Install outer tie rod onto inner tie rod.
(2) Do not tighten jam nut.

(3) Install tie rod end into the steering knuckle. Start tie rod end to steering knuckle attaching nut onto stud of tie rod end. While holding stud of tie rod end stationary, tighten tie rod end to steering knuckle attaching nut (Fig. 15). Then using a crowfoot and 11/32 socket (Fig. 17), torque tie rod end attaching nut to 75 N·m (55 ft. lbs.).

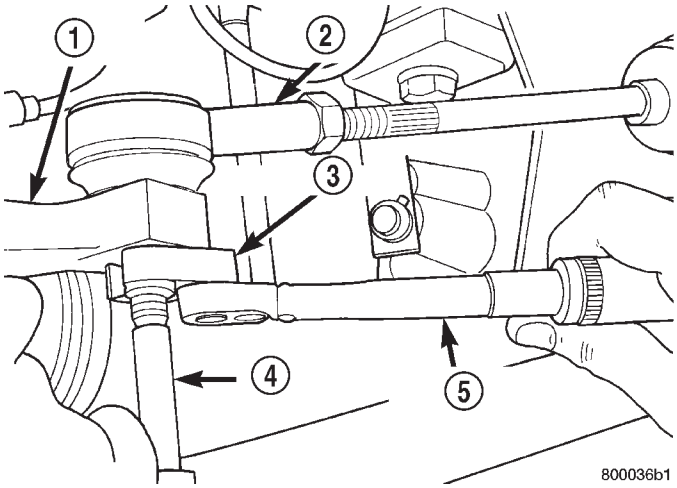

Fig. 17 Torquing Tie Rod End Attaching Nut

1 - STEERING KNUCKLE
2 - TIE ROD END
3 - CROWFOOT
4 - SOCKET
5 - TORQUE WRENCH

(4) Tighten tie rod jam nut (Fig. 14) to 75 N·m (55 ft. lbs.) torque.

CAUTION: During this procedure do not allow the steering gear boot to become twisted.

(5) Adjust the front toe setting on the vehicle (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

PUMP

DESCRIPTION

DESCRIPTION - PUMP (2.4L/3.3L/3.8L ENGINE)

Hydraulic pressure for the operation of the power steering gear is provided by a belt driven power steering pump. The power steering pump is mounted on the back side of the engine on all engine applications. The pumps are different depending on the engine option. The pump for the 2.4L engine is made out of cast iron and steel (Fig. 1). The pump used on the 3.3L/3.8L engine is made of aluminum (Fig. 2).

The pump for the 3.3L/3.8L engine does not have a return fitting as the pump for the 2.4L engine does. The power steering return hose on the 3.3L/3.8L engine goes to the reservoir instead of the pump.

PUMP (Continued)

5 - SUPPLY FITTING

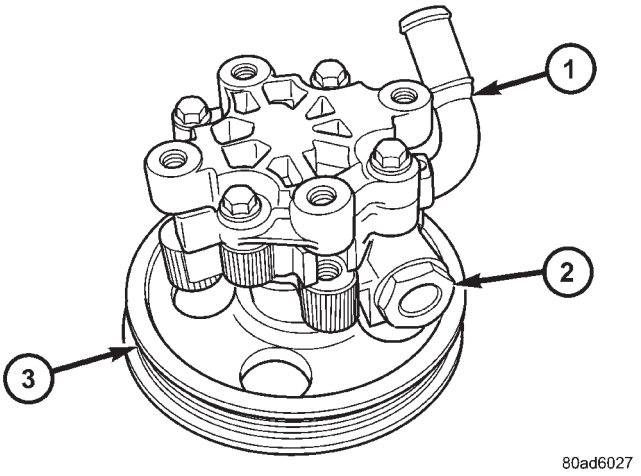

Fig. 2 POWER STEERING PUMP (3.3L/3.8L)

1 - SUPPLY FITTING
2 - PRESSURE FITTING
3 - PULLEY

DESCRIPTION - PUMP (2.5L DIESEL)

Hydraulic pressure for the operation of the power steering gear is provided by a belt driven power steering pump. The power steering pump is mounted front lower right corner of the engine (Fig. 13).

The pump has a supply fitting for fluid coming from the reservoir and a pressure port for exiting fluid that is headed for the steering gear.

OPERATION

The power steering pump is a constant displacement vane type pump. The 2.4L pump has an integral fluid reservoir and there is a secondary remote non-flow reservoir which acts only as a fluid fill and check point. The 3.3L/3.8L pump houses very little fluid and is therefore supplied by a remote flow through reservoir.

WARNING

WARNING: POWER STEERING FLUID, ENGINE PARTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES. DO NOT ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT PERSONAL INJURY FROM MOVING PARTS.

CAUTION

CAUTION: When the system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

STANDARD PROCEDURE - POWER STEERING PUMP INITIAL OPERATION

WARNING: FLUID LEVEL SHOULD BE CHECKED AND ADJUSTED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING ENGINE COMPONENTS.

CAUTION: Use only Mopar® Automatic Transmission Fluid (MS-9602) in power steering system. Use of other Mopar® power steering fluids (MS5931 and MS9933) should be avoided to ensure peak performance of the power steering system under all operating conditions. Do not overfill.

Read the fluid level through the side of the power steering fluid reservoir. The fluid level should indicate **"FILL RANGE"** when the fluid is at a temperature of approximately 21°C to 27°C (70°F to 80°F).

(1) Wipe the filler cap and area clean, then remove the cap.

PUMP (Continued)

(2) Fill the fluid reservoir to the proper level and let the fluid settle for at least two (2) minutes.

(3) Start the engine and let run for a few seconds, then turn the engine off.

(4) Add fluid if necessary. Repeat the above steps until the fluid level remains constant after running the engine.

(5) Raise the front wheels off the ground.

(6) Start the engine.

(7) Slowly turn the steering wheel right and left, lightly contacting the wheel stops.

(8) Add fluid if necessary.

(9) Lower the vehicle, then turn the steering wheel slowly from lock-to-lock.

(10) Stop the engine. Check the fluid level and refill as required.

(11) If the fluid is extremely foamy, allow the vehicle to stabilize a few minutes, then repeat the above procedure.

REMOVAL

REMOVAL - PUMP (2.4L ENGINE)

(1) Remove the (-) negative battery cable from the battery and isolate cable.

(2) Remove the cap from the power steering fluid reservoir.

(3) Using a siphon pump, remove as much power steering fluid as possible from the power steering fluid reservoir.

(4) Raise the vehicle on jack stands or centered on a frame contact type hoist. See Hoisting in Lubrication and Maintenance.

(5) Disconnect the oxygen sensor wiring harness from the vehicle wiring harness at the rear engine mount bracket.

NOTE: The exhaust system needs to be removed from the engine to allow for an area to remove the power steering pump from the vehicle.

(6) Remove the four bolts and flag nuts securing the catalytic converter from the exhaust manifold (Fig. 3).

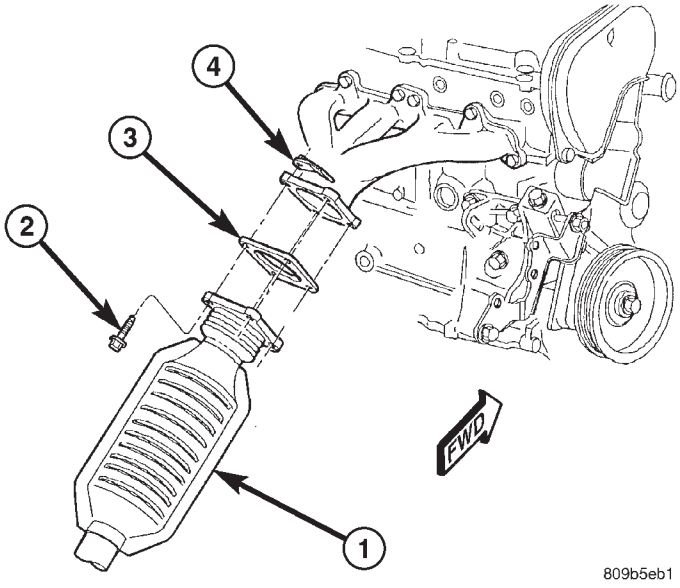

Fig. 3 Catalytic Converter to Exhaust Manifold

1 - CATALYTIC CONVERTER
2 - BOLT
3 - GASKET
4 - FLAG NUT

(7) Disconnect all the exhaust system isolators/hangers from the brackets on the exhaust system (2 at the mufflers and 1 at the resonator) (Fig. 4).

(8) Remove the exhaust system by moving it as far rearward, then lowering the front below the crossmember and out of the vehicle.

(9) Remove the power steering fluid supply hose from the fitting on the power steering pump. Drain off excess power steering fluid from hose.

(10) Move the heat sleeve on the power steering return hose to expose the hose connection at the pump (Fig. 5). Remove the hose from the power steering Pump. Allow the remaining power steering fluid to drain from the power steering pump and reservoir through the removed return hose.

(11) Remove the power steering fluid pressure line from the power steering pump (Fig. 6). Drain excess power steering fluid from tube.

(12) Remove the fasteners, then the accessory drive splash shield.

(15) Remove the drive belt from the power steering pump pulley.

(16) Remove the power steering pump and the front bracket from the cast bracket on the engine as an assembly through the exhaust tunnel.

(17) Remove the 3 bolts attaching the front bracket to the power steering pump and separate the power steering pump from the front bracket.

(18) If the power steering pump pulley needs to be transferred, (Refer to 19 - STEERING/PUMP - DISASSEMBLY).

REMOVAL - PUMP (3.3L/3.8L ENGINE)

(1) Remove the (-) negative battery cable from the battery and isolate cable.

(2) Remove the wiper module (unit)(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(3) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove the drive belt splash shield.

(5) Remove the pressure hose routing bracket bolt (Fig. 9).

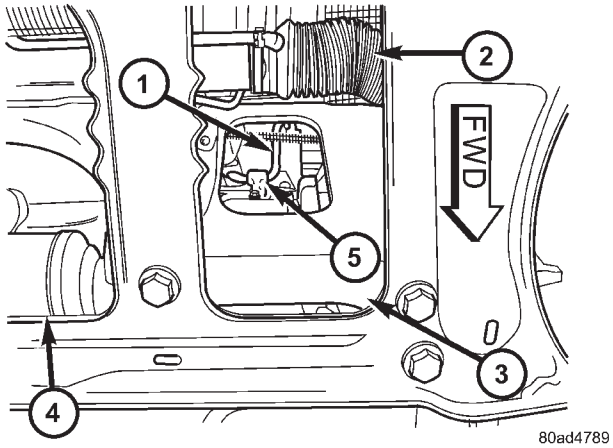

Fig. 9 Pressure Hose Routing Clamp

(12) Remove the pump (with pulley) through the engine compartment rocking it over the aluminum bracket.

REMOVAL - PUMP (2.5L DIESEL)

(1) Remove the negative (-) battery cable from the battery and isolate cable.

(2) Remove the fill cap from the power steering fluid reservoir.

(3) Using a siphon pump, remove as much power steering fluid as possible from the fluid reservoir.

(4) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(5) Remove the splash shields from below the engine compartment.

(6) Remove the accessory drive belt from the power steering pump pulley. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(7) Disconnect the fluid supply hose from the pump (Fig. 12).

(8) Disconnect the pressure hose from the pump (Fig. 12).

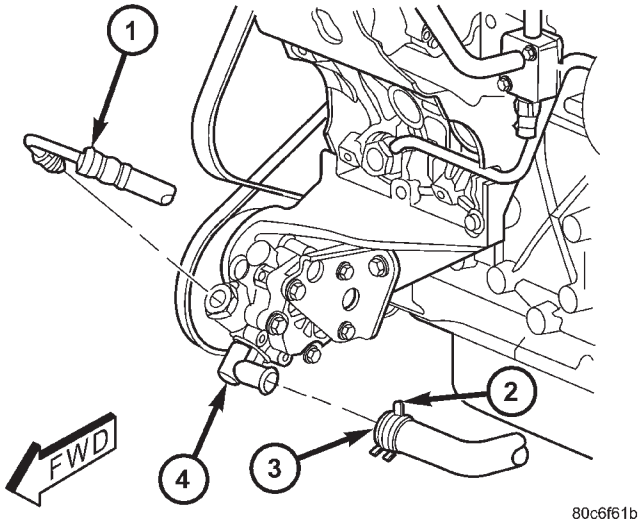

Fig. 12 Power Steering Pump - 2.5L Diesel

1 - PRESSURE HOSE
2 - HOSE CLAMP
3 - SUPPLY HOSE
4 - POWER STEERING PUMP

(9) Remove the bolt fastening the stamped bracket on the rear of the pump to the cast bracket (Fig. 13).

(10) Remove the three front mounting bolts through the pulley.

(11) Remove the pump from the cast bracket and vehicle.

DISASSEMBLY - PUMP (PULLEY)

The only serviceable part of the power steering pump is the pulley. The procedure following is for removal and installation of the pulley from the pump once the pump is removed from the vehicle.

PUMP (Continued)

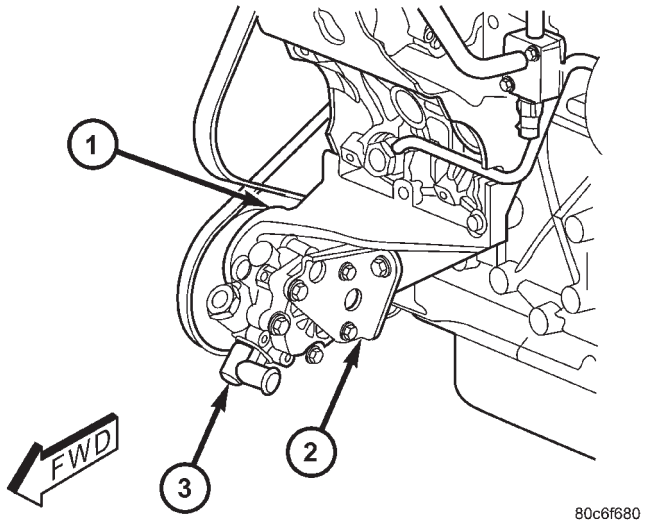

Fig. 13 Pump And Brackets - 2.5L Diesel

1 - CAST BRACKET
2 - STAMPED BRACKET
3 - POWER STEERING PUMP

(1) Remove the power steering pump from the vehicle. Refer to Removal And Installation in this section of the service manual.

(2) Remove the pulley from the shaft of the power steering pump using Puller C-4333 (Fig. 14).

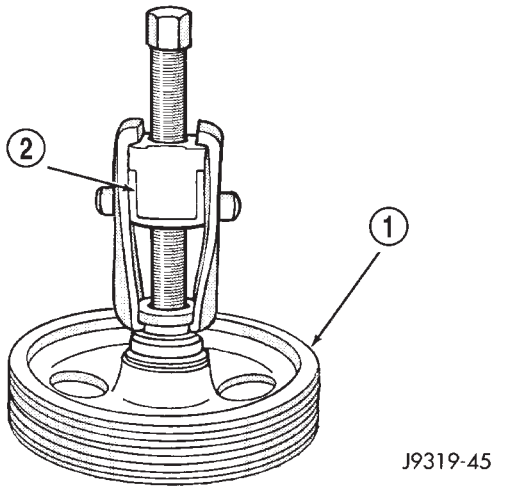

Fig. 14 Pulley Removal

1 - POWER STEERING PUMP DRIVE PULLEY
2 - SPECIAL TOOL C-4333

CAUTION: Do not hammer on power steering pump pulley. This will damage the pulley and the power steering pump.

(3) Replace pulley if it is found to be bent, cracked, or loose.

ASSEMBLY - PUMP (PULLEY)

The only serviceable part of the power steering pump is the pulley. The procedure following is for removal and installation of the pulley from the pump once the pump is removed from the vehicle.

(1) Install the pulley with Installer C-4063 (Fig. 15). Do not use the tool adapters.

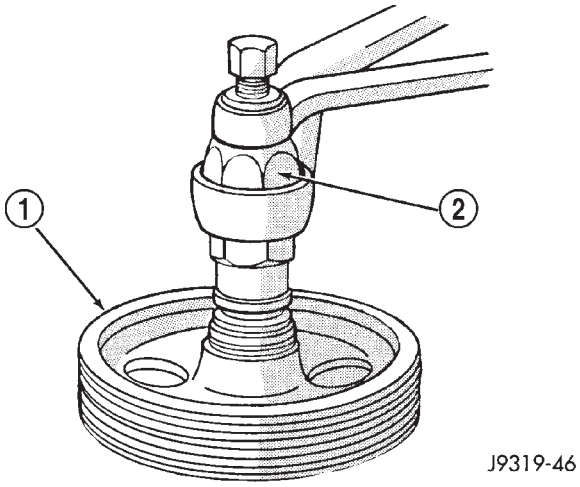

Fig. 15 Pulley Installation

1 - POWER STEERING PUMP DRIVE PULLEY
2 - SPECIAL TOOL C-4063–A

(2) Ensure that the tool and the pulley remain aligned with the pump shaft. Prevent the pulley from being cocked on the shaft.

(3) Install the pulley until it is flush with the end of the power steering pump shaft (Fig. 16).

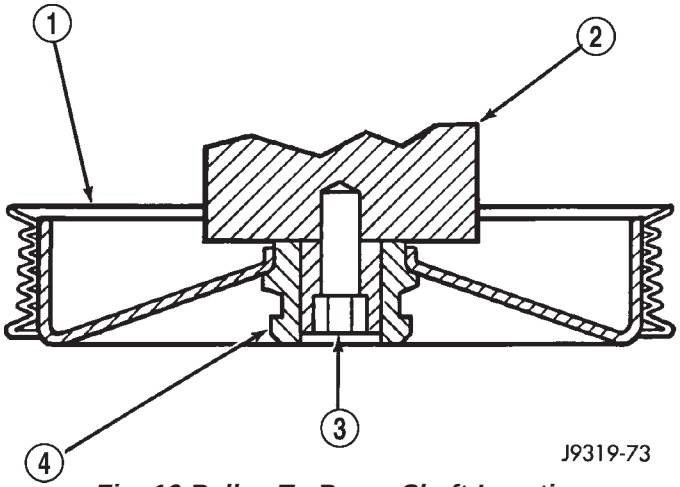

Fig. 16 Pulley To Pump Shaft Location

1 - PULLEY
2 - PUMP BODY
3 - PUMP SHAFT
4 - HUB

(4) Install the power steering pump on the vehicle.

PUMP (Continued)

INSTALLATION

INSTALLATION - PUMP (2.4L ENGINE)

(1) Install power steering pump back in vehicle using the reverse order of its removal through the exhaust tunnel of the vehicle.

(2) Install the power steering pump on its cast mounting bracket (Fig. 7), then install the nut and bolt attaching the front bracket to the cast bracket (Fig. 8). **Do not fully tighten at this time.**.

(3) Install the rear nut (Fig. 7).

(4) Install the power steering pump drive belt on pulley and adjust (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(5) Tighten the two adjustment slot bolts and the one pivot bolt to 54 N·m (40 ft. lbs.) torque.

(6) Install the accessory drive splash shield.

NOTE: Before installing power steering fluid pressure hose on power steering pump, inspect the O-ring on the pressure hose for damage and replace if necessary.

(7) Install the power steering fluid pressure line onto the output fitting of the power steering pump (Fig. 6). Tighten the pressure line to pump fitting tube nut to a torque of 31 N·m (275 in. lbs.).

(8) Install the power steering fluid low pressure return hose on the power steering pump low pressure fitting (Fig. 6). **Be sure hose clamps are properly reinstalled.**

(9) Install the power steering fluid supply hose on the power steering pump fluid fitting. **Be sure hose is clear of accessory drive belts all hose clamps are properly reinstalled.**

CAUTION: Heat sleeve must cover entire rubber portion of return hose to ensure desired thermal protection from exhaust.

(10) Properly position the protective heat sleeve over the power steering return hose. Securely tie strap the heat sleeve to the power steering hose to keep in it's proper position.

(11) Install the exhaust system (Fig. 4). Install all exhaust system isolators/hangers on the exhaust system brackets, then the four bolts and flag nuts (Fig. 3).

(12) Connect the oxygen sensor wiring harness to the vehicle wiring harness.

(13) Lower vehicle.

(14) Connect the negative battery cable on the negative battery post.

(15) Perform the POWER STEERING PUMP INITIAL OPERATION procedure to properly fill and bleed the power steering system. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(16) Inspect for leaks.

INSTALLATION - PUMP (3.3L/3.8L ENGINE)

(1) Install power steering pump back in vehicle using the reverse order of its removal through the engine compartment of the vehicle.

(2) Install the power steering pump on its mounting bracket.

(3) Install the 3 front power steering pump mounting bolts (Fig. 11). Tighten the 3 front power steering pump mounting bolts to a torque of 54 N·m (40 ft. lbs.).

NOTE: Before installing power steering pressure hose on power steering pump, inspect the O-ring on the power steering pressure hose for damage and replace if required.

(4) Install the power steering fluid pressure line into the pressure output fitting of the power steering pump (Fig. 10). **Do not fully tighten tube nut at this time.**

(5) Install the power steering fluid supply hose on the power steering pump supply fitting (Fig. 10). **Be sure hose clamp is properly installed.**

(6) Raise the vehicle.

(7) Install the routing clip on the engine for the pressure hose (Fig. 9) and tighten fastener.

(8) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(9) Install the drive belt splash shield.

(10) Lower the vehicle.

(11) Tighten the pressure line to pump pressure fitting tube nut to a torque of 31 N·m (275 in. lbs.).

(12) Install the wiper module (unit)(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(13) Connect the negative battery cable on the negative battery post.

(14) Fill and bleed the power steering system using the Power Steering Pump Initial Operation Procedure (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

(15) Inspect for leaks.

INSTALLATION - PUMP (2.5L DIESEL)

(1) Install the power steering pump on its cast mounting bracket.

(2) Install the three front power steering pump mounting bolts. Tighten the mounting bolts to a torque of 54 N·m (40 ft. lbs.).

(3) Install the rear mounting bolt fastening the stamped bracket to the cast bracket (Fig. 13). Tighten the mounting bolt to a torque of 54 N·m (40 ft. lbs.).

PUMP (Continued)

NOTE: Before installing power steering pressure hose on power steering pump, inspect the O-ring on the power steering pressure hose for damage and replace if required.

(4) Install the power steering fluid pressure hose fitting into the pressure port of the power steering pump (Fig. 12). Tighten the pressure line to pump fitting tube nut to a torque of 31 N·m (275 in. lbs.).

(5) Install the power steering fluid supply hose on the power steering pump supply fitting (Fig. 12). **Be sure hose clamp is properly reinstalled.**

(6) Install the accessary drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(7) Install the splash shields below the engine compartment.

(8) Lower the vehicle.

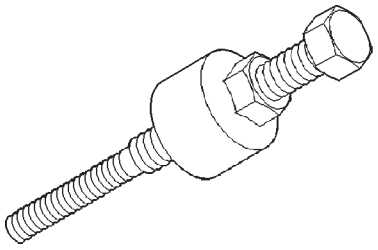
(9) Connect the negative (-) battery cable on the negative battery post.

(10) Fill and bleed the power steering system using the Power Steering Pump Initial Operation Procedure (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

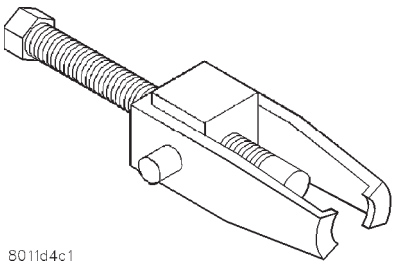
(11) Inspect for leaks.

SPECIAL TOOLS

POWER STEERING PUMP



Installer C-4063B



Puller C-4333

FLUID

STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT INJURY FROM MOVING PARTS AND TO ENSURE ACCURATE FLUID LEVEL READING.

The fluid level can be read on the exterior of the power steering fluid reservoir. The fluid level should be within the “FILL RANGE” when the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F) (Fig. 17).

Before removing the power steering filler cap, wipe the reservoir filler cap free of dirt and debris. Do not overfill the power steering system. **Use only Mopar® ATF+4 Automatic Transmission Fluid (MS-9602) in the power steering system.** For additional information on Automatic Transmission Fluid, (Refer to LUBRICATION & MAINTENANCE/ FLUID TYPES - DESCRIPTION).

CAUTION: Use only Mopar® ATF+4 Automatic Transmission Fluid (MS-9602). Use of other Mopar® power steering fluids (MS5931 and MS9933) should be avoided to ensure peak performance of the power steering system under all operating conditions.

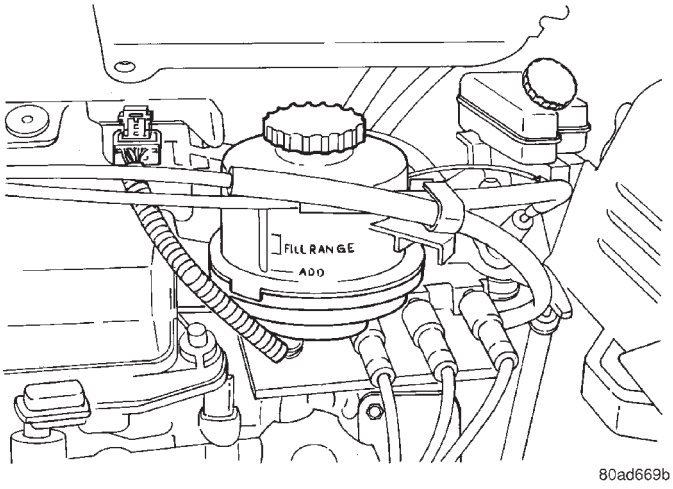


Fig. 17 Power Steering Fluid Reservoir

FLUID COOLER

DESCRIPTION

All models (except 2.5L Diesel) are equipped with a cooler for the power steering system fluid. The power steering fluid cooler is located on the front suspension cradle crossmember reinforcement (Fig. 18). There are two different size coolers depending on model and options. There is a standard 6-inch and an 8-inch.

OPERATION

The purpose of the power steering fluid cooler is to keep the temperature of the power steering system fluid from rising to a level that would affect the performance of the power steering system.

The cooler used on this vehicle is referred to as a fluid-to-air type cooler. This means that the air flow across the tubes (and fines surrounding them) of the cooler is used to extract the heat from the cooler which it has absorbed from the power steering fluid flowing through it. The cooler is placed in the power steering fluid return line, between the steering gear and the power steering fluid reservoir.

REMOVAL

(1) Using a siphon pump, remove as much fluid as possible from the power steering fluid reservoir.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove the hose clamps at the cooler and remove the hoses from the cooler inlet and outlet tubes.

(4) Remove the 2 bolts attaching the power steering cooler cradle crossmember reinforcement (Fig. 18). Remove the cooler.

INSTALLATION

(1) Install the power steering fluid cooler on the cradle crossmember reinforcement (Fig. 18). Install the mounting bolts and tighten to 11 N·m (100 in. lbs.).

(2) Install power steering fluid hoses on the cooler. **Be sure hose clamps are installed on hose past the upset bead on the power steering cooler tubes.**

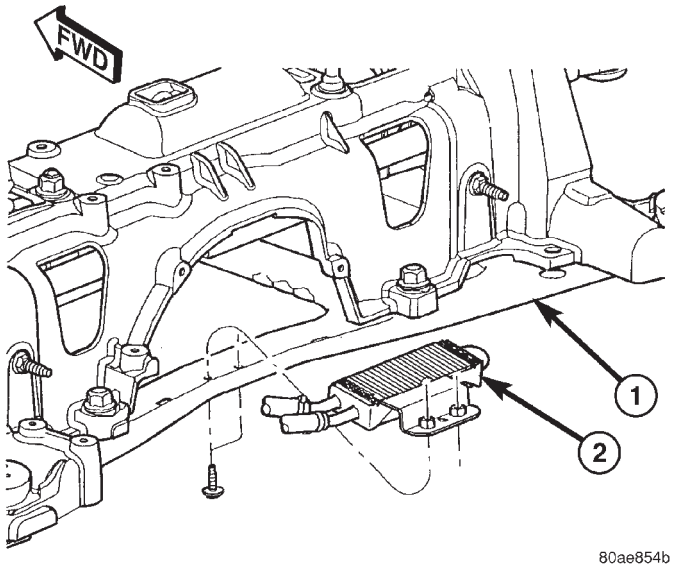

Fig. 18 Power Steering Cooler

1 - CRADLE CROSSMEMBER REINFORCEMENT
2 - POWER STEERING COOLER

(3) Lower the vehicle to a point where front tires are just off the ground.

(4) Perform Power Steering Pump Initial Operation procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

HOSE - POWER STEERING PRESSURE

REMOVAL

REMOVAL - 2.4L ENGINE

NOTE: Before proceeding, review all WARNINGS and CAUTIONS. (Refer to 19 - STEERING/PUMP - WARNING)(Refer to 19 - STEERING/PUMP - CAUTION)

(1) Remove cap from power steering fluid reservoir.

(2) Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

HOSE - POWER STEERING PRESSURE (Continued)

(3) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - REMOVAL)

(5) Place an oil drain pan under vehicle to catch power steering fluid.

(6) Back out pressure hose tube nut at power steering pump pressure fitting and remove hose from pump (Fig. 19).

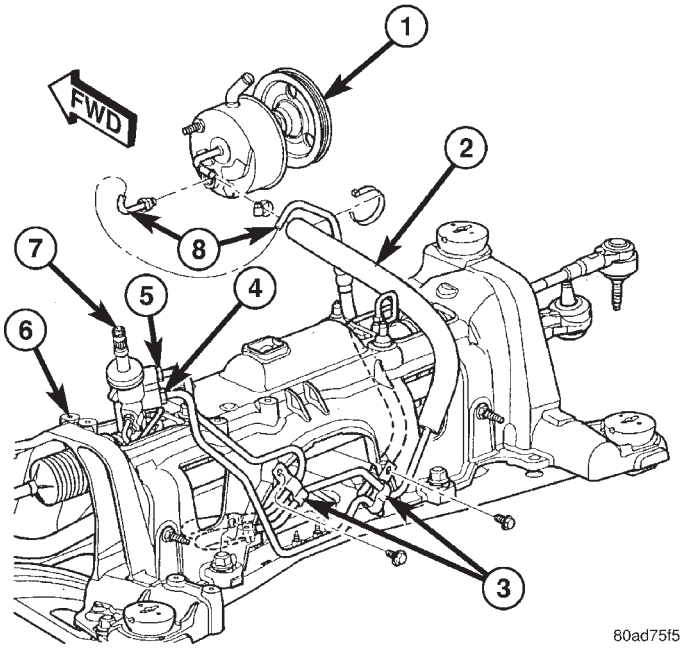

Fig. 19 PRESSURE AND RETURN HOSES - 2.4L

1 - POWER STEERING PUMP

6 - CRADLE CROSSMEMBER
7 - POWER STEERING GEAR
8 - PRESSURE HOSE

(7) Remove bolt attaching right routing clamp to front suspension cradle crossmember (Fig. 19). Remove pressure hose from clamp.

(8) Back out pressure hose tube nut at power steering gear and remove hose from gear (Fig. 19).

(9) Remove power steering fluid pressure hose from vehicle.

REMOVAL - 3.3L/3.8L ENGINE

NOTE: Before proceeding, review all WARNINGS and CAUTIONS. (Refer to 19 - STEERING/PUMP - WARNING)(Refer to 19 - STEERING/PUMP - CAUTION)

(1) Remove cap from power steering fluid reservoir.

(2) Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

(3) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - REMOVAL)

(5) Remove two bolts securing pressure hose routing clamps to suspension cradle crossmember and steel reinforcement (Fig. 20).

(6) Place an oil drain pan under vehicle to catch draining power steering fluid.

(7) Disconnect pressure hose at power steering gear (Fig. 20).

(8) Remove pressure hose routing bracket bolt at engine (Fig. 21). Bolt can be accessed through hole in cradle crossmember (Fig. 22).

(9) Disconnect pressure hose tube nut at power steering pump (Fig. 21).

(10) Remove power steering fluid pressure hose from vehicle.

INSTALLATION

INSTALLATION - 2.4L ENGINE

(1) Remove any used O-rings from ends of power steering hose.

(2) Using a lint free towel, wipe clean hose ends, power steering pump pressure outlet fitting and steering gear port.

(3) Install new O-rings on ends of power steering fluid pressure hose. Lubricate O-rings using clean power steering fluid.

CAUTION: Use care not to bend tube ends of power steering hoses when installing. Leaks and restrictions may occur.

CAUTION: Power steering fluid hoses must remain away from exhaust system and must not come in contact with any unfriendly surfaces on vehicle.

(4) Route hose up through cradle crossmember toward power steering pump avoiding tight bends or kinking.

(5) Install power steering pressure hose end into pump pressure outlet fitting (Fig. 19). Thread tube nut into outlet fitting, but do not tighten at this time.

(6) Route hose behind cradle crossmember and start hose end into gear port. Do not tighten hose tube nut at this time.

HOSE - POWER STEERING PRESSURE (Continued)

12 - ROUTING CLIP

(7) Install hose into right routing clamp (Fig. 19), then install mounting bolt into cradle crossmember. Tighten bolt to 23 N·m (200 in. lbs.) torque.

CAUTION: When tightening and torquing the pressure hose at the power steering pump, the pressure hose is to be rotated against the fluid return hose fitting on the pump.

(8) Tighten pressure hose tube nuts at pump and gear to 31 N·m (275 in. lbs.) torque.

(9) Install front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - INSTALLATION)

(10) Lower vehicle.

(11) Fill and bleed the power steering system using the Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(12) Inspect system for leaks.

INSTALLATION - 3.3L/3.8L ENGINE

(1) Remove any used O-rings from ends of power steering hose.

(2) Using a lint free towel, wipe clean hose ends, power steering pump pressure outlet fitting and steering gear port.

(3) Install new O-rings on ends of power steering fluid pressure hose. Lubricate O-rings using clean power steering fluid.

CAUTION: Use care not to bend tube ends of the power steering hoses when installing. Leaks and restrictions may occur.

CAUTION: Power steering fluid hoses must remain away from the exhaust system and must not come in contact with any unfriendly surfaces on the vehicle.

(4) Route hose up behind engine toward pump avoiding tight bends or kinking.

(5) Install power steering pressure hose end into pump pressure outlet fitting (Fig. 21). Thread tube nut into outlet fitting, but do not tighten at this time.

(6) Attach pressure hose routing bracket to engine (Fig. 21). Tighten bolt to 23 N·m (200 in. lbs.) torque.

(7) Tighten hose tube nut at pump outlet fitting to 31 N·m (275 in. lbs.) torque.

(8) Route hose behind cradle crossmember and start hose end into gear port. Do not tighten hose tube nut at this time.

(9) Attach hose to suspension cradle crossmember and steel reinforcement using two routing clamps and bolts (Fig. 20). Tighten clamp bolt at steel reinforcement to 11 N·m (100 in. lbs.) torque. Tighten clamp bolt at cradle crossmember to 23 N·m (200 in. lbs.) torque.

HOSE - POWER STEERING PRESSURE (Continued)

(10) Tighten hose tube nut at power steering gear port to 31 N·m (275 in. lbs.) torque.

(11) Install front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - INSTALLATION)

(12) Lower vehicle.

(13) Fill and bleed the power steering system using the Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(14) Inspect system for leaks.

HOSE - POWER STEERING RETURN

REMOVAL

REMOVAL - 2.4L ENGINE

NOTE: Before proceeding, review all WARNINGS and CAUTIONS. (Refer to 19 - STEERING/PUMP - WARNING)(Refer to 19 - STEERING/PUMP - CAUTION)

(1) Remove cap from power steering fluid reservoir.

(2) Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

(3) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - REMOVAL)

(5) Place an oil drain pan under vehicle to catch power steering fluid.

(6) Cut tie-strap securing insulating heat sleeve to power steering fluid return hose near power steering pump. Pull back heat sleeve to expose hose clamp.

(7) Remove clamp, then return hose from power steering pump (Fig. 19).

(8) Remove 2 bolts attaching power steering cooler to cradle crossmember reinforcement (Fig. 23).

(9) Remove bolts attaching routing clamps to front suspension cradle crossmember (Fig. 19). Remove return hose from clamps.

(10) Back out return hose tube nut at power steering gear and remove hose (Fig. 19).

REMOVAL - 3.3L/3.8L ENGINE

NOTE: Before proceeding, review all WARNINGS and CAUTIONS. (Refer to 19 - STEERING/PUMP - WARNING)(Refer to 19 - STEERING/PUMP - CAUTION)

(1) Remove cap from power steering fluid reservoir.

(2) Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

(3) Place an oil drain pan under vehicle to catch any draining power steering fluid.

(4) Remove clamp attaching return hose to power steering fluid reservoir. Disconnect hose from reservoir (Fig. 21).

(5) Follow return hose downward and open retainer at ABS bracket (Fig. 20). Remove hose tube from retainer.

(6) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(7) Remove front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - REMOVAL)

(8) Remove bolt securing return hose routing clamp to suspension cradle crossmember (Fig. 20).

(9) Remove 2 bolts attaching power steering cooler to cradle crossmember reinforcement (Fig. 23).

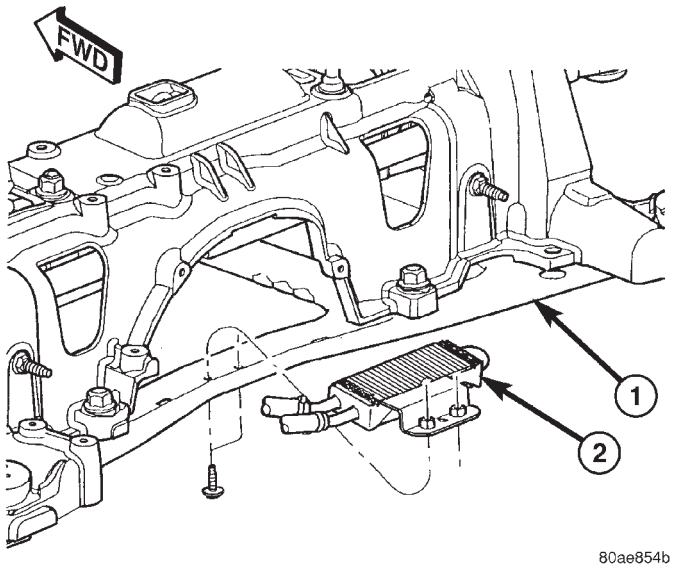

Fig. 23 POWER STEERING COOLER

1 - CRADLE CROSSMEMBER REINFORCEMENT
2 - POWER STEERING COOLER

(10) Disconnect return hose at power steering gear (Fig. 20).

(11) Remove power steering fluid return hose with cooler from vehicle.

HOSE - POWER STEERING RETURN (Continued)

INSTALLATION

INSTALLATION - 2.4L ENGINE

(1) Remove any used O-rings from ends of power steering hose.

(2) Using a lint free towel, wipe clean hose ends, power steering pump fitting and steering gear port.

(3) Install new O-ring on power steering gear end of return hose. Lubricate O-ring using clean power steering fluid.

CAUTION: Use care not to bend tube ends of the power steering hoses when installing. Leaks and restrictions may occur.

CAUTION: If a new return hose is being installed and it does not have an insulating heat sleeve installed, the heat shield from the original hose must be transferred before hose installation.

(4) Route hose along rear of cradle crossmember and start gear end of hose into gear port. Do not tighten hose tube nut at this time.

(5) Attach hose to suspension cradle crossmember using two routing clamps and bolts (Fig. 19). Tighten clamp bolts to 23 N·m (200 in. lbs.) torque.

(6) Tighten return hose tube nut at power steering gear port to 31 N·m (275 in. lbs.) torque.

(7) Install the power steering fluid cooler on the cradle crossmember reinforcement (Fig. 23). Install the mounting bolts and tighten to 11 N·m (100 in. lbs.).

CAUTION: Power steering fluid hoses must remain away from the exhaust system and must not come in contact with any unfriendly surfaces on the vehicle.

(8) Route pump end of hose over cradle crossmember toward pump avoiding tight bends or kinking.

(9) Install return hose onto power steering pump return fitting and secure with hose clamp (Fig. 19). Tighten the screw-type clamp to a torque of 2 N·m (18 in. lbs.).

CAUTION: To prevent overheating of power steering fluid return hose, protective heat shield sleeve must cover entire rubber hose.

(10) Slide insulating heat shield up over the clamp on the return hose and tie-strap it in place.

(11) Install front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - INSTALLATION)

(12) Lower vehicle.

(13) Fill and bleed the power steering system using the Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(14) Inspect system for leaks.

INSTALLATION - 3.3L/3.8L ENGINE

(1) Remove any used O-rings from ends of power steering hose.

(2) Using a lint free towel, wipe clean hose ends and power steering gear hose port.

(3) Install a new O-ring on gear port end of power steering fluid hose. Lubricate O-ring using clean power steering fluid.

CAUTION: Use care not to bend tube ends of the power steering hoses when installing. Leaks and restrictions may occur.

CAUTION: Power steering fluid hoses must remain away from the exhaust system and must not come in contact with any unfriendly surfaces on the vehicle.

(4) Route hose (with cooler attached) up toward reservoir avoiding tight bends or kinking.

(5) Start steering gear end of hose into gear port. Do not tighten hose tube nut at this time.

(6) Attach return hose tubes to suspension cradle crossmember using routing clamp and bolt (Fig. 20). Tighten clamp bolt to 23 N·m (200 in. lbs.) torque.

(7) Install the power steering fluid cooler on the cradle crossmember reinforcement (Fig. 23). Install the mounting bolts and tighten to 11 N·m (100 in. lbs.). When installing mounting bolts, include pressure hose routing clamp.

(8) Tighten hose tube nut at power steering gear port to 31 N·m (275 in. lbs.) torque.

(9) Install front emissions vapor canister. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - INSTALLATION)

(10) Lower vehicle.

(11) Install return hose tube into retainer on ABS bracket (Fig. 20). Close the bracket.

(12) Install return hose onto reservoir (Fig. 21). Slide the hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**

(13) Fill and bleed power steering system using the Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(14) Inspect system for leaks.

HOSE - POWER STEERING SUPPLY

REMOVAL

REMOVAL - 2.4L ENGINE

(1) Remove filler cap from power steering fluid reservoir.
(2) Using a siphon pump, remove as much power steering fluid as possible from the power steering fluid reservoir.
(3) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
(4) Remove hose clamp securing supply hose to power steering pump, then remove supply hose from pump fitting.
(5) Lower vehicle.
(6) Remove hose clamp attaching power steering fluid supply hose to power steering fluid reservoir, then remove supply hose.
(7) Remove the power steering fluid supply hose from the vehicle.

REMOVAL - 3.3L/3.8L ENGINE

NOTE: Before proceeding, review all WARNINGS and CAUTIONS. (Refer to 19 - STEERING/PUMP - WARNING)(Refer to 19 - STEERING/PUMP - CAUTION)

(1) Remove cap from power steering fluid reservoir.
(2) Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.
(3) Place an oil drain pan under vehicle to catch any draining power steering fluid.
(4) Remove clamp attaching supply hose to power steering fluid reservoir. Disconnect hose from reservoir (Fig. 21).
(5) Pull upward on hose routing clip releasing it from bracket on cylinder head cover (Fig. 21).

NOTE: It may be necessary to remove air cleaner housing to gain greater access to supply hose at power steering pump. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL)

(6) Remove clamp attaching supply hose to power steering pump. Disconnect hose from pump and remove from vehicle (Fig. 21).

INSTALLATION

INSTALLATION - 2.4L ENGINE

(1) Install and correctly route power steering fluid supply hose from remote fluid reservoir to power steering pump.
(2) Install fluid supply hose onto power steering fluid reservoir. Install hose clamp. **Be sure hose clamp is installed past bead on fluid reservoir fitting.**
(3) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
(4) Install power steering fluid supply hose on power steering pump supply fitting. Install hose clamp. **Be sure hose clamp is installed past bead on pump fitting.**
(5) Lower vehicle.
(6) Fill and bleed power steering system using Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)
(7) Inspect system for leaks.

INSTALLATION - 3.3L/3.8L ENGINE

(1) Install supply hose onto supply fitting on power steering pump (Fig. 21). Slide the hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**
(2) Align routing clip located toward center of supply hose with hole in bracket on cylinder head cover and push into place (Fig. 21).
(3) Install supply hose onto reservoir (Fig. 21). Slide the hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**
(4) Fill and bleed power steering system using Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)
(5) Inspect system for leaks.

RESERVOIR - POWER STEERING FLUID

DESCRIPTION

DESCRIPTION - 2.4L/3.3L/3.8L ENGINE

All vehicles use a remote mounted power steering fluid reservoir. The power steering fluid reservoir is mounted to the engine near the battery (Fig. 24).

RESERVOIR - POWER STEERING FLUID (Continued)

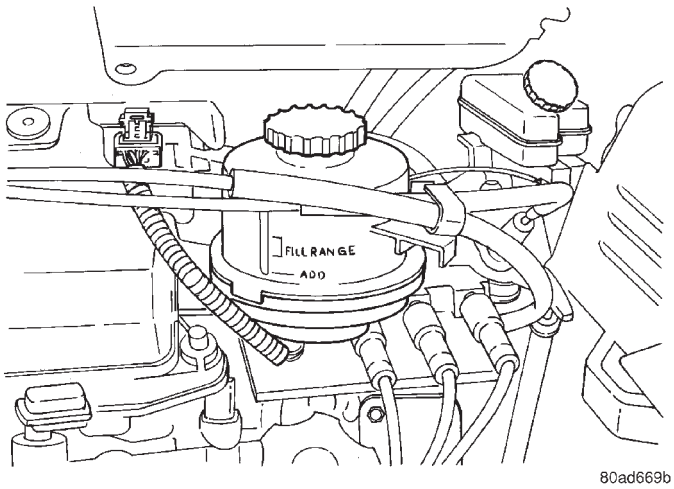

Fig. 24 Power Steering Fluid Reservoir (Typical)

DESCRIPTION - 2.5L DIESEL

All vehicles use a remote mounted power steering fluid reservoir. The power steering fluid reservoir is mounted to a bracket on the engine manifold (Fig. 25).

OPERATION

The power steering fluid reservoir stores and supplies power steering fluid for the power steering system.

REMOVAL

REMOVAL - 2.4L ENGINE

(1) Remove cap from power steering fluid reservoir.

(2) Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

(3) Open retainer on side of reservoir and remove cables from retainer.

(4) Remove clamp attaching supply hose to power steering fluid reservoir. Disconnect hose from reservoir.

(5) Remove bolts and nut securing reservoir in place.

(6) Remove reservoir.

REMOVAL - 3.3L/3.8L ENGINE

(1) Remove cap from power steering fluid reservoir.

(2) Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

(3) Open retainer on side of reservoir and remove cables from retainer.

(4) Remove clamp attaching supply hose to power steering fluid reservoir. Disconnect hose from reservoir (Fig. 21).

(5) Remove clamp attaching return hose to power steering fluid reservoir. Disconnect hose from reservoir (Fig. 21).

(6) Remove bolts and nut securing reservoir in place (Fig. 21).

(7) Remove reservoir.

REMOVAL - 2.5L DIESEL

(1) Open hood.

(2) Remove engine cover.

(3) Remove the filler cap from remote power steering fluid reservoir.

(4) Siphon as much fluid as possible from the fluid reservoir.

(5) Remove the clamp attaching the return hose to the power steering fluid reservoir. Disconnect hose from reservoir (Fig. 25).

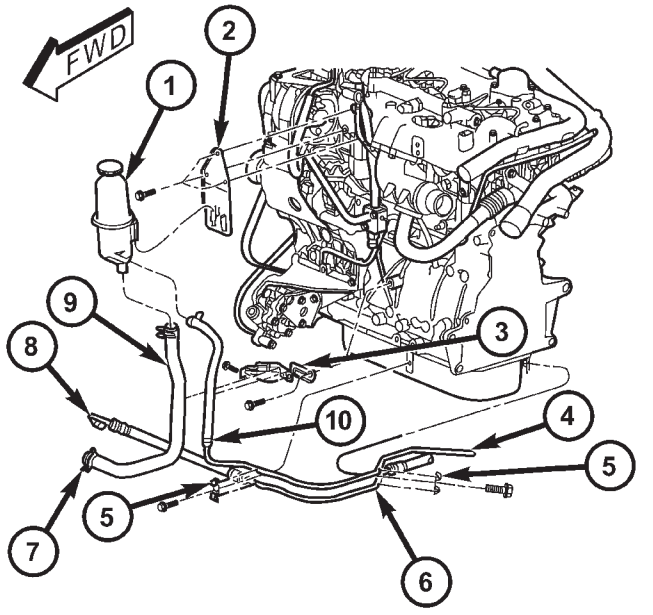

Fig. 25 Reservoir And Hoses - 2.5L Diesel

1 - POWER STEERING FLUID RESERVOIR
2 - RESERVOIR BRACKET
3 - SUPPLY HOSE BRACKET
4 - RETURN HOSE FROM GEAR
5 - ROUTING CLIP
6 - PRESSURE HOSE TO GEAR
7 - SUPPLY HOSE (PUMP END)
8 - PRESSURE HOSE (PUMP END)
9 - SUPPLY HOSE
10 - RETURN HOSE

(6) Remove the clamp attaching the supply hose to the power steering fluid reservoir. Disconnect hose from reservoir (Fig. 25).

(7) Press the tang on the reservoir mounting bracket retaining the reservoir to the bracket, then pull upward on reservoir and remove it from the bracket.

INSTALLATION

INSTALLATION - 2.4L ENGINE

(1) Place reservoir into position on engine.

(2) Install reservoir mounting bolts and nut. Tighten fasteners to 12 N·m (105 in. lbs.) torque.

(3) Install supply hose onto reservoir. Slide the hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**

(4) Fill and bleed power steering system using Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(5) Inspect system for leaks.

INSTALLATION - 3.3L/3.8L ENGINE

(1) Place reservoir into place on engine (Fig. 21).

(2) Install reservoir mounting bolts and nut (Fig. 21). Tighten fasteners to 12 N·m (105 in. lbs.) torque.

(3) Install supply hose onto reservoir (Fig. 21). Slide the hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**

(4) Install return hose onto reservoir (Fig. 21). Slide the hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**

(5) Fill and bleed power steering system using Power Steering Pump Initial Operation Procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(6) Inspect system for leaks.

INSTALLATION - 2.5L DIESEL

(1) Align the guide on the rear of the reservoir with the mounting bracket and push reservoir downward until reservoir clicks into place in the bracket.

(2) Install the supply hose onto the reservoir (Fig. 25). Slide the hose clamp into position on the fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**

(3) Install the return hose onto the reservoir (Fig. 25). Slide the hose clamp into position on the fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**

(4) Fill the fluid reservoir to the proper level with the correct Mopar® power steering fluid or equivalent.

(5) Start the engine and let run for a few seconds, then turn the engine off.

(6) Add fluid as necessary.

(7) Install the filler cap.

(8) Install engine cover.

POWER TRANSFER UNIT

DESCRIPTION

The Power Transfer Unit (P.T.U.) is attached to a modified automatic transaxle case where the right half shaft extension housing would normally be located.

The Power Transfer Unit is sealed from the transaxle and has its own oil sump. The Unit uses Mopar® SAE 80W-90 Gear and Axle Lubricant (MS-9020) and holds 1.15 liters (1.22 quarts).

Service of the Power Transfer Unit is limited to:

- Fluid Change
- Seals
- Gaskets
- One ball bearing
- Output flange

If the ring gear and pinion, any tapered roller bearings, case, covers, or pinion carrier fail the entire unit must be replaced.

OPERATION

The Transfer Unit provides the power to the rear wheels through a hypoid ring gear and pinion set.

DIAGNOSIS AND TESTING

SEAL IDENTIFICATION

For accurate seal diagnosis, repair seal name and location is critical. Refer to (Fig. 1), (Fig. 2), (Fig. 3) and (Fig. 4) for correct seal name and location.

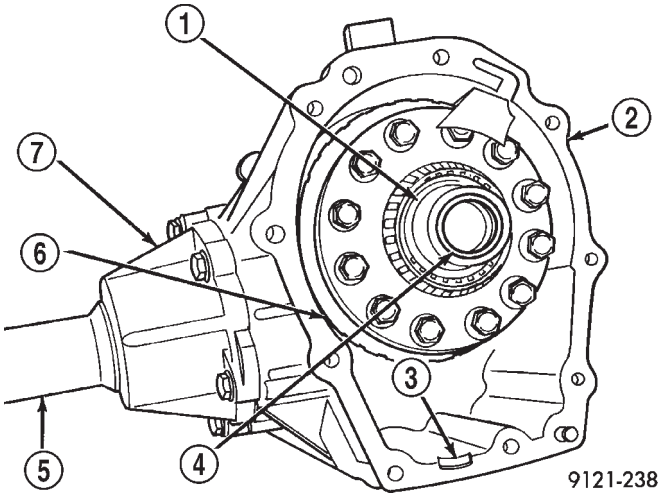

Fig. 1 Seal

FLUID LEAK DIAGNOSIS

When diagnosing fluid leaks on the Power Transfer Unit two weep holes are provided to diagnose certain seal leaks. These holes are located on the bottom side of the assembly (Fig. 5).

If fluid leak is detected from either weep hole, seal replacement is necessary. **Do not attempt to repair the leak by sealing weep holes,** they must be kept clear of sealants for proper seal operation.

If fluid is leaking from weep hole A (Fig. 5) the type of fluid leaking will determine which seal needs to be replaced. If the fluid leaking is red in color (transmission fluid) this indicates that the Transmission differential carrier seal should be replaced. If the fluid leaking is light brown (gear lube) this indicates that the Power Transfer Unit input seal should be replaced. For replacement of these seals refer to Power Transfer Unit Service Procedures.

If fluid is leaking from weep hole B (Fig. 5) the type of fluid leaking will determine which seal is leaking. If the fluid leaking is red in color (transmission fluid) this indicates that the input shaft end seal should be replaced. If the fluid leaking is light brown (gear lube) this indicates that the half shaft inner seal and P.T.U. input shaft cover seal should be replaced. For replacement of these seals refer to Power Transfer Unit Service Procedures.

Before condemning any seal or gasket be sure that the rear rocker arm cover on the engine is not the cause of the oil leak. Oil leaking from the rocker arm cover is easily mistaken for a leaking Power Transfer Unit.

POWER TRANSFER UNIT (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL INSPECTION

(1) Raise vehicle on hoist.
(2) Remove PTU inspection plug (Fig. 6).

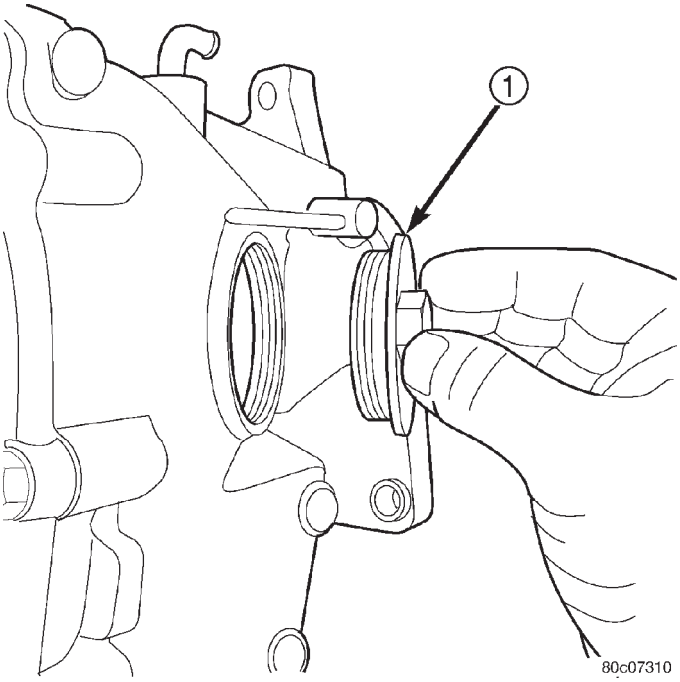

Fig. 6 Inspection Plug

1 - INSPECTION PLUG

(3) Fluid level should be within 3/16" from bottom of inspection hole. Add Mopar® Gear and Axle Lubricant 80W-90 as necessary with suitable suction gun (Fig. 7).
(4) Install inspection plug and torque to 20 N·m (180 in. lbs.) torque.
(5) Lower vehicle.

STANDARD PROCEDURE - PTU FLUID CHANGE

NOTE: PTU Fluid should be changed upon servicing the unit, or at the unit's regular scheduled interval. (Refer to LUBRICATION & MAINTENANCE/ MAINTENANCE SCHEDULES - DESCRIPTION)

(1) Raise vehicle on hoist.
(2) Remove PTU inspection plug (Fig. 8).
(3) Using suitable suction gun, draw fluid from PTU. Make sure hose contacts bottom of case to ensure all fluid is removed.

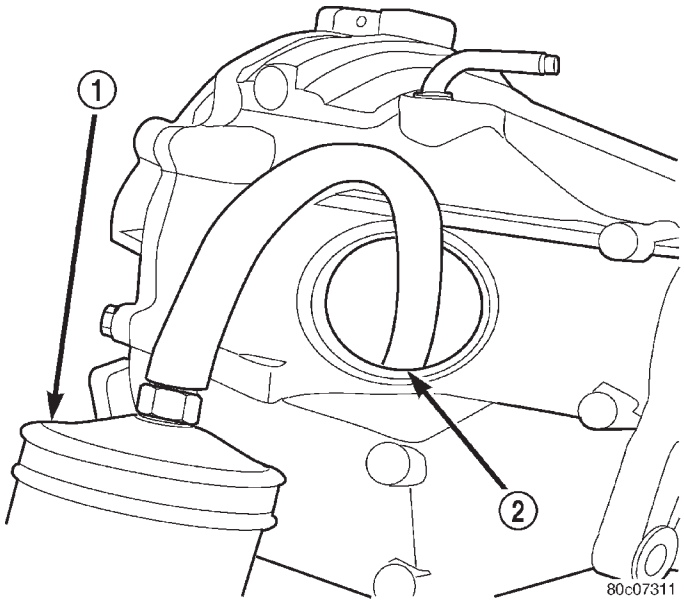

Fig. 7 Removing/Adding PTU Fluid

1 - SUCTION GUN
2 - INSPECTION HOLE

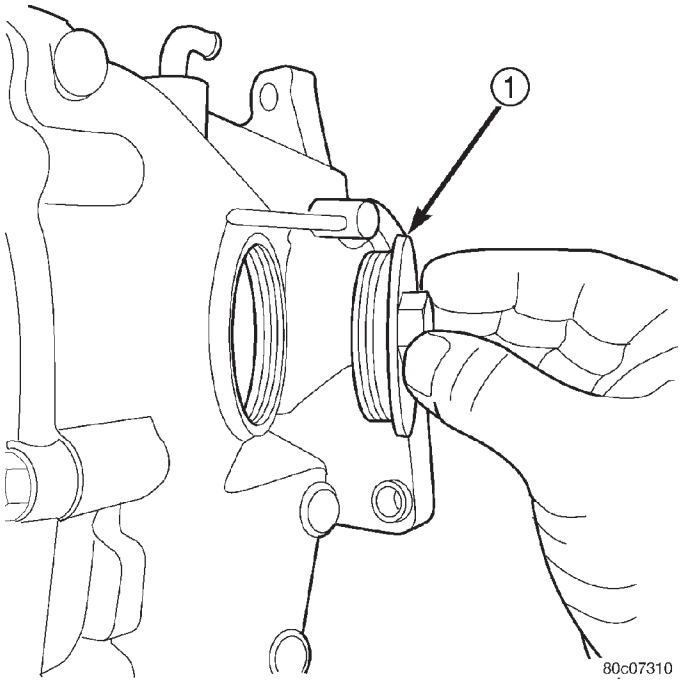

Fig. 8 Inspection Plug

1 - INSPECTION PLUG

POWER TRANSFER UNIT (Continued)

(4) Add 1.15 liters (1.22 quarts) of Mopar® Gear and Axle Lubricant 80W-90 with suction gun (Fig. 9).

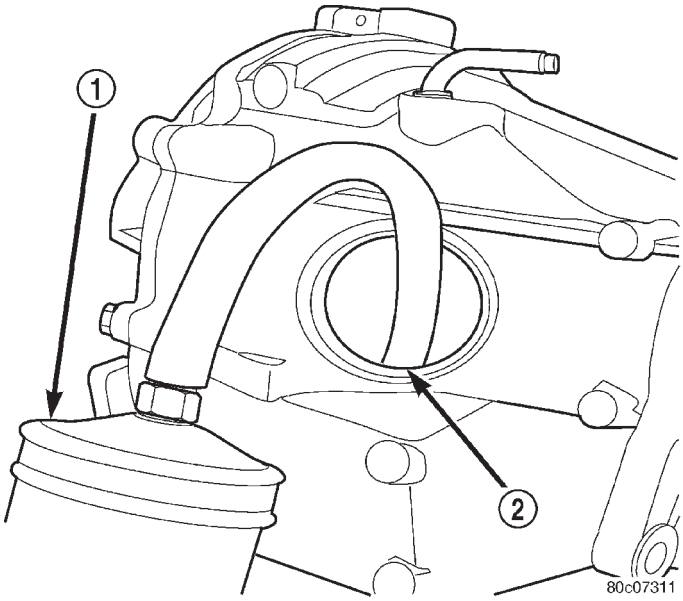

Fig. 9 Adding Fluid to PTU

1 - SUCTION GUN
2 - INSPECTION HOLE

(5) Install inspection plug and torque to 20 N·m (180 in. lbs.) torque.

(6) Lower vehicle.

REMOVAL

(1) Raise vehicle and remove front wheels.

CAUTION: A certain amount of oil will drain out of the transaxle when the drive shaft is removed.

(2) Remove right front drive shaft. Install a plug into the right driveshaft seal hole. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

(3) Mark propeller shaft front flange.

CAUTION: Do not let propeller shaft to hang freely. Damage to the shaft will occur.

(4) Remove propeller shaft assembly (Fig. 10). (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL)

(5) Remove cradle plate (Fig. 11).

(6) Remove the Power Transfer Unit mounting bracket bolts at the rear of the unit (Fig. 12).

(7) Remove the right outboard support bracket and bolts near the right axle shaft.

1 - P.T.U. MOUNT BRACKET
2 - P.T.U.

POWER TRANSFER UNIT (Continued)

(8) Remove the four mounting bolts for the P.T.U. (Fig. 13)and (Fig. 14).

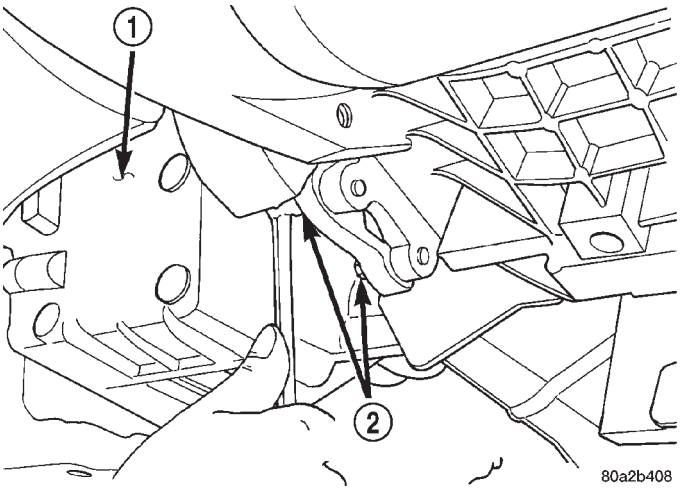

Fig. 13 P.T.U. Lower Mounting Bolts

1 - P.T.U.
2 - P.T.U. MOUNTING BOLTS

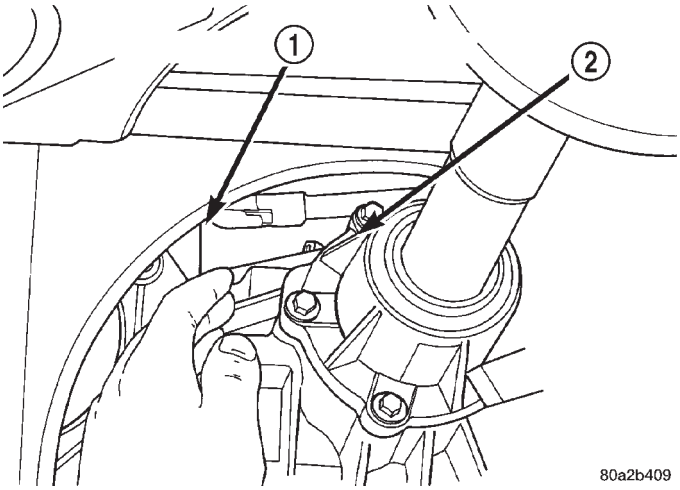

Fig. 14 P.T.U. Upper Mounting Bolts

1 - P.T.U. UPPER MOUNTING BOLTS
2 - P.T.U.

(9) Remove P.T.U. assembly from vehicle.

INSTALLATION

(1) To install, reverse removal procedure. Check transaxle fluid and P.T.U. fluid and fill to level.

(2) Refer to the Specifications section for the proper torque specifications.

ADJUSTMENTS

OUTPUT FLANGE SHIM SELECTION

This procedure is used when the output flange is replaced. Replacement of the output flange requires installation of the correct size shim to maintain bearing preload. **The shim must protrude from the new output flange the same distance that the original shim protruded from the original flange.**

(1) Stand the original output flange on end with shim side pointing up.

(2) Place original shim into groove in top of flange.

(3) Place a straight edge across the shim.

(4) Using feeler gauge, measure the distance between the straight edge and the top of the flange (Fig. 15). Record this measurement.

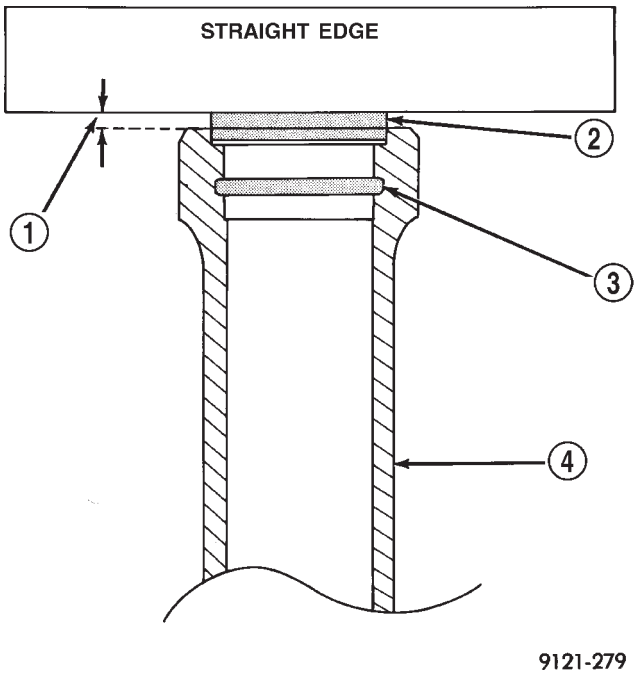

Fig. 15 Output Flange Shim Measurement

1 - MEASURE THIS DIMENSION
2 - SHIM
3 - O-RING
4 - OUTPUT FLANGE

(5) Repeat steps Step 1 through Step 4using the **new flange and the original shim.** Record this measurement.

(6) If measurements are not equal, use a new shim that protrudes from new output flange. Make sure it protrudes the same amount.

(7) For Example: The original shim protrudes 0.075 inch from the original output flange. Place the **original shim** into the new output flange. The protrusion of the shim in the new flange is 0.085 inch. This indicates that a 0.010 inch thinner shim is required to maintain the original protrusion.

(8) Install output flange and torque flange nut to 244 N·m (180 ft. lbs.).

(9) Check the turning torque of the pinion before installing the rear cover into the P.T.U. The turning torque should be between 2.0 N·m and 2.5 N·m (17 in. lbs. and 22 in. lbs.).

DIFFERENTIAL CARRIER SEAL

REMOVAL

The Power Transfer Unit must be removed from the vehicle to replace this seal.

(1) Remove P.T.U. from vehicle.

(2) Use a pry bar to remove seal from retainer plate (Fig. 16). Be careful not to damage seal journal when removing seal.

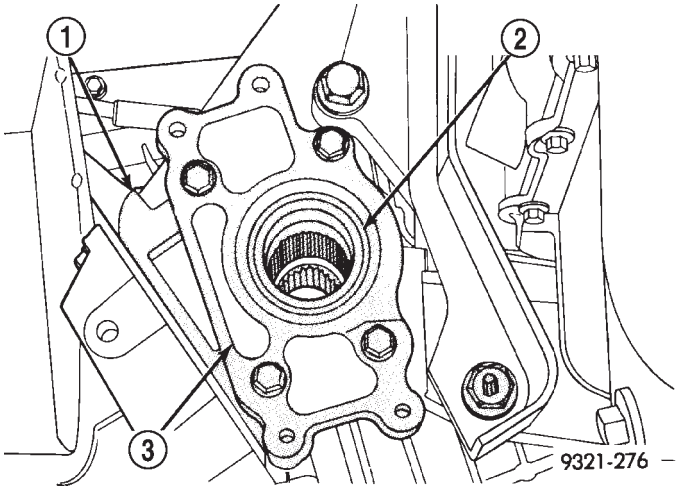

Fig. 16 Transaxle Differential Carrier Seal

1 - TRANSAXLE CASE
2 - DIFFERENTIAL CARRIER SEAL
3 - RETAINER PLATE

INSTALLATION

The Power Transfer Unit must be removed from the vehicle to replace this seal.

(1) Using a large socket, carefully install new seal. The spring side of the seal must face the transaxle differential.

(2) Reinstall the P.T.U. into the vehicle.

(3) Check and fill fluids as required.

END COVER BALL BEARING

REMOVAL

The end cover ball bearing can be removed and installed without removing the Power Transfer Unit from the vehicle. When replacing the bearing the output seal must be removed to gain access to the bearing.

(1) Raise vehicle on hoist.

(2) Remove right front half shaft from vehicle.

(3) Remove output seal with a hammer and chisel (Fig. 17).

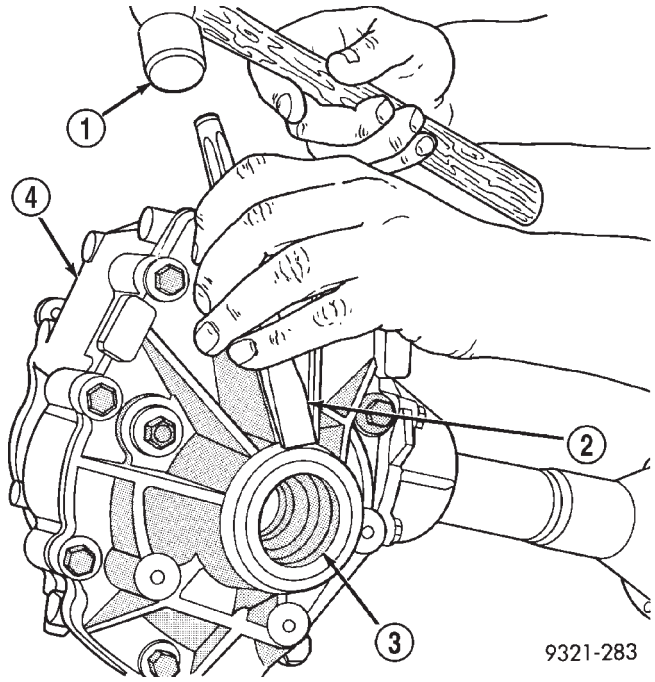

Fig. 17 Output Seal Removal

1 - HAMMER

(5) Use bearing puller MD998346 to remove bearing (Fig. 19).

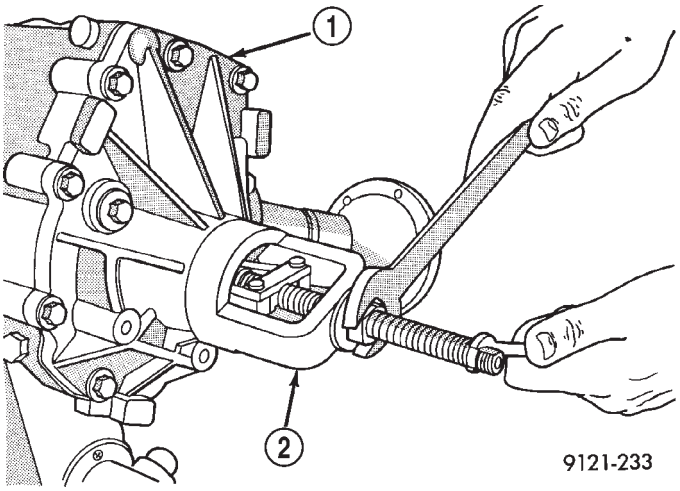

Fig. 19 Bearing Removal

1 - P.T.U. END COVER
2 - SPECIAL TOOL MD998346

INSTALLATION

The end cover ball bearing can be removed and installed without removing the Power Transfer Unit from the vehicle. When replacing the bearing the output seal must be removed to gain access to the bearing.

CAUTION: When installing bearing, position the bearing in place by hand square to the bore. Otherwise, bearing and/or housing damage may occur upon installation.

(1) Use installer MD998200 and driver handle C-4171 to install bearing (Fig. 20) into the housing.

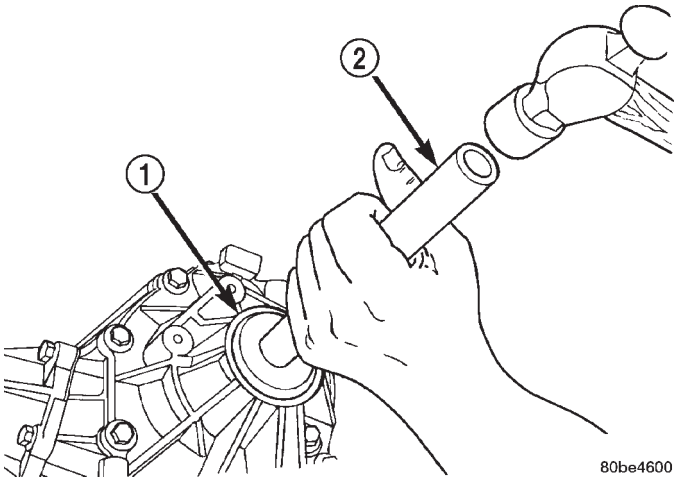

Fig. 20 Bearing Installation

1 - SPECIAL TOOL MD998200
2 - SPECIAL C-4171

(2) Install bearing retaining snap ring.

CAUTION: When installing bearing retaining snap ring, be sure to index the snap ring so that the snap ring does not cover bearing oil passage.

(3) Install new outer half shaft seal using MD998334 seal installer (Fig. 21). **Do not reuse the old seal.**

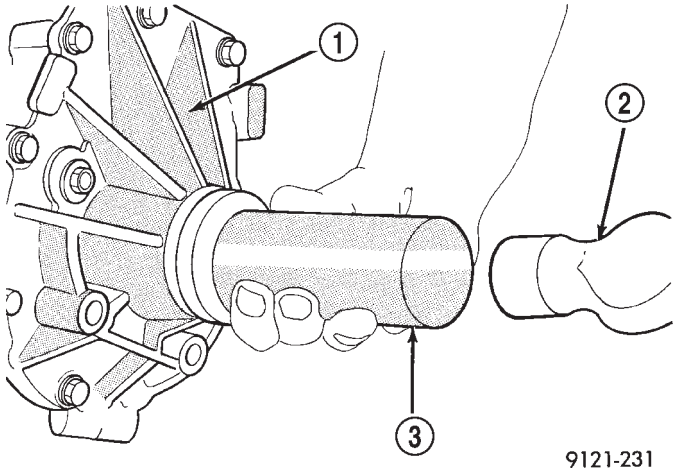

Fig. 21 Installing New Seal

1 - P.T.U. END COVER
2 - HAMMER
3 - SPECIAL TOOL MD998334

(4) Reinstall right front half shaft.
(5) Check and fill fluids as required.

END COVER SEAL

REMOVAL

The Power Transfer Unit must be removed from the vehicle to perform this operation. (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL)

(1) Remove P.T.U. end cover bolts (Fig. 22).

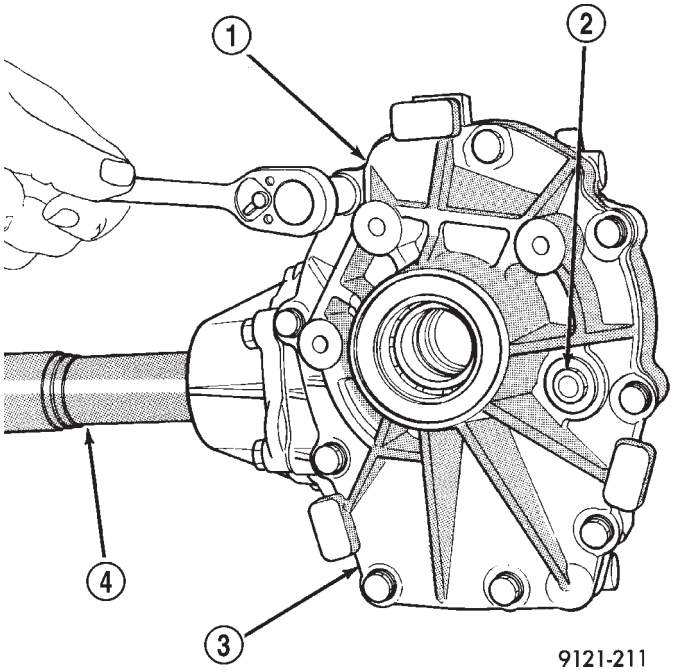

Fig. 22 P.T.U. End Cover Bolts

1 - POWER TRANSFER UNIT
2 - FILL PLUG
3 - END COVER
4 - OUTPUT SHAFT

(2) Gently tap on end cover ears with a hammer to separate end cover from the case (Fig. 23).

(3) Clean and inspect sealer surfaces.

INSTALLATION

(1) Reinstall cover and tighten bolts to 28 N·m (250 in. lbs.) in the sequence shown in (Fig. 24). Retighten first bolt after all others are tight.

CAUTION: When end cover is installed be careful not to damage the P.T.U. Input Shaft Cover Seal.

(2) Reinstall P.T.U. into vehicle.

(3) Check and fill fluids as required.

1 - END COVER
2 - END COVER SEAL
3 - AXLE SHAFT SEAL

HALF SHAFT INNER SEAL (Continued)

INSTALLATION

The power transfer unit half shaft inner seal is the smaller of the two seals located on the inside of the end cover.

(1) Clean and inspect seal area.

(2) Install seal with a 1 1/16 inch socket (Fig. 28). The seal must be installed with the spring side of the seal facing end cover ball bearing. The seal will bottom against a machined shoulder in the cover.

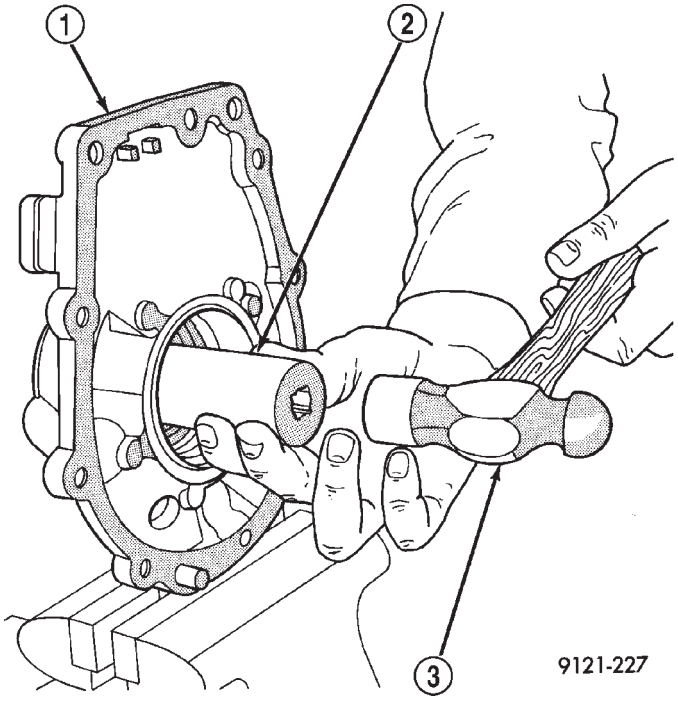

Fig. 28 Seal Installation

1 - END COVER
2 - SOCKET
3 - HAMMER

(3) Clean sealing surfaces of the end cover and P.T.U. case. Apply a bead of Mopar® Gasket Maker, Loctite Gasket Eliminator No. 518 or equivalent.

(4) Place end cover onto P.T.U. case and install bolts. Tighten bolts to 28 N·m (250 in. lbs.) in the sequence shown in (Fig. 29). Retighten first bolt after all other bolts are tight.

(5) Reinstall P.T.U. assembly.

(6) Check and fill fluids as required.

INPUT SHAFT COVER SEAL

REMOVAL

The power transfer unit input shaft cover seal is the larger of the two seals located on the inside of the end cover. The differential bearing cup must be removed to service this seal.

(1) Remove P.T.U. end cover bolts (Fig. 30).

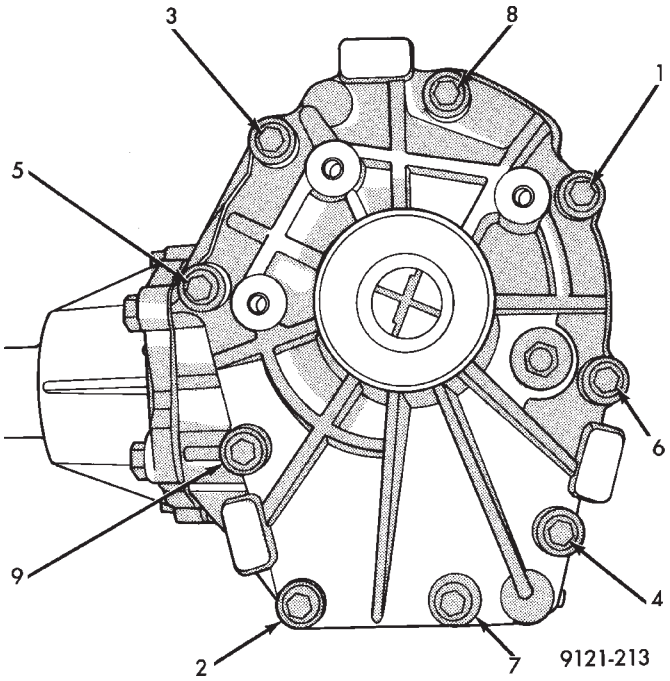

Fig. 29 Bolt Tightening Sequence

4 - SOFT JAW VICE

INSTALLATION

The power transfer unit input shaft cover seal is the larger of the two seals located on the inside of the end cover. The differential bearing cup must be removed to service this seal.

(1) Clean and inspect seal area.

(2) Use special tool No. MD998803 and install seal (Fig. 34). When installing seal the spring side of the seal must face toward the special tool.

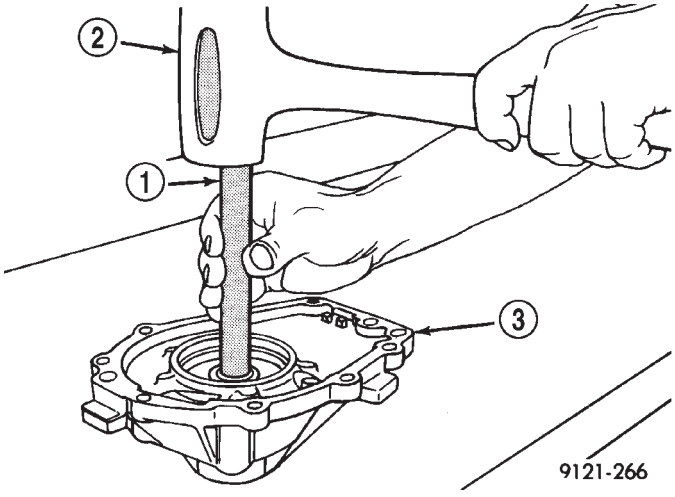

Fig. 34 Seal Installation

1 - SPECIAL TOOL No. MD998803
2 - HAMMER
3 - END COVER

INPUT SHAFT COVER SEAL (Continued)

(3) Reinstall the original bearing race and shim using special tool No. 6522 (Fig. 35) and (Fig. 36).

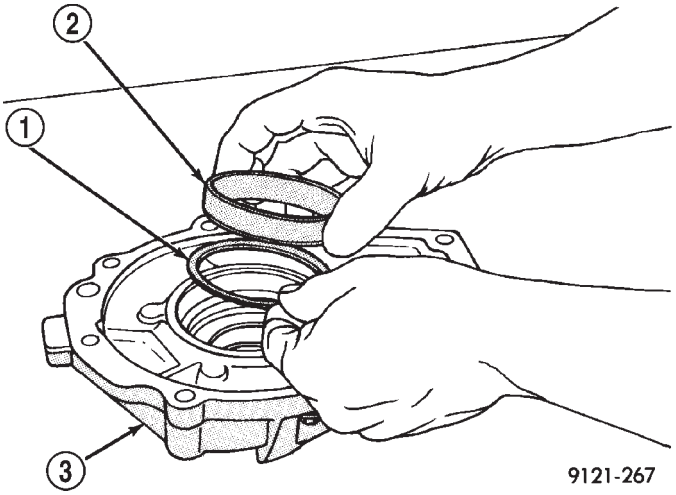

Fig. 35 Bearing Shim and Race

1 - SHIM
2 - BEARING RACE
3 - END COVER

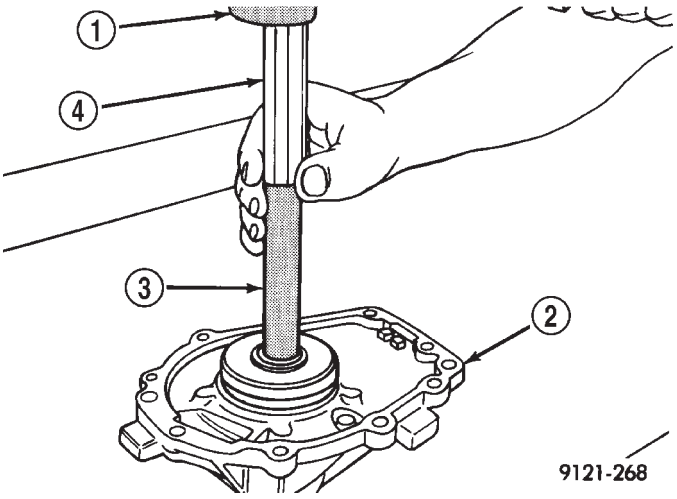

Fig. 36 Installing Bearing Race

1 - HAMMER
2 - END COVER
3 - SPECIAL TOOL No. 6522
4 - HANDLE 4171

CAUTION: The original shim must be installed behind the bearing cup to maintain proper bearing preload.

(4) Apply Mopar® Gasket Maker, Loctite Gasket Eliminator No. 518 or equivalent to sealing surfaces of end cover.

(5) Place end cover onto P.T.U. case and install bolts. Tighten bolts to 28 N·m (250 in. lbs.) in the sequence shown in (Fig. 37). Retighten first bolt after all others are tight.

CAUTION: When end cover is installed be careful not to damage the P.T.U. Input Shaft Cover Seal.

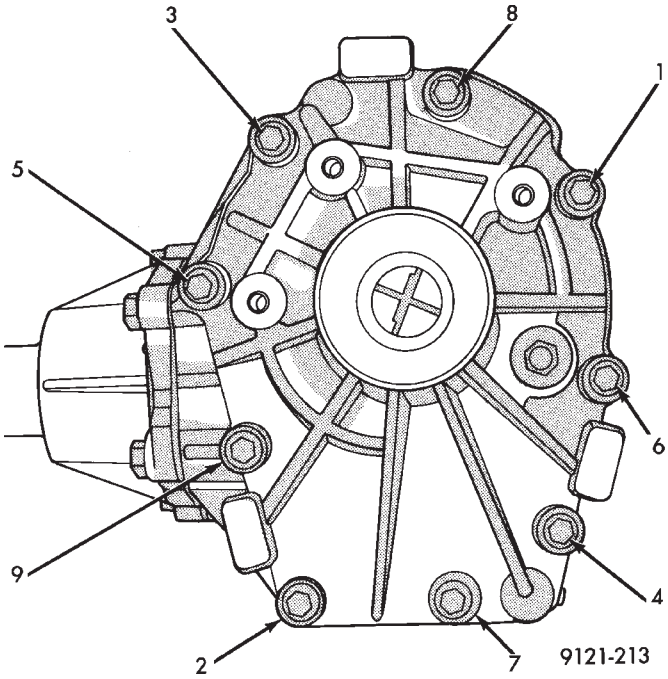

Fig. 37 Bolt Tightening Sequence

(6) Reinstall P.T.U. assembly into vehicle.
(7) Check and fill fluids as required.

INPUT SHAFT END SEAL

REMOVAL

The input shaft end seal is located on the end of the input shaft.

(1) Remove power transfer unit from the vehicle.

(2) Remove end cover bolts (Fig. 38).

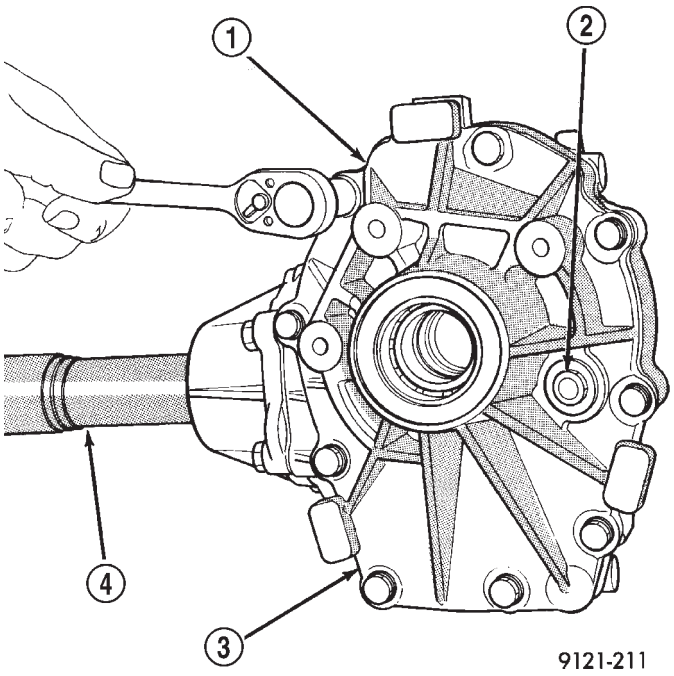

Fig. 38 End Cover Bolts

1 - POWER TRANSFER UNIT
2 - FILL PLUG
3 - END COVER
4 - OUTPUT SHAFT

(3) Tap on end cover ears to separate end cover from case (Fig. 39).

(4) Pry out seal with a pry bar (Fig. 40).

INSTALLATION

The input shaft end seal is located on the end of the input shaft.

(1) Clean and inspect seal area.

(2) Remove input shaft from housing and stand on soft block of wood. Install input shaft end seal with seal installer 5065 and handle C-4171.

(3) Lubricate seal lip after installing seal into input shaft.

(4) Clean sealing surfaces of the end cover and P.T.U. case. Apply a bead of Mopar® Gasket Maker, Loctite Gasket Eliminator No. 518 or equivalent.

INPUT SHAFT END SEAL (Continued)

(5) Place end cover onto P.T.U. case and install bolts. Tighten bolts to 28 N·m (250 in. lbs.) in the sequence shown in (Fig. 41). Retighten first bolt after all others are tight.

CAUTION: When end cover is installed be careful not to damage the P.T.U. Input Shaft Cover Seal.

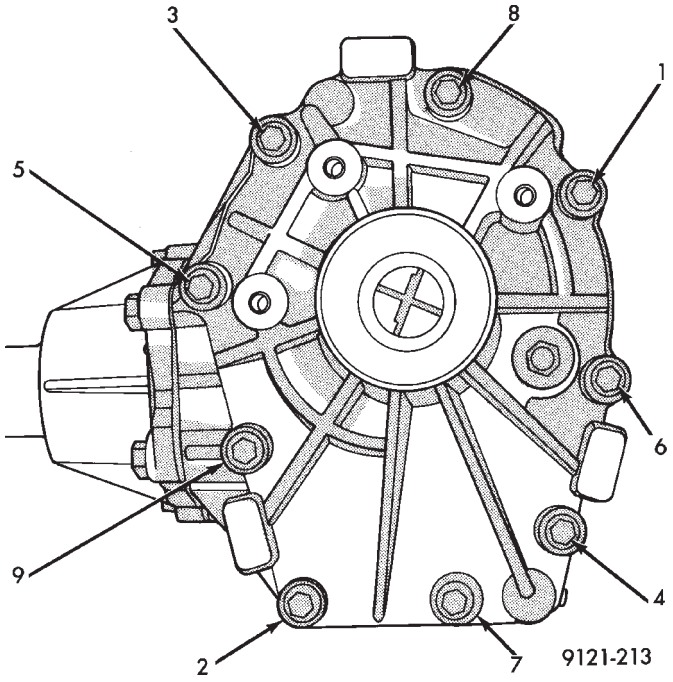

Fig. 41 Bolt Tightening Sequence

(6) Reinstall P.T.U. assembly.
(7) Check and fill fluids as required.

INPUT SHAFT SEAL

REMOVAL

The Power Transfer Unit must be removed from the vehicle to service this seal. Refer to Power Transfer Unit Removal in this section for procedures.

(1) Remove P.T.U. end cover bolts (Fig. 42).
(2) Gently tap on end cover ears to separate cover from case (Fig. 43).
(3) Remove ring gear oil trough (Fig. 44).
(4) Remove input shaft and ring gear from case (Fig. 45).
(5) Use Special Tool No. 7794-A (seal puller) to remove seal (Fig. 46).

INSTALLATION

The Power Transfer Unit must be removed from the vehicle to service this seal. Refer to Power Transfer Unit Removal in this section for procedures.

(1) Clean and inspect seal area.

(2) Lay housing on bench and install new seal with seal driver C-4657 and handle C-4171 (Fig. 47). The seal must be installed with the spring side facing towards the ring gear. Drive the seal in until it bottoms against the case shoulder.

(3) Install input shaft.

(4) Install oil trough.

INPUT SHAFT SEAL (Continued)

(5) Apply Mopar® Gasket Maker or equivalent to sealing surfaces of end cover and reinstall. Tighten bolts to 28 N·m (250 in. lbs.)

CAUTION: When end cover is installed be careful not to damage the P.T.U. Input Shaft Cover Seal.

(6) Reinstall P.T.U. assembly into vehicle.
(7) Check and fill fluids as required.

OUTER HALF SHAFT SEAL

REMOVAL

The outer half shaft seal is located on the outside of the end cover. The P.T.U. does not have to be removed to replace this seal.

(1) Lift vehicle on hoist.
(2) Remove right front half shaft from vehicle.
(3) Remove seal with a chisel and hammer (Fig. 48).

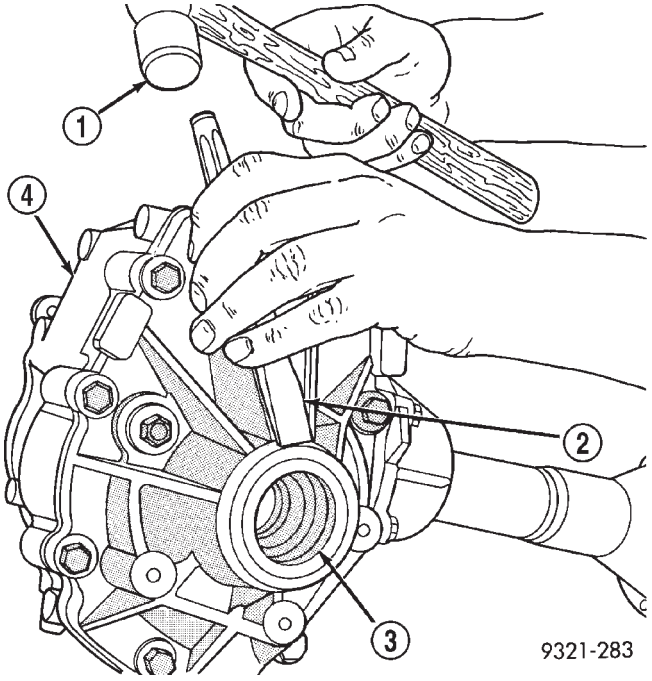

Fig. 48 Seal Removal

1 - HAMMER
2 - CHISEL
3 - SEAL
4 - POWER TRANSFER UNIT

INSTALLATION

The outer half shaft seal is located on the outside of the end cover. The P.T.U. does not have to be removed to replace this seal.

(1) Clean and inspect seal area.
(2) Install new seal with seal installer MD998334 (Fig. 49).

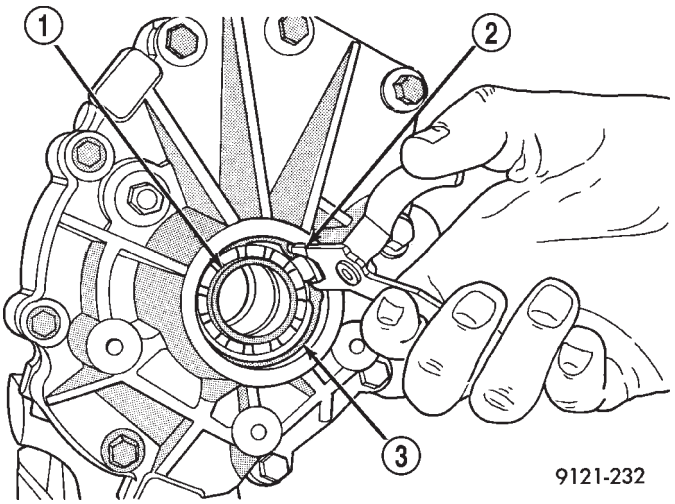

Fig. 49 Seal Installation

31TH AUTOMATIC TRANSAXLE

DESCRIPTION

This transaxle combines torque converter, three speed transmission, final drive gearing, and differential into a front wheel drive system.

Within this transaxle, there are three primary areas:

(1) Main center line plus valve body.

(2) Transfer shaft center line (includes governor and parking sprag).

(3) Differential center line.

Center distances between the main rotating parts in these three areas are held precise to maintain a low noise level.

The torque converter, transaxle area, and differential are housed in an integral aluminum die casting. **The differential oil sump is common with the transaxle sump. Separate filling of the differential is NOT necessary.**

The torque converter is attached to the crankshaft through a flexible driving plate. Cooling of the converter is accomplished by circulating the transaxle fluid through a remote cooler. There are two types of coolers used. An oil-to-water type cooler located in the radiator side tank and/or an oil-to-air heat exchanger. The torque converter assembly is a sealed unit that cannot be disassembled.

The transaxle fluid is filtered by an internal filter attached to the lower side of the valve body assembly.

Engine torque is transmitted to the torque converter and then through the input shaft to multiple-disc clutches in the transaxle. The power flow depends on the application of the clutches and bands. Refer to Elements in Use Chart in Diagnosis and Tests section.

The transaxle consists of:

- Two multiple-disc clutches
- An overrunning clutch
- Two servos
- A hydraulic accumulator
- Two bands
- Two planetary gear sets

This provides three forward ratios and a reverse ratio. The common sun gear of the planetary gear sets is connected to the front clutch by a driving shell. The driving shell is splined to the sun gear and front clutch retainer. The hydraulic system consists of an oil pump and a single valve body which contains all of the valves except the governor valves. The transaxle sump and differential sump are both vented through the dipstick. Output torque from the main center line is delivered through helical gears to the transfer shaft. This gear set is a factor in the transaxle final drive (axle) ratio. The shaft also car-

11 - DIFFERENTIAL

ries the governor and parking sprag. An integral helical gear on the transfer shaft drives the differential ring gear.

OPERATION

Transmission output is directed to an integral differential by a transfer gear system in the following input-to-output ratios:

FIRST	2.69:1
SECOND	1.55:1
THIRD	1.00:1
REVERSE	2.10:1

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PRELIMINARY DIAGNOSIS

Automatic transaxle malfunctions are usually caused by the following general conditions:

- Improper fluid level/condition
- Poor engine performance
- Improper engine or transaxle adjustments
- Transaxle hydraulic malfunctions
- Transaxle mechanical malfunctions

Diagnosis of transaxle problems should always begin with checking the easily accessible variables:

- Fluid level and condition
- Gearshift cable adjustment
- Throttle valve cable adjustment

After verifying or adjusting these variables, road test the vehicle to determine if the problem has been corrected or that further diagnosis is necessary. If the problem still exists, refer to the following diagnosis charts to aid in determining the source or cause of failure.

Hydraulic pressure tests should be performed when a transaxle internal failure is suspected. The hydraulic flow charts, in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for all gear ranges. Normal working pressures are also supplied for each of the gear ranges.

31TH AUTOMATIC TRANSAXLE (Continued)

TRANSAXLE DIAGNOSIS CHARTS

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low	1. Add Fluid
	2. Throttle Linkage Misadjusted	2. Adjust linkage - setting may be too long.
	3. Excessive Pinion Backlash	3. Check per Service Manual. Correct as needed.
	4. Hydraulic Pressure Incorrect	4. Check pressure. Remove, overhaul or adjust valve body as needed.
	5. Band Misadjusted.	5. Adjust rear band.
	6. Valve Body Check Balls Missing.	6. Inspect valve body for proper check ball installation.
	7. Clutch, band or planetary component Damaged.	7. Remove, disassemble and repair transmission as necessary.
	8. Converter Clutch (if equipped) Faulty.	8. Replace converter and flush cooler and line before installing new converter.
DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Misadjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Rear Band Misadjusted.	4. Adjust band.
	5. Valve Body Filter Plugged.	5. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	6. Oil Pump Gears Worn/Damaged.	6. Remove transmission and replace oil pump.
	7. Hydraulic Pressure Incorrect.	7. Perform pressure test, remove transmission and repair as needed.
	8. Reaction Shaft Seal Rings Worn/Broken.	8. Remove transmission, remove oil pump and replace seal rings.
	9. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	9. Remove and disassemble transmission and repair as necessary.
	10. Governor Valve Stuck.	10. Remove and inspect governor components. Replace worn or damaged parts.
	11. Regulator Valve Stuck.	11. Clean.

31TH AUTOMATIC TRANSAXLE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/ Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. Filter Plugged.	3. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary.
	4. Oil Pump Damaged.	4. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	5. Valve Body Malfunctioned.	5. Check press and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	6. Transmission Internal Component Damaged.	6. Remove and disassemble transmission. Repair or replace failed components as needed. Remove and disassemble transmission. Repair or replace failed components as needed.
	7. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck.	7. Remove, disassemble, repair.
	8. Torque Converter Damage.	8. Inspect and replace as required.

31TH AUTOMATIC TRANSAXLE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SHIFTS DELAYED OR ERRATIC (ALSO SHIFTS HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Fluid Filter Clogged.	2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test.
	3. Throttle Linkage Misadjusted.	3. Adjust linkage as described in service section.
	4. Throttle Linkage Binding.	4. Check cable for binding. Check for return to closed throttle at transmission.
	5. Gearshift Linkage/Cable Misadjusted.	5. Adjust linkage/cable as described in service section.
	6. Governor Valve Sticking.	6. Inspect, clean or repair.
	7. Governor Seal Rings Worn/ Damaged.	7. Inspect/replace.
	8. Clutch or Servo Failure.	8. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	9. Front Band Misadjusted.	9. Adjust band.
	10. Pump Suction Passage Leak.	10. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Misadjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Rear Band Misadjusted/Worn.	2. Adjust band; replace.
	3. Valve Body Malfunction.	3. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	4. Rear Servo Malfunction.	4. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary.
	5. Direct Clutch in Overdrive Worn	5. Disassemble overdrive. Replace worn or damaged parts.
	6. Front Clutch Burnt.	6. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Valve, Shaft, Weights or Body Damaged/Stuck.	1. Remove governor assembly and clean or repair as necessary.
	2. Valve Body Malfunction.	2. Stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.
	2. Governor Valve Sticking.	2. Remove, clean and inspect. Replace faulty parts.

31TH AUTOMATIC TRANSAXLE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Valve Sticking.	1. Remove governor, clean, inspect and repair as required.
	2. Valve Body Malfunction.	2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	3. Front Servo Piston Cocked in Bore.	3. Inspect servo and repair as required.
	4. Front Band Linkage Malfunction	4. Inspect linkage and look for bind in linkage.
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Misadjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Floor mat under pedal, accelerator cable worn or brackets bent.
	3. Governor/Valve Body Hydraulic Pressures Too High or Too Low Due to Sticking Governor, Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Valve Body Malfunction.	4. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	5. Valve Body Malfunction.	5. Sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve.
STUCK IN LOW GEAR (WILL NOT UPSHIFT)	1. Throttle Linkage Misadjusted/ Stuck.	1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable.
	2. Gearshift Linkage Misadjusted.	2. Adjust linkage and repair linkage if worn or damaged.
	3. Governor/Valve Body, Governor Valve Stuck Closed; Loose Output Shaft Support or Governor Housing Bolts, Leaking Seal Rings or Valve Body Problem (i.e., Stuck 1- 2 Shift Valve/Gov. Plug).	3. Check line and governor pressures to determine cause. Correct as required.
	4. Front Band Out of Adjustment .	4. Adjust Band.
	5. Clutch or Servo Malfunction.	5. Air pressure check operation of clutches and bands. Repair faulty component.
CREEPS IN NEUTRAL	1. Gearshift Linkage Misadjusted.	1. Adjust linkage.
	2. Rear Clutch Dragging/Warped Welded.	2. Disassemble and repair.
	3. Valve Body Malfunction.	3. Perform hydraulic pressure test to determine cause and repair as required.

31TH AUTOMATIC TRANSAXLE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
BUZZING NOISE	1. Fluid Level Low	1. Add fluid and check for leaks.
	2. Shift Cable Misassembled.	2. Route cable away from engine and bell housing.
	3. Valve Body Misassembled.	3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws.
	4. Pump Passages Leaking	4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts.
	5. Cooling System Cooler Plugged.	5. Flow check cooler circuit. Repair as needed.
	6.Overrunning Clutch Damaged.	6. Replace clutch.
SLIPS IN REVERSE ONLY	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Gearshift Linkage Misadjusted.	2. Adjust linkage.
	3. Rear Band Misadjusted.	3. Adjust band.
	4. Rear Band Worn.	4. Replace as required.
	5. Hydraulic Pressure Too Low.	5. Perform hydraulic pressure tests to determine cause.
	6. Rear Servo Leaking.	6. Air pressure check clutch-servo operation and repair as required.
	7. Band Linkage Binding.	7. Inspect and repair as required.
SLIPS IN FORWARD DRIVE RANGES	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Fluid Foaming.	2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary.
	3. Throttle Linkage Misadjusted.	3. Adjust linkage.
	4. Gearshift Linkage Misadjusted.	4. Adjust linkage.
	5. Rear Clutch Worn.	5. Inspect and replace as needed.
	6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking Governor, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines	6. Perform hydraulic and air pressure tests to determine cause.
	7. Rear Clutch Malfunction, Leaking Seals or Worn Plates.	7. Air pressure check clutch-servo operation and repair as required.
	8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only).	8. Replace Clutch.
SLIPS IN LOW GEAR ″D″ ONLY, BUT NOT IN 1 POSITION	Overrunning Clutch Faulty.	Replace overrunning clutch.

31TH AUTOMATIC TRANSAXLE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
GROWLING, GRATING OR SCRAPING NOISES	1. Drive Plate Broken.	1. Replace.
	2. Torque Converter Bolts Hitting Dust Shield.	2. Dust shield bent. Replace or repair.
	3. Planetary Gear Set Broken/ Seized.	3. Check for debris in oil pan and repair as required.
	4. Overrunning Clutch Worn/Broken.	4. Inspect and check for debris in oil pan. Repair as required.
	5. Oil Pump Components Scored/ Binding.	5. Remove, inspect and repair as required.
	6. Output Shaft Bearing or Bushing Damaged.	6. Remove, inspect and repair as required.
	7. Clutch Operation Faulty.	7. Perform air pressure check and repair as required.
	8. Front and Rear Bands Misadjusted.	8. Adjust bands.
DRAGS OR LOCKS UP	1. Fluid Level Low.	1. Check and adjust level.
	2. Clutch Dragging/Failed	2. Air pressure check clutch operation and repair as required.
	3. Front or Rear Band Misadjusted.	3. Adjust bands.
	4. Case Leaks Internally.	4. Check for leakage between passages in case.
	5. Servo Band or Linkage Malfunction.	5. Air pressure check servo operation and repair as required.
	6. Overrunning Clutch Worn.	6. Remove and inspect clutch. Repair as required.
	7. Planetary Gears Broken.	7. Remove, inspect and repair as required (look for debris in oil pan).
WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Shift Cable Incorrect Routing.	2. Check shift cable for correct routing. Should not touch engine or bell housing.
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.
HARSH 1-2 OR 2-3 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Misadjusted.	1. Adjust linkage/cable.
	2. Neutral Switch Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Neutral Switch Faulty.	3. Refer to service section for test and replacement procedure.
	4. Neutral Switch Connect Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.

31TH AUTOMATIC TRANSAXLE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Misadjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/Burnt.	3. Air pressure test clutch operation. Remove and rebuild if necessary.
OIL LEAKS (ITEMS LISTED REPRESENT POSSIBLE LEAK POINTS AND SHOULD ALL BE CHECKED.	1. Fluid Lines and Fittings Loose/ Leaks/Damaged.	1. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	2. Filler Tube (where tube enters case) Leaks/Damaged.	2. Replace tube seal. Inspect tube for cracks in tube.
	3. Pressure Port Plug Loose Loose/Damaged.	3. Tighten to correct torque. Replace plug or reseal if leak persists.
	4. Pan Gasket Leaks.	4. Tighten pan screws to 150 inch pounds. If leaks persist, replace gasket. Do no over tighten screws.
	5. Valve Body Manual Lever Shaft Seal Leaks/Worn.	5. Replace shaft seal.
	6. Rear Bearing Access Plate Leaks.	6. Replace gasket. Tighten screws.
	7. Gasket Damaged or Bolts are Loose.	7. Replace bolts or gasket or tighten both.
	8. Adapter/Extension Gasket Damaged Leaks/Damaged.	8. Replace gasket.
	9. Neutral Switch Leaks/Damaged.	9. Replace switch and gasket.
	10. Converter Housing Area Leaks.	10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.
	11. Pump Seal Leaks/Worn/ Damaged.	11. Replace seal.
	12. Torque Converter Weld Leak/Cracked Hub.	12. Replace converter.
	13. Case Porosity Leaks.	13. Replace case.

DIAGNOSIS AND TESTING - ROAD TEST

Prior to performing a road test, check the fluid level and throttle valve cable adjustments.

During the road test, the transaxle should be operated in each position to check for slipping and any variation in shifting.

If vehicle operates at high speeds, but has poor acceleration, the converter's overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed for high speeds, the stator clutch may have seized.

Observe closely for slipping or engine speed flare-up. Slipping or flare-up in any gear usually indicates clutch, band, or overrunning clutch problems. If the condition is far advanced, an overhaul will probably be necessary to restore normal operation.

In most cases, the clutch or band that is slipping can be determined by noting the transaxle operation in all selector positions and then comparing which internal units are applied in those positions. The Elements–in–Use Chart provides a basis for road test analysis.

31TH AUTOMATIC TRANSAXLE (Continued)

			CLUTCHES				BANDS	
LEVER POSITION	START SAFETY	PARK SPRAG	FRONT	REAR	LOCKUP	OVER-RUNNING	(KICKDOWN) FRONT	LOW/REV REAR
P - PARK	X	X						
R - REVERSE			X					X
N - NEUTRAL	X							
D - DRIVE								
First				X		X		
Second				X			X	
Third			X	X	X			
2 - SECOND								
First				X		X		
Second				X			X	
1 - Low				X				X

The rear clutch is applied in both the D first gear and 1 first gear positions. Also, the overrunning clutch is applied in D first gear and the low/reverse band is applied in 1 first gear position. If the transaxle slips in D range first gear, but does not slip in 1 first gear, the overrunning clutch is slipping. Similarly, if the transaxle slips in any two forward gears, the rear clutch is slipping.

Using the same procedure, the rear clutch and front clutch are applied in D third gear. If the transaxle slips in third gear, either the front clutch or the rear clutch is slipping. By selecting another gear that does not use one of those units, the unit that is slipping can be determined. If the transaxle also slips in reverse, the front clutch is slipping. If the transaxle does not slip in reverse, the rear clutch is slipping.

The process of elimination can be used to detect any unit that slips and to confirm proper operation of good units. Road testing can usually diagnose slipping units, although the actual cause of the problem may not be detected. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Therefore, unless the condition is obvious, the transaxle should never be disassembled until hydraulic pressure tests have been performed.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TESTS

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most transaxle problems.

Before performing pressure tests, check fluid level and condition, as well as control cable adjustments. Fluid must be at operating temperature (150-200 degrees F.).

Install an engine tachometer. Raise vehicle on a hoist that allows front wheels to turn, and position tachometer so it can be read.

Disconnect throttle cable and shift cable from transaxle levers so they can be controlled from outside the vehicle.

Attach 100 psi gauges (C-3292) to ports required for test being conducted. A 300 psi gauge (C-3293SP) is required for reverse pressure test at rear servo.

Test port locations are shown in (Fig. 1).

TEST ONE (SELECTOR IN 1)

(1) Attach gauges to line and low-reverse ports.

(2) Operate engine at 1000 rpm for test.

(3) Move selector lever on transaxle all the way rearward (1 position).

(4) Read pressures on both gauges as throttle lever on transaxle is moved from full clockwise position to full counterclockwise position.

31TH AUTOMATIC TRANSAXLE (Continued)

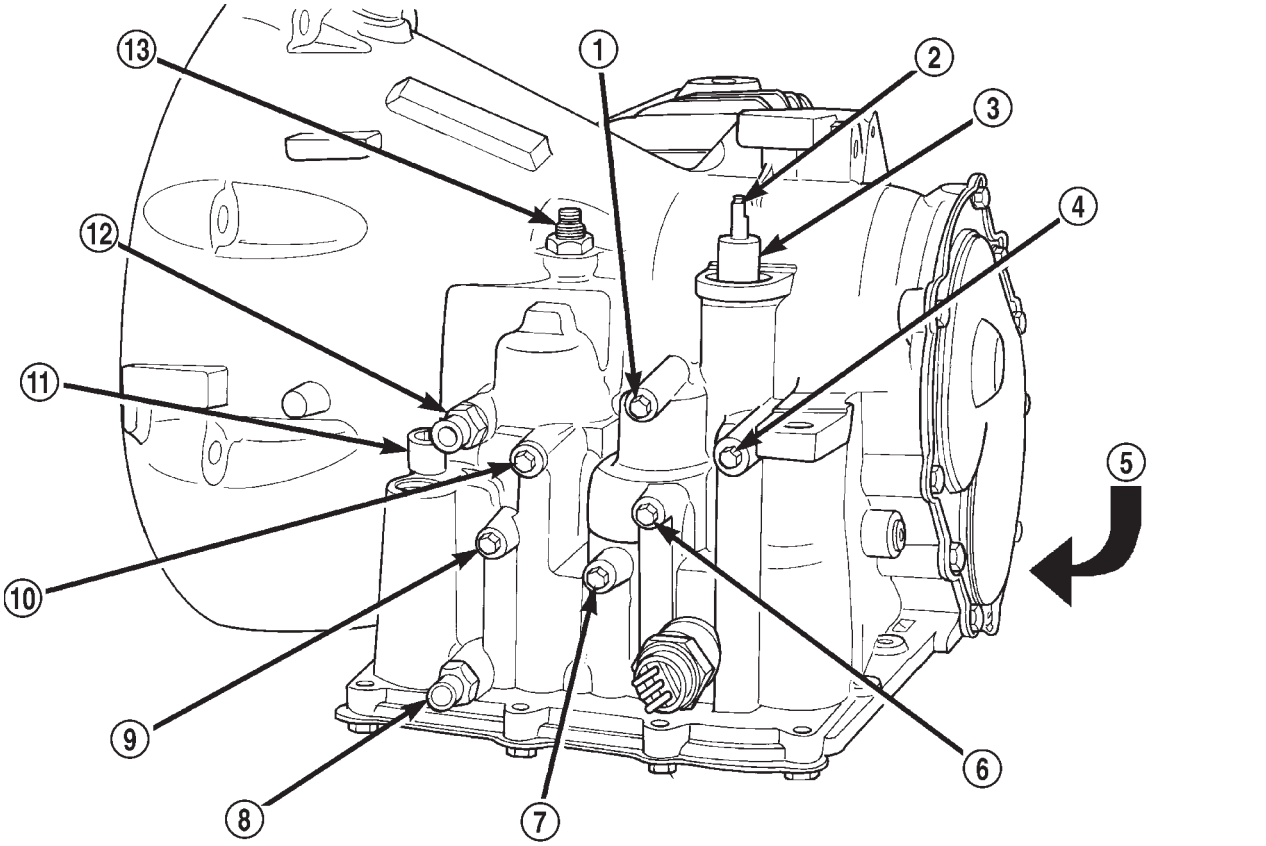

Fig. 1 Test Port Locations

10 - KICKDOWN APPLY
11 - CONVERTER CLUTCH SOLENOID CONNECTOR
12 - FROM COOLER
13 - KICKDOWN BAND ADJUSTING SCREW

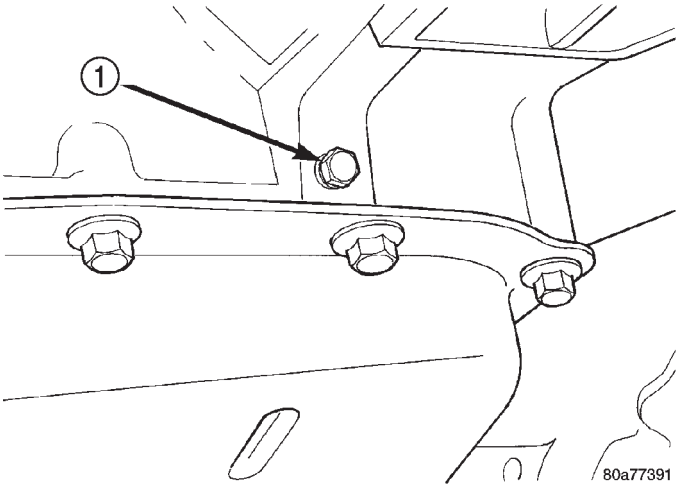

Fig. 2 Governor Pressure Tap

1 - GOVERNOR PRESSURE PLUG

(5) Line pressure should read 52 to 58 psi with throttle lever clockwise. Pressure should gradually increase to 80 to 88 psi.as lever is moved counter-clockwise.

(6) Low/reverse pressure should read the same as line pressure, within 3 psi.

(7) This tests pump output, pressure regulation, and condition of rear clutch and rear servo hydraulic circuits.

TEST TWO (SELECTOR IN 2)

(1) Attach one gauge to line pressure port, and tee another gauge into lower cooler line fitting. This will allow lubrication pressure readings to be taken.

(2) Operate engine at 1000 rpm for test.

(3) Move selector lever on transaxle one detent forward from full rearward position. This is selector 2 position.

(4) Read pressures on both gauges as throttle lever on transaxle is moved from full clockwise position to full counterclockwise position.

(5) Line pressure should read 52 to 58 psi with throttle lever clockwise. Pressure should gradually increase to 80 to 88 psi. as lever is moved counterclockwise.

(6) Lubrication pressure should be 10 to 25 psi with lever clockwise and 10 to 35 psi with lever at full counterclockwise.

(7) This tests pump output, pressure regulation, and condition of rear clutch and lubrication hydraulic circuits.

TEST THREE (SELECTOR IN D)

(1) Attach gauges to line and kickdown release ports.

(2) Operate engine at 1600 rpm for test.

(3) Move selector lever on transaxle two detents forward from full rearward position. This is selector D position.

(4) Read pressures on both gauges as throttle lever on transaxle is moved from full clockwise to the full counterclockwise position.

(5) Line pressure should read 52 to 58 psi with throttle lever clockwise. Pressure should gradually increase to 80 to 88 psi. as lever is moved counterclockwise.

(6) Kickdown release is pressurized only in direct drive and should be same as line pressure within 3 psi, up to kickdown point.

(7) This tests pump output, pressure regulation, and condition of rear clutch, front clutch, and hydraulic circuits.

TEST FOUR (SELECTOR IN REVERSE)

(1) Attach 300 psi gauge (C-3292SP) to low-reverse port.

(2) Operate engine at 1600 rpm for test.

(3) Move selector lever on transaxle four detents forward from full rearward position. This is selector R position.

(4) Low/reverse pressure should read 180 to 220 psi with throttle lever clockwise. Pressure should gradually increase to 260 to 300 psi. as lever is moved counterclockwise.

(5) This tests pump output, pressure regulation, and condition of front clutch and rear servo hydraulic circuits.

(6) Move selector lever on transaxle to D position to check that low/reverse pressure drops to zero.

(7) This tests for leakage into rear servo, due to case porosity, which can cause reverse band burn out.

TEST RESULT INDICATIONS

(1) If proper line pressure, minimum to maximum, is found in any one test, the pump and pressure regulator are working properly.

(2) Low pressure in D, 1, and 2 but correct pressure in R, indicates rear clutch circuit leakage.

(3) Low pressure in D and R, but correct pressure in 1 indicates front clutch circuit leakage.

(4) Low pressure in R and 1, but correct pressure in 2 indicates rear servo circuit leakage.

(5) Low line pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.

GOVERNOR PRESSURE

Test only if transaxle shifts at wrong vehicle speeds when throttle cable is correctly adjusted.

(1) Connect a 100 psi gauge to governor pressure port. It is located at lower right side of case, below differential cover (Fig. 2).

(2) Operate transaxle in third gear to read pressures. The governor pressure should respond smoothly to changes in mph and should return to 0 to 3 psi when vehicle is stopped. High pressure (above 3 psi) at standstill will prevent the transaxle from downshifting.

THROTTLE PRESSURE

No gauge port is provided for throttle pressure. Incorrect throttle pressure should be suspected if part throttle upshift speeds are either delayed or occur too early in relation to vehicle speed. Engine runaway on shifts can also be an indicator of low throttle pressure setting, or misadjusted throttle cable.

In no case should throttle pressure be adjusted until the transaxle throttle cable adjustment has been verified to be correct.

31TH AUTOMATIC TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - TORQUE CONVERTER HOUSING FLUID LEAKAGE

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

(1) Verify proper transmission fluid level.

(2) Verify that the leak originates from the converter housing area and is transmission fluid.

(3) Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (Fig. 3). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

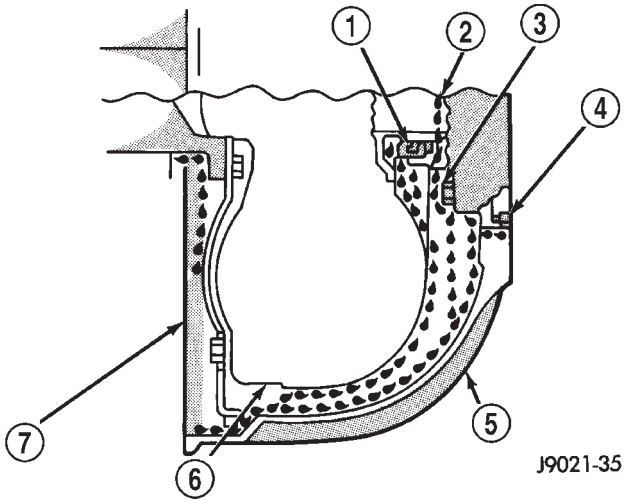

Fig. 3 Converter Housing Leak Paths

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal leaks tend to move along the drive hub and onto the rear of the converter (Fig. 3). Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing (Fig. 3).

TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (Fig. 4).
- Torque converter hub weld (Fig. 4).

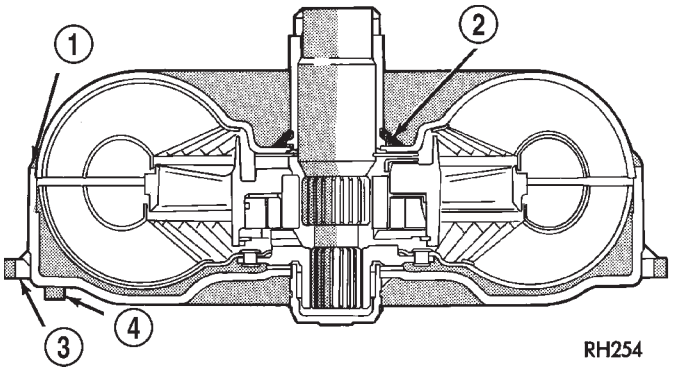

Fig. 4 Converter Leak Points—Typical

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

DIAGNOSIS AND TESTING - CLUTCH AND SERVO AIR PRESSURE TESTS

A no drive condition might exist even with correct fluid pressure, because of inoperative clutches or bands. The inoperative units, clutches, bands, and servos can be located through a series of tests. This is done by substituting air pressure for fluid pressure (Fig. 5).

The front and rear clutches, kickdown servo, and low-reverse servo may be tested by applying air pressure to their respective passages. To make air pressure tests, proceed as follows:

NOTE: Compressed air supply must be free of all dirt or moisture. Use a pressure of 30 psi.

Remove oil pan and valve body. Refer to Valve Body for removal procedure.

FRONT CLUTCH

Apply air pressure to front clutch apply passage and listen for a dull thud which indicates that front clutch is operating. Hold air pressure on for a few seconds and inspect system for excessive oil leaks.

31TH AUTOMATIC TRANSAXLE (Continued)

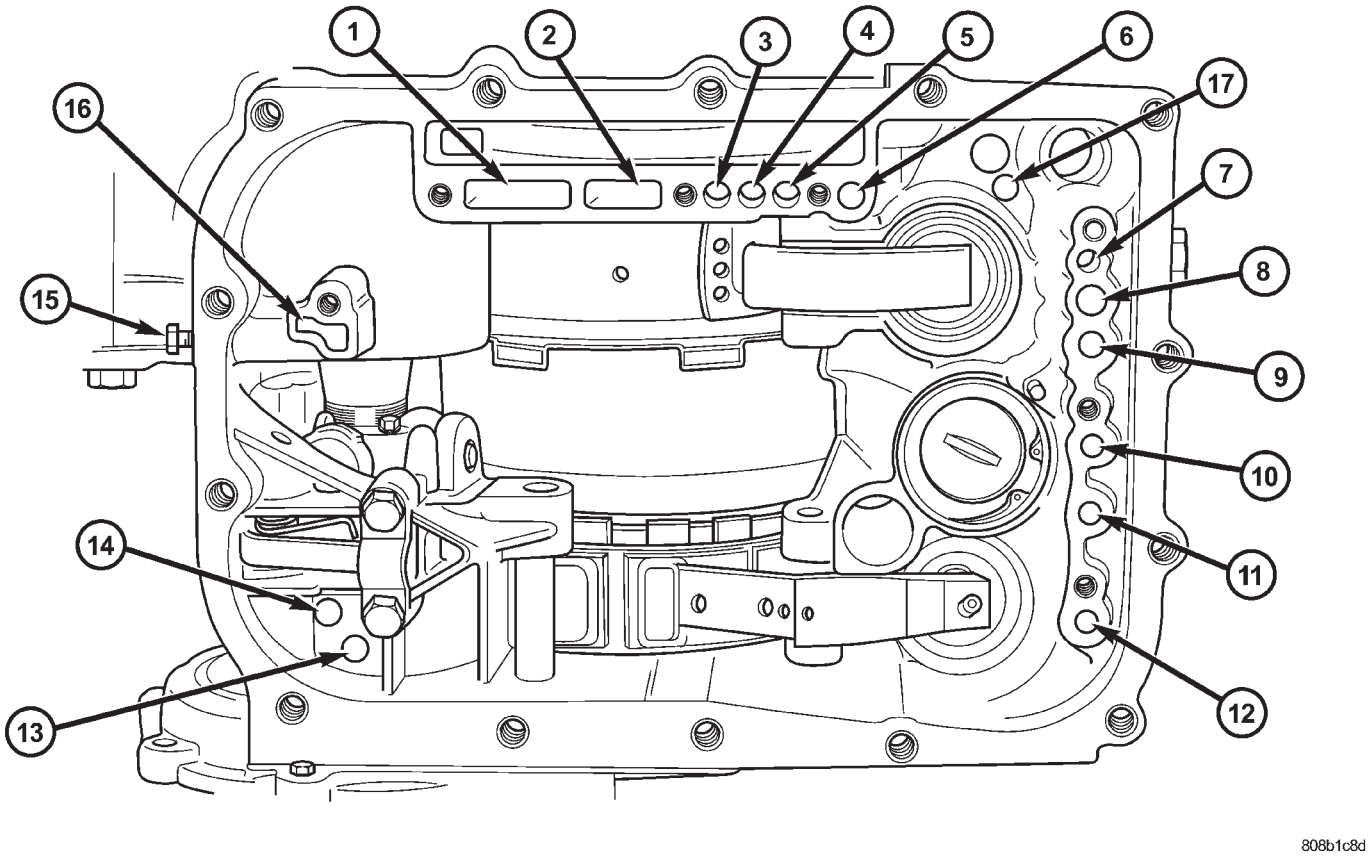

Fig. 5 Air Pressure Tests

1 - PUMP SUCTION	7 - TO OIL COOLER	13 - GOVERNOR PRESSURE
2 - PUMP PRESSURE	8 - KICKDOWN SERVO OFF	14 - LINE PRESSURE TO GOVERNOR
3 - FRONT CLUTCH APPLY	9 - KICKDOWN SERVO ON	15 - GOVERNOR PRESSURE PLUG
4 - REAR CLUTCH APPLY	10 - ACCUMULATOR OFF	16 - GOVERNOR PRESSURE
5 - TO TORQUE CONVERTER	11 - ACCUMULATOR ON	17 - BYPASS VALVE BORE
6 - FROM TORQUE CONVERTER	12 - LOW-REVERSE SERVO APPLY	

REAR CLUTCH

Apply air pressure to rear clutch apply passage and listen for a dull thud which indicates that rear clutch is operating. Also inspect for excessive oil leaks. If a dull thud cannot be heard in the clutches, place finger tips on clutch housing and again apply air pressure. Movement of piston can be felt as the clutch is applied.

KICKDOWN SERVO (FRONT)

Direct air pressure into KICKDOWN SERVO ON passage. Operation of servo is indicated by a tightening of front band. Spring tension on servo piston should release the band.

LOW AND REVERSE SERVO (REAR)

Direct air pressure into LOW-REVERSE SERVO APPLY passage. Operation of servo is indicated by a tightening of rear band. Spring tension on servo piston should release the band.

If clutches and servos operate properly, no upshift indicates that a malfunction exists in the valve body.

31TH AUTOMATIC TRANSAXLE (Continued)

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transaxle case and valve body can be repaired by the use of Heli-Coils, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tapping the hole with a Heli-Coil tap, or equivalent, and installing a Heli-Coil insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove fluid level indicator tube bolt and tube/indicator assembly (Fig. 6). Plug opening to prevent debris intrusion.

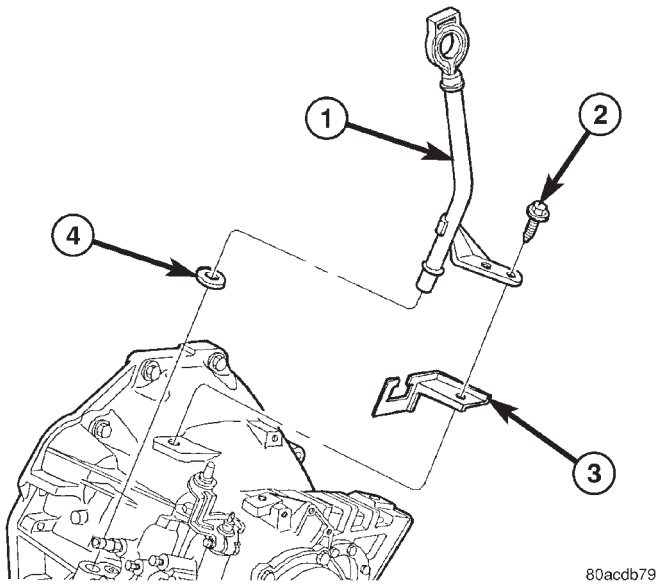

Fig. 6 Fluid Level Indicator Assembly

1 - INDICATOR ASSEMBLY
2 - BOLT
3 - KICKDOWN CABLE BRACKET
4 - SEAL

(3) Disconnect torque converter clutch solenoid (TCC) connector.

(4) Disconnect kickdown cable from lever and bracket (Fig. 7). Position out of way.

(5) Disconnect gearshift cable from manual valve lever and upper mount bracket (Fig. 8). Position out of way.

(6) Disconnect back-up lamp switch connector.

(7) Remove upper two (2) transaxle-to-engine bolts.

2 - TOOL 8266–2
3 - TOOL C-3339

(22) Lower engine/transaxle assembly.
(23) Obtain transmission jack and helper.
(24) Remove remaining transaxle-to-engine bolts and remove transaxle assembly from vehicle.

DISASSEMBLY

CAUTION: If transaxle failure has occured, it is necessary to flush the transaxle oil cooler and lines to remove debris and particles that could contaminate and/or fail a new or rebuilt unit. (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE)

NOTE: This procedure does not include disassembly of final drive (differential) components. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/FINAL DRIVE - DISASSEMBLY)

(1) Measure input shaft end play before disassembly using Tool 8266 and dial indicator C-3339 (Fig. 15):
(a) Set up tools as shown in (Fig. 15).
(b) Move input shaft in and out to obtain end play reading. End play specifications are 0.19 to 1.50 mm (0.008 to 0.060 inch).
(c) Record indicator reading for reference when reassembling the transaxle.
(2) Remove transaxle oil pan-to-case bolts (Fig. 16).

ACCUMULATOR

DESCRIPTION

The accumulator (Fig. 105) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case.

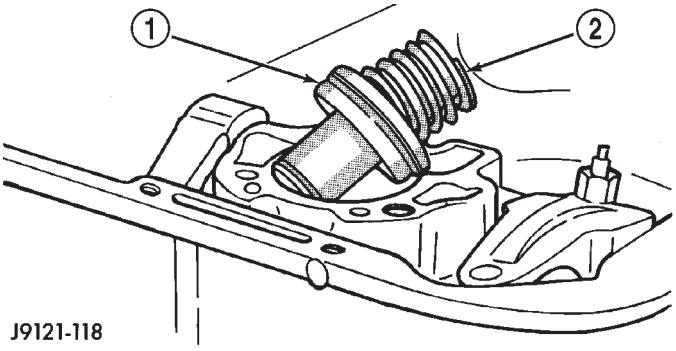

Fig. 105 Accumulator

1 - ACCUMULATOR PISTON
2 - PISTON SPRING

OPERATION

Line pressure is directed between the lands of the piston (Fig. 106), bottoming it against the accumulator plate. The accumulator stays in this position after the transmission is placed into a Drive position. When the 1-2 upshift occurs (Fig. 107), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

NOTE: The accumulator is shown in the inverted position for illustrative purposes.

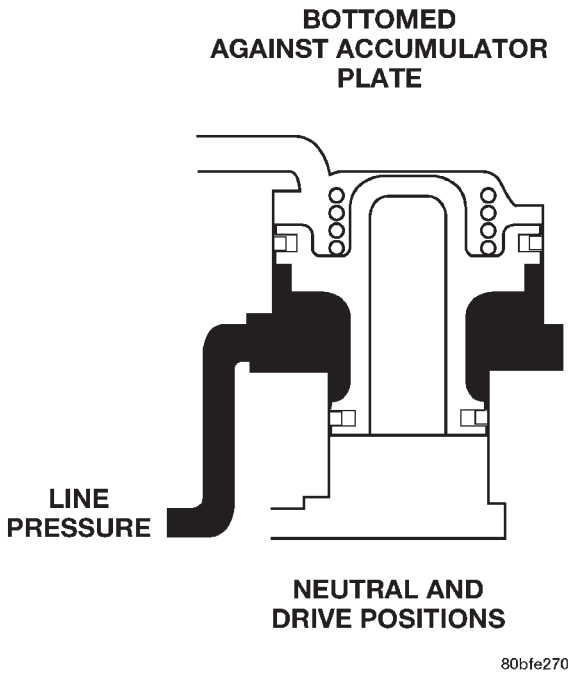

Fig. 106 Accumulator in Neutral and Drive Positions

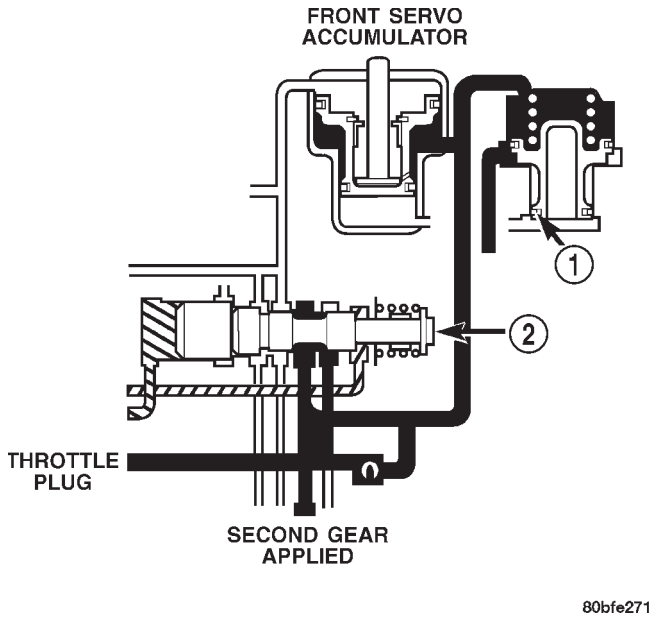

Fig. 107 Accumulator in Second Gear Position

2 - SHUTTLE VALVE

BANDS

DESCRIPTION

KICKDOWN (FRONT) BAND

DESCRIPTION

The kickdown, or “front”, band (Fig. 108) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/ wrap the drum that it holds).

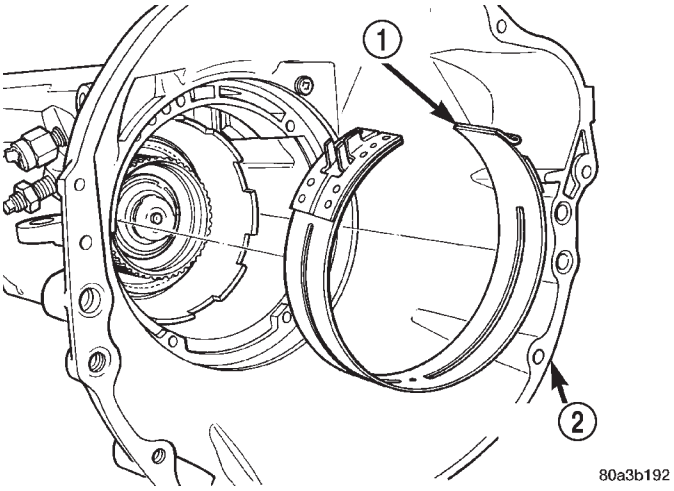

Fig. 108 Front Band—Typical

1 - FRONT BAND
2 - TRANSMISSION HOUSING

OPERATION

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

OPERATION

LOW/REVERSE (REAR) BAND

DESCRIPTION

The low/reverse band, or “rear”, band (Fig. 109) is similar in appearance and operation to the front band. The rear band is also a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

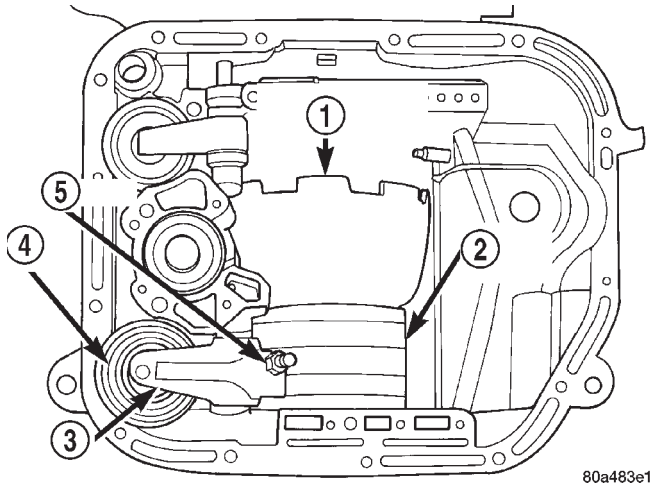

Fig. 109 Rear Band

1 - PLANETARY GEARTRAIN
2 - REAR BAND
3 - LEVER
4 - SERVO
5 - ADJUSTER

OPERATION

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

ADJUSTMENTS

ADJUSTMENT - FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

(1) Disconnect battery negative cable.
(2) Remove air cleaner assembly.
(3) Loosen band adjusting screw locknut (Fig. 110). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.
(4) Tighten band adjusting screw to 8 N·m (72 in. lbs.).
(5) Back off front band adjusting screw 2¼ turns.
(6) Hold adjuster screw in position and tighten locknut to 47 N·m (35 ft. lbs.) torque.
(7) Install air cleaner assembly.
(8) Connect battery negative cable.

ADJUSTMENTS - REAR BAND

The transmission oil pan must be removed for access to the rear (low/reverse) band adjusting screw.

(1) Raise vehicle.

BANDS (Continued)

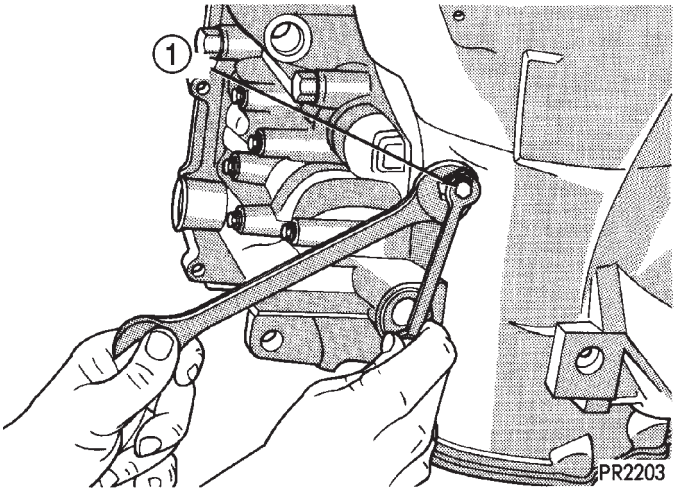

Fig. 110 Front (Kickdown) Band Adjustment Location

1 - KICKDOWN BAND ADJUSTING SCREW

(2) Remove transaxle oil pan and drain fluid (Fig. 111) (Fig. 112).

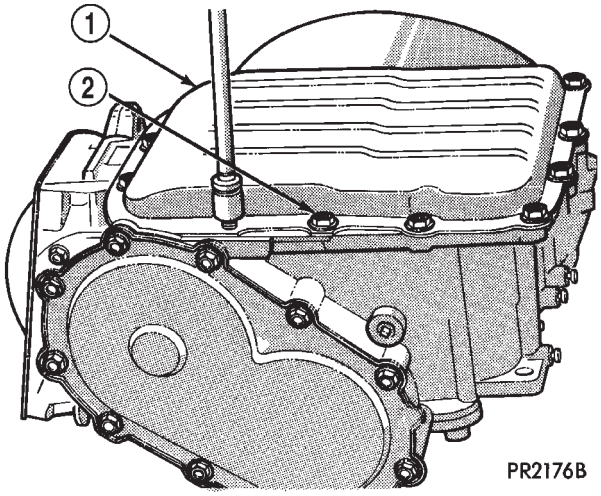

Fig. 111 Transaxle Oil Pan Bolts

1 - TRANSAXLE OIL PAN
2 - OIL PAN BOLTS

(3) Loosen band adjusting screw locknut 5-6 turns. Be sure adjusting screw turns freely in lever.

(4) Tighten adjusting screw to 5 N·m (41 in. lbs.) (Fig. 113).

(5) Back off adjusting screw 3½ turns.

(6) Hold adjusting screw in place and tighten locknut to 14 N·m (125 ft. lbs.) torque.

(7) Install a bead of Mopar® Silicone Rubber Adhesive Sealant to the oil pan and install to case immediately.

(8) Install oil pan-to-case bolts and torque to 19 N·m (165 in. lbs.).

(9) Lower vehicle and refill transmission with Mopar® ATF Plus 4, Type 9602, fluid.

CLUTCH - FRONT

DESCRIPTION

The front clutch assembly (Fig. 119) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump. It is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack. In some transmissions, the snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

DISASSEMBLY

(1) Remove front clutch waved snap ring using a suitable screwdriver (Fig. 114).

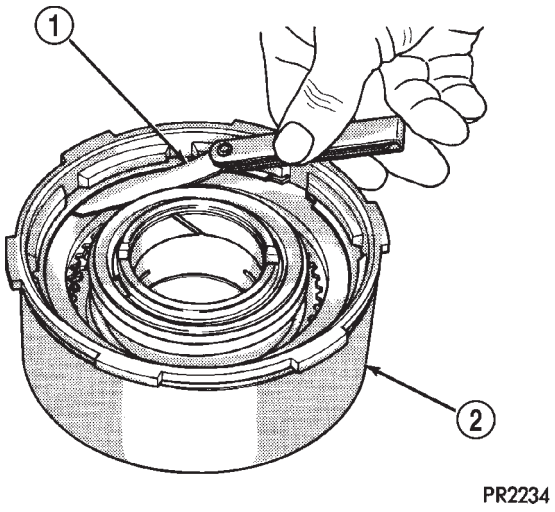

Fig. 125 Measuring Front Clutch Plate Clearance

1 - FEELER GAUGE
2 - FRONT CLUTCH ASSEMBLY

CLUTCH - REAR

DESCRIPTION

The rear clutch assembly (Fig. 132) is composed of the input shaft, rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack. In some transmissions, the snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

CLUTCH - REAR (Continued)

DISASSEMBLY

(1) Remove rear clutch snap ring (Fig. 126) (Fig. 132).

FINAL DRIVE

DISASSEMBLY

NOTE: The differential is serviced as an assembly. Service is limited to bearing cups and cones. Any other failure must be repaired by differential assembly and transfer shaft replacement.

(1) Remove transfer shaft.
(2) Measure differential bearing turning torque. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/BEARINGS - ADJUSTMENTS)
(3) Remove adapter plate seal.
(4) Remove differential cover-to-transaxle case bolts (Fig. 140).

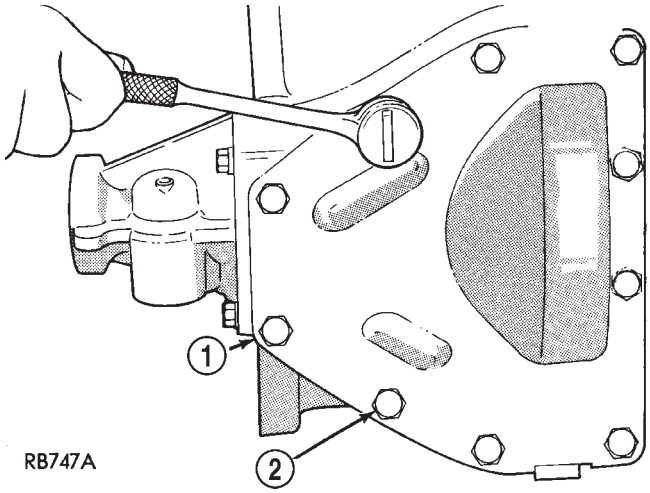

Fig. 140 Differential Cover Bolts

1 - DIFFERENTIAL COVER
2 - DIFFERENTIAL COVER BOLT

FINAL DRIVE (Continued)

(5) Remove differential cover (Fig. 141). Clean surfaces of old adhesive prior to reassembly.

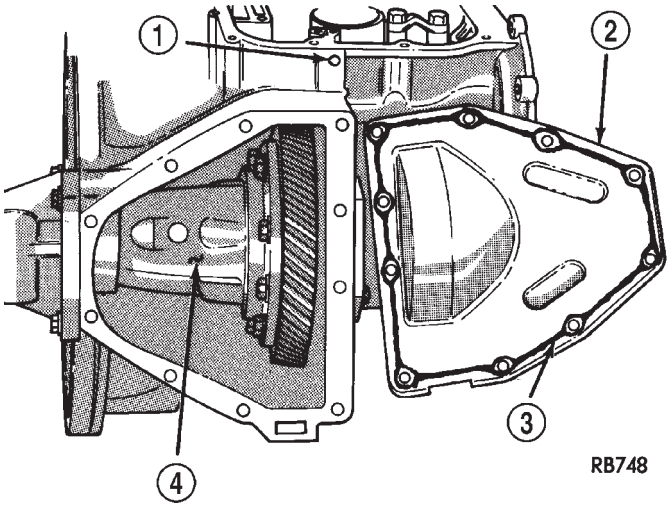

Fig. 141 Remove Differential Cover

1 - GOVERNOR PRESSURE PLUG
2 - DIFFERENTIAL COVER
3 - 1/8 INCH BEAD OF R T V SEALANT
4 - DIFFERENTIAL ASSEMBLY

(6) Remove bearing retainer axle seal using slide hammer C-637 and Tool 7794A, or Tool L-4518.

(7) Remove differential bearing retainer-to-transaxle case bolts (Fig. 142).

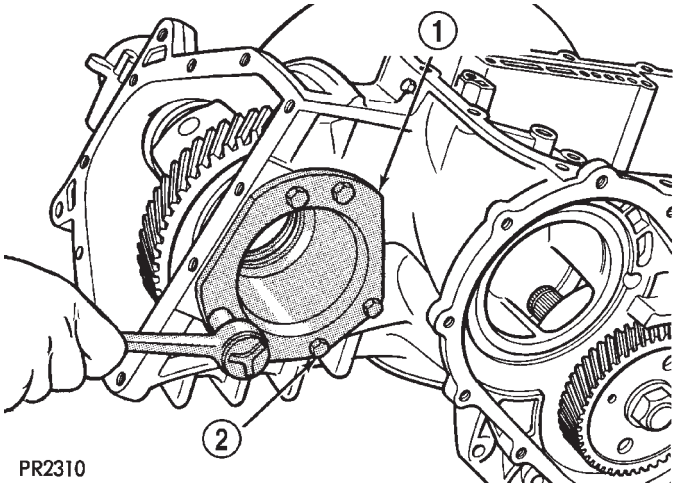

Fig. 142 Differential Bearing Retainer Bolts

1 - DIFFERENTIAL BEARING RETAINER
2 - DIFFERENTIAL BEARING RETAINER BOLTS (6)

(8) Remove bearing retainer from transaxle. Use to L-4435 to aid in removal by rotating retainer out of assembly (Fig. 143). Clean surfaces of old adhesive prior to reassembly.

(9) Remove adapter plate-to-transaxle case bolts.

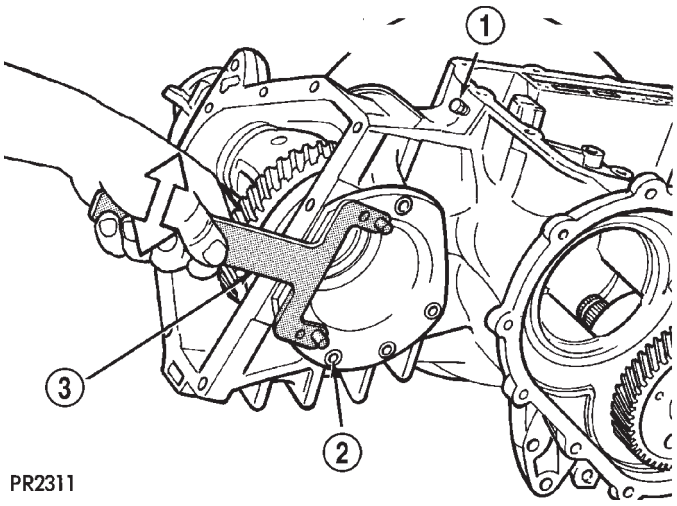

Fig. 143 Remove Bearing Retainer Using Tool L-4435

1 - GOVERNOR PRESSURE PLUG
2 - DIFFERENTIAL BEARING RETAINER
3 - SPECIAL TOOL L-4435

WARNING: HOLD ON TO DIFFERENTIAL WHILE REMOVING EXTENSION HOUSING TO PREVENT IT FROM ROLLING OUT OF TRANSAXLE.

(10) Remove extension housing from transaxle case. Use Tool L-4435 to aid in removal by rotating plate out of assembly. Clean surfaces of old adhesive prior to reassembly.

(11) Measure and record differential side gear end play using dial indicator C-3339 and Tool C-4995 as shown in (Fig. 144) and (Fig. 145). **Side gear end play must be within 0.001-0.013 in. Replace differential assembly if outside this range.**

2 - DIFFERENTIAL BEARING RETAINER
3 - SPECIAL TOOL L-4435

(9) Install and torque bearing retainer bolts to 34 N·m (25 ft. lbs.) torque (Fig. 159).

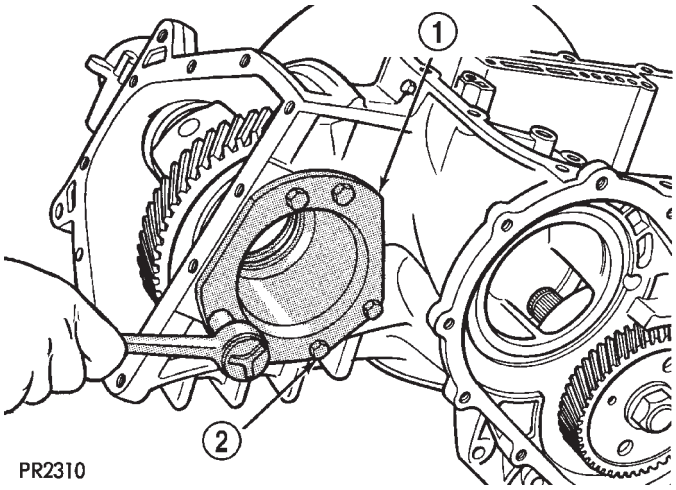

Fig. 159 Differential Bearing Retainer Bolts

1 - DIFFERENTIAL BEARING RETAINER
2 - DIFFERENTIAL BEARING RETAINER BOLTS (6)

(10) Install bearing retainer axle seal using Tool L-4520 (inverted), and driver handle C-4171 (Fig. 160).

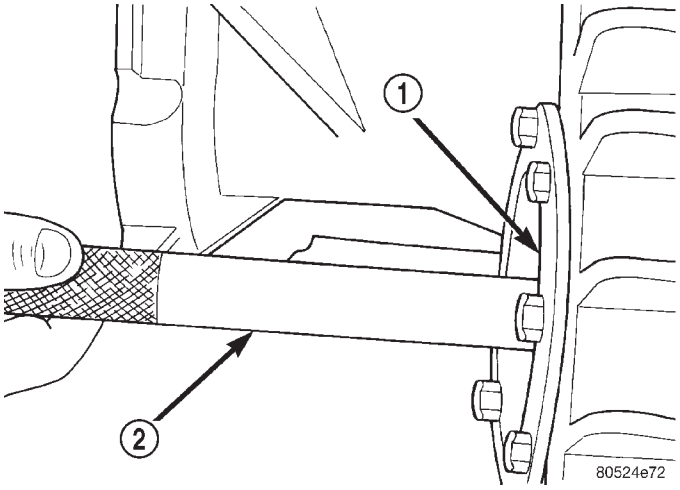

Fig. 160 Install Bearing Retainer Axle Seal

1 - SPECIAL TOOL L-4520
2 - SPECIAL TOOL C-4171

FINAL DRIVE (Continued)

(11) Install adapter plate axle seal using Tool L-4520 (inverted), and driver handle C-4171.

(12) Check differential turning torque. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/BEARINGS - ADJUSTMENTS)

(13) Apply an 1/8" bead of Mopar® Silicone Rubber Adhesive Sealant to the differential cover (Fig. 161).

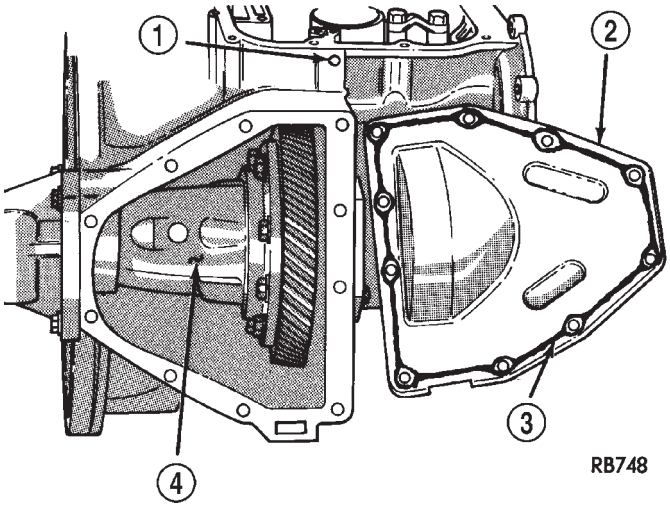

Fig. 161 Install Differential Cover

1 - GOVERNOR PRESSURE PLUG
2 - DIFFERENTIAL COVER
3 - 1/8 INCH BEAD OF R T V SEALANT
4 - DIFFERENTIAL ASSEMBLY

(14) Install differential cover-to-transaxle case bolts and torque to 19 N·m (165 in. lbs.) torque (Fig. 162).

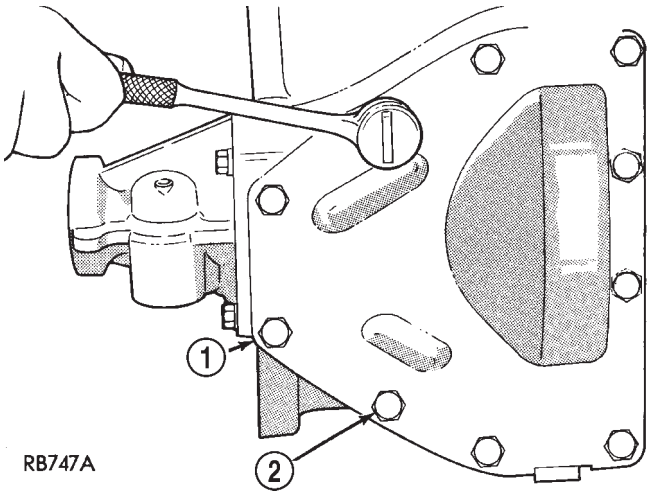

Fig. 162 Differential Cover Bolts

1 - DIFFERENTIAL COVER
2 - DIFFERENTIAL COVER BOLT

(15) Install transfer shaft and related components.

ADJUSTMENTS

ADJUSTMENT - DIFFERENTIAL BEARING

NOTE: Transfer shaft MUST be removed from transaxle to obtain an accurate differential turning torque measurement.

Differential turning torque should be measured and adjusted during any transaxle or differential teardown/assembly, or if any of the following parts are replaced:

- Transaxle case
- Differential carrier
- Differential bearing retainer
- Extension housing
- Differential bearing cups and cones

(1) Position the transaxle assembly vertically on the support stand, differential bearing retainer side up.

(2) Install Tool L-4436A into the differential and onto the pinion mate shaft (Fig. 163).

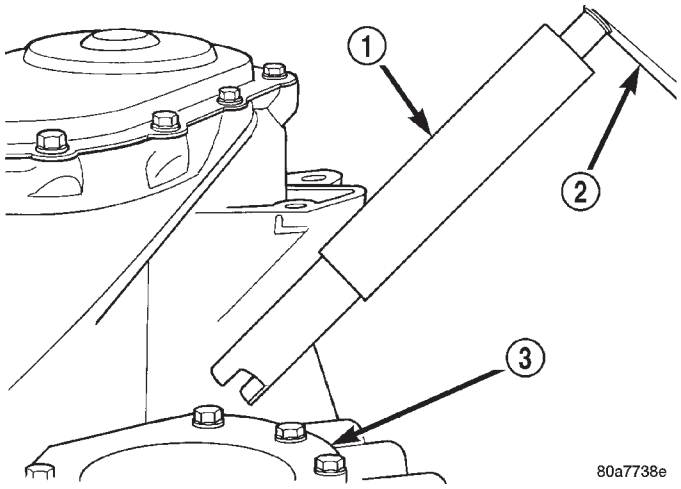

Fig. 163 Tool L-4436 and Torque Wrench

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH
3 - DIFFERENTIAL BEARING RETAINER

(3) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

FINAL DRIVE (Continued)

(4) Using Tool L-4436A and an inch-pound torque wrench, check the turning torque of the differential (Fig. 164). **Turning torque should be within 5–18 in. lbs.**

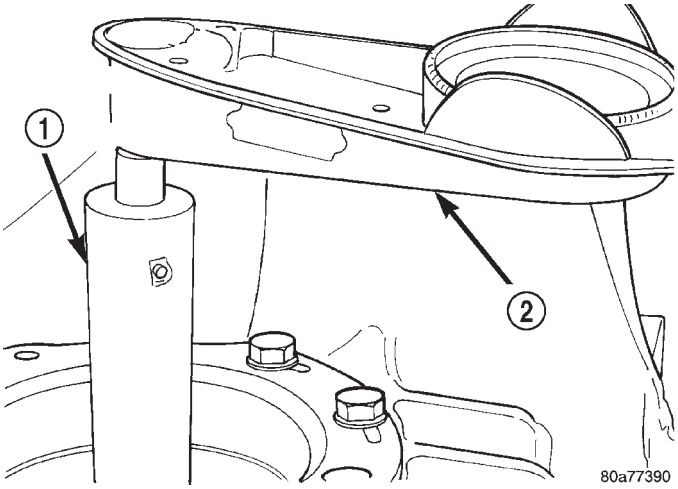

Fig. 164 Checking Differential Bearings Turning Torque

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH

(5) If the turning torque is within specifications, remove tools. Setup is complete.

(6) If turning torque is not within specifications proceed with the following steps to obtain proper shim selection:

(a) Remove differential bearing retainer from the transaxle case.

(b) Remove the bearing cup from the differential bearing retainer using Tool 6062A.

(c) Remove the existing shim from under the cup.

(d) Measure the existing shim.

NOTE: If the turning torque was too high when measured, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is was too low, install a 0.05 mm (0.002 inch) thicker shim. Repeat until 5 to 18 inch-pounds turning torque is obtained. Refer to the "Differential Bearing Shim Chart." Oil Baffle is not required when making shim selection.

(e) Install the proper shim under the bearing cup. Make sure the oil baffle is installed properly in the bearing retainer, below the bearing shim and cup.

(f) Install the differential bearing cup, shim, and oil baffle using Tool 5052 and C-4171. Seal the retainer to the housing with MOPAR® Silicone Rubber Adhesive Sealant and torque bolts to 28 N·m (250 in. lbs.).

DIFFERENTIAL BEARING SHIM CHART

(7) Using Tool L-4436A and an inch-pound torque wrench, recheck differential turning torque. **Turning torque should be within 5–18 in. lbs.**

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL AND CONDITION CHECK

NOTE: The transmission and differential sump have a common oil sump with a communicating opening between the two.

FLUID LEVEL CHECK

The torque converter fills in both the P Park and N Neutral positions. Place the selector lever in P Park to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground. This will assure complete oil level stabilization between differential and transmission.** The fluid should be at normal operating temperature (approximately 82 C. or 180 F.). The fluid level is correct if it is in the HOT region (cross-hatched area) on the fluid level indicator (Fig. 165).

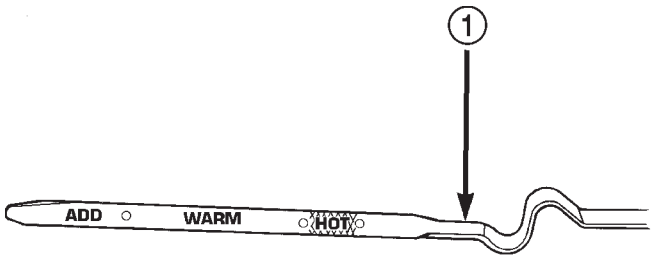

Fig. 165 Fluid Level Indicator Markings

1 - TRANSAXLE DIPSTICK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transaxle has too much fluid, the gears churn up foam and cause the same conditions which occur with a low fluid level.

In either case, the air bubbles can cause overheating, fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and servo operation. Foaming can also result in fluid escaping from the transaxle dipstick where it may be mistaken for a leak.

FLUID CONDITION

Along with fluid level, it is important to check the condition of the fluid. Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602) when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition, or the need for a fluid change.**

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

STANDARD PROCEDURE - FLUID AND FILTER CHANGE

NOTE: For the recommended maintenance (fluid/filter change) intervals for this transaxle, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

NOTE: Only fluids of the type labeled Mopar® ATF+4 (Automatic Transmission Fluid) Type 9602 should be used. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transaxle is disassembled for any reason, the fluid and filter should be changed.

FLUID/FILTER SERVICE (RECOMMENDED)

(1) Raise vehicle on a hoist. Place a drain container with a large opening, under transaxle oil pan.

(2) Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.

(3) Remove oil filter-to-valve body screws (Fig. 166).

(4) Remove oil filter and gasket (Fig. 167).

(5) Install a new filter and gasket (Fig. 167).

(6) Clean the oil pan and magnet. Reinstall pan using new Mopar® Silicone Rubber Adhesive Sealant. Torque oil pan bolts to 19 N·m (165 in. lbs.).

(7) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602) through the dipstick opening.

FLUID (Continued)

3 - OIL FILTER SCREWS (2)
4 - OIL FILTER

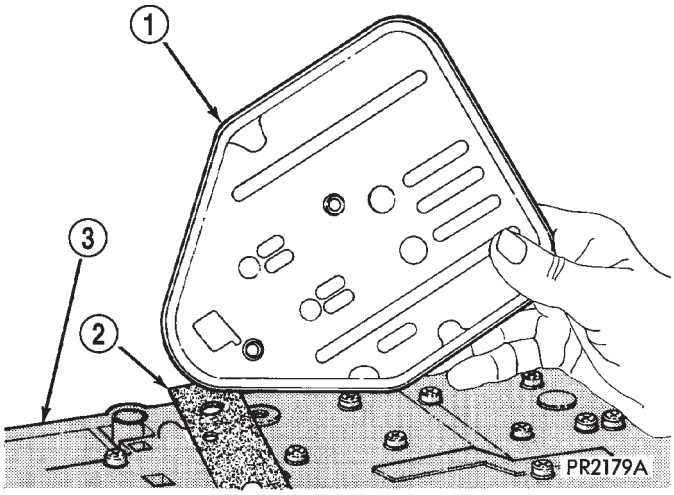

Fig. 167 Oil Filter and Gasket

1 - OIL FILTER
2 - GASKET
3 - VALVE BODY

(8) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(9) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the “ADD” mark on the dipstick (Fig. 168).

(10) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/FLUID - STANDARD PROCEDURE)

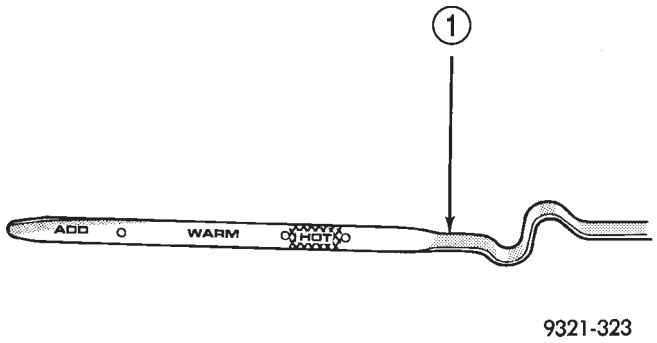

Fig. 168 Dipstick Markings

1 - TRANSAXLE DIPSTICK

(11) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

DIPSTICK TUBE FLUID SUCTION METHOD (ALTERNATIVE)

(1) When performing the fluid suction method, make sure the transaxle is at full operating temperature.

(2) To perform the dipstick tube fluid suction method, use a suitable fluid suction device (Vacula™ or equivalent).

(3) Insert the fluid suction line into the dipstick tube.

NOTE: Verify that the suction line is inserted to the lowest point of the transaxle oil pan. This will ensure complete evacuation of the fluid in the pan.

(4) Follow the manufacturers recommended procedure and evacuate the fluid from the transaxle.

(5) Remove the suction line from the dipstick tube.

(6) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602) through the dipstick opening.

(7) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(8) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the “ADD” mark on the dipstick (Fig. 168).

(9) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/FLUID - STANDARD PROCEDURE)

(10) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

GEAR SHIFT CABLE

REMOVAL

(1) Disconnect battery negative cable.
(2) Disconnect gear shift cable at manual valve lever (Fig. 169).
(3) Disconnect gear shift cable from upper mount bracket (Fig. 169).

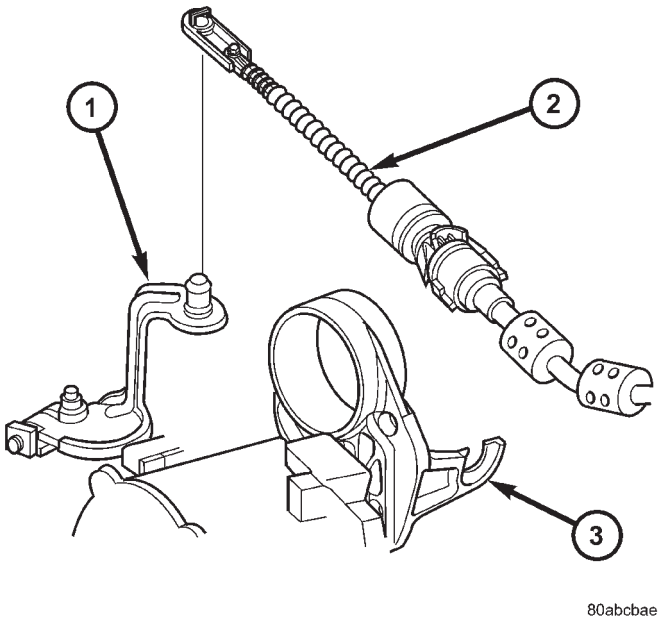

Fig. 169 Gearshift Cable at Transaxle

1 - MANUAL VALVE LEVER
2 - GEAR SHIFT CABLE
3 - UPPER MOUNT BRACKET

(4) Remove instrument panel lower silencer (Fig. 170).

GEAR SHIFT CABLE (Continued)

(7) Disconnect gear shift cable from gear shift lever (Fig. 173).

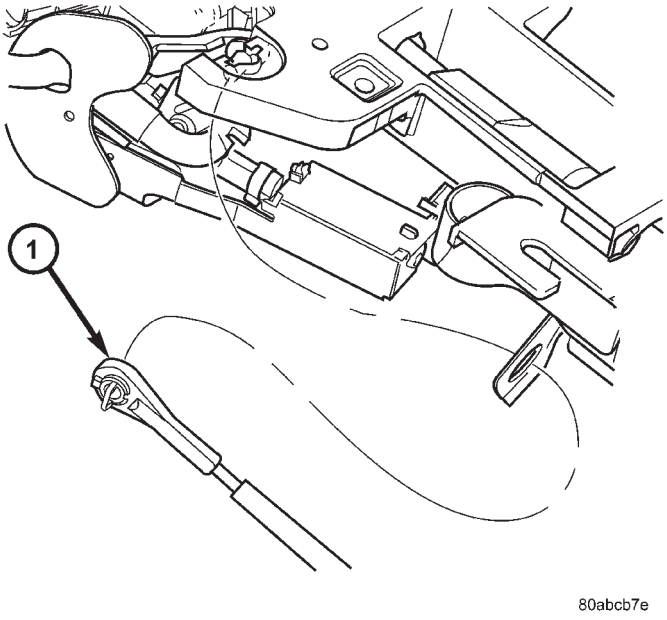

Fig. 173 Gearshift Cable at Column

1 - GEAR SHIFT CABLE

(8) Remove gear shift cable from column bracket (Fig. 173).

(9) Disengage grommet from dash panel and remove gear shift cable from inside vehicle (Fig. 174).

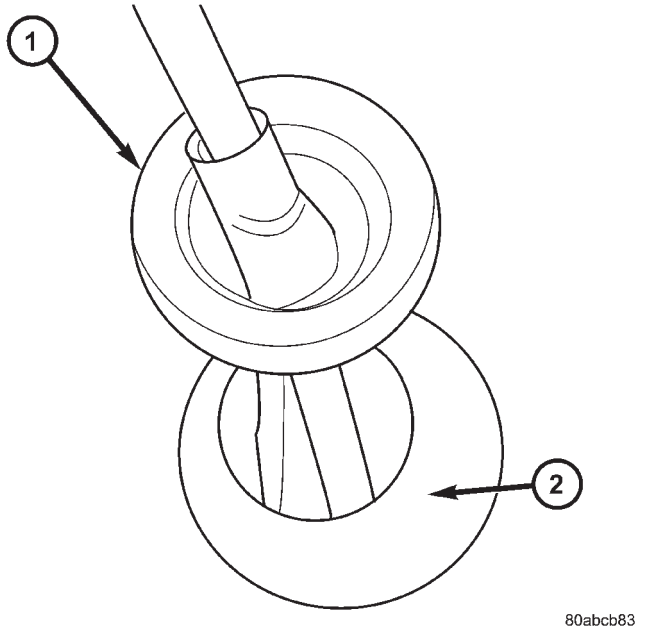

Fig. 174 Gearshift Cable/Grommet at Dash Panel

1 - CABLE GROMMET
2 - DASH PANEL

INSTALLATION

(1) Fish gear shift cable dash panel opening into engine compartment and secure grommet (Fig. 175).

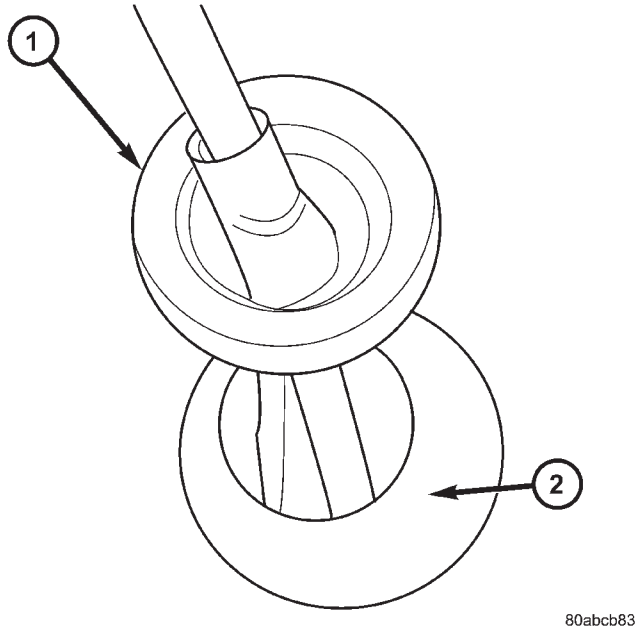

Fig. 175 Gearshift Cable/Grommet at Dash Panel

1 - CABLE GROMMET
2 - DASH PANEL

(2) Install gear shift cable through column bracket (Fig. 176) until audible “click” is heard.

(3) Connect gear shift cable to gear shift lever (Fig. 176).

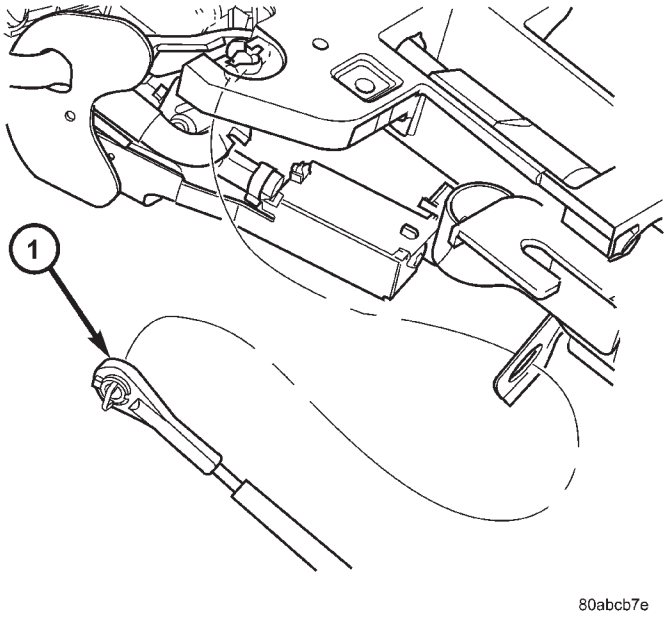

Fig. 176 Gearshift Cable at Column

1 - GEAR SHIFT CABLE

GEAR SHIFT CABLE (Continued)

(4) Connect PRNDL cable to gear shift lever (Fig. 177). Adjust if necessary.

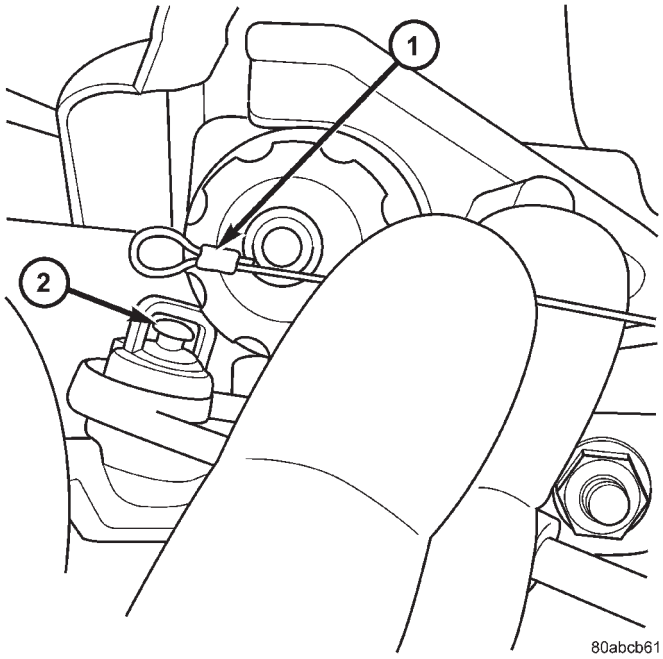

Fig. 177 PRNDL Cable

1 - PRNDL CABLE
2 - GEAR SHIFT LEVER

(5) Install knee bolster (Fig. 178).

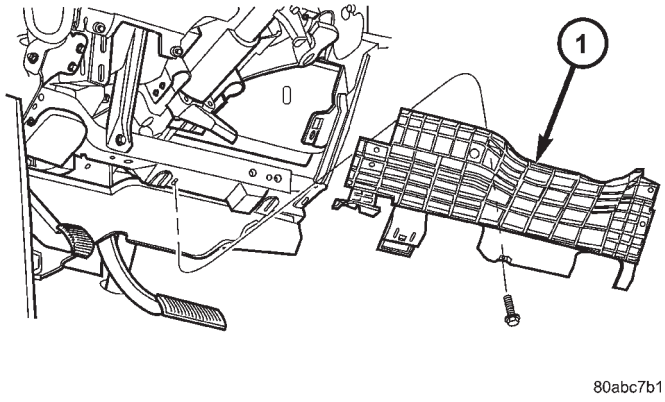

Fig. 178 Knee Bolster

1 - KNEE BOLSTER

(6) Install instrument panel lower silencer (Fig. 179).

(7) Install gear shift cable to transaxle upper mount bracket (Fig. 180). An audible “click” should be heard.

(8) Connect gear shift cable end to transaxle manual valve lever (Fig. 180).

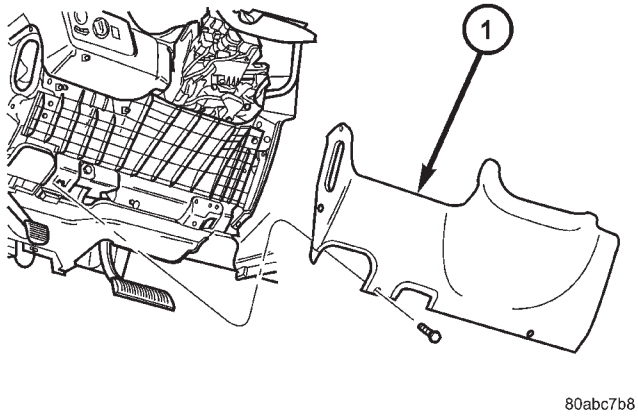

Fig. 179 Instrument Panel Lower Silencer

1 - INSTRUMENT PANEL LOWER SILENCER

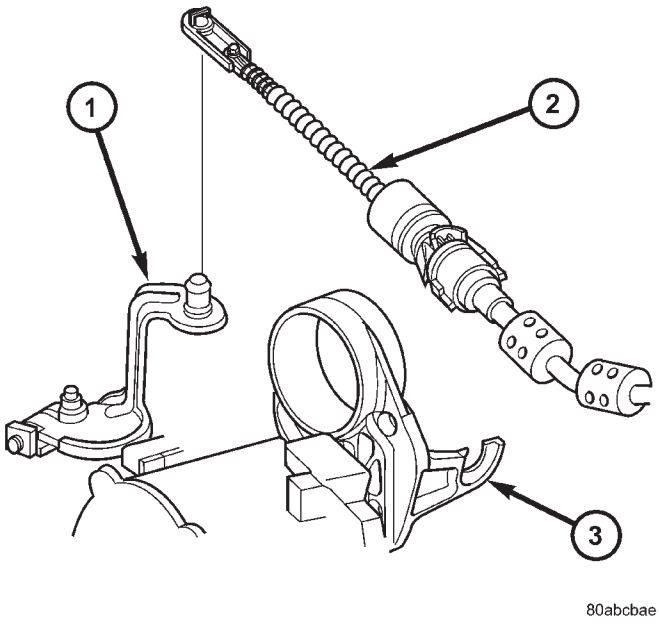

Fig. 180 Gearshift Cable at Transaxle

1 - MANUAL VALVE LEVER
2 - GEAR SHIFT CABLE
3 - UPPER MOUNT BRACKET

(9) Adjust gearshift cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/GEAR SHIFT CABLE - ADJUSTMENTS)

ADJUSTMENTS

GEARSHIFT CABLE ADJUSTMENT

Lift and rotate the gearshift hand lever into the park (P) gate position and remove the ignition key. This confirms the shift lever is in the gated park (P) position.

After confirming the park gate position, turn the ignition switch . If the starter will operate, the park gate position is correct. Move the shift lever into the neutral (N) position. If the starter will operate in this position, the linkage is properly adjusted. If the starter fails to operate in either position, linkage adjustment is required.

(1) Park the vehicle on level ground and set the parking brake.

(2) Place the gearshift lever in park (P) gate position and remove key.

(3) Loosen the cable adjustment screw at the transaxle operating lever (Fig. 181).

(4) Pull the transaxle operating lever fully forward to the park detent position.

(5) Release the park brake, then rock the vehicle to assure it is in park lock. Reset the park brake.

(6) Tighten the cable adjustment screw to 8 N·m (70 in. lbs.). Gearshift cable should now be properly adjusted.

(7) Verify PRNDL indicator still displays the corresponding gear completely. If not, readjustment of PRNDL may be required.

(8) Check adjustment by using the preceding procedure.

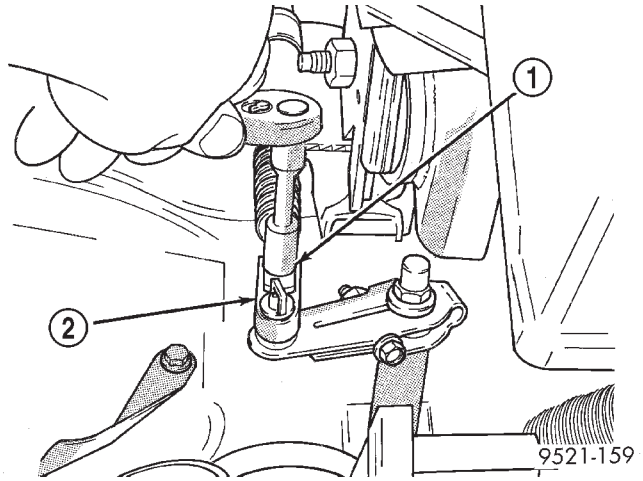

Fig. 181 Gearshift Cable Adjustment

1 - SHIFT CABLE ADJUSTMENT
2 - SHIFT CABLE

GOVERNOR

DESCRIPTION

The governor assembly is fastened to the transaxle transfer shaft. It consists of a governor body, weight, valve, and shaft.

OPERATION

The governor meters hydraulic pressure, and this metered pressure is used to signal the transmission when it is time for a shift to occur. It does this by balancing governor pressure on one side of a shift valve, and throttle pressure on the other. When governor pressure increases far enough to overcome the throttle pressure on the valve, a shift occurs.

With the gearshift selector in a forward driving range, line pressure flows from the manual valve and down to the governor valve. When the output shaft starts to rotate with vehicle motion, the governor weight assembly will start to move outward due to centrifugal force. As the weight is moved outward, it will pull the valve with it until the land of the valve uncovers the line pressure port. As the port begins to become uncovered, governor pressure is metered. As the vehicle's speed continues to increase, the weight assembly will be at a point at which governor pressure is acting on the left side of the reaction area of the valve. This produces sufficient force to compress the spring and allow the outer weight to move out against the outer governor body retaining ring. At a very high speed, the governor valve will be opened as far as possible. In this condition, it is possible for governor pressure to meet, but not to exceed, line pressure. Generally governor pressure ranges from 0-100 psi from idle to maximum speed, and rises proportionally with the increase in output shaft speed. Governor pressure and throttle pressure are acting upon the shift valves to determine when a shift will occur. Governor pressure is a direct indication of road speed, and throttle pressure is an indication of engine load. When both parameters have been met by the throttle and governor pressures, an upshift or downshift will occur.

CLEANING

Thoroughly clean all the governor parts in a suitable cleaning solution but do not use any type of caustic cleaning agents.

The governor weight components and the governor valve, must slide freely in their bores when clean and dry. Minor surface scratches and burrs can be smoothed with crocus cloth.

INSPECTION

The aluminum governor valve and outer weight have a hard coating on them. Check condition of this

GOVERNOR (Continued)

coating carefully. Do not reuse either part if the coating is damaged.

Inspect the governor weight spring for distortion. Replace the spring, if distorted, collapsed, or broken. Clean the filter in solvent and dry it with compressed air. Replace the filter, if damaged. Inspect the park gear for chipped or worn gear teeth or damaged ring grooves. Replace the gear, if damaged.

Check the teeth on the park gear for wear or damage. Replace the gear if necessary. Inspect the metal seal rings on the park gear hub. Replace the rings only if severely worn, or broken.

OIL PUMP

DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support (Fig. 182).

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Using hose cutters or a suitable blade, cut the **To cooler** line off flush with the cooler inlet fitting and place a collecting container under the open line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is inter-

5 - OUTER GEAR

OIL PUMP (Continued)

mittent, or it takes more than 20 seconds to collect one quart of fluid, (Refer to 21 - TRANSMISSION/ TRANSAXLE/AUTOMATIC - 31TH - DIAGNOSIS AND TESTING) for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet using a service splice kit. Refer to instructions included with the kit.

(5) Refill the transmission to proper level. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/FLUID - STANDARD PROCEDURE)

DISASSEMBLY

(1) Remove reaction shaft support-to-pump body bolts.

(2) Remove reaction shaft support, and the inner and outer pump gears (Fig. 183).

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

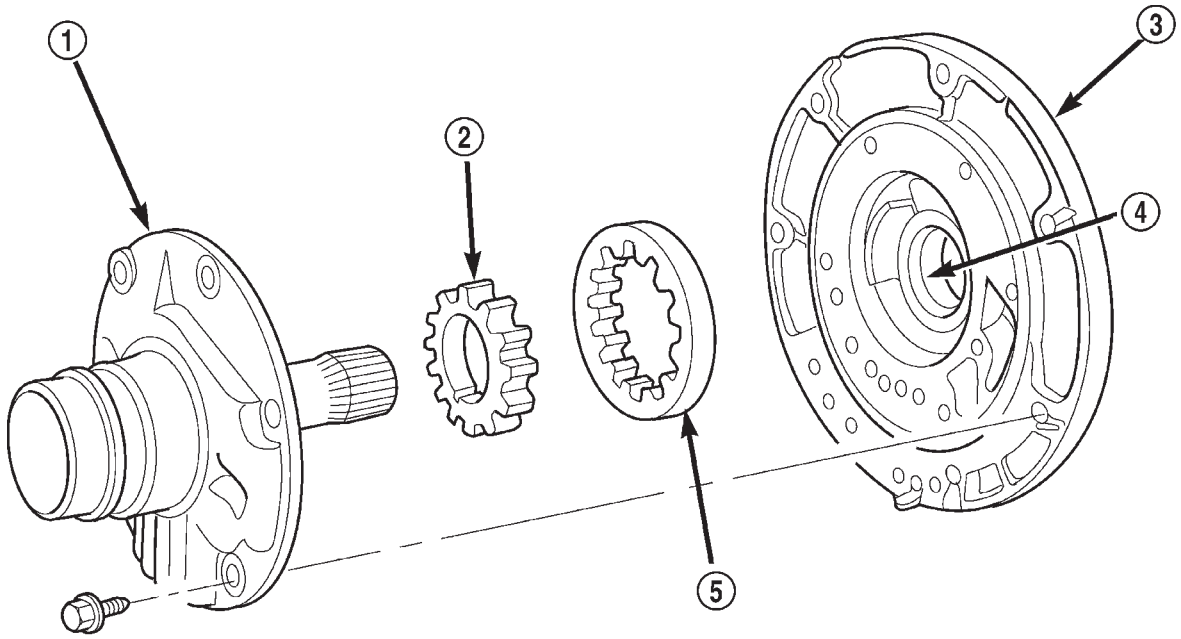
INSPECTION

(1) Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

(2) Visually inspect the pump and support components. Replace the pump assembly if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump assembly if the gears if pitted, worn chipped, or damaged.

(3) Inspect the pump bushing. Then check the reaction shaft support bushing. Replace the pump assembly if either bushing is heavily worn, scored or damaged.

(4) Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by installing the gears in the pump body and measure pump component clearances as follows:



80bdbd50

Fig. 183 Oil Pump Assembly

1 - REACTION SHAFT SUPPORT
2 - INNER GEAR
3 - PUMP BODY
4 - PUMP BUSHING
5 - OUTER GEAR

OIL PUMP (Continued)

(5) Reinstall gears to pump body and measure outer gear-to-pocket clearance with a feeler gauge (Fig. 184). **Outer gear-to-pocket clearance should be within 0.045-0.141 mm (0.0018-0.0056 in.).**

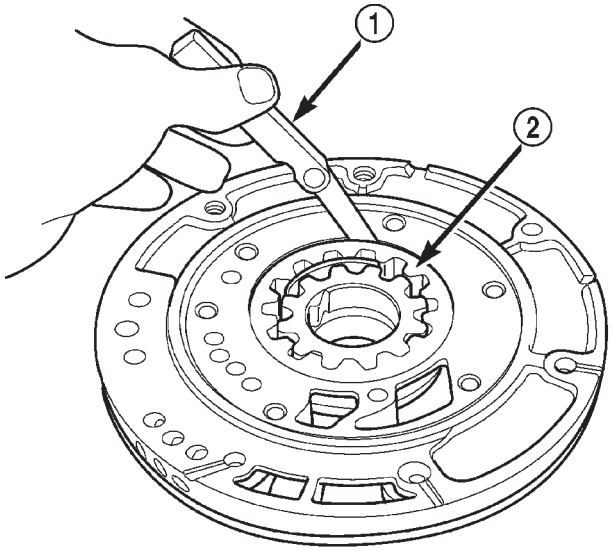


Fig. 184 Measuring Pump Outer Gear-to-Pocket Clearance

1 - FEELER GAUGE
2 - OUTER GEAR

(6) Measure both inner and outer gear side clearance with Plastigage™. If Plastigage™ is not available, measure across the pump body with a straight edge and feeler gauge.

(a) Position an appropriate piece of Plastigage™ across both gears.

(b) Align the plastigage to a flat area on the reaction shaft housing.

(c) Install the reaction shaft support to the pump housing and torque to 28 N·m (250 in. lbs.).

(d) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it. **Inner and outer gear side clearance should be within 0.020-0.046 mm (0.0008-0.0018 in.)**.

ASSEMBLY

(1) Install inner and outer gears to pump body (Fig. 183). Lubricate gears with Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602).

(2) Install reaction shaft support to pump body and align holes.

(3) Install and torque reaction shaft support-to-pump body bolts to 28 N·m (250 in. lbs.).

PARK/NEUTRAL POSITION SWITCH

DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH

The park/neutral starting switch is the center terminal of the 3 terminal switch. It provides ground for the starter solenoid circuit through the selector lever in only Park (P) and Neutral (N) positions.

(1) To test switch, remove wiring connector from switch and test for continuity between center pin of switch and transaxle case. Continuity should exist only when transaxle is in Park or Neutral.

(2) Check gearshift cable adjustment before replacing a switch which tests bad.

REMOVAL

(1) Unscrew switch from transaxle case allowing fluid to drain into a container. Move selector lever to Park, then to Neutral position, and inspect to see the switch operating lever fingers are centered in switch opening.

INSTALLATION

(1) Screw the switch with a new seal into transaxle case and tighten to 33 N·m (24 ft. lbs.). Retest switch with the test lamp.

(2) Add fluid to transaxle to bring up to proper level.

(3) The back-up lamp switch circuit is through the two outside terminals of the 3 terminal switch.

(4) To test switch, remove wiring connector from switch and test for continuity between the two outside pins.

(5) Continuity should exist only with transaxle in Reverse position.

(6) No continuity should exist from either pin to the case.

PLANETARY GEARTRAIN

DISASSEMBLY

(1) Remove snap ring and #4 thrust washer (Fig. 185)

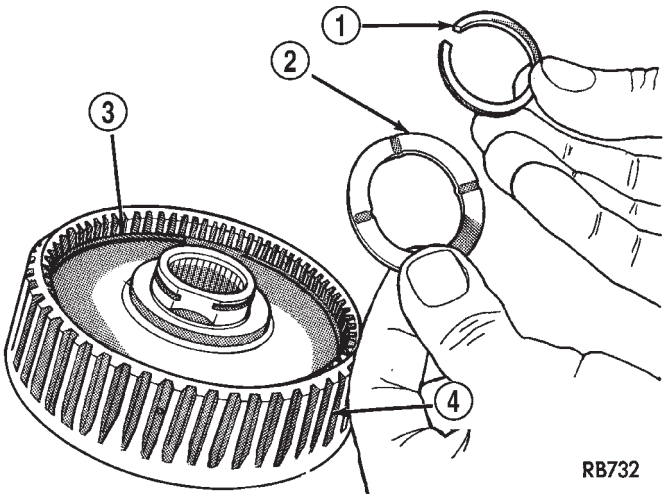

Fig. 185 Front Planetary Gear Snap Ring and No. 4 Thrust Washer

1 - SNAP RING
2 - #4 THRUST WASHER
3 - SNAP RING
4 - FRONT PLANETARY GEAR ASSEMBLY

SEAL - OIL PUMP

REMOVAL

The pump oil seal can be replaced without removing the pump and reaction shaft support assembly from the transaxle case.

(1) Screw seal remover Tool C-3981-B into seal (Fig. 194), then tighten screw portion of tool to withdraw the seal.

INSTALLATION

The pump oil seal can be replaced without removing the pump and reaction shaft support assembly from the transaxle case.

(1) To install a new seal, place seal in opening of the pump housing (lip side facing inward). Using Tool C-4193 and Handle Tool C-4171, drive new seal into housing until tool bottoms (Fig. 195).

SERVO - KICKDOWN

DESCRIPTION

The kickdown servo (Fig. 196) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

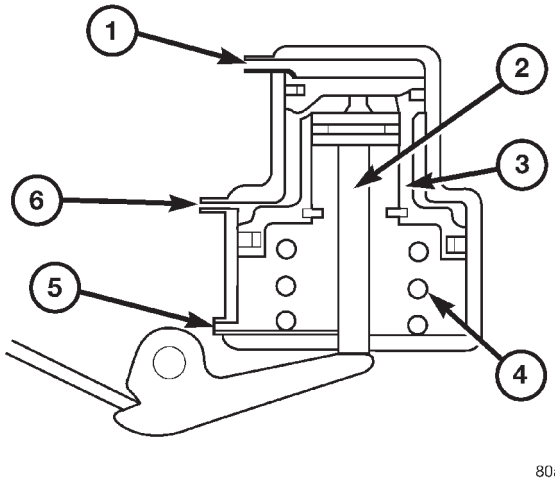

Fig. 196 Front Servo

1 - VENT
2 -PISTON ROD
3 - PISTON
4 - SPRING
5 - RELEASE PRESSURE
6 - APPLY PRESSURE

OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend though its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston. The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

DISASSEMBLY

(1) Remove kickdown servo snap ring (Fig. 197).

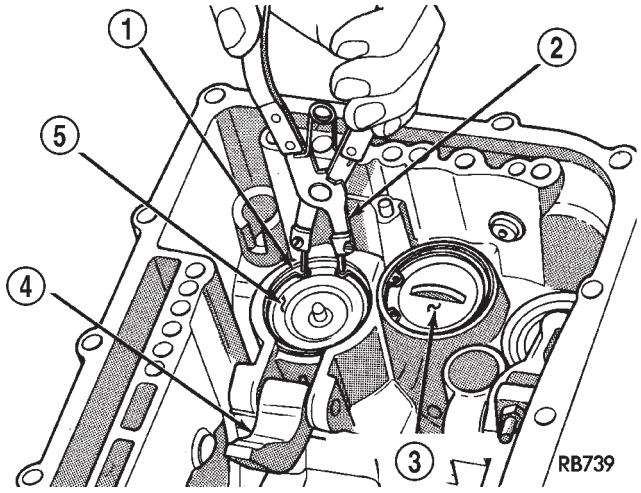

Fig. 197 Kickdown Servo Snap Ring

1 - SNAP RING
2 - SNAP RING PLIERS
3 - ACCUMULATOR PLATE
4 - KICKDOWN LEVER

8 - PISTON ROD
9 - SEAL RINGS

CLEANING

Clean the servo piston components (Fig. 201) with solvent and dry them with compressed air. Wipe the band clean with lint free shop towels.

Replace the front band if distorted, lining is burned, flaking off, or worn to the point where the grooves in the lining material are no longer visible.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

SERVO - KICKDOWN (Continued)

INSPECTION

Inspect the servo components (Fig. 202). Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap-ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

SERVO - LOW/REVERSE

DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

SERVO - LOW/REVERSE (Continued)

DISASSEMBLY

(1) Back off low/reverse band adjustment and position lever out of the way (Fig. 204).

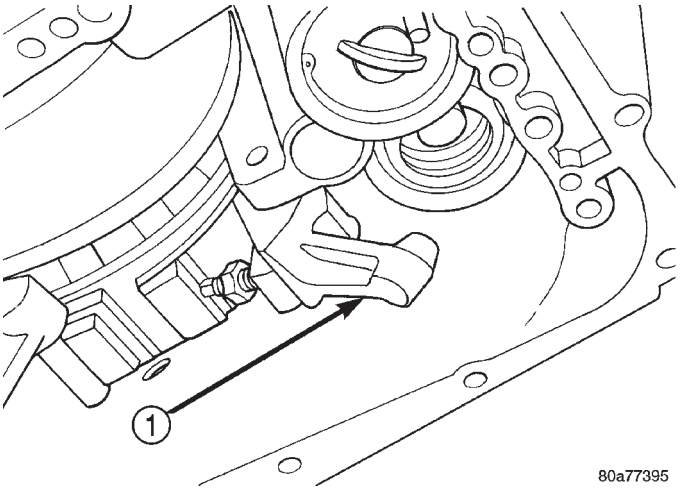

Fig. 204 Low/Reverse Lever

1 - LOW-REVERSE LEVER

(2) Remove low/reverse servo snap ring (Fig. 205).

1 - SERVO PISTON
2 - SPRING

(2) Install low/reverse servo snap ring (Fig. 205).

SHIFT INTERLOCK SOLENOID

DESCRIPTION

The Brake/Transmission Shift Interlock system consists of an electro-magnetic solenoid mounted to the steering column (Fig. 209). The solenoid's plunger consists of an integrated hook, which operates the shift lever pawl (part of shift lever assembly), and a plunger return spring (Fig. 210). The solenoid also has an integrated bracket, which facilitates fastening to the steering column.

OPERATION

The Brake/Transmission Shift Interlock (BTSI) Solenoid prevents the transmission shift lever from being moved out of PARK (P) unless the brake pedal is applied. The BTSI solenoid is hardwired to and controlled by the Intelligent Power Module (IPM). Battery voltage is applied to one side of the solenoid with the ignition key is in either the OFF, ON/RUN, or START positions (Fig. 211). The ground side of the solenoid is controlled by a driver within the IPM. It relies on voltage supplied from the stop lamp switch to the stop lamp sense circuit within the IPM to tell when the brake pedal is depressed. When the brake pedal is depressed, the ground circuit opens, de-energizing the solenoid. When the brake pedal is released, the ground circuit is closed, energizing the solenoid.

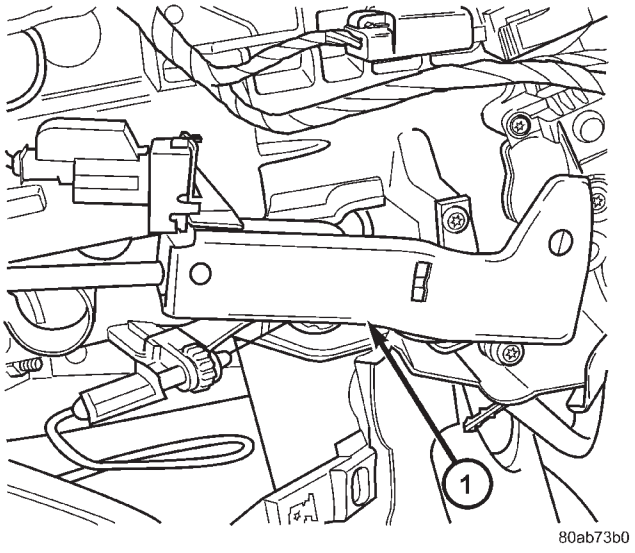

Fig. 209 Brake/Transmission Shift Interlock (BTSI) Solenoid Location

1 - BTSI SOLENOID

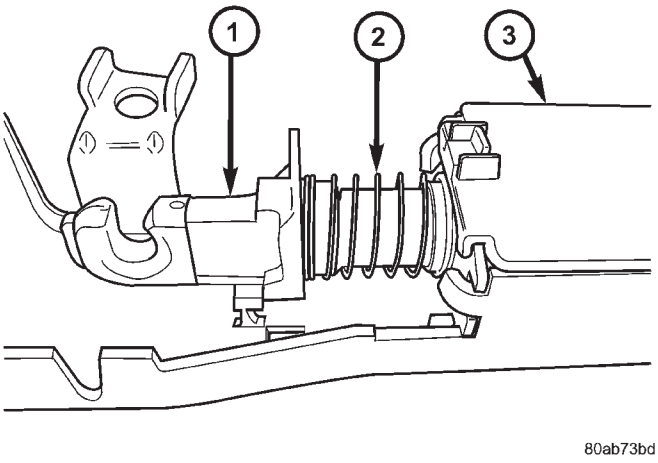

Fig. 210 Solenoid Plunger and Return Spring

SHIFT INTERLOCK SOLENOID (Continued)

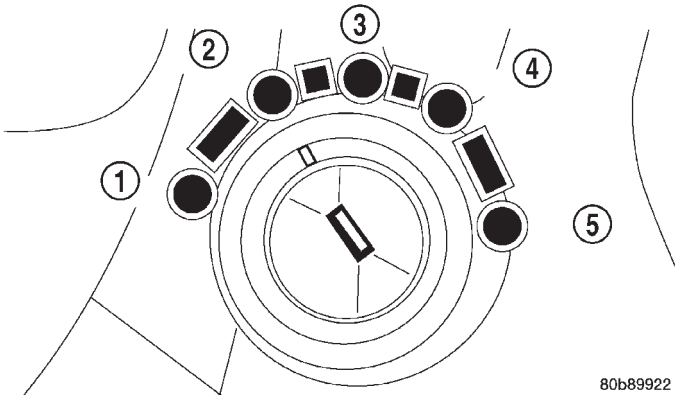

Fig. 211 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

When the ignition key is in either the OFF, ON/RUN, or START positions, the BTSI solenoid is energized, and the solenoid plunger hook pulls the shift lever pawl into position, prohibiting the shift lever from moving out of PARK (P) (Fig. 212). When the brake pedal is depressed, the ground circuit opens, de-energizing the solenoid. This moves the gearshift lever pawl out of the way (Fig. 213), allowing the shift lever to be moved into any gear position.

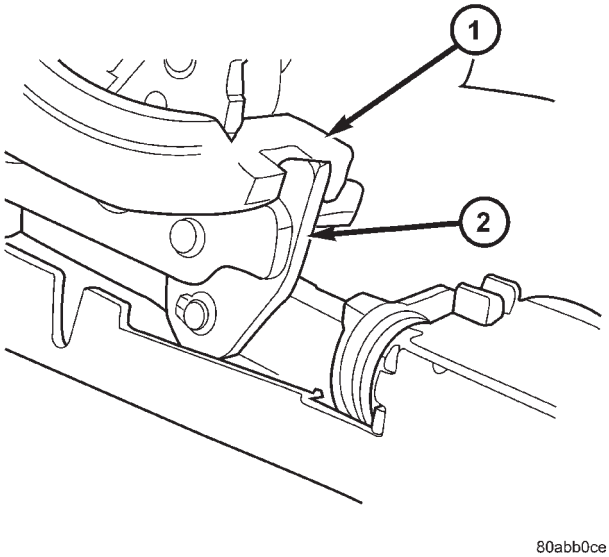

Fig. 212 Pawl Engaged to Shift Lever

1 - GEAR SHIFT LEVER
2 - GEAR SHIFT LEVER PAWL

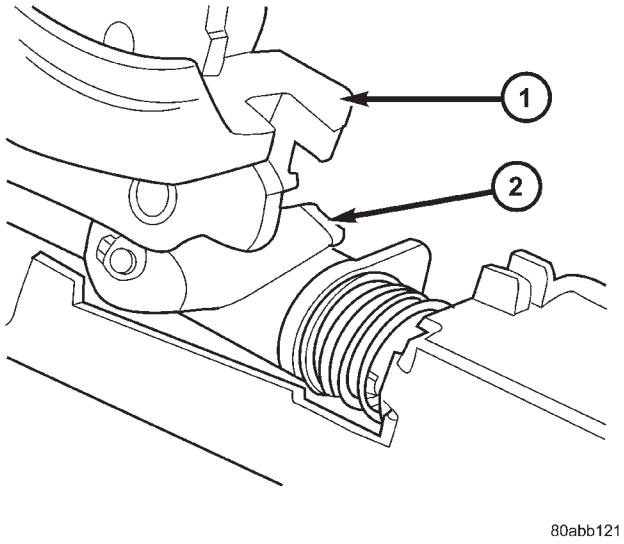

Fig. 213 Pawl Disengaged From Shift Lever

1 - GEAR SHIFT LEVER
2 - GEAR SHIFT LEVER PAWL

A conventional mechanical interlock system is also used. This system manually prohibits shifter movement when the ignition switch is in the LOCK or ACC positions. Solenoid operation is not required in these key positions.

For intended BTSI system operation, refer to the following chart:

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park with brake pedal applied.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

SHIFT INTERLOCK SOLENOID (Continued)

DIAGNOSIS AND TESTING - BRAKE/ TRANSMISSION SHIFT INTERLOCK SOLENOID

For intended BTSI system operation, refer to the following chart:

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park with brake pedal applied.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system repair. Refer to the appropriate Diagnostic Information.	

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove instrument panel lower shroud (Fig. 214).

SOLENOID - TCC

DESCRIPTION

The torque converter clutch (TCC) solenoid is fastened to the transaxle valve body, and its connector protrudes through the transaxle case (Fig. 222).

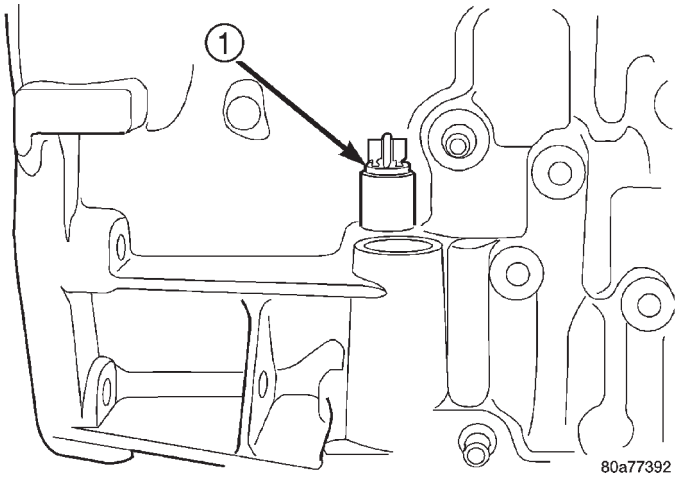

Fig. 222 Torque Converter Clutch Solenoid

1 - TCC SOLENOID WIRING CONNECTOR

OPERATION

The torque converter clutch solenoid is responsible for controlling application of the torque converter clutch. It is controlled by the Powertrain Control Module (PCM), which determines when conditions are acceptable for torque converter lock-up.

REMOVAL

(1) Remove valve body from transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/VALVE BODY - REMOVAL)

(2) Remove three (3) torque converter clutch solenoid-to-valve body screws (Fig. 223).

(3) Remove torque converter clutch solenoid (Fig. 223). Note orientation of plug and spring.

SOLENOID - TCC (Continued)

THROTTLE VALVE CABLE (Continued)

ADJUSTMENTS

THROTTLE VALVE LINKAGE ADJUSTMENT

The throttle valve linkage adjustment is very important to proper transaxle operation. This adjustment positions a valve which controls shift speed, shift quality, and part throttle downshift sensitivity. If the setting is too short, early shifts and slippage between shifts may occur. If the setting is too long, shifts may be delayed and part throttle downshifts may be very sensitive.

LINKAGE ADJUSTMENT PROCEDURE

(1) Perform transaxle throttle valve linkage adjustment while engine is at normal operating temperature.

(2) Using small screwdriver, disengage adjustment lock at transaxle.

(3) Rotate lever at transaxle all the way to the left side of vehicle against stop.

(4) Slide cable adjuster until cable core end touches clip at throttle valve lever.

(5) Press adjuster lock (Fig. 228) to retain setting.

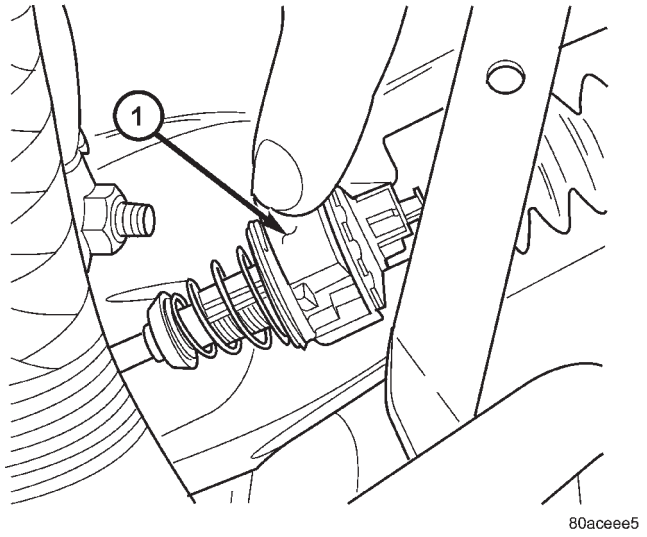

Fig. 228 Throttle Valve Cable Adjustment Lock

1 - ADJUSTER LOCK

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 229) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the fluid cooler and lines.

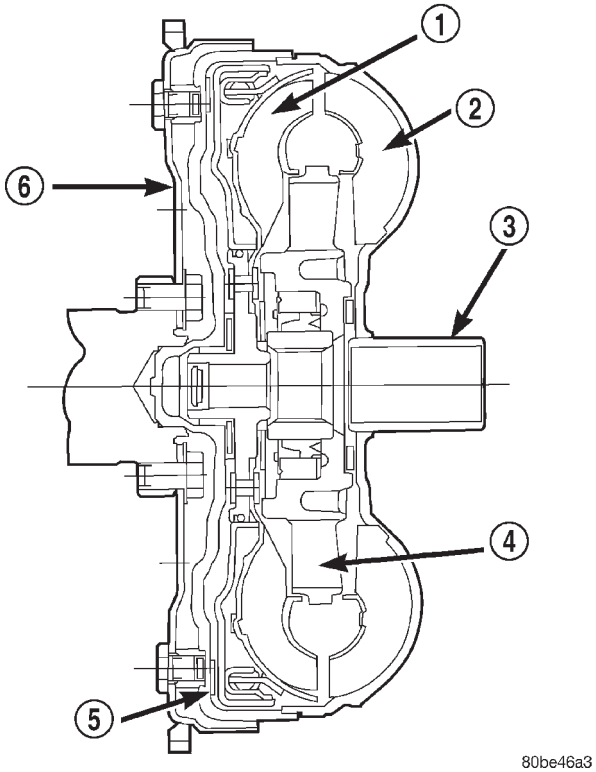

Fig. 229 Torque Converter Assembly

1 - TURBINE
2 - IMPELLER
3 - HUB
4 - STATOR
5 - CONVERTER CLUTCH DISC
6 - DRIVE PLATE

TORQUE CONVERTER (Continued)

IMPELLER

The impeller (Fig. 230) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving member of the system.

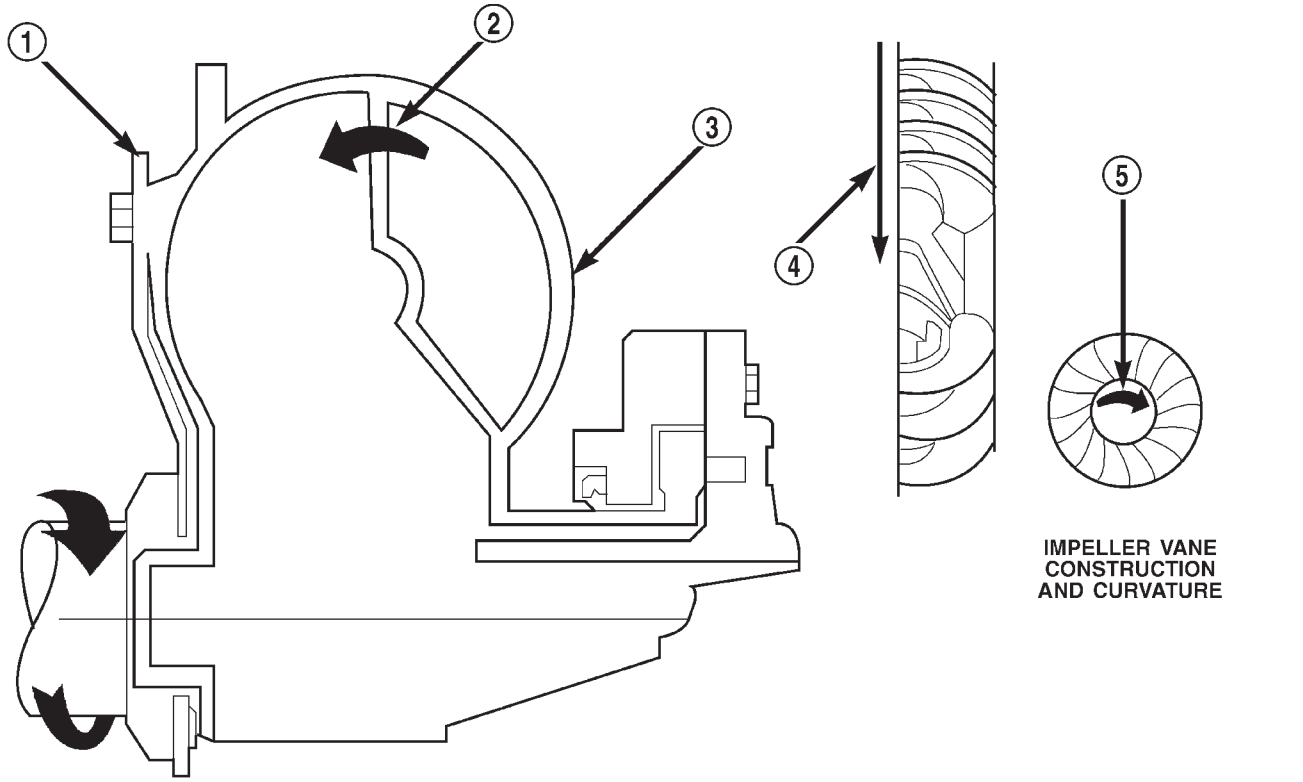

Fig. 230 Impeller

2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

TORQUE CONVERTER (Continued)

TURBINE

The turbine (Fig. 231) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

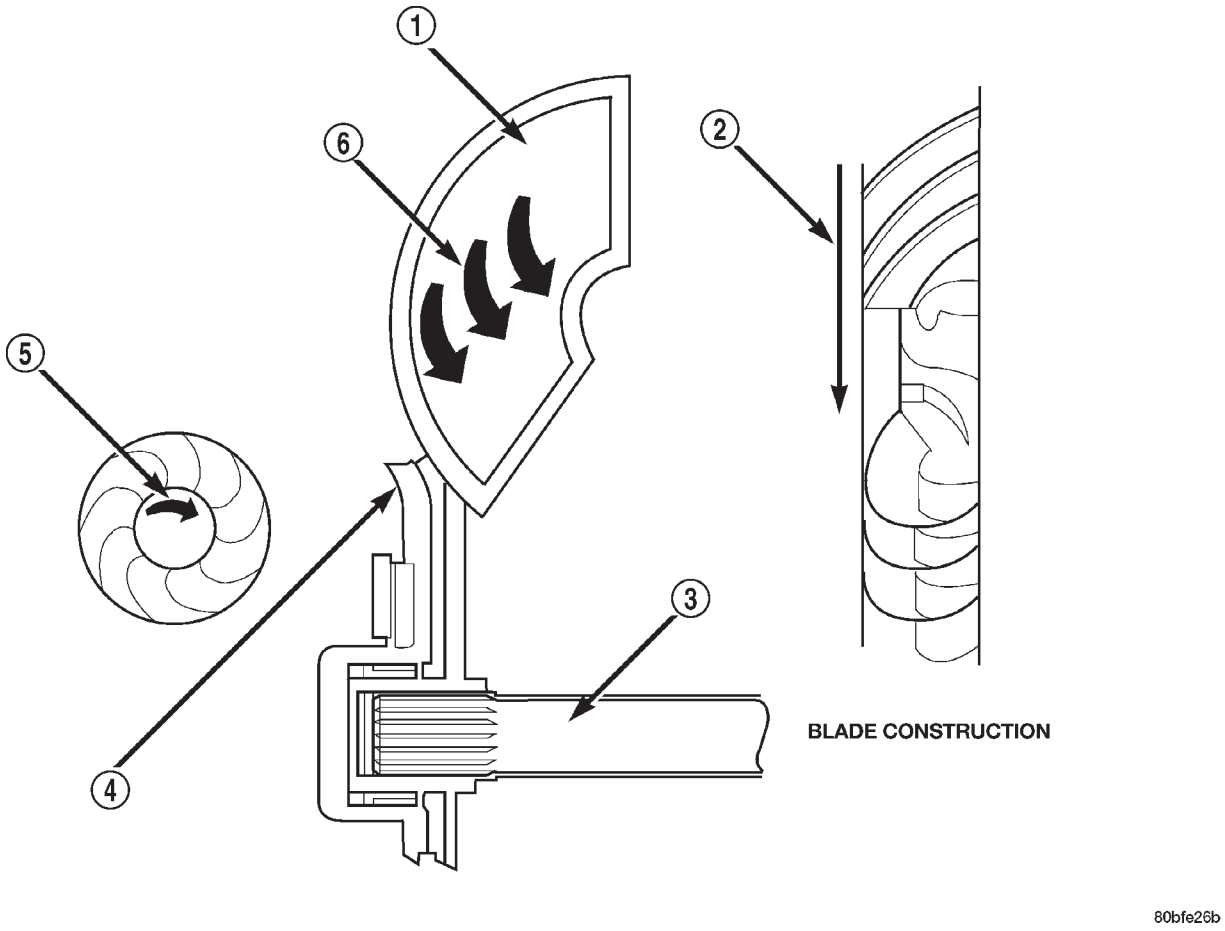

Fig. 231 Turbine

2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 232) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 233). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

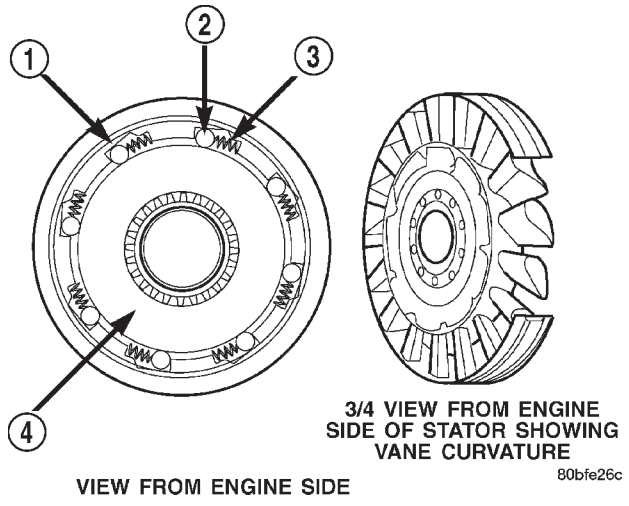

Fig. 232 Stator Components

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 234) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock–free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

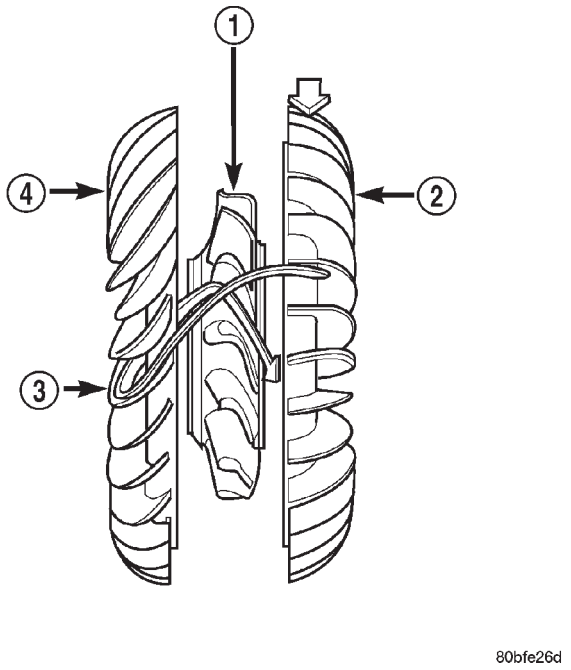

Fig. 233 Stator Location

2 - THRUST WASHER ASSEMBLY
3 - IMPELLER
4 - STATOR
5 - TURBINE
6 - PISTON
7 - FRICTION DISC

TORQUE CONVERTER (Continued)

OPERATION

The converter impeller (Fig. 235) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

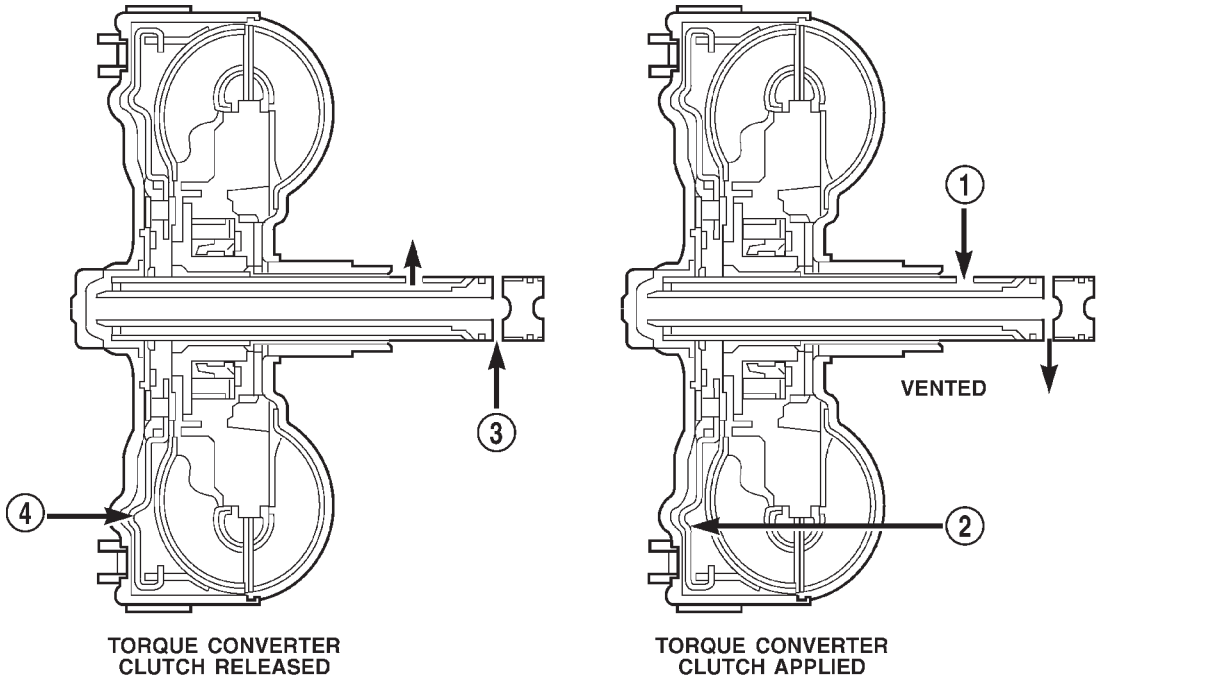

Fig. 235 Torque Converter Fluid Operation

1 - APPLY PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD
3 - RELEASE PRESSURE
4 - THE PISTON MOVES SLIGHTLY REARWARD

TORQUE CONVERTER (Continued)

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 236). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the over–running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock–up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

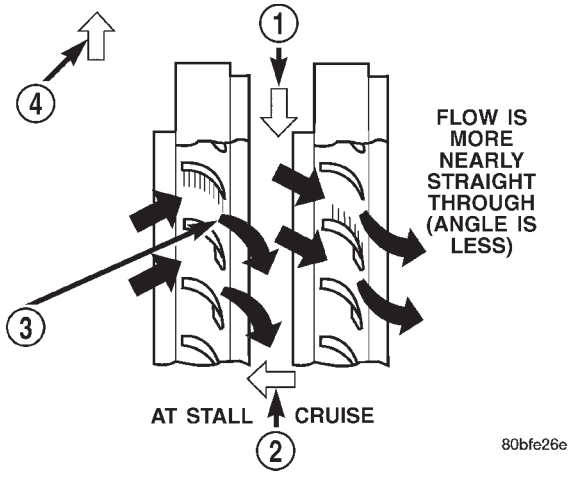

Fig. 236 Stator Operation

2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the front cover's friction material, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Powertrain Control Module (PCM). The engagement cannot be activated in the lower gears because it eliminates the torque multiplication effect of the torque converter necessary for acceleration. Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch will engage at approximately 56 km/h (35 mph) with light throttle, after the shift to third gear.

REMOVAL

(1) Remove transmission and torque converter from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH - REMOVAL)

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 237). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

TORQUE CONVERTER (Continued)

(8) Install the transmission in the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH - INSTALLATION)

(9) Fill the transmission with the recommended fluid.

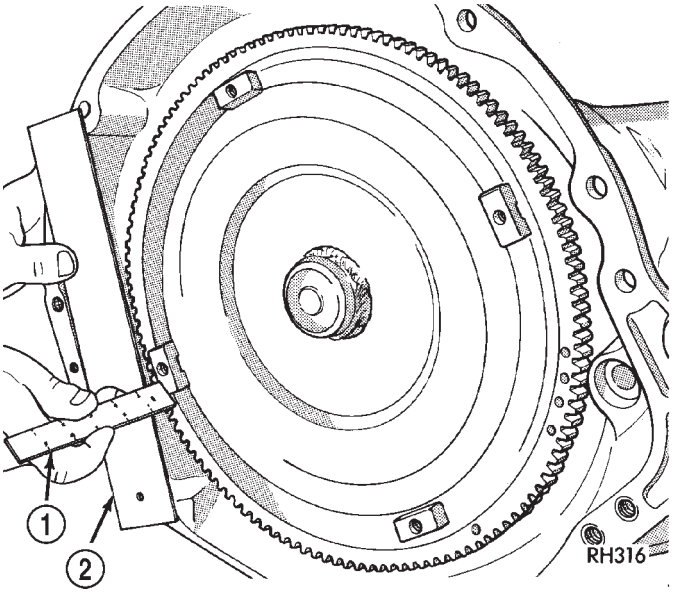

Fig. 237 Checking Torque Converter Seating

1 - SCALE
2 - STRAIGHTEDGE

TRANSFER SYSTEM - OUTPUT SHAFT/GEAR/BEARING

REMOVAL

NOTE: Transfer Gear should be removed for repair of output shaft, to obtain an accurate output shaft turning torque measurement upon reassembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/TRANSFER SYSTEM - REMOVAL)

NOTE: Transaxle geartrain must be removed to gain access to and service output shaft. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH - DISASSEMBLY)

(1) Using a suitable punch, bend retaining strap tabs flat to facilitate bolt removal (Fig. 238).

(2) Remove retaining strap and stirrup-to-gear bolts (Fig. 239).

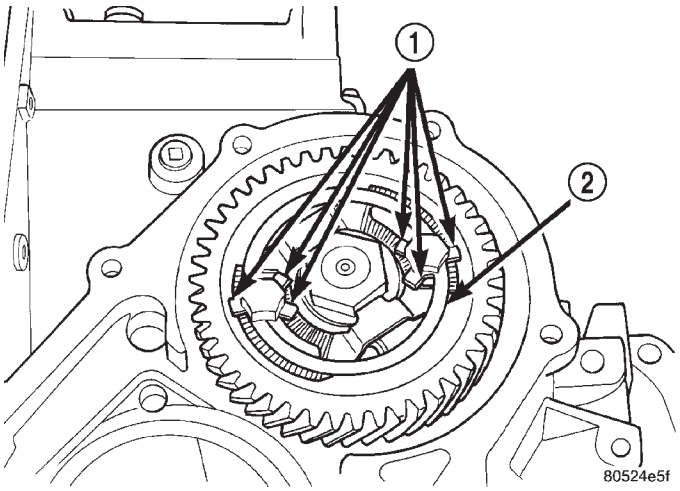

Fig. 238 Bend Strap Tabs Flat

1 - ARBOR PRESS RAM
2 - SPECIAL TOOL C-4637
3 - REAR PLANETARY ANNULUS GEAR
4 - CUP FROM TOOL L-4518
5 - BEARING CONE

(3) Using a press and a ½" socket to protect the shaft, install output shaft into rear planetary annulus gear (Fig. 253).

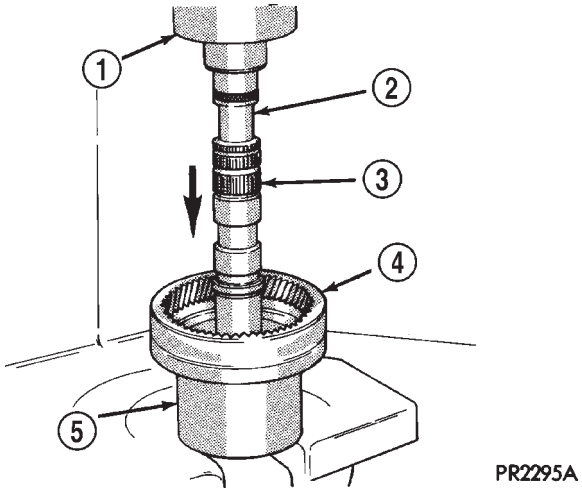

Fig. 253 Install Output Shaft into Rear Planetary Annulus Gear

1 - PRESS
2 - 1/2 INCH SOCKET
3 - OUTPUT SHAFT
4 - REAR ANNULUS GEAR
5 - SPACER

(4) Using Tool L-4429-3, install both output shaft bearing cups to transaxle case (Fig. 254) (Fig. 255).

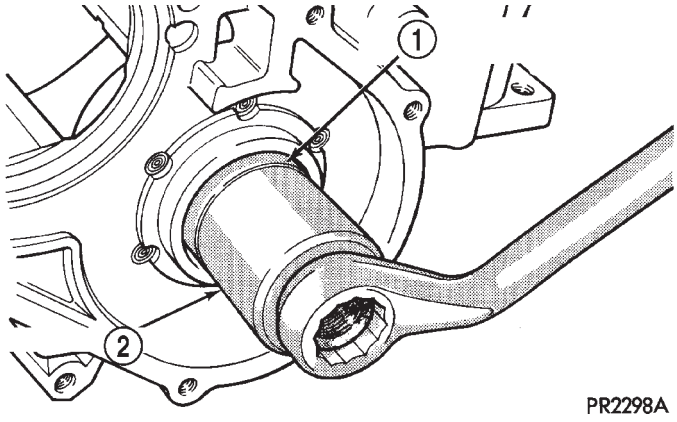

Fig. 254 Install Output Shaft Gear Bearing Cup

1 - OUTPUT SHAFT GEAR BEARING CUP
2 - SPECIAL TOOL L-4429-3

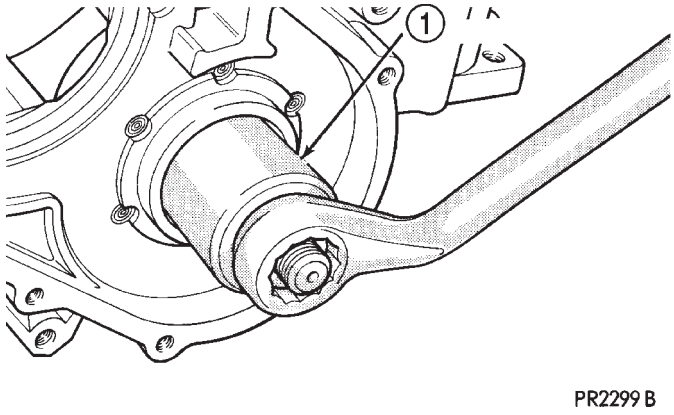

Fig. 255 Install Rear Planetary Annulus Gear Bearing Cup

1 - SPECIAL TOOL L-4429-3

(5) Determine output shaft bearing shim thickness. Shim thickness need be determined only if any of the following parts are replaced:

- Transaxle case
- Output shaft
- Rear planetary annulus gear
- Output shaft gear
- Rear annulus and output shaft gear bearing cones
- Overrunning clutch race cups

To determine proper shim thickness, Refer to Output Shaft Bearing Adjustment. **Check output shaft bearing turning torque, using an inch-pound torque wrench. If turning torque is 3-8 in. lbs., the proper shim has been installed.**

TRANSFER SYSTEM - OUTPUT SHAFT/GEAR/BEARING (Continued)

(6) Install output shaft assembly with appropriate shim (Fig. 256) (Fig. 257).

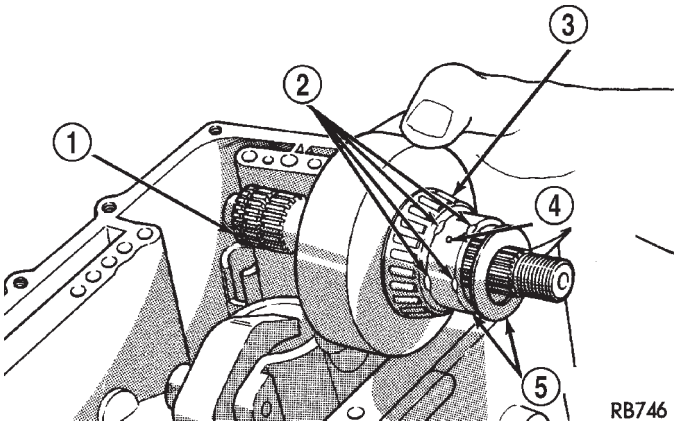

Fig. 256 Install Output Shaft Assembly

(11) Using an in. lb. torque wrench, measure output shaft bearing turning torque (Fig. 262).

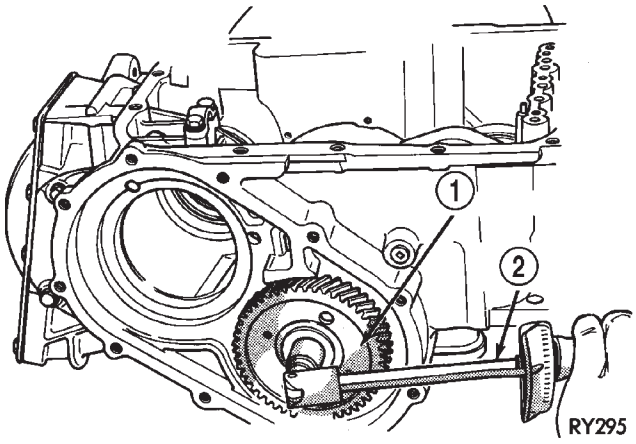

Fig. 262 Checking Bearing Turning Torque

1 - OUTPUT SHAFT GEAR
2 - TORQUE WRENCH

(12) Install stirrup and strap. Install bolts but do not tighten.

NOTE: Once the stirrup assembly is positioned onto the output gear, it is necessary to "clock" the stirrup against the flats of the output gear retaining nut.

(13) Rotate stirrup clockwise against flats of gear retaining nut (Fig. 263).

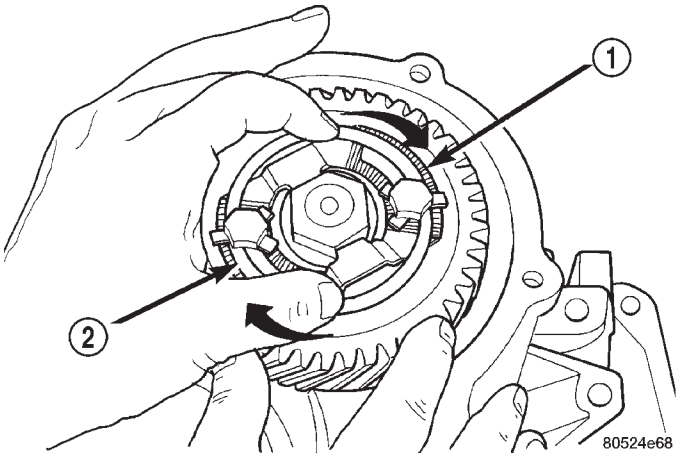

Fig. 263 Turn Stirrup Clockwise Against Flats of Retaining Nut

1 - TURN STIRRUP CLOCKWISE
2 - STRAP

(14) Torque stirrup and strap bolts to 23 N·m (200 in. lbs..) (Fig. 264).

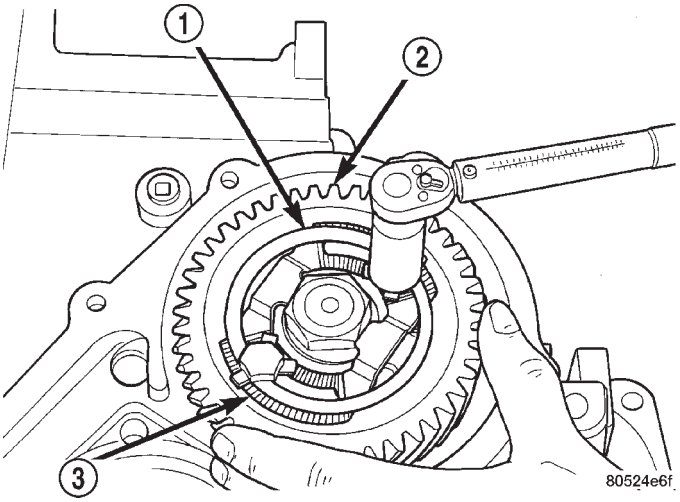

Fig. 264 Tighten Strap Retaining Nuts

1 - STRAP
2 - OUTPUT GEAR
3 - STIRRUP

(15) Bend tabs of strap up against “flats”of retaining bolts to prevent bolts from backing out of gear in the event they come loose.

(16) Install transfer shaft and gear. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/TRANSFER SYSTEM - INSTALLATION)

(17) Assemble transaxle geartrain. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH - ASSEMBLY)

ADJUSTMENTS

ADJUSTMENT - OUTPUT SHAFT BEARING

(1) With output shaft gear removed, install a 13.65 mm (0.537 inch) and a 1.34 mm (0.053 inch) gauging shims on the planetary rear annulus gear hub using grease to hold the shims in place. The 13.65 mm shim has a larger inside diameter and must be installed over the output shaft first. The 1.34 mm shim pilots on the output shaft.

(2) Install output shaft gear and bearing assembly, torque to 271 N·m (200 ft. lbs.).

(3) To measure bearing end play:

(4) Attach Tool L-4432 to the output shaft gear.

(5) Mount a steel ball with grease into the end of the output shaft.

(6) Push and pull the gear while rotating back and forth to insure seating of the bearing rollers.

(7) Using a dial indicator, mounted to the transaxle case, measure output shaft end play.

(8) Once bearing end play has been determined, refer to the output shaft bearing shim chart.

(9) The 12.65 mm (0.498 inch), 13.15 mm (0.518 inch) or 13.65 mm (0.537 inch) shims are always installed first. **These shims have lubrication slots which are necessary for proper bearing lubrication.**

(10) Shims thinner than 12.65 mm listed in the chart are common to both the transfer shaft and output shaft bearings.

(11) Use Tool L-4434 to remove the retaining nut and washer. To remove the output shaft gear use Tool L-4407.

(12) Remove the two gauging shims and install the proper shim combination, making sure to install the 12.65, 13.15, or 13.65 mm shim first. Use grease to hold the shims in place. Install the output shaft gear and bearing assembly.

(13) Install the retaining nut and washer and torque to 271 N·m (200 ft. lbs.).

(14) Using an inch-pound torque wrench, check the turning torque. **The torque should be between 3 and 8 inch-pounds.**

(15) If the turning torque is too high, install a 0.05mm (0.002 inch) thicker shim. If the turning torque is too low, install a 0.05 mm (0.002 inch) thinner shim. Repeat until the proper turning torque is 3 to 8 inch pounds.

TRANSFER SYSTEM - OUTPUT SHAFT/GEAR/BEARING (Continued)

TRANSFER SYSTEM - TRANSFER SHAFT/GEAR/BEARING (Continued)

ADJUSTMENTS

ADJUSTMENT - TRANSFER SHAFT BEARING

(1) Use Tool L-4434 to remove the retaining nut and washer. Remove the transfer shaft gear using Tool L-4407.

(2) Install a 2.29 mm (0.090 inch) and a 1.39 mm (0.055 inch) gauging shims on the transfer shaft behind the governor support.

(3) Install transfer shaft gear and bearing assembly and torque the nut to 271 N·m (200 ft. lbs.).

(4) To measure bearing end play:Attach Tool L-4432 to the transfer gear.

(5) Mount a steel ball with grease into the end of the transfer shaft.

(6) Push and pull the gear while rotating back and forth to insure seating of the bearing rollers.

(7) Using a dial indicator, measure transfer shaft end play.

(8) Refer to the Transfer Bearing Shim Chart for the required shim combination to obtain the proper bearing setting.

(9) Use Tool L-4434 to remove the retaining nut and washer. Remove the transfer shaft gear using Tool L-4407.

(10) Remove the two gauging shims and install the correct shim combination. Install the transfer gear and bearing assembly.

(11) Install the retaining nut and washer and torque to 271 N·m (200 ft. lbs.). Measure transfer shaft end play, end play should be 0.05 to 0.25 mm (0.002 to 0.010 inch).

(12) Measure bearing end play as outlined in Step (4). End play should be between 0.05 mm and 0.25 mm (0.002 to 0.010 inch).

NOTE: If end play is too high, install a 0.05 mm (0.002 inch) thinner shim combination. If end play is too low, install a 0.05 mm (0.002 inch) thicker shim combination. Repeat until 0.05 to 0.25 mm (0.002 to 0.010 inch) end play is obtained.

End Play (with 2.29 mm and 1.39 mm gauging shims installed)		Required Shim Combination	Total Thickness	
mm	inch	mm	mm	inch

VALVE BODY

REMOVAL

(1) Disconnect battery negative cable.
(2) Disconnect throttle valve cable from throttle valve lever at transaxle.
(3) Disconnect gearshift cable from gearshift lever at transaxle.
(4) Disconnect torque converter clutch solenoid connector.
(5) Raise vehicle on hoist.
(6) Remove transaxle oil pan bolts (Fig. 297).

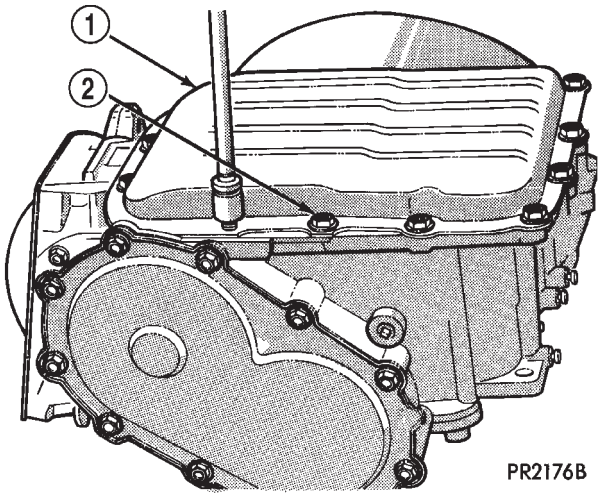

Fig. 297 Transaxle Oil Pan Bolts

1 - TRANSAXLE OIL PAN
2 - OIL PAN BOLTS

(7) Separate oil pan from case and drain fluid into suitable container (Fig. 298).

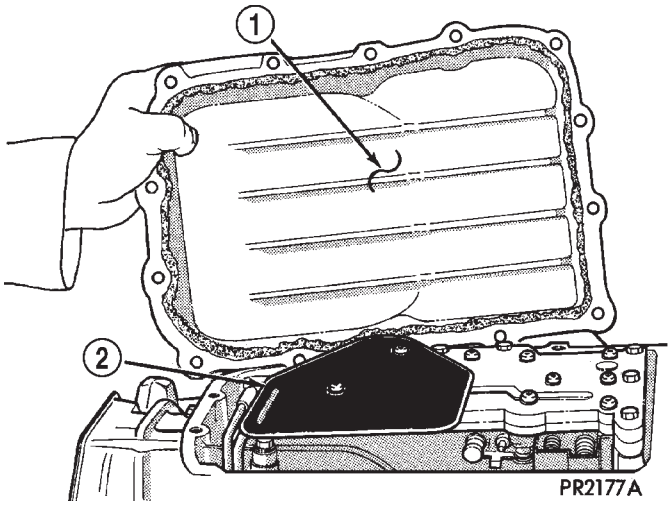

Fig. 298 Transaxle Oil Pan

1 - TRANSAXLE OIL PAN
2 - OIL FILTER

(8) Remove oil filter-to-valve body screws (Fig. 299).

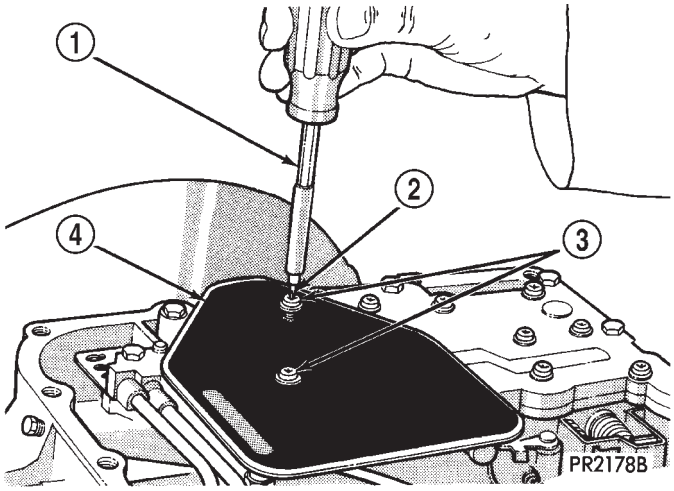

Fig. 299 Oil Filter Screws

1 - SCREWDRIVER HANDLE
2 - SPECIAL TOOL L-4553
3 - OIL FILTER SCREWS (2)
4 - OIL FILTER

(9) Remove oil filter and gasket (Fig. 300).

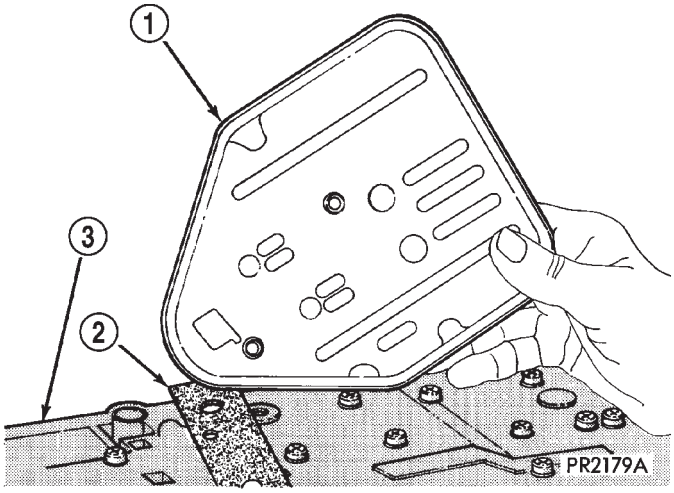

Fig. 300 Oil Filter and Gasket

1 - OIL FILTER
2 - GASKET
3 - VALVE BODY

VALVE BODY (Continued)

(10) Remove cooler bypass valve from valve body (Fig. 301).

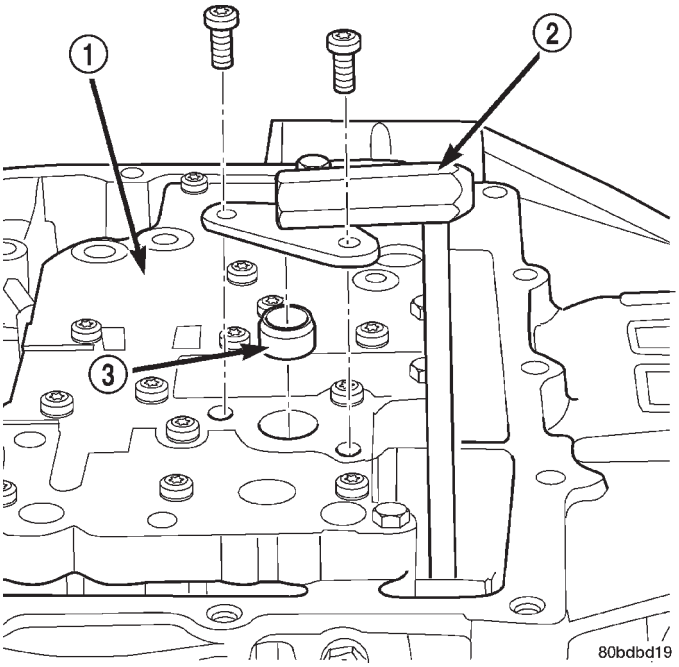

Fig. 301 Cooler Bypass Valve and Seal

1 - TRANSFER PLATE
2 - BYPASS VALVE
3 - SEAL

(11) Remove park rod e-clip (Fig. 302).

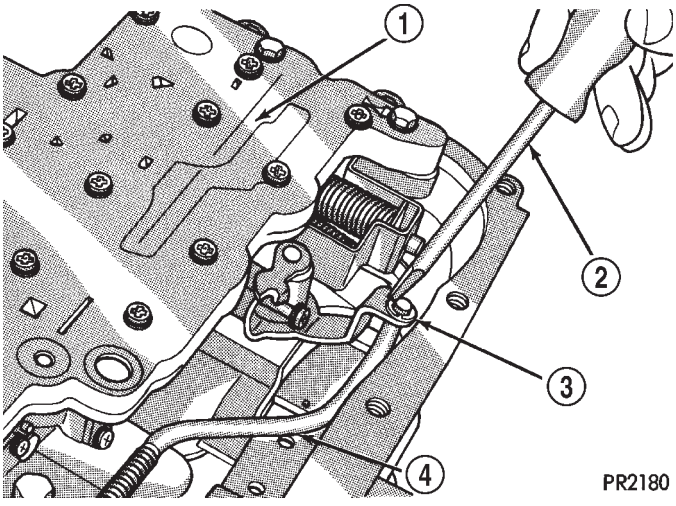

Fig. 302 Parking Rod E-Clip

1 - VALVE BODY

3 - "E" CLIP
4 - PARKING ROD

(12) Remove park rod from valve body (Fig. 303).

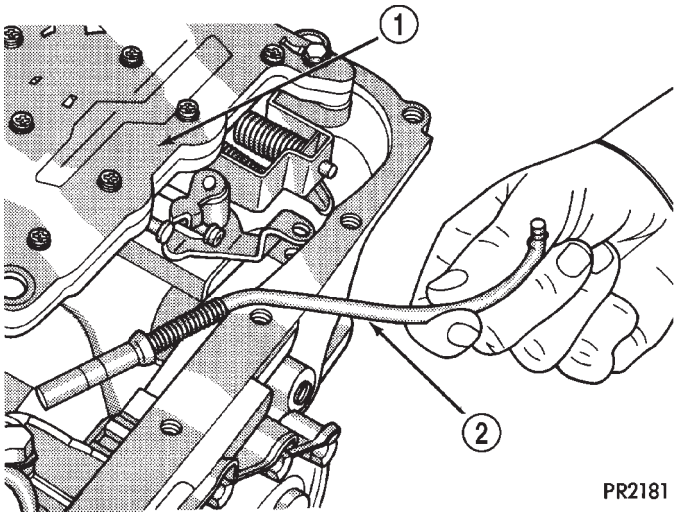

Fig. 303 Parking Rod

1 - VALVE BODY
2 - PARKING ROD

(13) Remove valve body-to-transaxle case bolts (Fig. 304).

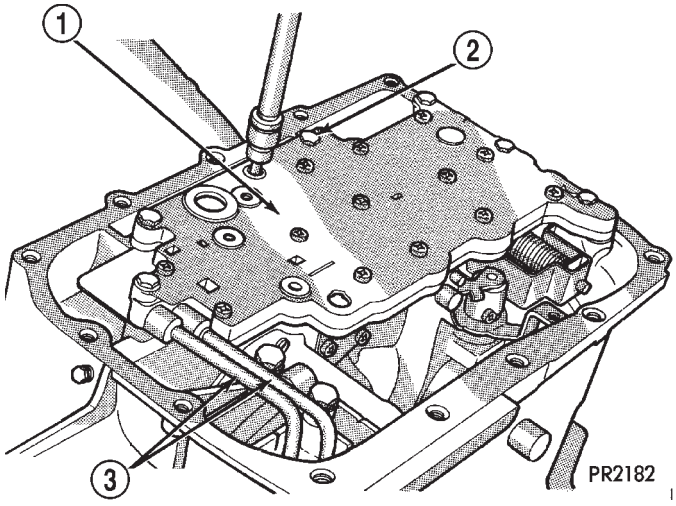

Fig. 304 Valve Body Attaching Bolts

1 - VALVE BODY
2 - VALVE BODY ATTACHING BOLTS (7)
3 - GOVERNOR TUBES

VALVE BODY (Continued)

(14) Remove valve body from transaxle. Note orientation of governor tubes (Fig. 305).

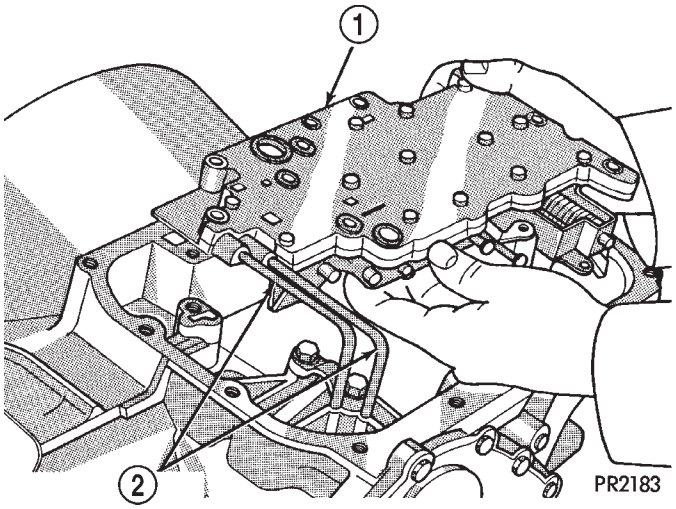

Fig. 305 Valve Body and Governor Tubes

1 - VALVE BODY ASSEMBLY
2 - GOVERNOR TUBES

DISASSEMBLY

CAUTION: Do not clamp any portion of valve body or transfer plate in a vise. Any slight distortion of the aluminum body or transfer plate will result in sticking valves, excessive leakage, or both. When removing or installing valves or plugs, slide them in or out carefully. Do not use force.

NOTE: TAG ALL SPRINGS AS THEY ARE REMOVED FOR REASSEMBLY IDENTIFICATION.

(1) Remove detent spring-to-valve body screws and remove spring (Fig. 306).

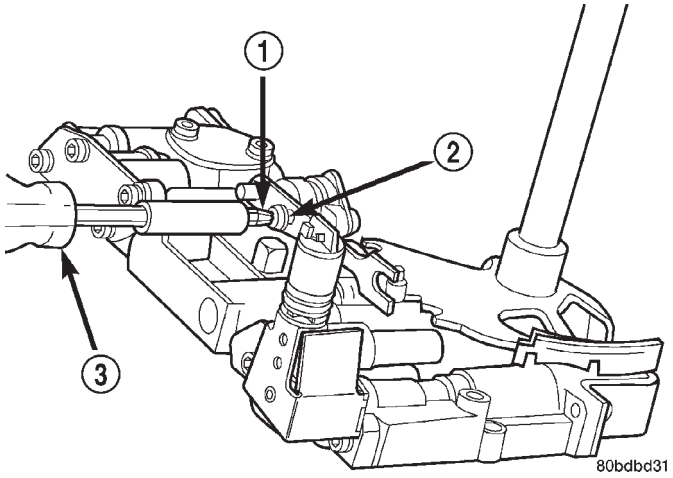

Fig. 306 Detent Spring Attaching Screw and Spring

1 - SPECIAL TOOL L-4553
2 - DETENT SPRING SCREW
3 - SCREWDRIVER HANDLE

(2) Remove valve body-to-separator plate screws (Fig. 307) (Fig. 308).

VALVE BODY (Continued)

(12) Remove shift/shuttle valves and springs as shown in (Fig. 320).

CLEANING

Clean the valve body components in a parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution. Dry the parts with compressed air. Make sure all passages are clean and free from obstructions.

NOTE: Do not use rags or shop towels to wipe off valve body components. Lint from these materials will adhere to the valve body components. Lint will interfere with valve operation and may clog filters and fluid passages.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with crocus cloth. The cloth should be in sheet form and be positioned on a surface plate, sheet of plate glass, or equally flat surface. However, if distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

CAUTION: Many of the valve body valves and plugs are made of coated aluminum. Aluminum components can be identified by the dark color of the special coating applied to the surface (or by testing with a magnet). DO NOT polish or sand aluminum valves or plugs with any type of material, or under any circumstances. This practice might damage the special coating and cause the valves and plugs to stick and bind.

Aluminum valves and plugs should not be sanded or polished under any circumstances. However, minor burrs or scratches on steel valves and plugs can be removed with crocus cloth but do not round off the

VALVE BODY (Continued)

valve or plug edges. Squareness of these edges is vitally important. These edges prevent foreign matter from lodging between the valves, plugs and bore.

INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Also inspect the coating on the aluminum valves and plugs. If the coating is damaged or worn through, the valve (or valve body) should be replaced.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores. Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

ASSEMBLY

(1) Install shift/shuttle valves and springs as shown in (Fig. 320).

(2) Install torque converter clutch solenoid, spring, and plug as shown in (Fig. 319).

(3) Install governor plugs as shown in (Fig. 318).

(4) Install pressure regulator and manual control springs and valves as shown in (Fig. 317).

(5) Install pressure regulator spring retainer/adjusting screw bracket (Fig. 321).

(6) Install manual valve from valve body (Fig. 322).

1 - OIL FILTER
2 - GASKET
3 - VALVE BODY

(6) Install oil filter-to-valve body screws (Fig. 337) to 5 N·m (45 in. lbs.).

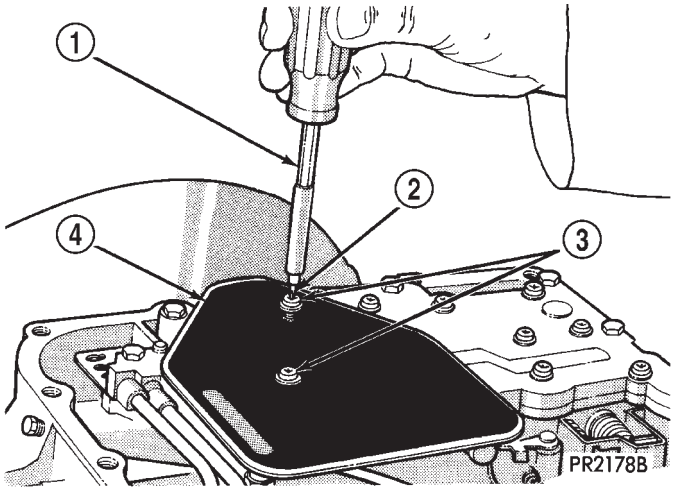

Fig. 337 Oil Filter Screws

1 - SCREWDRIVER HANDLE
2 - SPECIAL TOOL L-4553
3 - OIL FILTER SCREWS (2)
4 - OIL FILTER

(7) Install a bead of Mopar® Silicone Rubber Adhesive Sealant to oil pan (Fig. 338) and immediately install to case.

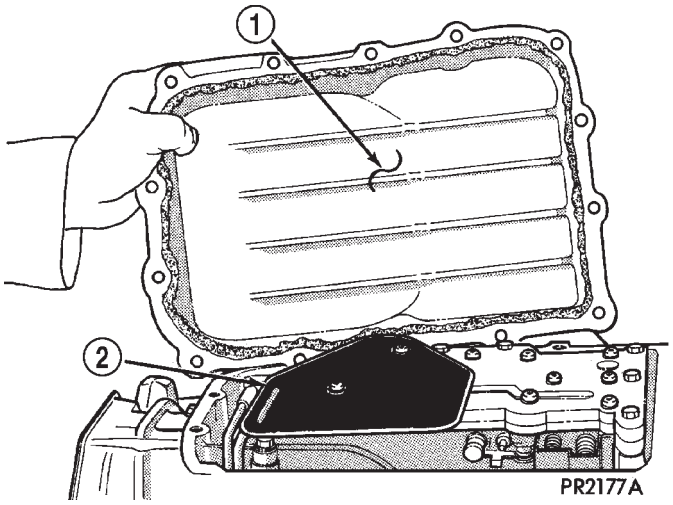

Fig. 338 Transaxle Oil Pan

1 - TRANSAXLE OIL PAN
2 - OIL FILTER

VALVE BODY (Continued)

(8) Install and torque oil pan-to-transaxle bolts (Fig. 339) to 19 N·m (165 in. lbs.).

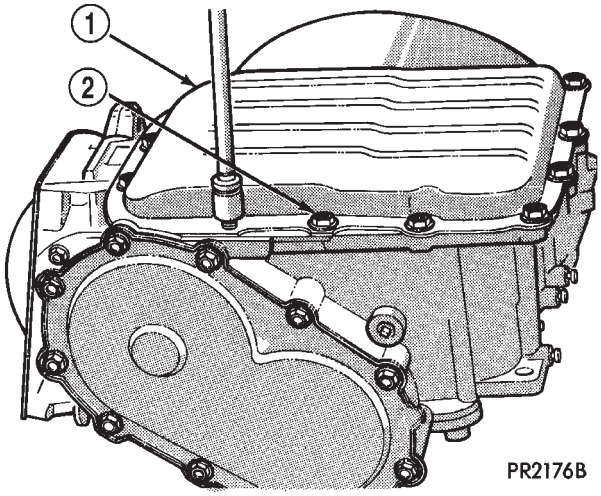

Fig. 339 Transaxle Oil Pan Bolts

1 - TRANSAXLE OIL PAN
2 - OIL PAN BOLTS

(9) Lower vehicle.
(10) Connect torque converter clutch solenoid.
(11) Connect gearshift cable to manual valve lever.
(12) Connect throttle valve cable to throttle valve lever at transaxle.
(13) Connect battery negative cable.

ADJUSTMENTS

HYDRAULIC CONTROL PRESSURE ADJUSTMENTS

LINE PRESSURE

An incorrect throttle pressure setting will cause incorrect line pressure readings even though line pressure adjustment is correct. Always inspect and correct throttle pressure adjustment before adjusting the line pressure.

The approximate adjustment for line pressure is 1-5/16 inches, measured from valve body to inner edge of adjusting nut. However, due to manufacturing tolerances, the adjustment can be varied to obtain specified line pressure.

The adjusting screw may be turned with an Allen wrench. One complete turn of adjusting screw changes closed throttle line pressure approximately 1-2/3 psi. Turning adjusting screw counterclockwise increases pressure, and clockwise decreases pressure.

THROTTLE PRESSURE

Throttle pressures cannot be tested accurately; therefore, the adjustment should be measured if a malfunction is evident.

(1) Insert gauge pin of Tool C-3763 between the throttle lever cam and kickdown valve.

(2) By pushing in on tool, compress kickdown valve against its spring so throttle valve is completely bottomed inside the valve body.

(3) While compressing spring, turn throttle lever stop screw with adapter C-4553. Turn until head of screw touches throttle lever tang, with throttle lever cam touching tool and throttle valve bottomed. Be sure adjustment is made with spring fully compressed and valve bottomed in the valve body.

VEHICLE SPEED SENSOR/ PINION GEAR

REMOVAL

(1) Remove harness connector from sensor (Fig. 340). Be sure weather seal stays on harness connector.

(2) Remove bolt securing the sensor in the extension housing (Fig. 340) .

(3) Carefully pull sensor and pinion gear assembly out of extension housing.

(4) Remove pinion gear from sensor (Fig. 340) .

(5) Inspect pinion gear for damage (missing teeth, etc.) and replace as necessary.

NOTE: When removing vehicle speed sensor for any reason, a new o-ring MUST be used.

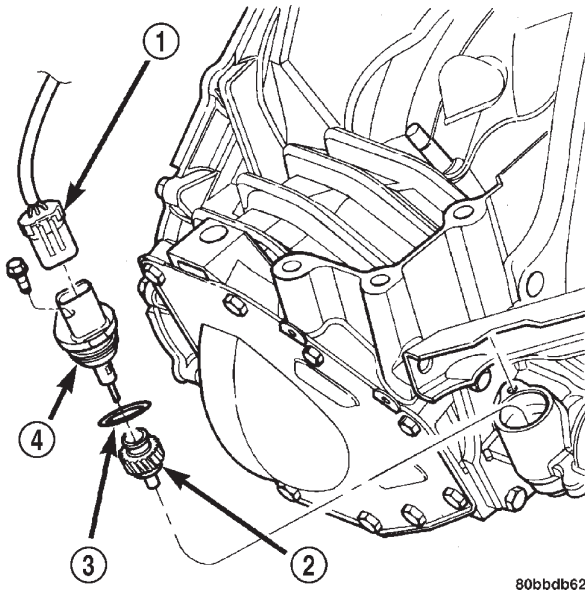

Fig. 340 Vehicle Speed Sensor Removal/Installation

1 - CONNECTOR
2 - SPEEDO PINION
3 - O-RING
4 - SENSOR

INSTALLATION

(1) Install vehicle speed sensor and pinion gear to extension housing with new o-ring (Fig. 340).
(2) Install bolt and torque to 7 N·m (60 in. lbs.).
(3) Connect connector.
(4) Lower vehicle.

41TE AUTOMATIC TRANSAXLE

DESCRIPTION

The 41TE (Fig. 1) is a four-speed transaxle that is a conventional hydraulic/mechanical assembly with an integral differential, and is controlled with adaptive electronic controls and monitors. The hydraulic system of the transaxle consists of the transaxle fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transaxle consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly
- Integral differential assembly

Control of the transaxle is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Transmission Control Module (TCM).

The TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB scan tool.

TRANSAXLE IDENTIFICATION

The 41TE transaxle is identified by a barcode label that is fixed to the transaxle case as shown in (Fig. 2).

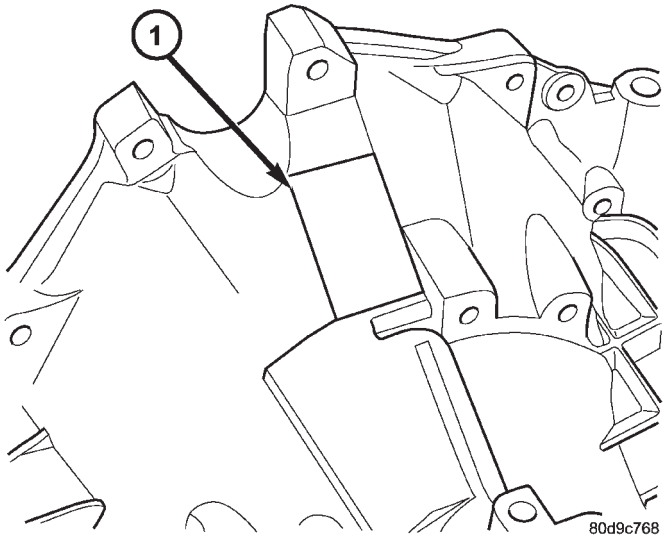

Fig. 2 Transaxle Identification Label

1 - IDENTIFICATION LABEL

The label contains a series of digits that can be translated into useful information such as transaxle part number, date of manufacture, manufacturing origin, plant shift number, build sequence number, etc. Refer to (Fig. 3) for identification label breakdown.

If the tag is not legible or missing, the “PK” number, which is stamped into the transaxle case behind the transfer gear cover, can be referred to for identification. This number differs slightly in that it contains the entire transaxle part number, rather than the last three digits.

OPERATION

Transmission output is directed to an integral differential by a transfer gear system in the following input-to-output ratios:

First	2.84 : 1
Second	1.57 : 1
Third	1.00 : 1
Overdrive	0.69 : 1
Reverse	2.21 : 1

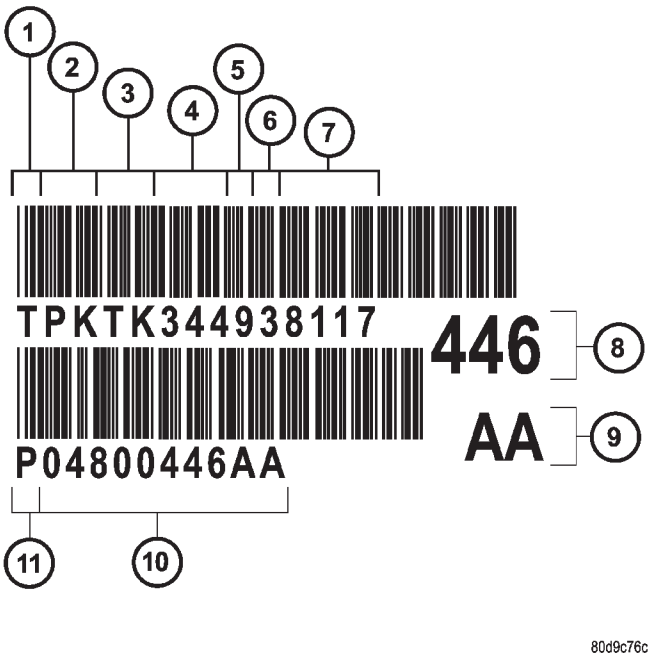

Fig. 3 Identification Label Breakdown

1 - T=TRACEABILITY
2 - SUPPLIER CODE (PK=KOKOMO)
3 - COMPONENT CODE (TK=KOKOMO TRANSMISSION)
4 - BUILD DAY (344=DEC. 9)
5 - BUILD YEAR (9=1999)

7 - BUILD SEQUENCE NUMBER
8 - LAST THREE OF P/N
9 - NIK
10 - TRANSAXLE PART NUMBER
11 - P=PART NUMBER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - 41TE TRANSAXLE GENERAL DIAGNOSIS

NOTE: Before attempting any repair on a 41TE four-speed automatic transaxle, check for diagnostic trouble codes (DTC’s) using the DRB scan tool. Refer to the Transmission Diagnostic Procedures Manual.

Transaxle malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then per-

form a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

DIAGNOSIS AND TESTING - ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transaxle should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transaxle cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transaxle in all selector positions.

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

Shift Lever Position	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse
P - PARK					X
R - REVERSE			X		X
N - NEUTRAL					X
OD - OVERDRIVE					
First	X				X
Second	X			X	
Direct	X	X			
Overdrive		X		X	
D - DRIVE*					
First	X				X
Second	X			X	
Direct	X	X			
L - LOW*					
First	X				X
Second	X			X	
Direct	X	X			
* Vehicle upshift and downshift speeds are increased when in these selector positions.					

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TESTS

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most hydraulic transaxle problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature (150 to 200 degrees F.).

Install an engine tachometer, raise vehicle on hoist which allows front wheels to turn, and position tachometer so it can be read.

Attach 300 psi gauge (C-3293SP) to port(s) required for test(s) being conducted. Use adapter set L-4559 to adapt gauge(s) to transaxle.

Test port locations are shown in (Fig. 4).

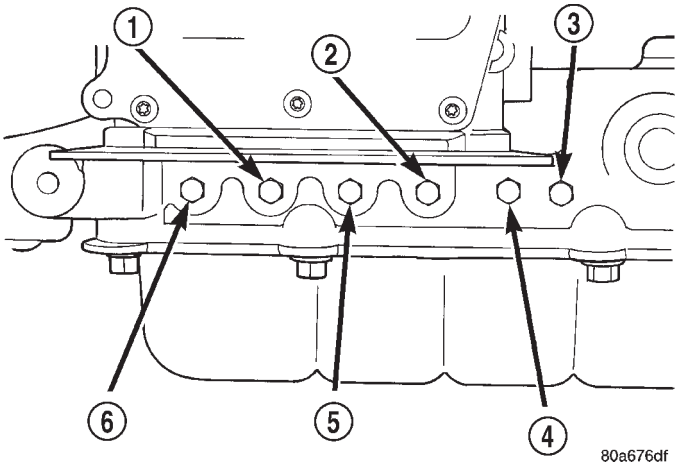

Fig. 4 Pressure Taps

1 - OVERDRIVE CLUTCH
2 - TORQUE CONVERTER OFF
3 - LOW/REVERSE CLUTCH
4 - 2/4 CLUTCH
5 - REVERSE CLUTCH
6 - UNDERDRIVE CLUTCH

TEST ONE-SELECTOR IN LOW (1st GEAR)

(1) Attach pressure gauge to the low/reverse clutch tap.

(2) Move selector lever to the (L) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.

(4) Low/reverse clutch pressure should read 115 to 145 psi.

(5) This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

TEST TWO-SELECTOR IN DRIVE (2nd GEAR)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

(1) Attach gauge to the underdrive clutch tap.

(2) Move selector lever to the 3 position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.

(4) In second gear the underdrive clutch pressure should read 110 to 145 psi.

TEST TWO A–SELECTOR IN OD (4th Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

(1) Attach gauge to the underdrive clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.

(4) Underdrive clutch pressure should read below 5 psi. If not, then either the solenoid assembly or TCM is at fault.

TEST THREE-OVERDRIVE CLUTCH CHECK (3rd and 2nd Gear)

(1) Attach gauge to the overdrive clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph. Vehicle should be in 3rd gear.

(4) Overdrive clutch pressure should read 74 to 95 psi.

(5) Move selector lever to the (3) position and increase indicated vehicle speed to 30 mph.

(6) The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.

(7) This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.

TEST FOUR-SELECTOR IN OVERDRIVE (4th Gear)

(1) Attach gauge to the 2/4 clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in 4th gear.

(4) The 2/4 clutch pressure should read 75 to 95 psi.

(5) This test checks the 2/4 clutch hydraulic circuit.

TEST FIVE-SELECTOR IN OVERDRIVE (4th Gear-CC on)

(1) Attach gauge to the torque converter clutch off pressure tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

CAUTION: Both wheels must turn at the same speed.

(4) Torque converter clutch off pressure should be less than 5 psi.

(5) This test checks the torque converter clutch hydraulic circuit.

41TE AUTOMATIC TRANSAXLE (Continued)

TEST SIX-SELECTOR IN REVERSE

(1) Attach gauges to the reverse and LR clutch tap.

(2) Move selector lever to the (R) position.

(3) Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 rpm.

(4) Reverse and LR clutch pressure should read 165 to 235 psi.

(5) This test checks the reverse clutch hydraulic circuit.

TEST RESULT INDICATIONS

(1) If proper line pressure is found in any one test, the pump and pressure regulator are working properly.

(2) Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.

(3) Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.

(4) If the overdrive clutch pressure is greater than 5 psi in Step 4 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.

(5) If the underdrive clutch pressure is greater than 5 psi in Step 4 of Test Two A, a defective solenoid assembly or TCM is the cause.

PRESSURE CHECK SPECIFICATIONS

Gear Selector Position	Actual Gear	Pressure Taps					
		Underdrive Clutch	Overdrive Clutch	Reverse Clutch	Torque Converter Clutch Off	2/4 Clutch	Low/ Reverse Clutch
Park * 0 mph	PARK	0-2	0-5	0-2	60-110	0-2	115-145
REVERSE * 0 mph	REVERSE	0-2	0-7	165-235	50-100	0-2	165-235
NEUTRAL * 0 mph	NEUTRAL	0-2	0-5	0-2	60-110	0-2	115-145
L # 20 mph	FIRST	110-145	0-5	0-2	60-110	0-2	115-145
3 # 30 mph	SECOND	110-145	0-5	0-2	60-110	115-145	0-2
3 # 45 mph	DIRECT	75-95	75-95	0-2	60-90	0-2	0-2
OD # 30 mph	OVERDRIVE	0-2	75-95	0-2	60-90	75-95	0-2
OD # 50 mph	OVERDRIVE WITH TCC	0-2	75-95	0-2	0-5	75-95	0-2

*** Engine speed at 1500 rpm**

 # CAUTION: Both front wheels must be turning at the same speed.

DIAGNOSIS AND TESTING - CLUTCH AIR PRESSURE TESTS

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure (Fig. 5) (Fig. 6). The clutches may be tested by applying air pressure to their respective passages. The valve body must be removed and Tool 6056 installed. To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

Remove oil pan and valve body. See Valve body removal.

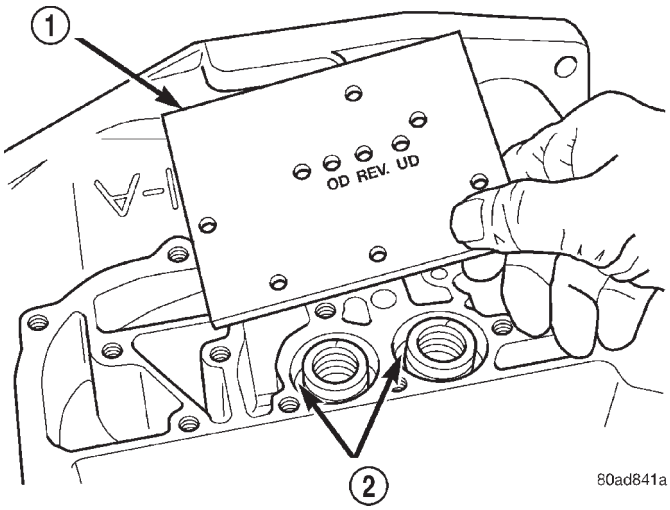

Fig. 5 Air Pressure Test Plate

1 - TOOL 6056
2 - ACCUMULATORS

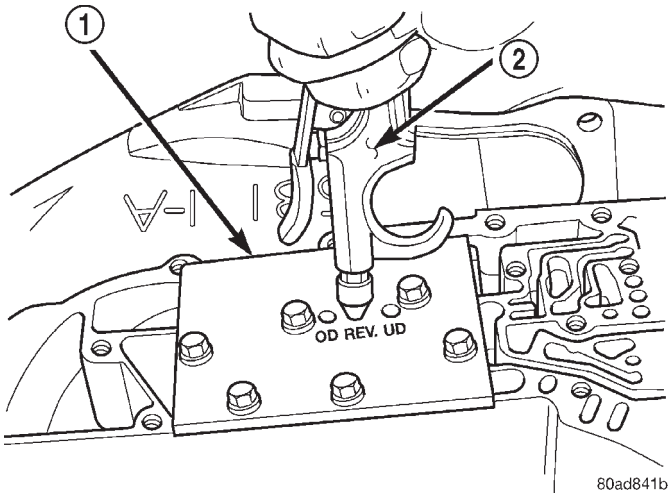

Fig. 6 Testing Reverse Clutch

1 - TOOL 6056
2 - AIR NOZZLE

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer. Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole (rear of case, between 2 bolt holes). Then, look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Air pressure is applied to the low/reverse and the 2/4 clutches. This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

DIAGNOSIS AND TESTING - TORQUE CONVERTER HOUSING FLUID LEAKAGE

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

(1) Verify proper transmission fluid level.

(2) Verify that the leak originates from the converter housing area and is transmission fluid.

(3) Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (Fig. 7). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair.

41TE AUTOMATIC TRANSAXLE (Continued)

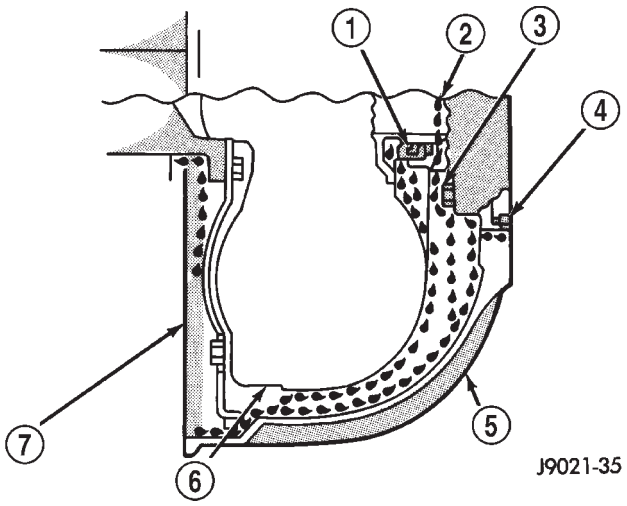

Fig. 7 Converter Housing Leak Paths

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal leaks tend to move along the drive hub and onto the rear of the converter (Fig. 7). Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing (Fig. 7).

TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (Fig. 8).
- Torque converter hub weld (Fig. 8).

REMOVAL

NOTE: If transaxle assembly is being replaced or overhauled (clutch and/or seal replacement), it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect battery cables.
(2) Remove battery shield (Fig. 9).

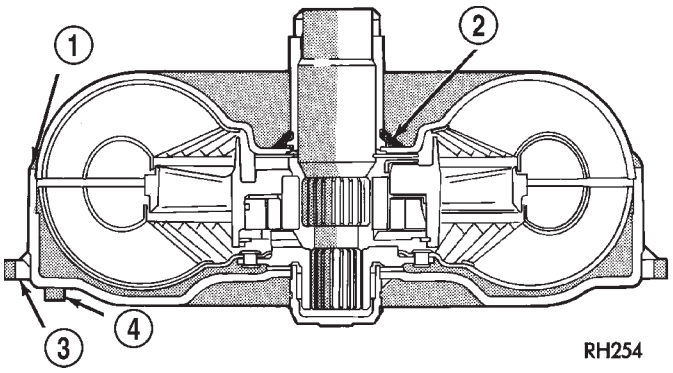

Fig. 8 Converter Leak Points - Typical

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

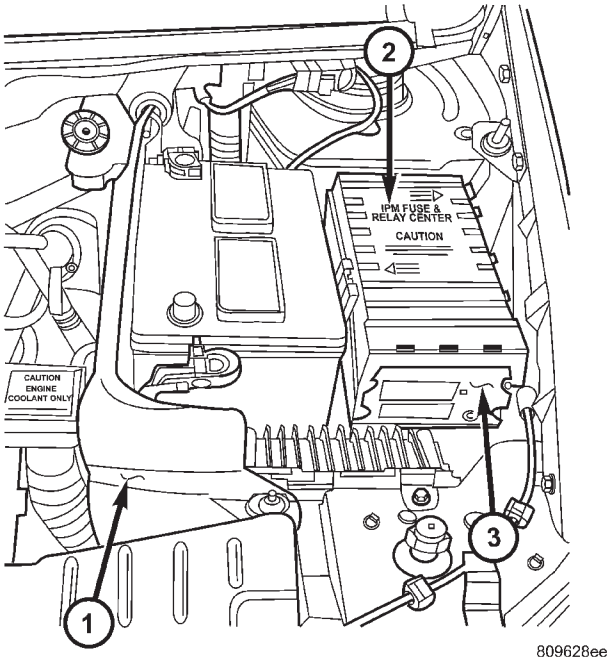

Fig. 9 Battery Thermal Guard

1 - BATTERY THERMOWRAP (IF EQUIPPED)

3 - FRONT CONTROL MODULE

41TE AUTOMATIC TRANSAXLE (Continued)

(3) Remove coolant recovery bottle (Fig. 10).

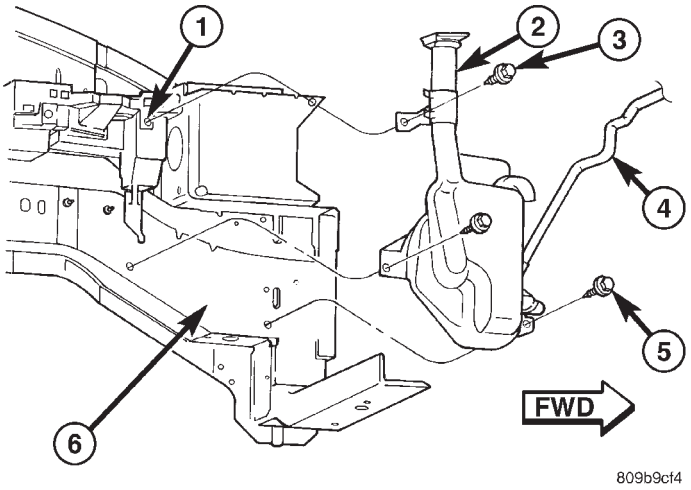

Fig. 10 Coolant Recovery Bottle

1 - UPPER BOLT ATTACHING TO BATTERY TRAY
2 - COOLANT RECOVERY CONTAINER
3 - UPPER BOLT
4 - HOSE
5 - LOWER BOLT (QTY. 2)
6 - LEFT SIDE FRAME RAIL

(4) Remove fluid level indicator/tube assembly. Plug opening to prevent debris from entering transaxle.

(5) Using a blade or suitable hose cutter, cut transaxle oil cooler lines off flush with fittings. Plug lines and fittings to prevent debris from entering transaxle or cooler circuit. A service splice kit will be installed upon reassembly.

(6) Disconnect input and output shaft speed sensor connectors (Fig. 11).

(7) Disconnect transmission range sensor (TRS) connector (Fig. 11).

(8) Disconnect solenoid/pressure switch assembly connector (Fig. 11).

(9) Disconnect gear shift cable from manual valve lever and upper mount bracket (Fig. 12).

(10) Disconnect crankshaft position sensor (if equipped). Remove sensor from bellhousing.

(11) Reposition leak detection pump harness and hoses.

(12) Remove rear mount bracket-to-transaxle case bolts (Fig. 13).

(13) Remove transaxle upper bellhousing-to-block bolts.

(14) Raise vehicle on hoist.

(15) Remove transaxle oil pan and drain fluid into suitable container.

(16) Remove front wheel/tire assemblies.

(17) Remove left and right halfshaft assemblies. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

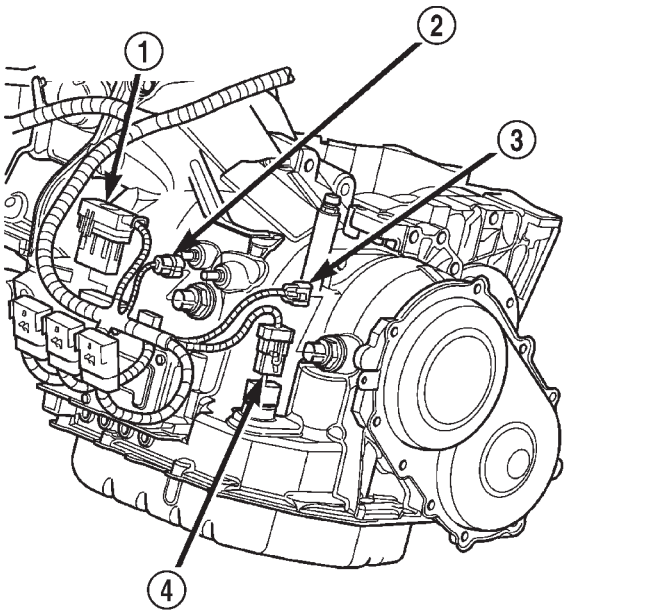

Fig. 11 Component Connector Location—Typical

(18) AWD models: Remove power transfer unit. (Refer to 21 - TRANSMISSION/TRANSAXLE/ POWER TRANSFER UNIT - REMOVAL)

(19) Remove rear mount bracket-to-transaxle case lower (horizontal) bolt (Fig. 13).

(20) Remove front mount/bracket assembly.

(21) Remove starter motor.

(22) Remove lateral bending brace.

(23) Remove inspection cover.

(24) Remove torque converter-to-drive plate bolts.

(25) Support engine/transaxle assembly at engine oil pan with screw jack and wood block.

(26) Partially remove left wheelhouse splash shield to gain access to and remove upper mount thru-bolt (Fig. 14).

(27) Lower engine/transaxle assembly with screw jack.

(28) Obtain helper and/or transmission jack. Secure transmission jack to transaxle assembly.

(29) Remove upper mount bracket from transaxle (Fig. 14).

(30) Remove remaining transaxle bellhousing-to-engine bolts.

(31) Remove transaxle assembly from vehicle.

DISASSEMBLY

CAUTION: If transaxle failure has occurred, it is necessary to flush the transaxle oil cooler and lines to remove debris and particles that could contaminate and/or fail a new or rebuilt unit. (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE)

NOTE: If transaxle is being overhauled (clutch and/or seal replacement) or replaced, it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

NOTE: This procedure does not include final drive (differential) disassembly.

(1) Remove input and output speed sensors.

(2) Remove three (3) solenoid/pressure switch assembly-to-case bolts.

ASSEMBLY

CAUTION: If transaxle failure has occurred, it is necessary to flush the transaxle oil cooler and lines to remove debris and particles that could contaminate and/or fail a new or rebuilt unit. (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE)

CAUTION: The cooler bypass valve must be replaced if transaxle failure has occurred. Do not attempt to reuse or clean old valve.

NOTE: If transaxle is being overhauled (clutch and/or seal replacement), the TCM Quick Learn procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Install both output bearing cups using Tool 5050 (Fig. 87).

(2) Install low/reverse piston retainer gasket (Fig. 88). Make sure gasket holes line up with case.

4 - OUTPUT GEAR

(14) **OUTPUT GEAR BEARING ADJUSTMENT:**

(a) With output gear removed, install a 4.50 mm (0.177 in.) gauging shim (Fig. 103) on the rear carrier assembly hub, using grease to hold the shim in place.

(b) Using Tool 6259, install output gear and bearing assembly. Torque to 271 N·m (200 ft. lbs.).

(c) Measure bearing end play. Attach Tool L-4432 to the gear (Fig. 102).

(d) Push and pull the gear while rotating back and forth to ensure seating of bearing rollers.

(e) Using a dial indicator mounted to the transaxle case, measure output gear end play as shown in (Fig. 102).

(f) Refer to the output gear bearing shim chart for the required shim to obtain proper bearing setting.

(g) Use Tool 6259 to remove the output gear retaining bolt and washer. To remove the output gear, use Tool L4407A.

(h) Remove the gauging shim and install the proper shim determined by the chart. Use grease to hold the shim in place.

2 - HOOK TOOL
3 - DIAL INDICATOR TIP TOOL 6268

(49) Install rear sun gear and #7 needle bearing (Fig. 139).

NOTE: The number seven needle bearing has three anti-reversal tabs and is common with the number five and number two position. The orientation should allow the bearing to seat flat against the rear sun gear (Fig. 138). A small amount of petrolatum can be used to hold the bearing to the rear sun gear.

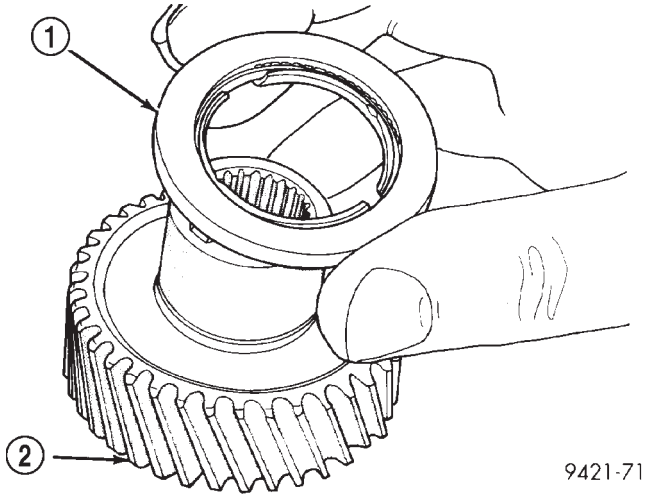

Fig. 138 Number 7 Bearing

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

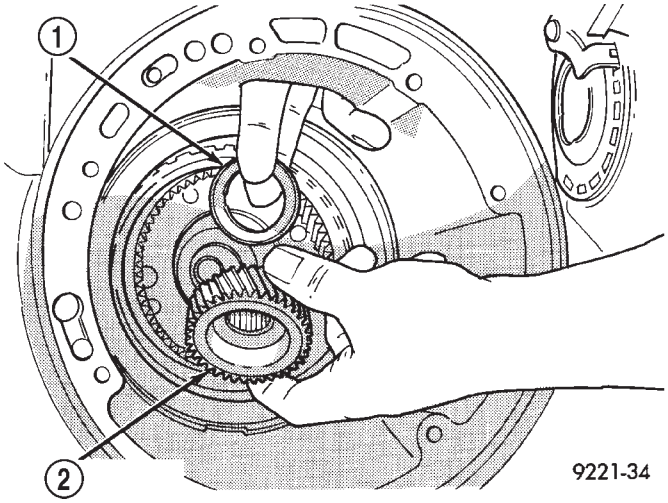

Fig. 139 Install Rear Sun Gear and #7 Needle Bearing

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

41TE AUTOMATIC TRANSAXLE (Continued)

(c) Remove oil pump o-ring (Fig. 144). **Be sure to reinstall oil pump o-ring after selecting the proper #4 thrust plate.**

(d) Set up input shaft for measurement with Indicator Set C3339 and End Play Set 8266 as shown in (Fig. 145).

(e) Measure the input shaft end play with the transaxle in the vertical position. **Input shaft end play must be within 0.005 to 0.025 inch.** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch which is within specifications.

(f) Refer to the No. 4 thrust plate chart to select the proper No. 4 thrust plate:

ACCUMULATOR

DESCRIPTION

The 41te underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston, seals, return spring(s), and a cover or plug. The overdrive and underdrive accumulators are located within the transaxle case, and are retained by the valve body (Fig. 169) .

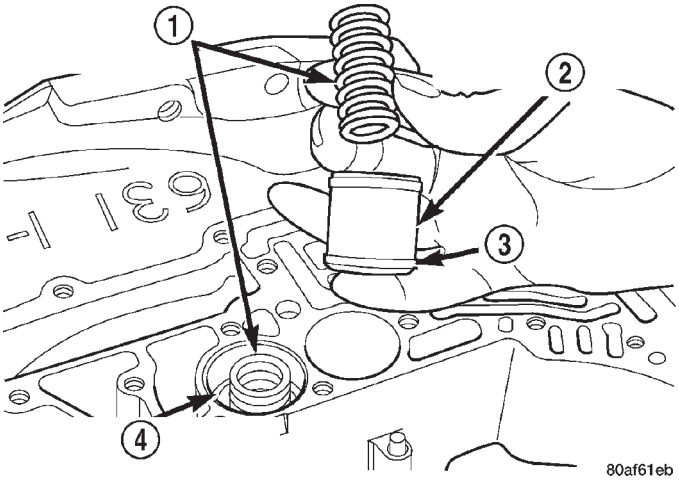

Fig. 169 Underdrive and Overdrive Accumulators

1 - RETURN SPRING
2 - UNDERDRIVE CLUTCH ACCUMULATOR
3 - SEAL RING (2)
4 - OVERDRIVE CLUTCH ACCUMULATOR

The low reverse accumulator (Fig. 170) is also located within the transaxle case, but the assembly is retained by a cover and a snap-ring.

The 2/4 accumulator is located in the valve body. It is retained by a cover and retaining screws (Fig. 171) .

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and spring(s). The intended result is a smooth, firm clutch application.

AUTOSTICK SWITCH

DESCRIPTION

Autostick is a driver-interactive transaxle feature that offers manual gear shifting capability. The control switch is part of the transaxle gear shift lever as shown in (Fig. 172). It can only be serviced by replacing the gearshift lever assembly. (Refer to 19 - STEERING/COLUMN/GEAR SHIFT LEVER - REMOVAL)

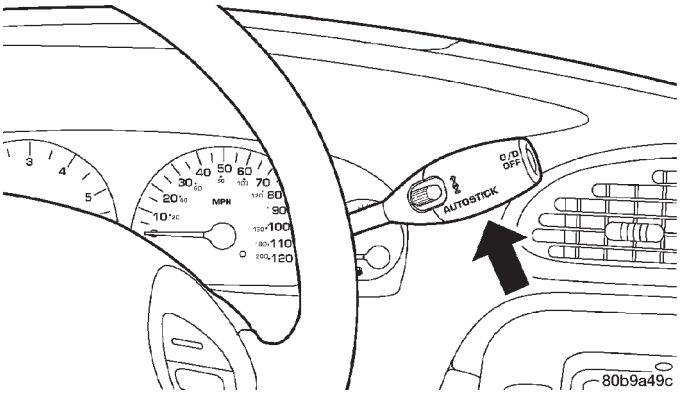

Fig. 172 Autostick Switch Location (if equipped)

OPERATION

When the shift lever is moved into the Autostick position (as indicated by the Shift Lever Position Indicator in the cluster), the transaxle remains in whatever gear it was using before Autostick was activated. The TCM sends a 5 volt signal through the switch and then monitors the signal for voltage drop. Each switch state (driver command) results in a specific voltage reading sensed by the TCM. The TCM then determines transaxle operation (upshift/downshift/OD Lockout) based on their corresponding voltage. Refer to the following chart for corresponding switch states and voltage readings:

Switch State	Voltage Reading
Autostick DOWN depressed	0.3V-1.6V
Autostick UP depressed	1.6V-2.8V
Overdrive OFF ″Lockout″ depressed	2.8V-3.8V
All switches open	3.8V-4.8V
-Voltage values <.3V and >4.8V are considered INVALID and will result in a DTC	

Moving the switch up causes an upshift and moving the switch down causes a downshift. The instrument cluster will illuminate the selected gear. The vehicle can be launched in 1st, 2nd, or 3rd gear while in the Autostick mode. The speed control is operable in 3rd and 4th gear Autostick mode. Speed control will be deactivated if the transaxle is shifted to 2nd gear. Shifting into OD position cancels the Autostick mode, and the transaxle resumes the OD shift schedule.

DRIVING CLUTCHES

DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly (Fig. 173). The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

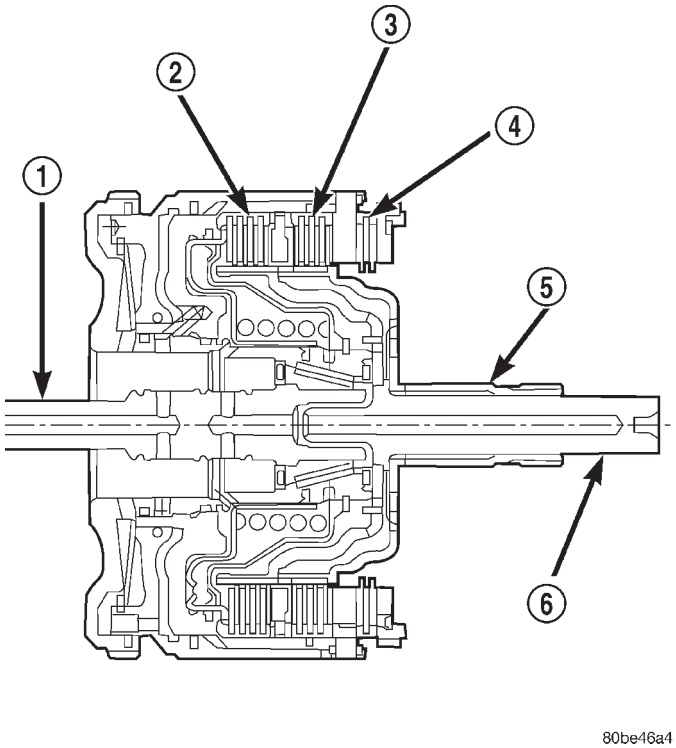

Fig. 173 Input Clutch Assembly

1 - INPUT SHAFT
2 - UNDERDRIVE CLUTCH
3 - OVERDRIVE CLUTCH
4 - REVERSE CLUTCH
5 - OVERDRIVE SHAFT
6 - UNDERDRIVE SHAFT

DRIVING CLUTCHES (Continued)

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

NOTE: Refer to the "Elements In Use" chart in Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

FINAL DRIVE

DISASSEMBLY

NOTE: The differential is serviced as an assembly. Differential service is limited to bearing cups and cones. Any other differential component failure must be remedied by differential assembly and transfer shaft replacement.

The transfer shaft should be removed for differential repair and bearing turning torque checking.

(1) Remove the differential cover and bolts (Fig. 174) (Fig. 175).

(2) Remove the differential bearing retainer and bolts (Fig. 176) (Fig. 177).

(3) Using a plastic hammer, remove extension housing/adapter plate on the right side of the transaxle.

WARNING: HOLD ONTO DIFFERENTIAL ASSEMBLY TO PREVENT IT FROM ROLLING OUT OF HOUSING.

(4) Use Miller Special Tool 5048, 5048-3 Collets, and L-4539-2 Button to remove the differential bearing cone on the extension housing side.

ADJUSTMENTS

ADJUSTMENT - DIFFERENTIAL BEARING PRELOAD

NOTE: Perform all differential bearing preload measurements with the transfer shaft and gear removed.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT USING EXISTING SHIM

(1) Position the transaxle assembly vertically on the support stand, differential bearing retainer side up.

(2) Install Tool L-4436A into the differential and onto the pinion mate shaft (Fig. 208).

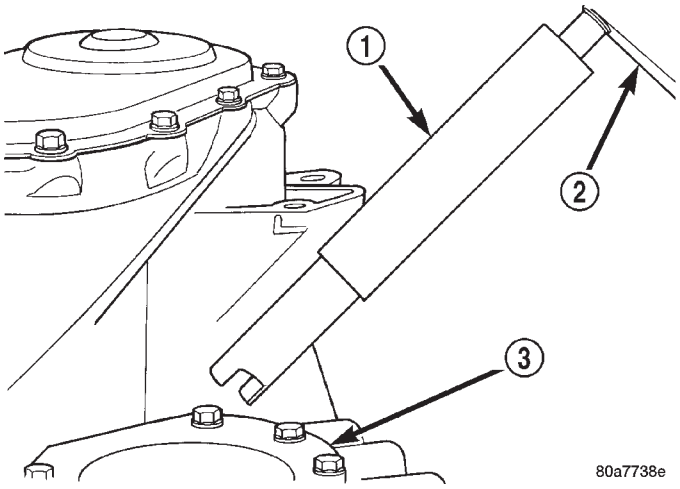

Fig. 208 Tool L-4436 and Torque Wrench

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH
3 - DIFFERENTIAL BEARING RETAINER

FINAL DRIVE (Continued)

(3) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

(4) Using Tool L-4436A and an inch-pound torque wrench, check the turning torque of the differential (Fig. 209). **The turning torque should be between 5 and 18 inch-pounds.**

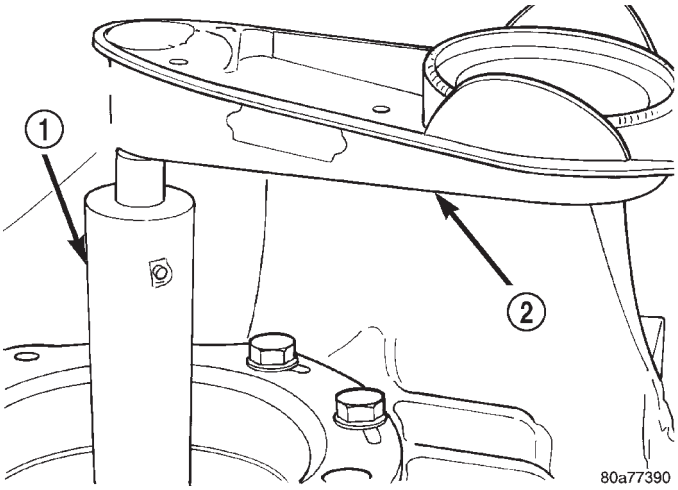

Fig. 209 Checking Differential Bearings Turning Torque

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH

(5) If the turning torque is within specifications, remove tools. Setup is complete.

(6) If turning torque is not within specifications proceed with the following steps.

(a) Remove differential bearing retainer from the transaxle case.

(b) Remove the bearing cup from the differential bearing retainer using Tool 6062A.

(c) Remove the existing shim from under the cup.

(d) Measure the existing shim.

(e) If the turning torque was too high when measured, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is was too low, install a 0.05 mm (0.002 inch) thicker shim. Repeat until 5-18 inch-pounds turning torque is obtained. Oil Baffle is not required to be installed when making shim selection.

(f) Install the proper shim under the bearing cup. Make sure the oil baffle is installed properly in the bearing retainer, below the bearing shim and cup.

(g) Install the differential bearing retainer using Tool 5052 and C-4171. Seal the retainer to the housing with MOPAR® Silicone Rubber Adhesive Sealant and torque bolts to 28 N·m (250 in. lbs.).

(7) Using Tool L-4436A and an inch-pound torque wrench, recheck the turning torque of the differential (Fig. 209). **The turning torque should be within 5-18 inch-pounds.**

Shim thickness need be determined only if any of the following parts are replaced:

- Transaxle case
- Differential carrier
- Differential bearing retainer
- Extension housing
- Differential bearing cups and cones

FINAL DRIVE (Continued)

DIFFERENTIAL BEARING SHIM CHART

PART NUMBER	SHIM THICKNESS	
	MM	INCH
4659257	.980	0.0386

4659283	2.02	0.0796
4659284	2.06	0.0812

PRELOAD ADJUSTMENT W/O SHIM

(1) Remove the bearing cup from the differential bearing retainer using Miller special Tool 6062A.

(2) Remove existing shim from under bearing cup.

(3) Reinstall the bearing cup into the retainer using Miller Special Tool 6061, and C-4171.

NOTE: Oil baffle is not required when making the shim calculation.

(4) Install the bearing retainer into the case. Torque bolts to 28 N·m (250 in. lbs.).

(5) Position the transaxle assembly vertically on the support stand and install Miller Special Tool L-4436-A into the bearing retainer.

(6) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

(7) Attach a dial indicator to the case and zero the dial. Place the tip on the end of Special Tool L-4436-A.

(8) Place a large screwdriver to each side of the ring gear and lift. Check the dial indicator for the amount of end play.

CAUTION: Do not damage the transaxle case and/or differential retainer sealing surface.

(9) Using the end play measurement that was determined, add 0.18mm (0.007 inch). This should give you between 5-18 inch pounds of bearing preload. Refer to the Differential Bearing Shim Chart to determine which shim to use.

(10) Remove the differential bearing retainer. Remove the bearing cup.

(11) Install the oil baffle. Install the proper shim combination under the bearing cup.

(12) Install the differential bearing retainer. Seal the retainer to the housing with Mopar® Silicone Rubber Adhesive Sealant. Torque bolts to 28 N·m (250 in. lbs.).

(13) Using Miller Special Tool L-4436-A and an inch-pound torque wrench, check the turning torque of the differential (Fig. 209). The turning torque should be between 5-18 inch-pounds.

NOTE: If turning torque is too high install a 0.05mm (0.002 inch) thicker shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thinner shim. Repeat until 5-18 inch-pounds of turning torque is obtained.

FLUID

STANDARD PROCEDURE

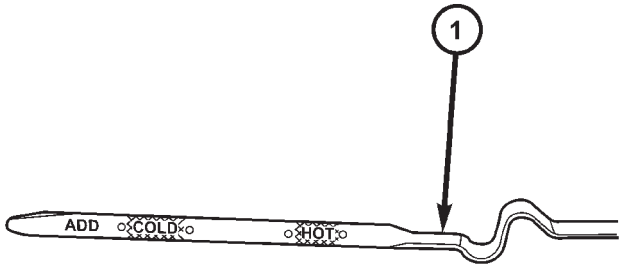
FLUID LEVEL AND CONDITION CHECK

NOTE: Only transmission fluid of the type labeled Mopar ATF+4 (Automatic Transmission Fluid–Type 9602) should be used in this transaxle.

FLUID LEVEL CHECK

The transmission sump has a fluid level indicator (dipstick) to check oil similar to most automatic transmissions. It is located on the left side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P Park and N Neutral positions. Place the selector lever in P Park to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature 82° C (180° F), the fluid level is correct if it is in the HOT region on the oil level indicator (Fig. 210). The fluid level should be within the COLD region of the dipstick at 27° C (80° F) fluid temperature.



80d64ee0

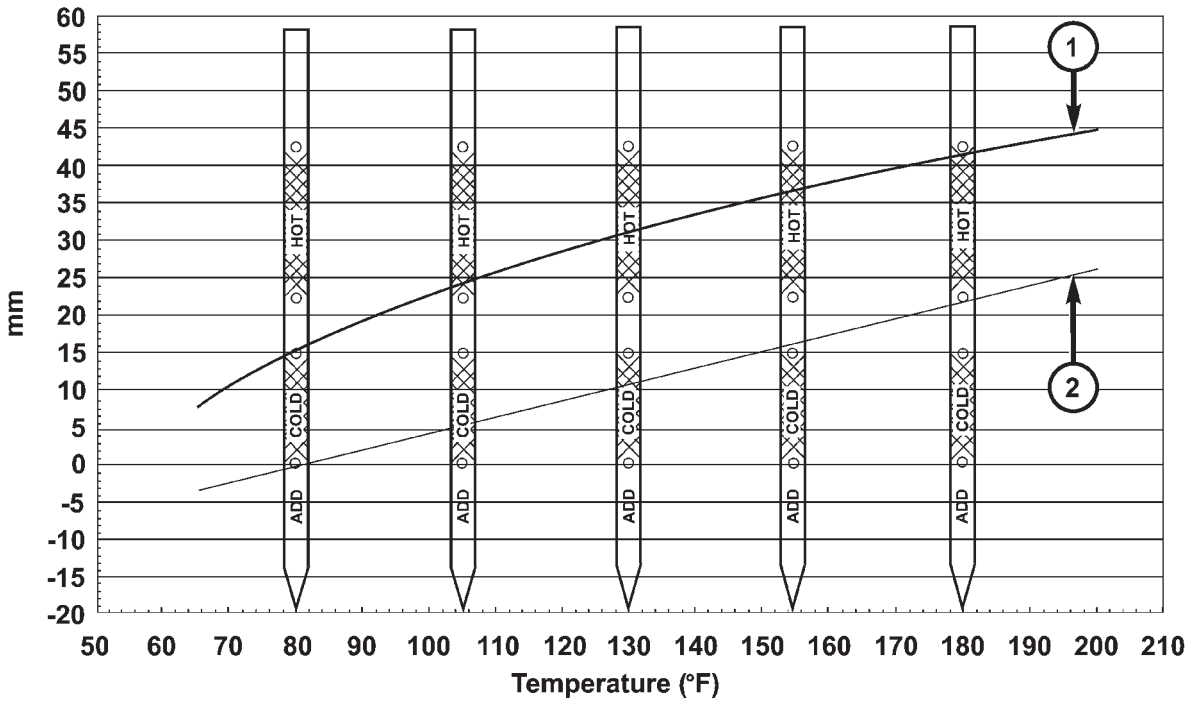
Fig. 210 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

FLUID LEVEL CHECK USING DRB

NOTE: Engine and Transaxle should be at normal operating temperature before performing this procedure.

(1) Start engine and apply parking brake.
(2) Hook up DRB scan tool and select transmission.
(3) Select sensors.
(4) Read the transmission temperature value.
(5) Compare the fluid temperature value with the fluid temperature chart (Fig. 211).



80d64e6e

Fig. 211 Transmission Fluid Temperature Chart

1 - MAX. LEVEL
2 - MIN. LEVEL

FLUID (Continued)

(6) Adjust transmission fluid level shown on the indicator according to the chart.

(7) Check transmission for leaks.

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transaxle has too much fluid, the gears churn up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transaxle vent where it may be mistaken for a leak.

FLUID CONDITION

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transaxle recondition is probably required. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602) when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition or the need for a fluid change.**

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

STANDARD PROCEDURE - FLUID AND FILTER SERVICE

NOTE: Refer to the maintenance schedules in LUBRICATION and MAINTENANCE, or the vehicle owner's manual, for the recommended maintenance (fluid/filter change) intervals for this transaxle.

NOTE: Only fluids of the type labeled Mopar® ATF+4 (Automatic Transmission Fluid) Type 9602 should be used. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transaxle is disassembled for any reason, the fluid and filter should be changed.

FLUID/FILTER SERVICE (RECOMMENDED)

(1) Raise vehicle on a hoist. Refer to LUBRICATION and MAINTENANCE for proper procedures. Place a drain container with a large opening, under transaxle oil pan.

(2) Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.

(3) Install a new filter and o-ring on bottom of the valve body (Fig. 212).

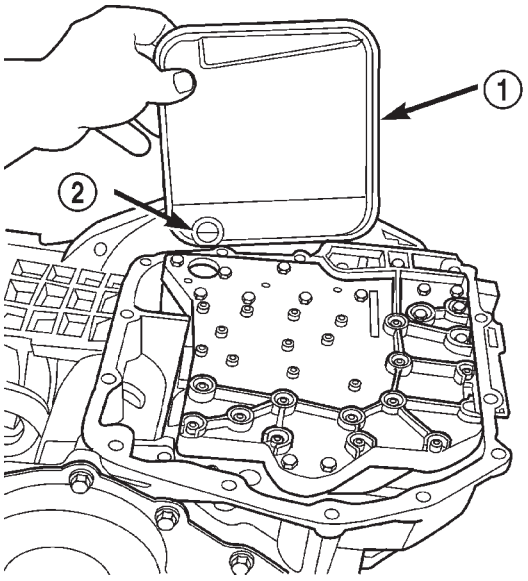


Fig. 212 Filter and O-Ring

1 - OIL FILTER
2 - O-RING

(4) Clean the oil pan and magnet. Reinstall pan using new Mopar Silicone Adhesive sealant. Tighten oil pan bolts to 19 N·m (165 in. lbs.).

(5) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) Type 9602 through the dipstick opening.

(6) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

FLUID (Continued)

(7) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 213).

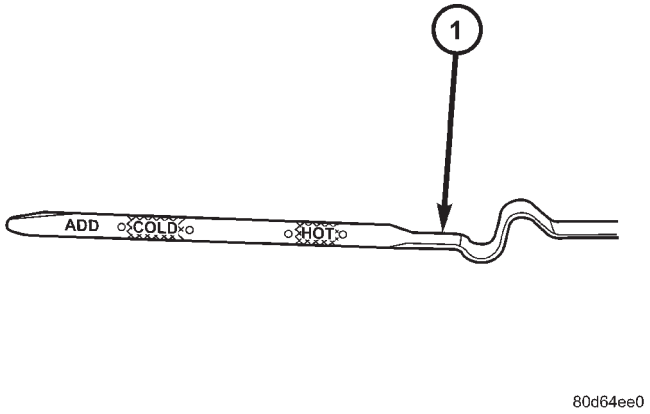

Fig. 213 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

(8) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). Refer to Fluid Level and Condition Check for the proper fluid fill procedure.

(9) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

DIPSTICK TUBE FLUID SUCTION METHOD (ALTERNATIVE)

(1) When performing the fluid suction method, make sure the transaxle is at full operating temperature.

(2) To perform the dipstick tube fluid suction method, use a suitable fluid suction device (Vacula™ or equivalent).

(3) Insert the fluid suction line into the dipstick tube.

NOTE: Verify that the suction line is inserted to the lowest point of the transaxle oil pan. This will ensure complete evacuation of the fluid in the pan.

(4) Follow the manufacturers recommended procedure and evacuate the fluid from the transaxle.

(5) Remove the suction line from the dipstick tube.

(6) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) Type 9602 through the dipstick opening.

(7) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(8) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 213).

(9) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

(10) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

GEAR SHIFT CABLE

REMOVAL

(1) Disconnect battery cables.

(2) Remove battery shield.

(3) Remove battery.

(4) Remove speed control servo and position out of way.

(5) Disconnect gear shift cable at manual valve lever (Fig. 214).

(6) Disconnect gear shift cable from upper mount bracket (Fig. 214).

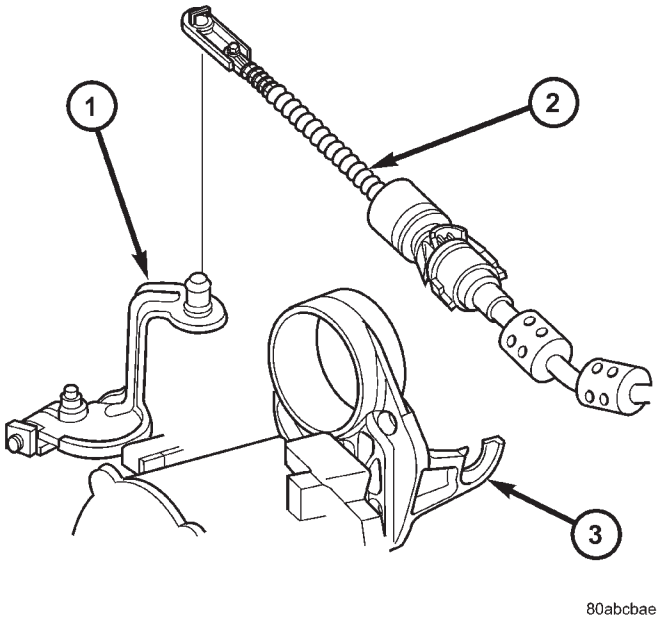

Fig. 214 Gearshift Cable at Transaxle - Typical

1 - MANUAL VALVE LEVER
2 - GEAR SHIFT CABLE
3 - UPPER MOUNT BRACKET

GEAR SHIFT CABLE (Continued)

(7) Remove instrument panel lower silencer (Fig. 215).

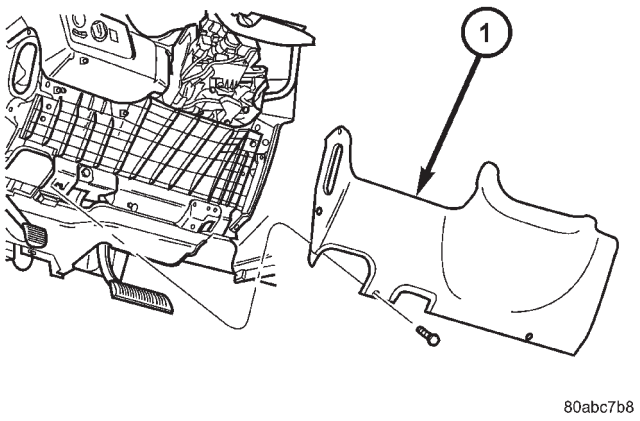

Fig. 215 Instrument Panel Lower Silencer

1 - INSTRUMENT PANEL LOWER SILENCER

(8) Remove knee bolster (Fig. 216).

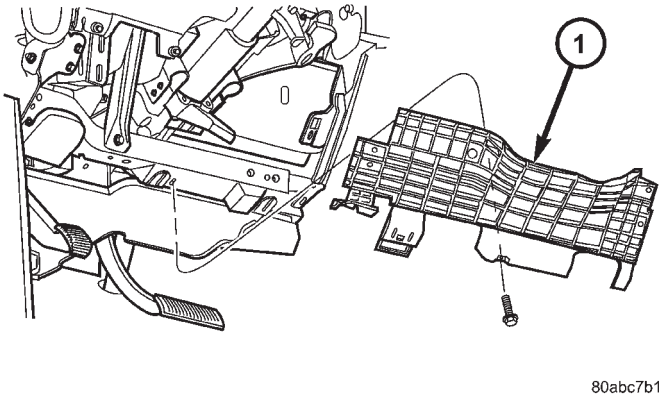

Fig. 216 Knee Bolster

1 - KNEE BOLSTER

(9) Disconnect gear shift cable from gear shift lever (Fig. 217).

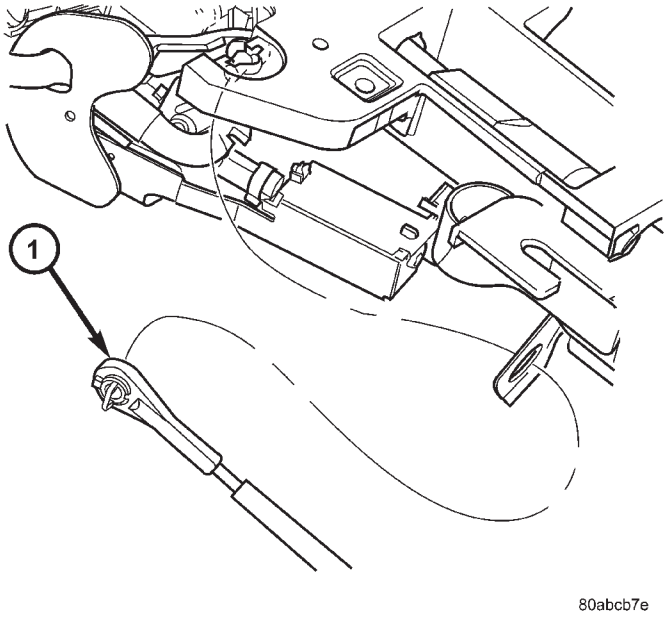

Fig. 217 Gearshift Cable at Column

1 - GEAR SHIFT CABLE

(10) Remove gear shift cable from column bracket (Fig. 217).

(11) Disengage grommet from dash panel (Fig. 218) and remove gear shift cable from inside vehicle.

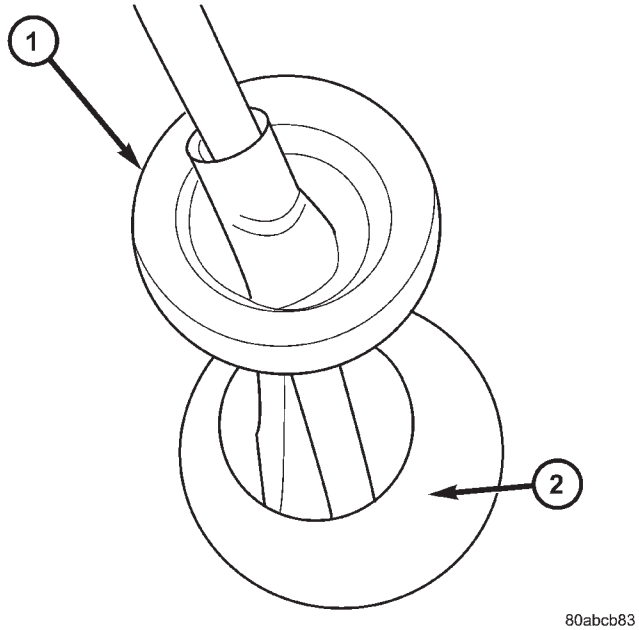

Fig. 218 Gearshift Cable/Grommet at Dash Panel

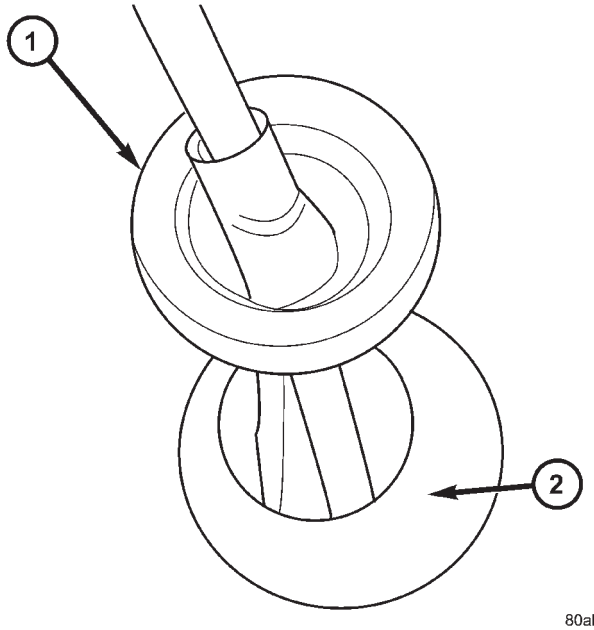
1 - CABLE GROMMET
2 - DASH PANEL

GEAR SHIFT CABLE (Continued)

INSTALLATION

(1) Fish gear shift cable dash panel opening into engine compartment and secure grommet (Fig. 219).



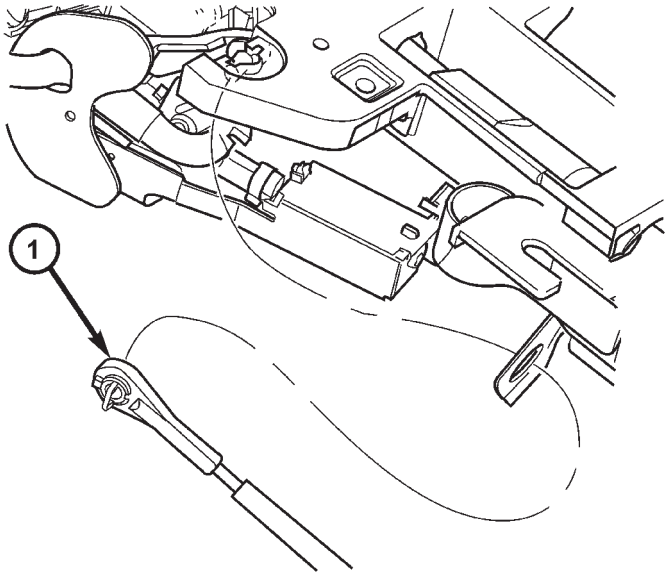
80abcb83

Fig. 219 Gearshift Cable/Grommet at Dash Panel

1 - CABLE GROMMET
2 - DASH PANEL

(2) Install gear shift cable through column bracket (Fig. 220) until audible “click” is heard.

(3) Connect gear shift cable to gear shift lever (Fig. 220).

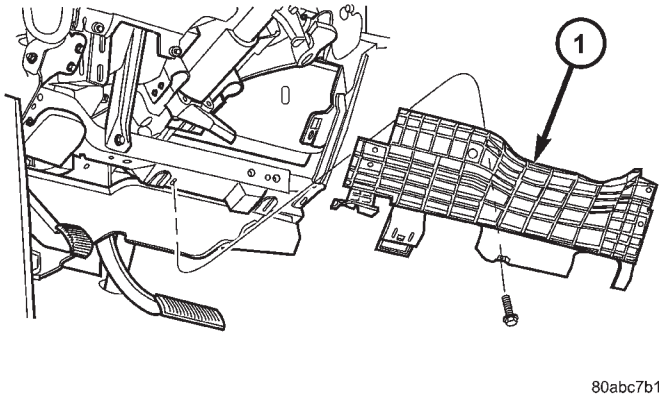


80abcb7e

Fig. 220 Gearshift Cable at Column

1 - GEAR SHIFT CABLE

(4) Install knee bolster (Fig. 221).

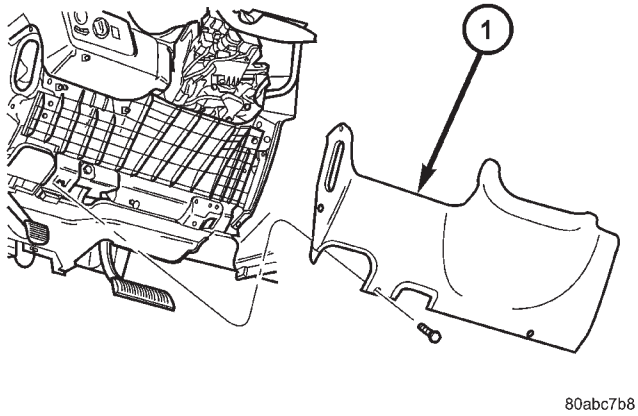


80abc7b1

Fig. 221 Knee Bolster

1 - KNEE BOLSTER

(5) Install instrument panel lower silencer (Fig. 222).



80abc7b8

Fig. 222 Instrument Panel Lower Silencer

1 - INSTRUMENT PANEL LOWER SILENCER

GEAR SHIFT CABLE (Continued)

(6) Install gear shift cable to transaxle upper mount bracket (Fig. 223). An audible “click” should be heard.

(7) Connect gear shift cable end to transaxle manual valve lever (Fig. 223).

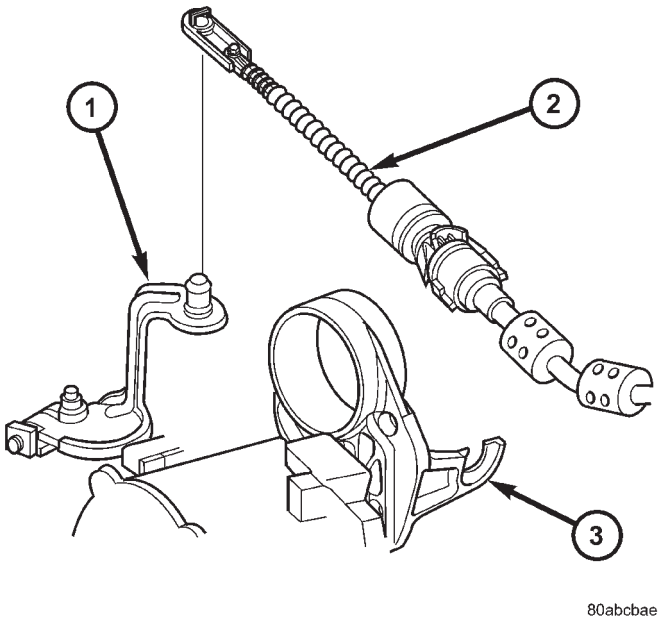


Fig. 223 Gearshift Cable at Transaxle

1 - MANUAL VALVE LEVER
2 - GEAR SHIFT CABLE
3 - UPPER MOUNT BRACKET

(8) Adjust gearshift cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/GEAR SHIFT CABLE - ADJUSTMENTS)

(9) Install speed control servo into position.

(10) Install battery.

(11) Install battery shield.

(12) Connect battery cables.

ADJUSTMENTS

GEARSHIFT CABLE ADJUSTMENT

VERIFICATION

(1) Place gearshift lever in gated park (P).

(2) Attempt to move vehicle by rocking back and forth on level ground. If vehicle does not move, attempt to start engine. If engine starts, the park position is correct.

(3) Set parking brake.

(4) Turn key to on/run and depress brake pedal. Place gearshift lever in neutral (N).

(5) Attempt to start engine. If engine starts in both neutral (N) or park (P), gearshift cable is adjusted properly. No adjustment is required.

(6) If engine does not start in either park (P) or neutral (N), perform adjustment procedure.

ADJUSTMENT

(1) Park the vehicle on level ground and set the parking brake.

(2) Place the gearshift lever in gated park (P) and remove ignition key.

(3) Loosen the cable adjustment screw at the transaxle manual valve lever (Fig. 224).

(4) Pull the gearshift lever fully forward to the park detent position.

(5) Release the park brake, then rock the vehicle to assure it is in park. Reset the park brake.

(6) Tighten the cable adjustment screw to 8 N·m (70 in. lbs.). Gearshift cable should now be properly adjusted.

(7) Verify adjustment by using the verification procedure.

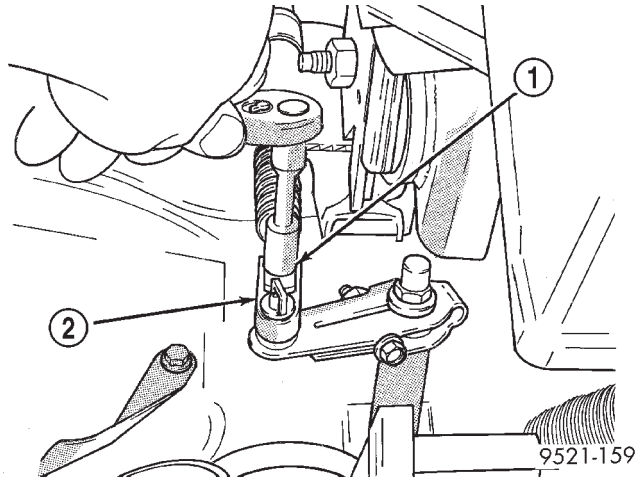

Fig. 224 Gearshift Cable Adjustment

1 - GEARSHIFT CABLE ADJUSTMENT SCREW
2 - GEARSHIFT CABLE

HOLDING CLUTCHES

DESCRIPTION

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 and Low/Reverse clutches are considered holding clutches and are contained at the rear of the transaxle case. (Fig. 225) .

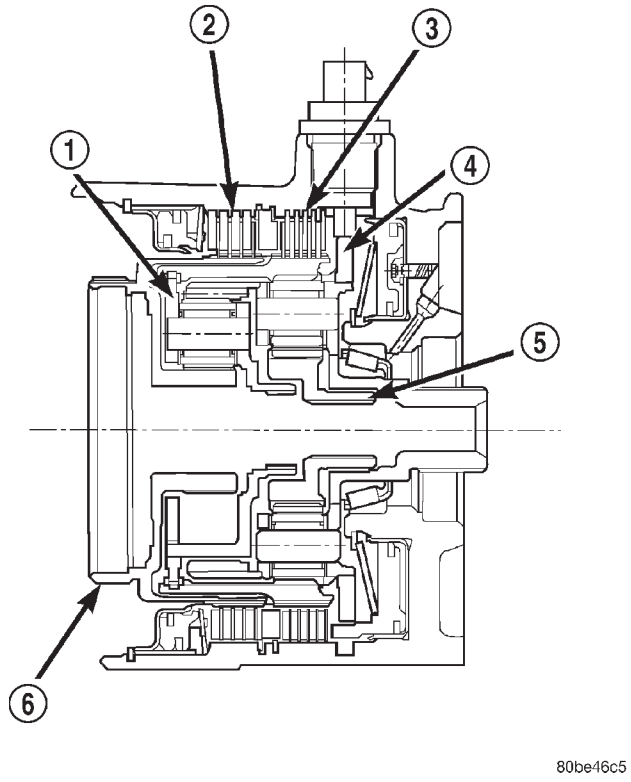

Fig. 225 2/4 and Low/Reverse Clutches

1 - FRONT PLANET CARRIER/REAR ANNULUS
2 - 2/4 CLUTCH
3 - L/R CLUTCH
4 - REAR PLANET CARRIER/FRONT ANNULUS
5 - REAR SUN GEAR
6 - FRONT SUN GEAR ASSEMBLY

OPERATION

NOTE: Refer to the "Elements In Use" chart in Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transaxle case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transaxle case.

INPUT CLUTCH ASSEMBLY

DISASSEMBLY

(1) Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).

(2) Tap down reverse clutch reaction plate to release pressure from snap ring (Fig. 226).

(15) Install input clutch assembly to the Input Clutch Pressure Fixture–Tool 8391 (Fig. 272).

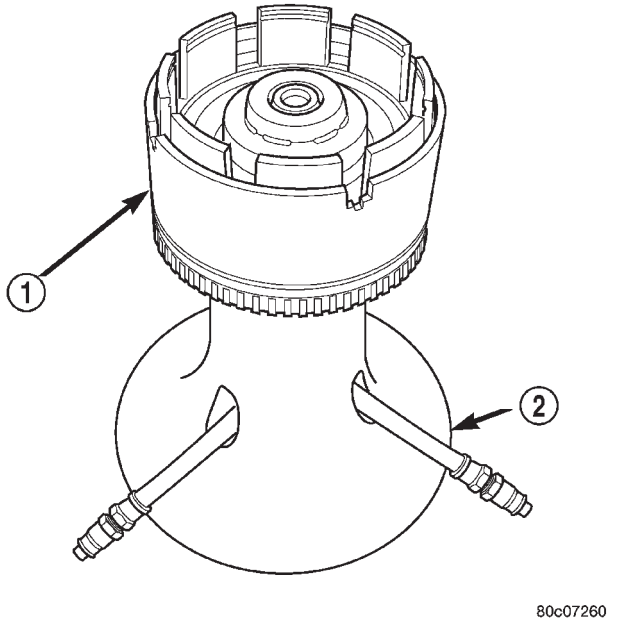

Fig. 272 Input Clutch Assembly on Pressure Fixture Tool 8391

1 - INPUT CLUTCH ASSEMBLY
2 - INPUT CLUTCH PRESSURE FIXTURE 8391

(16) Set up dial indicator on the UD clutch pack as shown in (Fig. 273).

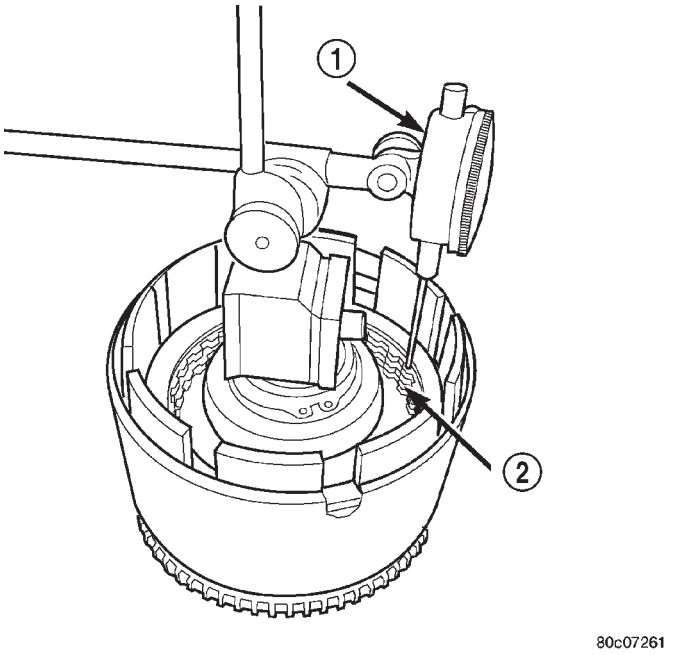

Fig. 273 Set Up Dial Indicator to Measure UD Clutch Clearance

1 - DIAL INDICATOR
2 - UNDERDRIVE CLUTCH

(17) Using moderate pressure, press down and hold (near indicator) the UD clutch pack with screwdriver or suitable tool and zero dial indicator (Fig. 274). When releasing pressure on clutch pack, indicator reading should advance 0.005–0.010.

CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.

(18) Apply 30 psi (206 kPa) to the underdrive hose on Tool 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four (4) places, 90° apart.

INPUT CLUTCH ASSEMBLY (Continued)

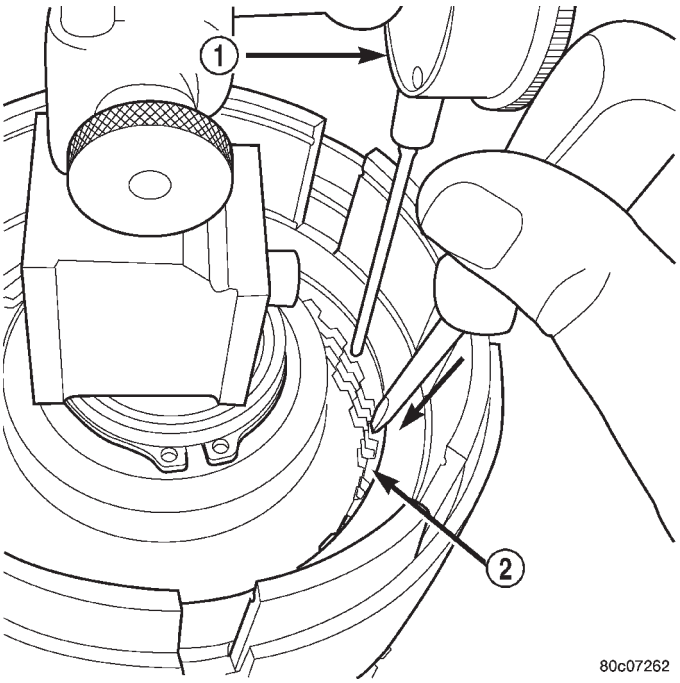

Fig. 274 Press Down on UD Clutch Pack and Zero Dial Indicator

1 - DIAL INDICATOR
2 - UNDERDRIVE CLUTCH

(19) Take average of four measurements and compare with UD clutch pack clearance specification. **Underdrive clutch pack clearance must be 0.94-1.50 mm (0.037-0.059 in.).**

(20) If necessary, select the proper reaction plate to achieve specifications:

UNDERDRIVE REACTION PLATE THICKNESS	
4659939AB	5.837-5.937 mm (0.230-0.234 in.)
4659940AB	6.147-6.248 mm (0.242-0.246 in.)
4659941AB	6.457-6.557 mm (0.254-0.258 in.)

(21) Install the OD clutch pack (four frictions/three steels) (Fig. 275).

(22) Install OD pressure plate waved snap ring (Fig. 276).

(23) Install the OD/Reverse pressure plate with large step down (towards OD clutch pack) (Fig. 277).

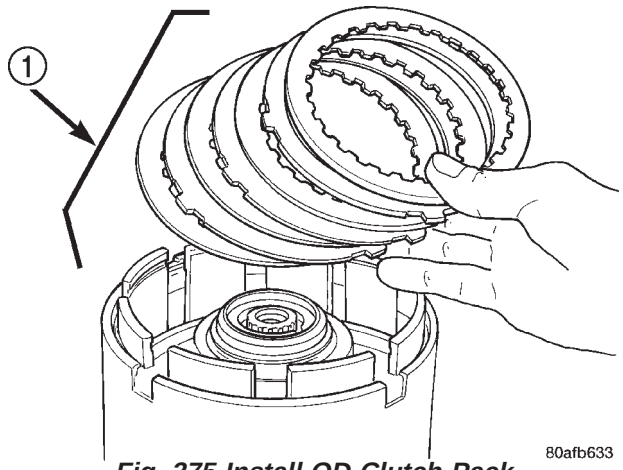

Fig. 275 Install OD Clutch Pack

1 - OVERDRIVE CLUTCH PACK

(24) Install OD pressure plate flat snap ring (Fig. 278).

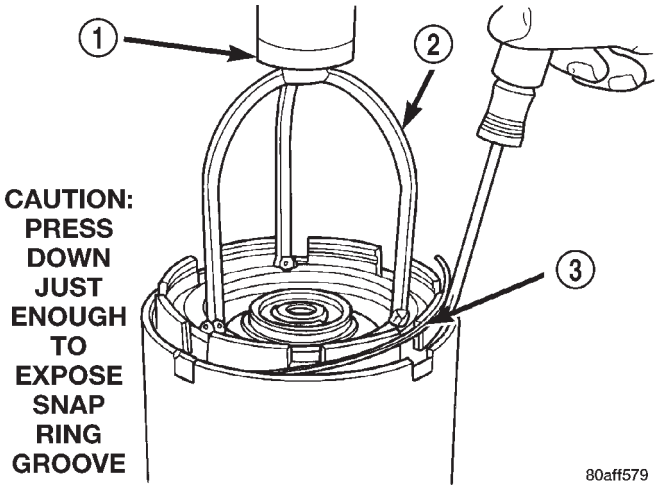

Fig. 278 Install Flat Snap Ring

1 - ARBOR PRESS RAM
2 - TOOL 5059A
3 - FLAT SNAP RING

(25) Measure OD clutch pack clearance. Set up dial indicator on top of the OD/Reverse pressure plate as shown in (Fig. 279).

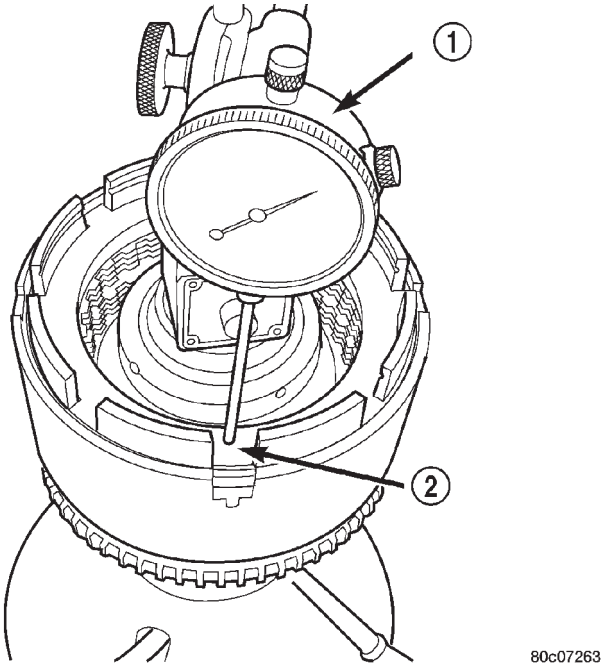

Fig. 279 Measure OD Clutch Pack Clearance

1 - DIAL INDICATOR
2 - OD/REVERSE REACTION PLATE

(26) Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Tool 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.

(27) Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 1.07-3.25 mm (0.042-0.128 in.).**

If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.

(28) Install reverse clutch pack (two frictions/one steel) (Fig. 280).

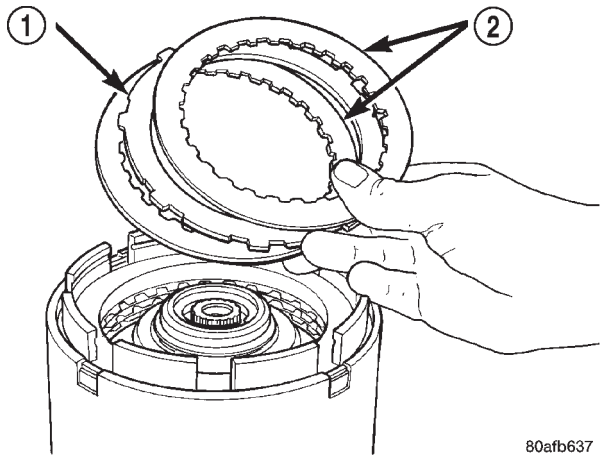

Fig. 280 Install Reverse Clutch Pack

1 - REVERSE CLUTCH PLATE
2 - REVERSE CLUTCH DISCS

(29) Install reverse clutch reaction plate with the flat side down towards reverse clutch (Fig. 281).

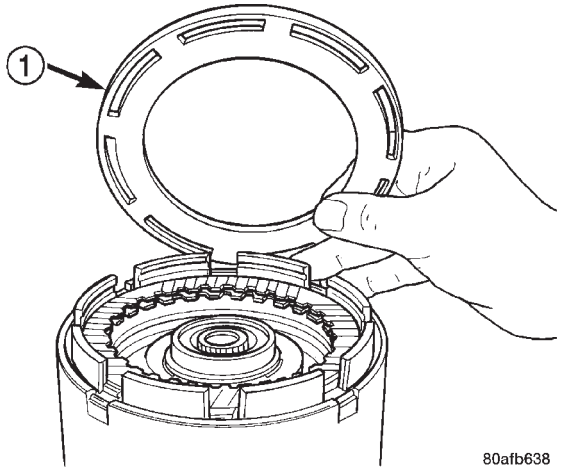

Fig. 281 Install Reaction Plate

1 - REVERSE CLUTCH REACTION PLATE (FLAT SIDE DOWN)

INPUT CLUTCH ASSEMBLY (Continued)

(30) Tap reaction plate down to allow installation of the reverse clutch snap ring. Install reverse clutch snap ring (Fig. 282).

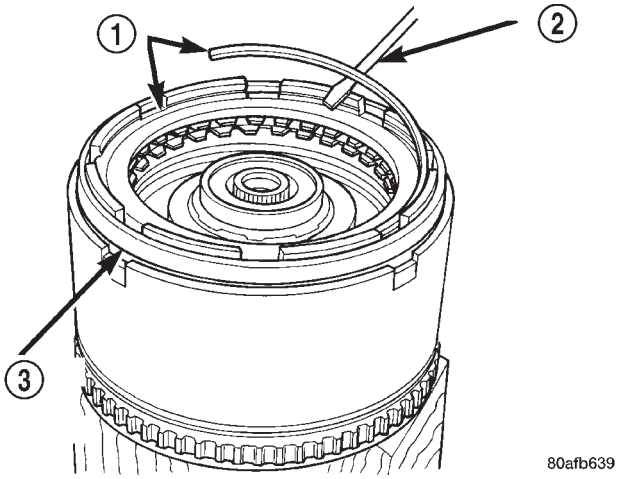

Fig. 282 Install Reverse Clutch Snap Ring

1 - REVERSE CLUTCH SNAP RING (SELECT)
2 - SCREWDRIVER

(31) Pry up reverse reaction plate to seat against snap ring (Fig. 283).

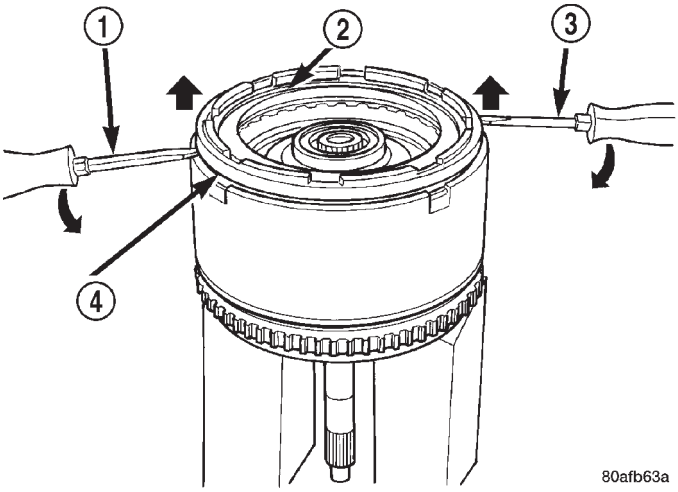

Fig. 283 Pry Up Reaction Plate to Seat Against Snap Ring

1 - SCREWDRIVER
2 - SNAP RING
3 - SCREWDRIVER
4 - MUST RAISE REVERSE REACTION PLATE TO RAISE SNAP RING

(32) Set up a dial indicator on the reverse clutch pack as shown in (Fig. 284).

(33) Using moderate pressure, press down and hold (near indicator) reverse clutch disc with screwdriver or suitable tool and zero dial indicator (Fig. 285). When releasing pressure, indicator should advance 0.005-0.010. as clutch pack relaxes.

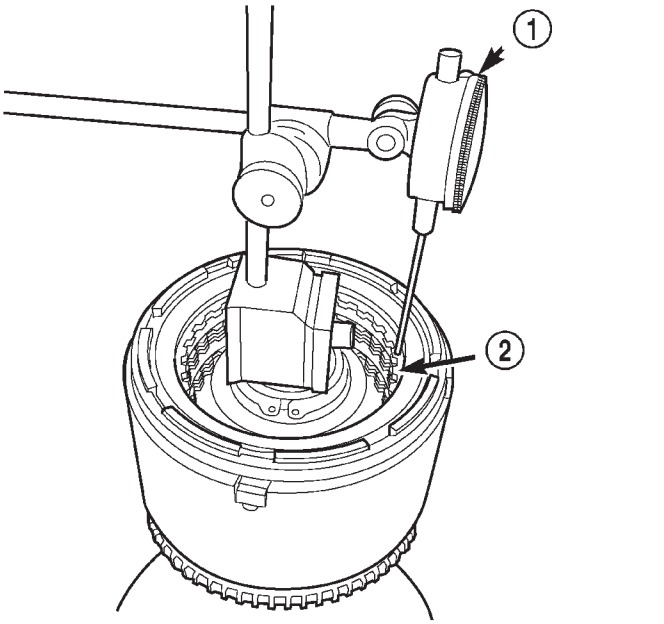

Fig. 284 Measure Reverse Clutch Pack Clearance

1 - DIAL INDICATOR
2 - REVERSE CLUTCH

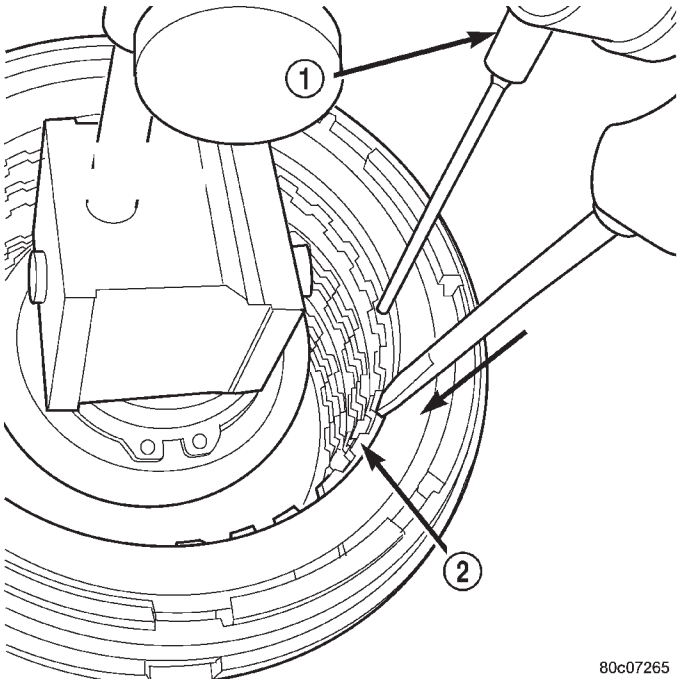

Fig. 285 Press Down on Reverse Clutch and Zero Indicator

1 - DIAL INDICATOR
2 - REVERSE CLUTCH

INPUT CLUTCH ASSEMBLY (Continued)

(34) Apply 30 psi (206 kPa) air pressure to the reverse clutch hose on Tool 8391. Measure and record reverse clutch pack measurement in four (4) places, 90° apart.

(35) Take average of four measurements and compare with reverse clutch pack clearance specification. **The reverse clutch pack clearance is 0.89-1.37 mm (0.035-0.054 in.).** Select the proper reverse clutch snap ring to achieve specifications:

REVERSE CLUTCH SNAP RING THICKNESS	
4377195	1.53-1.58 mm (0.060-0.062 in.)
4412871	1.77-1.83 mm (0.070-0.072 in.)
4412872	2.02-2.07 mm (0.080-0.082 in.)
4412873	2.27-2.32 mm (0.090-0.091 in.)

(36) To complete the assembly, reverse clutch and overdrive clutch must be removed.

(37) Install the #2 needle bearing (Fig. 286).

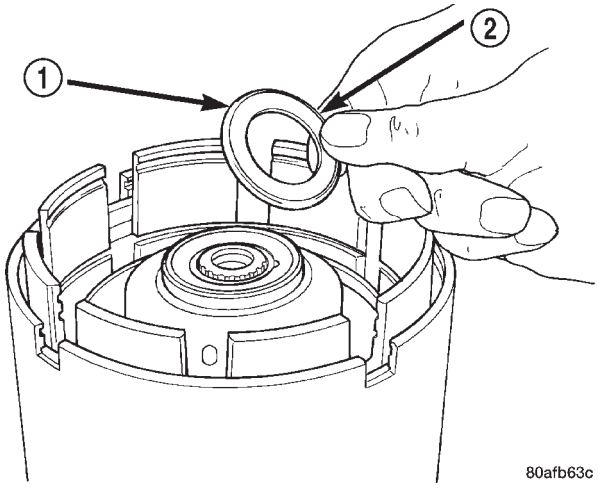

Fig. 286 Install No. 2 Needle Bearing

1 - #2 NEEDLE BEARING (NOTE 3 SMALL TABS)
2 - TABS UP

(38) Install the underdrive shaft assembly (Fig. 287).

(39) Install the #3 thrust washer to the underdrive shaft assembly. Be sure five tabs are seated properly (Fig. 288).

(40) Install the #3 thrust plate to the bottom of the overdrive shaft assembly. Retain with petrolatum or transmission assembly gel (Fig. 289).

3 - #3 THRUST WASHER

(42) Reinstall overdrive and reverse clutch as shown. **Rechecking these clutch clearances is not necessary.**

OIL PUMP

DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transaxle case (Fig. 291). The oil pump consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support.

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring oil pump output volume will determine if sufficient flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that transmission fluid is at the proper level. If adding fluid is necessary, fill to the proper level with Mopar® ATF+4 (Automatic Transmission Fluid–Type 9602). The following procedure is to check oil pump output volume:

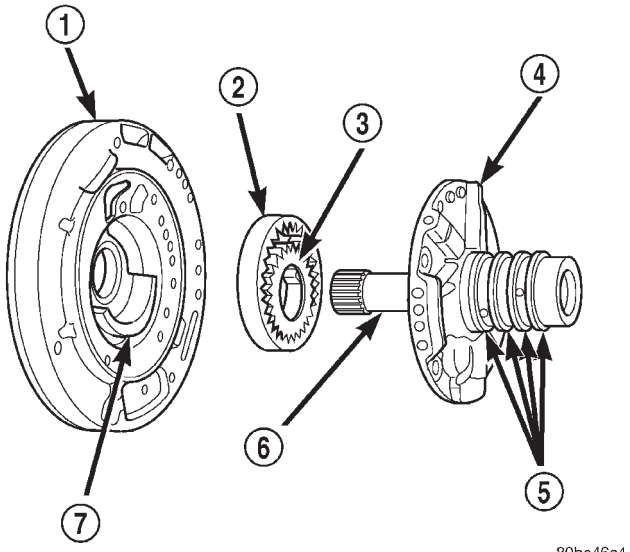

Fig. 291 Oil Pump Assembly

1 - PUMP HOUSING
2 - OUTER PUMP GEAR
3 - INNER PUMP GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT

(1) Using hose cutters or a suitable blade, cut the “to cooler” (Fig. 292) line off flush with the cooler inlet fitting and place a collection container under the open line.

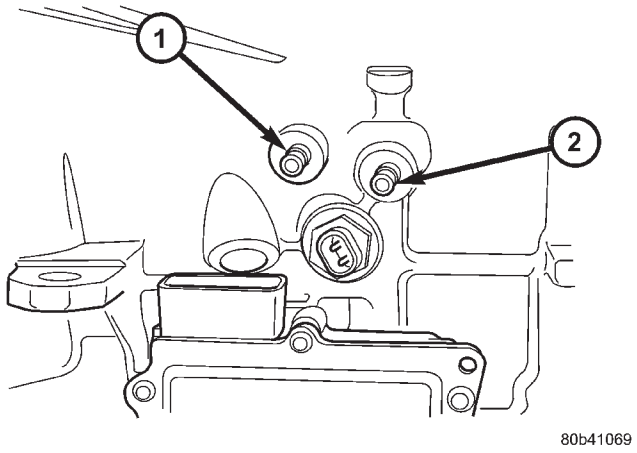

Fig. 292 Transaxle Oil Cooler Fittings

1 - FROM COOLER
2 - TO COOLER

OIL PUMP (Continued)

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Start engine and run **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of ATF is collected in 20 seconds or less, flow is within acceptable limits. If fluid flow is intermittent or it takes more than 20 seconds to collect one quart of ATF, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - DIAGNOSIS AND TESTING).

(4) Inspect the cooler hose for damage. Replace if necessary.

(5) Re-connect the to cooler line to the transmission using a service splice kit. Refer to instructions inclued with the kit.

(6) Refill the transaxle to proper level with Mopar® ATF+4 (Automatic Transmission Fluid–Type 9602).

DISASSEMBLY

When disassembling the transaxle it is necessary to inspect the oil pump for wear and damage.

(1) Remove the reaction shaft support bolts.

(2) Remove reaction shaft support from pump housing (Fig. 293).

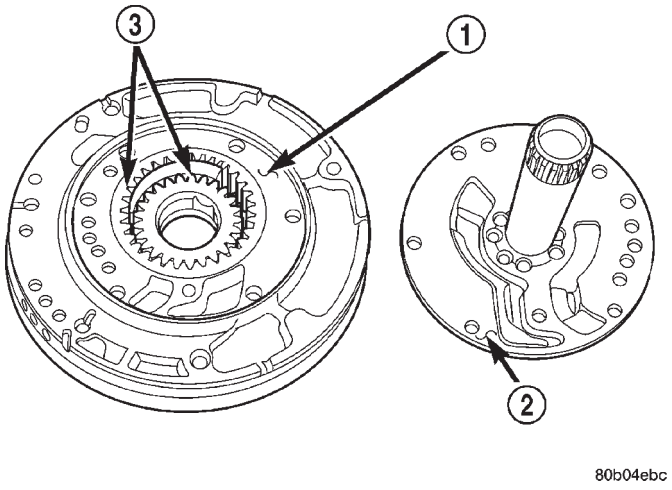

Fig. 293 Reaction Shaft Support

1 - PUMP HOUSING
2 - REACTION SHAFT SUPPORT
3 - PUMP GEARS

(3) Remove the pump gears (Fig. 294) and check for wear and damage on pump housing and gears.

(4) Re-install the gears and check clearances.

(5) Measure the clearance between the outer gear and the pump pocket (Fig. 295). Clearance should be 0.089–0.202 mm (0.0035-0.0079 in.).

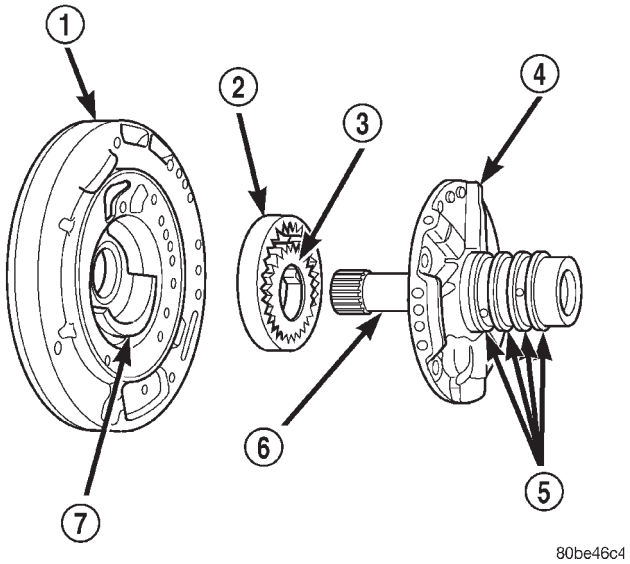

Fig. 294 Oil Pump Assembly

2 - OUTER PUMP GEAR
3 - INNER PUMP GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT

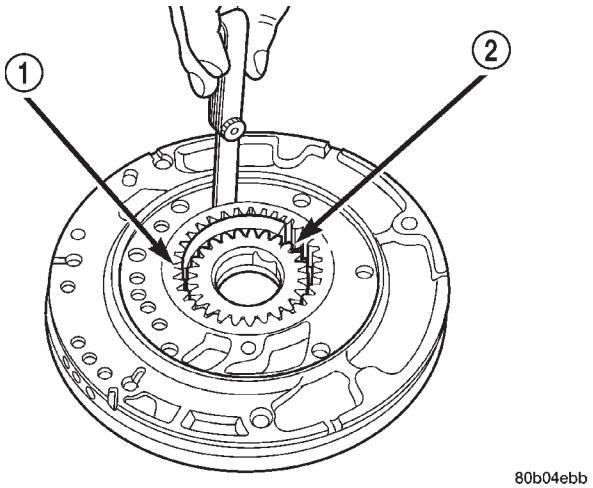

Fig. 295 Measure Outer Gear to Pocket

1 - OUTER GEAR
2 - POCKET

(6) Measure clearance between outer gear and crescent. Clearance should be 0.060-0.298 mm (0.0023-0.0117 in.).

(7) Measure clearance between inner gear and crescent. Clearance should be 0.093-0.385 mm (0.0036-0.0151 in.).

OIL PUMP (Continued)

(8) Position an appropriate piece of Plastigage across both pump gears.

(9) Align the Plastigage to a flat area on the reaction shaft support housing.

(10) Install the reaction shaft to the pump housing. Tighten the bolts to 27 N·m (20 ft. lbs.).

(11) Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.

(12) Clearance between outer gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.). Clearance between inner gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.).

ASSEMBLY

(1) Assemble oil pump as shown in (Fig. 296)

(2) Install and torque reaction shaft support-to-oil pump housing bolts to 28 N·m (20 ft. lbs.) torque.

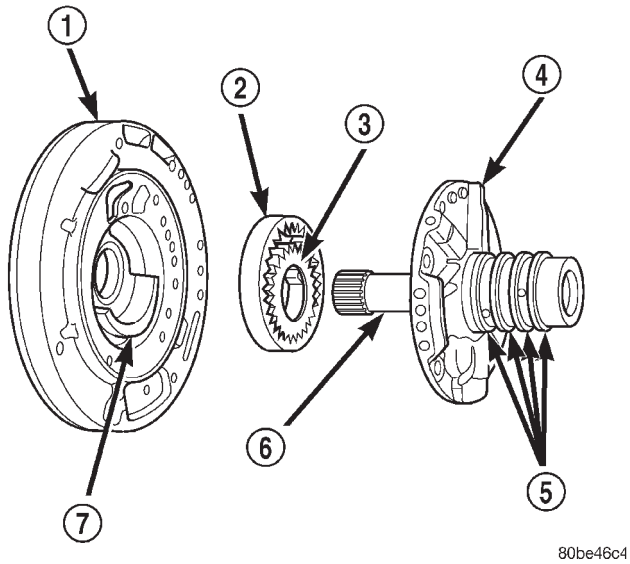

Fig. 296 Oil Pump Assembly

1 - PUMP HOUSING
2 - OUTER PUMP GEAR
3 - INNER PUMP GEAR

PLANETARY GEARTRAIN

DESCRIPTION

The planetary geartrain is located between the input clutch assembly and the rear of the transaxle case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft (Fig. 297).

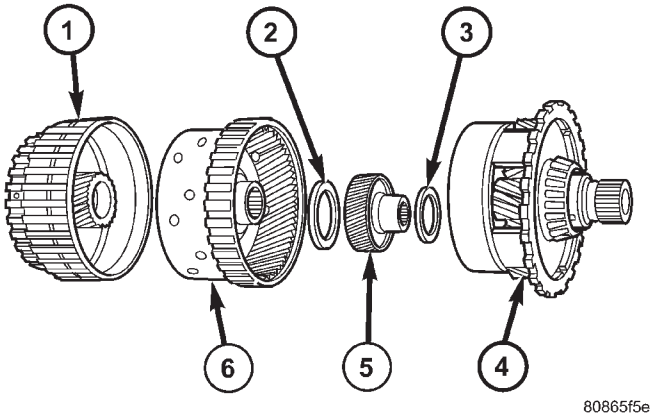

Fig. 297 Planetary Geartrain

1 - FRONT SUN GEAR ASSEMBLY
2 - #6 THRUST BEARING
3 - #7 THRUST BEARING
4 - REAR CARRIER/FRONT ANNULUS ASSEMBLY
5 - REAR SUN GEAR
6 - FRONT CARRIER/REAR ANNULUS ASSEMBLY

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

SEAL - OIL PUMP

REMOVAL

(1) Remove transaxle from vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL).

(2) Using Tool C-3981-B, remove oil pump seal (Fig. 298).

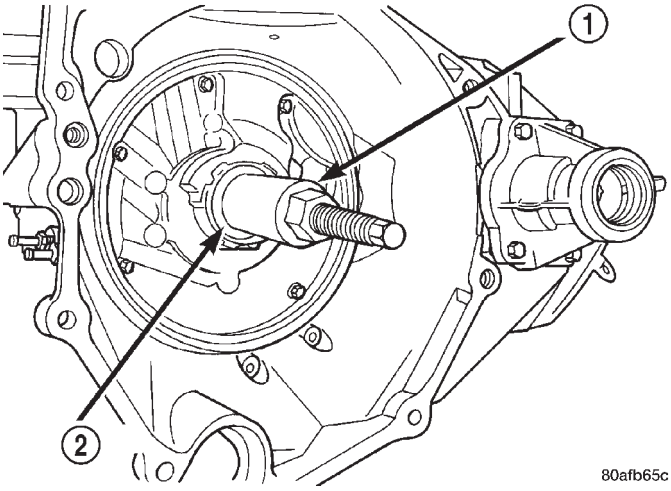

Fig. 298 Remove Oil Pump Seal

1 - TOOL C-3981–B
2 - OIL PUMP SEAL

INSTALLATION

(1) Using Tool C-4193, install oil pump seal (Fig. 299).

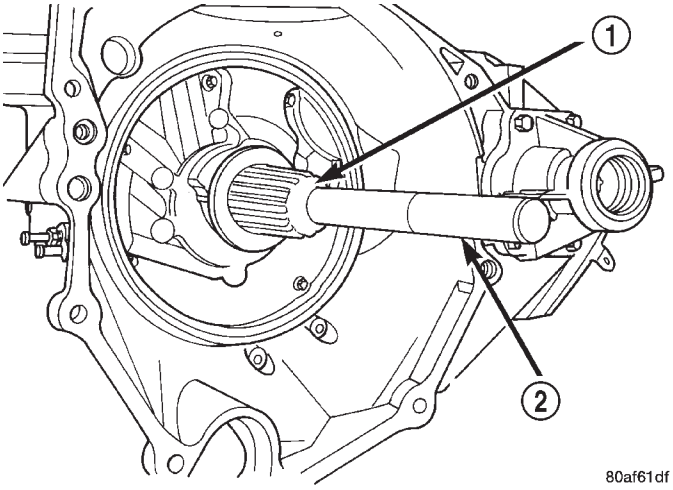

Fig. 299 Install Oil Pump Seal

1 - TOOL C-4193
2 - HANDLE TOOL C-4171

(2) Install transaxle to vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION).

SHIFT INTERLOCK SOLENOID

DESCRIPTION

The Brake/Transmission Shift Interlock system consists of an electro-magnetic solenoid mounted to the steering column (Fig. 300). The solenoid's plunger consists of an integrated hook, which operates the shift lever pawl (part of shift lever assembly), and a plunger return spring (Fig. 301). The solenoid also has an integrated bracket, which facilitates fastening to the steering column.

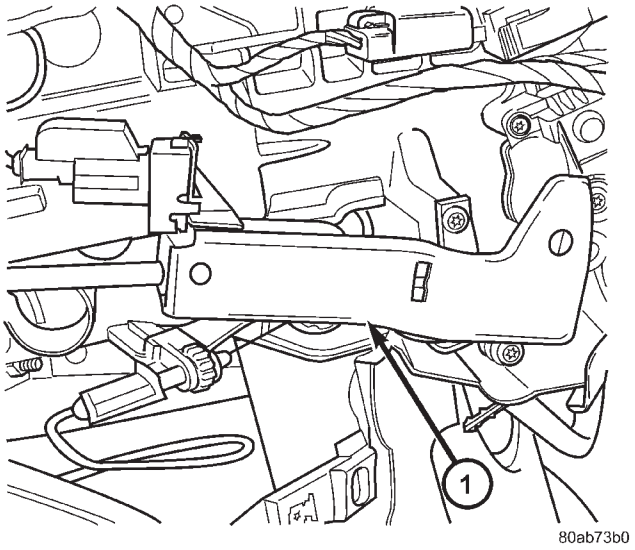

Fig. 300 Brake/Transmission Shift Interlock (BTSI) Solenoid Location

1 - BTSI SOLENOID

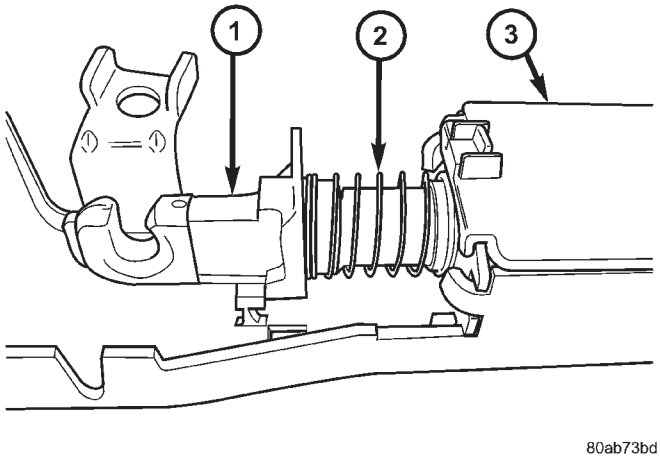

Fig. 301 Solenoid Plunger and Return Spring

1 - PLUNGER
2 - RETURN SPRING
3 - BTSI SOLENOID

SHIFT INTERLOCK SOLENOID (Continued)

OPERATION

The Brake/Transmission Shift Interlock (BTSI) Solenoid prevents the transmission shift lever from being moved out of PARK (P) unless the brake pedal is applied. The BTSI solenoid is hardwired to and controlled by the Intelligent Power Module (IPM). Battery voltage is applied to one side of the solenoid with the ignition key is in either the OFF, ON/RUN, or START positions (Fig. 302). The ground side of the solenoid is controlled by a driver within the IPM. It relies on voltage supplied from the stop lamp switch to the stop lamp sense circuit within the IPM to tell when the brake pedal is depressed. When the brake pedal is depressed, the ground circuit opens, de-energizing the solenoid. When the brake pedal is released, the ground circuit is closed, energizing the solenoid.

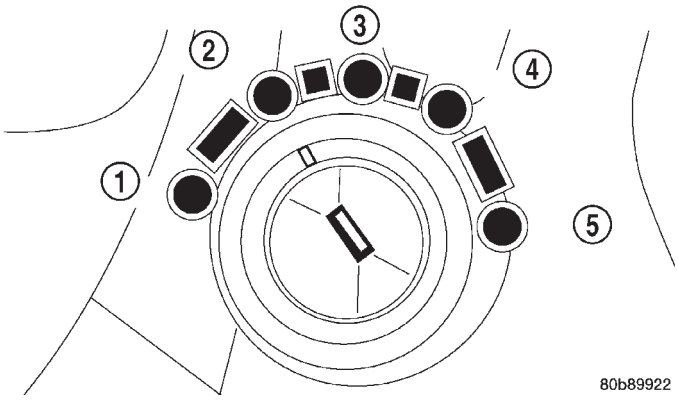

Fig. 302 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

When the ignition key is in either the OFF, ON/RUN, or START positions, the BTSI solenoid is energized, and the solenoid plunger hook pulls the shift lever pawl into position, prohibiting the shift lever from moving out of PARK (P) (Fig. 303). When the brake pedal is depressed, the ground circuit opens, de-energizing the solenoid. This moves the gearshift lever pawl out of the way (Fig. 304), allowing the shift lever to be moved into any gear position.

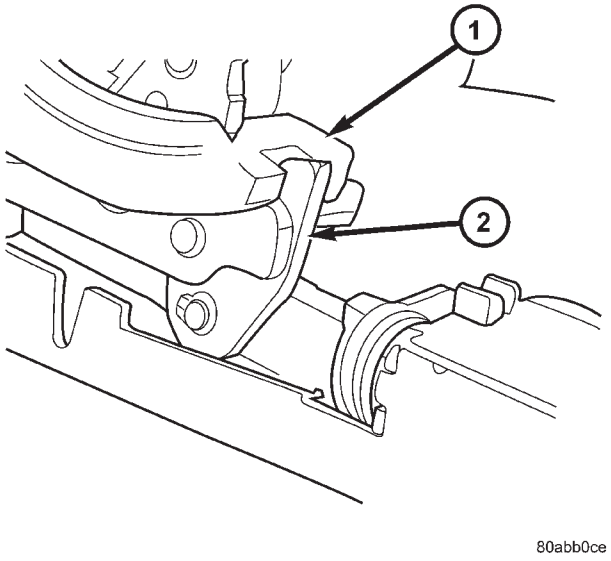

Fig. 303 Pawl Engaged to Shift Lever

1 - GEAR SHIFT LEVER
2 - GEAR SHIFT LEVER PAWL

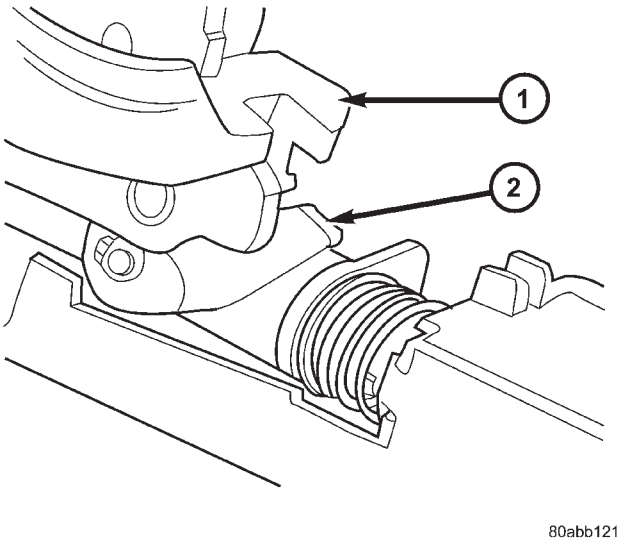

Fig. 304 Pawl Disengaged From Shift Lever

1 - GEAR SHIFT LEVER
2 - GEAR SHIFT LEVER PAWL

SHIFT INTERLOCK SOLENOID (Continued)

A conventional mechanical interlock system is also used. This system manually prohibits shifter movement when the ignition switch is in the LOCK or ACC positions. Solenoid operation is not required in these key positions.

For intended BTSI system operation, refer to the following chart:

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park with brake pedal applied.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

DIAGNOSIS AND TESTING - BRAKE/ TRANSMISSION SHIFT INTERLOCK SOLENOID

For intended BTSI system operation, refer to the following chart:

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park with brake pedal applied.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system repair. Refer to the appropriate Diagnostic Information.	

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove instrument panel lower shroud (Fig. 305).

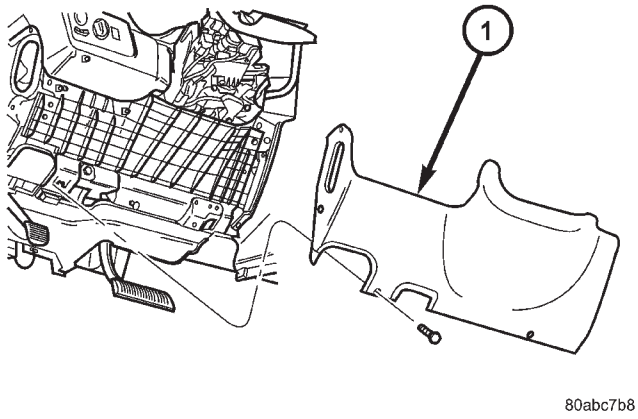

Fig. 305 Instrument Panel Lower Silencer

1 - INSTRUMENT PANEL LOWER SILENCER

(3) Remove knee bolster (Fig. 306).

1 - KNEE BOLSTER

(5) Install instrument panel lower silencer (Fig. 312).

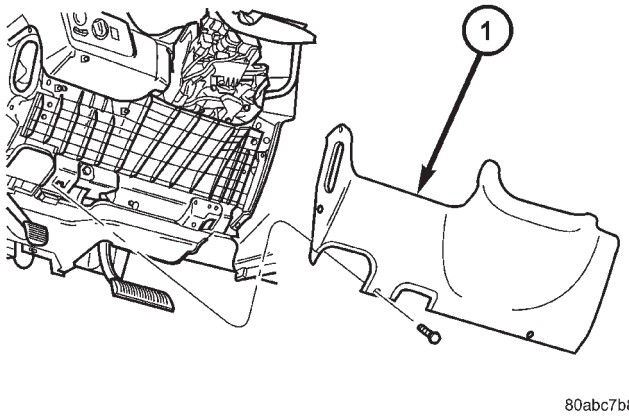

Fig. 312 Instrument Panel Lower Silencer

1 - INSTRUMENT PANEL LOWER SILENCER

(6) Connect battery negative cable.
(7) Verify proper shift interlock system operation. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 31TH/SHIFT INTERLOCK SOLENOID - OPERATION)

SOLENOID/PRESSURE SWITCH ASSY

DESCRIPTION

The Solenoid/Pressure Switch Assembly (Fig. 313) is external to the transaxle and mounted to the transaxle case. The assembly consists of four solenoids that control hydraulic pressure to the LR/CC, 2/4, OD, and UD friction elements. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the TCM. Likewise, the pressure switches can only be service by replacing the assembly.

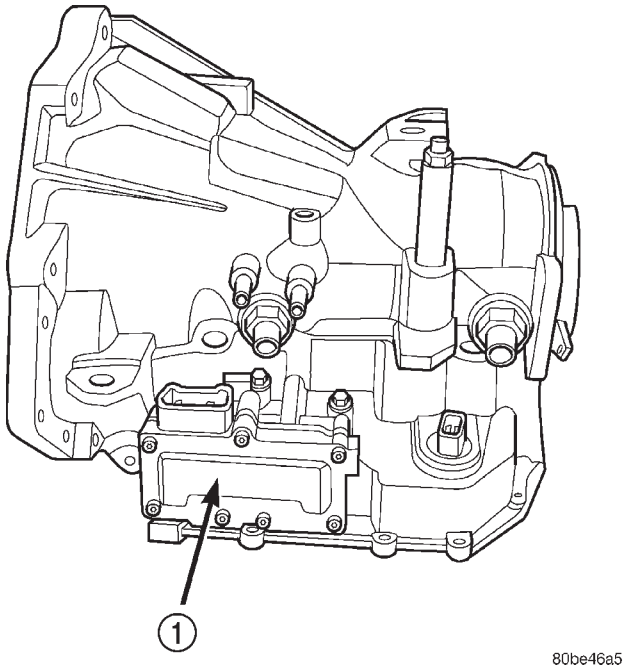

Fig. 313 Solenoid/Pressure Switch Assembly

1 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

SOLENOID/PRESSURE SWITCH ASSY (Continued)

OPERATION

SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which by design allow fluid to pass through in their relaxed or "off" state. This allows transaxle limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. It no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL

OP = OPEN

CL = CLOSED

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

The TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 rpm, the TCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

REMOVAL

NOTE: If solenoid/pressure switch assembly is being replaced, it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect battery negative cable.
(2) Remove air cleaner assembly.
(3) Disconnect solenoid/pressure switch assembly connector.
(4) Disconnect input speed sensor connector.
(5) Remove input speed sensor (Fig. 314).

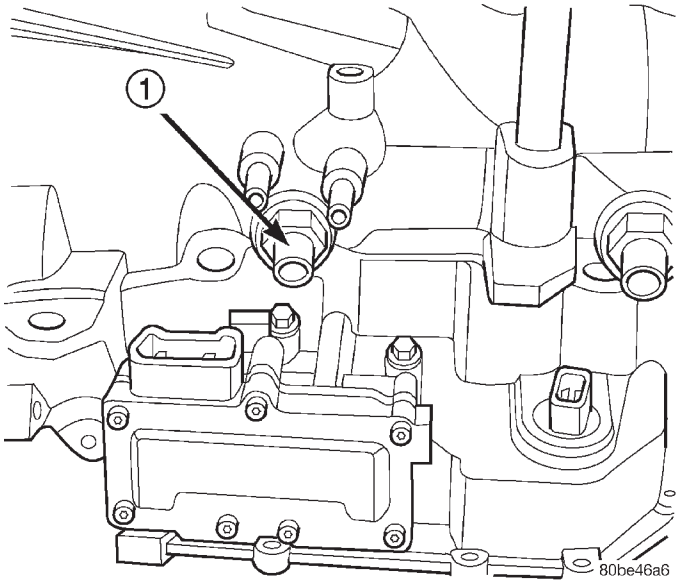

Fig. 314 Input Speed Sensor

1 - INPUT SPEED SENSOR

SOLENOID/PRESSURE SWITCH ASSY (Continued)

(6) Remove three (3) solenoid/pressure switch assembly-to-transaxle case bolts (Fig. 315).

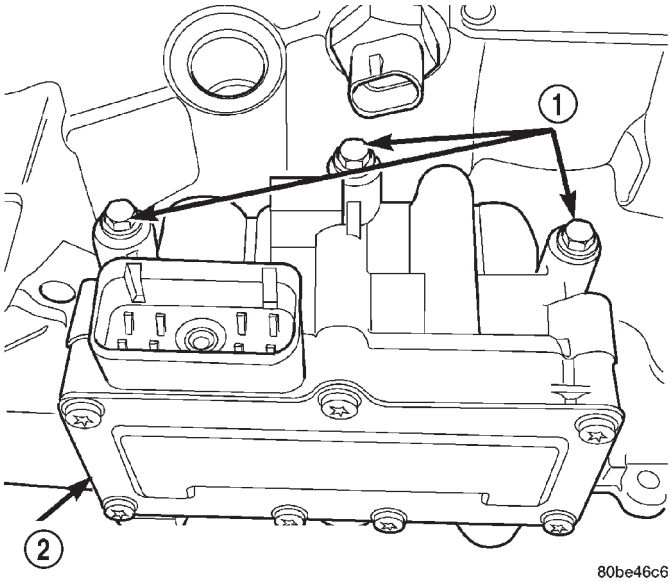

Fig. 315 Solenoid/Pressure Switch Assembly-to-Case Bolts

1 - BOLTS
2 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

(7) Remove solenoid/pressure switch assembly and gasket (Fig. 316). Use care to prevent gasket material and foreign objects from become lodged in the transaxle case ports.

INSTALLATION

NOTE: If solenoid/pressure switch assembly is being replaced, it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Install solenoid/pressure switch assembly and new gasket to transaxle (Fig. 316).
(2) Install and torque three (3) bolts (Fig. 315) to 13 N·m (110 in. lbs.).
(3) Install input speed sensor (Fig. 314) and torque to 27 N·m (20 ft. lbs.).
(4) Connect input speed sensor connector.
(5) Install solenoid/pressure switch 8-way connector and torque to 4 N·m (35 in. lbs.).
(6) Install air cleaner assembly.
(7) Connect battery negative cable.
(8) If solenoid/pressure switch assembly was replaced, perform TCM Quick Learn procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

SPEED SENSOR - INPUT

DESCRIPTION

The Input Speed Sensor is a two-wire magnetic pickup device that generates AC signals as rotation occurs. It is threaded into the transaxle case (Fig. 317) , sealed with an o-ring (Fig. 318), and is considered a primary input to the Transmission Control Module (TCM).

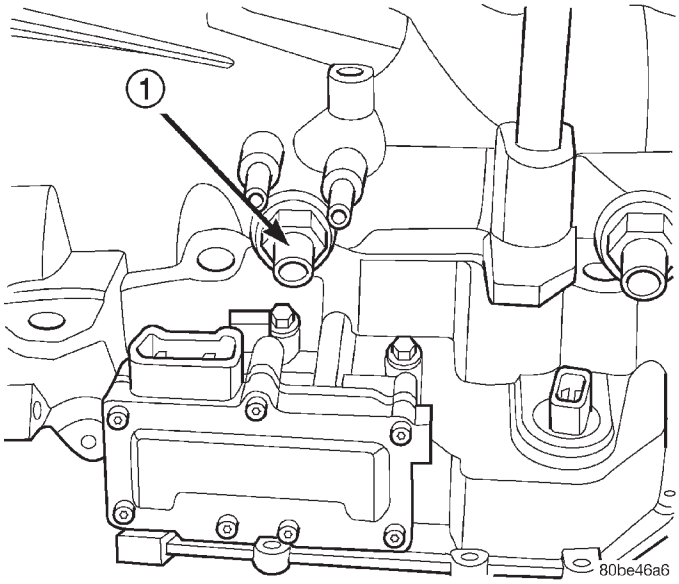

Fig. 317 Input Speed Sensor Location

1 - INPUT SPEED SENSOR

SPEED SENSOR - INPUT (Continued)

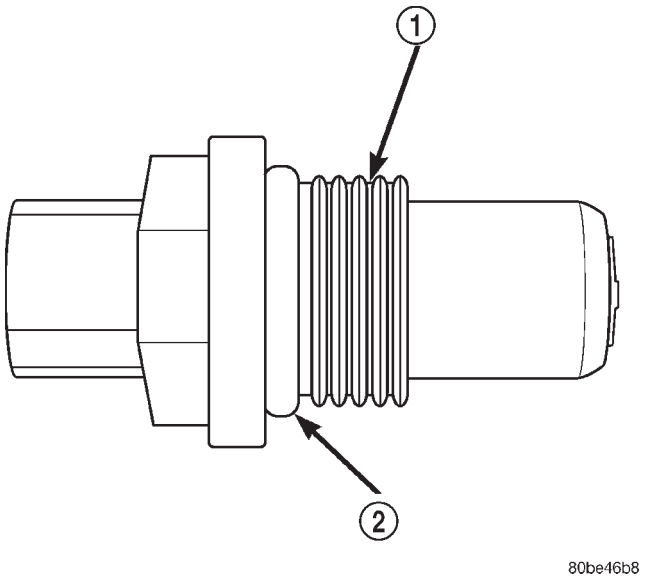

Fig. 318 O-Ring Location

1 - INPUT SPEED SENSOR
2 - O-RING

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil (Fig. 319), an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

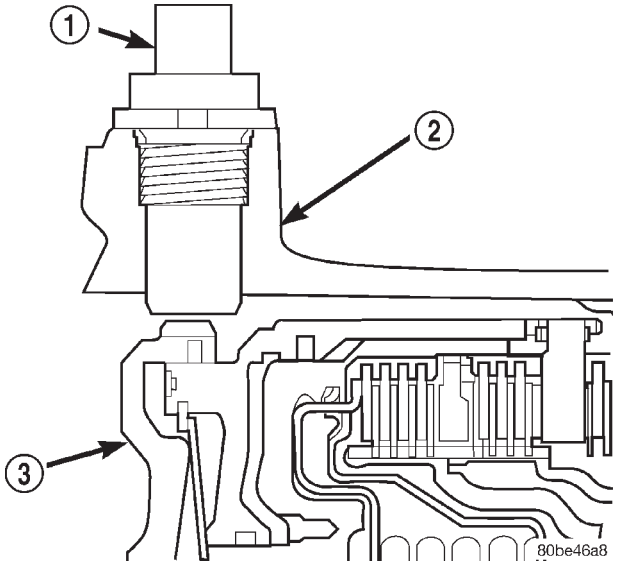

Fig. 319 Sensor Relation to Input Clutch Hub

1 - INPUT SPEED SENSOR
2 - TRANSAXLE CASE
3 - INPUT CLUTCH HUB

The TCM compares the input speed signal with output speed signal to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

(1) Disconnect battery negative cable.

(2) If necessary, disconnect and cap off transmission oil cooler lines.

(3) Disconnect input speed sensor connector.

(4) Unscrew and remove input speed sensor (Fig. 320).

(5) Inspect speed sensor o-ring (Fig. 321) and replace if necessary.

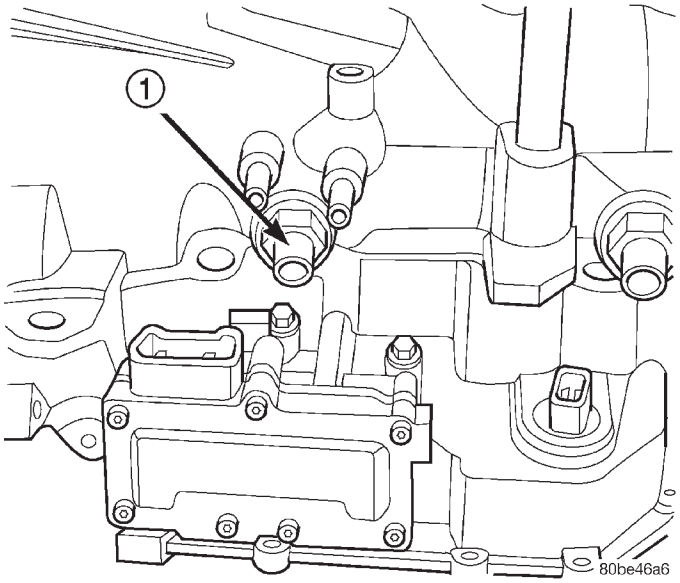

Fig. 320 Input (Turbine) Speed Sensor

1 - INPUT SPEED SENSOR

SPEED SENSOR - INPUT (Continued)

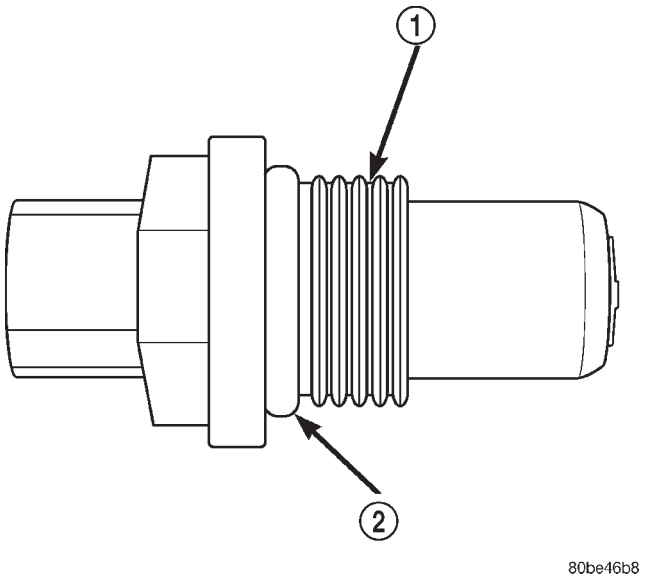

Fig. 321 O-ring Location

1 - INPUT SPEED SENSOR
2 - O-RING

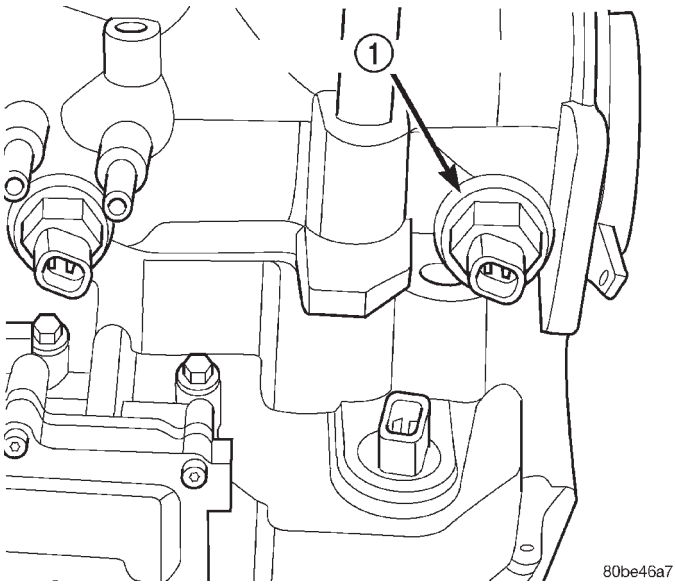

Fig. 322 Output Speed Sensor

1 - OUTPUT SPEED SENSOR

INSTALLATION

(1) Verify o-ring is installed into position.
(2) Install and tighten input speed sensor to 27 N·m (20 ft. lbs.).
(3) Connect speed sensor connector.
(4) Connect battery negative cable.

SPEED SENSOR - OUTPUT

DESCRIPTION

The Output Speed Sensor is a two-wire magnetic pickup device that generates an AC signal as rotation occurs. It is threaded into the transaxle case (Fig. 322) , sealed with an o-ring (Fig. 323), and is considered a primary input to the Transmission Control Module (TCM).

OPERATION

The Output Speed Sensor provides information on how fast the output shaft is rotating. As the rear planetary carrier park pawl lugs pass by the sensor coil (Fig. 324), an AC voltage is generated and sent to the TCM. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

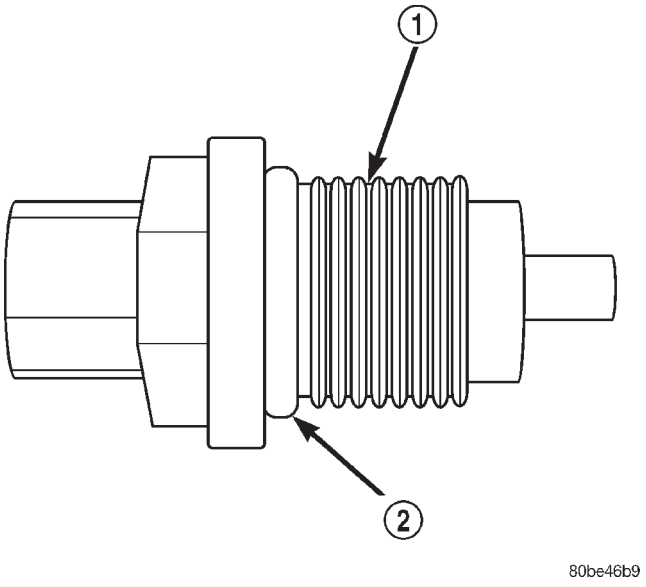

Fig. 323 O-Ring Location

1 - OUTPUT SPEED SENSOR
2 - O-RING

SPEED SENSOR - OUTPUT (Continued)

1 - OUTPUT SPEED SENSOR
2 - REAR PLANET CARRIER/OUTPUT SHAFT ASSEMBLY
3 - TRANSAXLE CASE

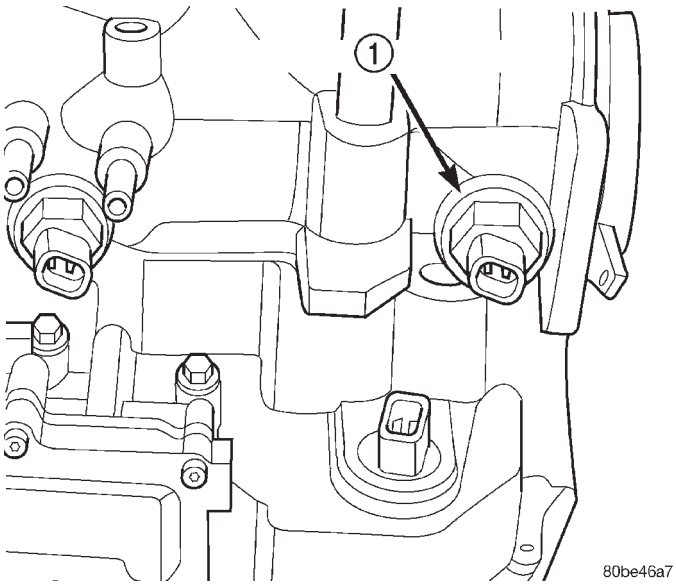

Fig. 325 Output Speed Sensor

1 - OUTPUT SPEED SENSOR

VEHICLE SPEED SIGNAL

The vehicle speed signal is taken from the Output Speed Sensor. The TCM converts this signal into a pulse per mile signal and sends it to the PCM. The PCM, in turn, sends the vehicle speed message across the communication bus to the BCM. The BCM sends this signal to the Instrument Cluster to display vehicle speed to the driver. The vehicle speed signal pulse is roughly 8000 pulses per mile.

REMOVAL

(1) Disconnect battery negative cable.
(2) Raise vehicle on hoist.
(3) Disconnect output speed sensor connector.
(4) Unscrew and remove output speed sensor (Fig. 325).
(5) Inspect speed sensor o-ring (Fig. 326) and replace if necessary.

INSTALLATION

(1) Verify o-ring is installed into position (Fig. 326).
(2) Install and tighten input speed sensor to 27 N·m (20 ft. lbs.).
(3) Connect speed sensor connector.
(4) Connect battery negative cable.

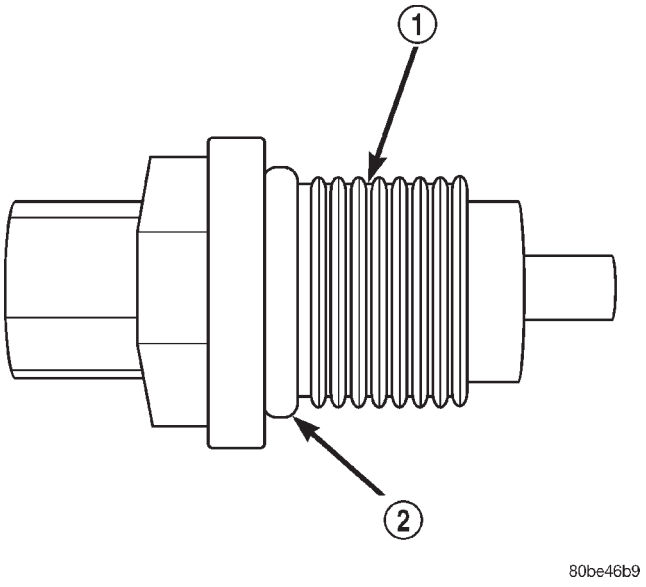

Fig. 326 O-ring Location

1 - OUTPUT SPEED SENSOR
2 - O-RING

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 327) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the fluid cooler and lines.

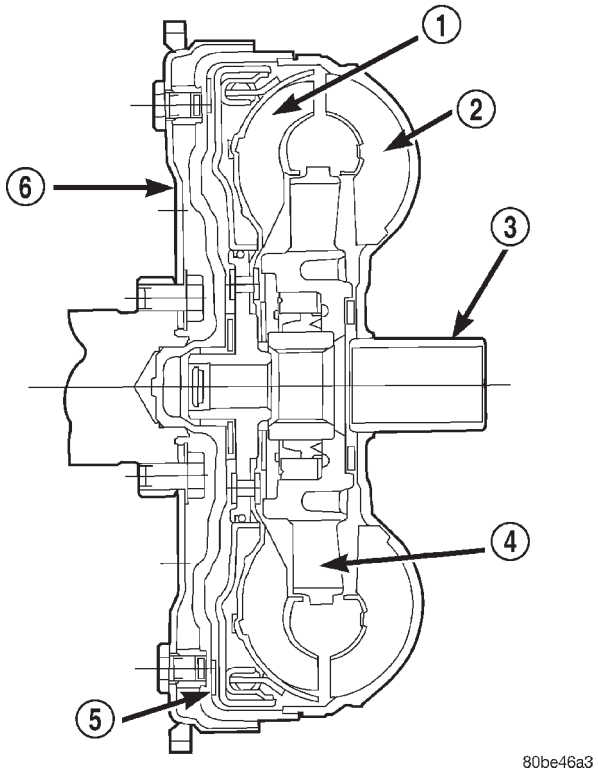

Fig. 327 Torque Converter Assembly

2 - IMPELLER
3 - HUB
4 - STATOR
5 - CONVERTER CLUTCH DISC
6 - DRIVE PLATE

TORQUE CONVERTER (Continued)

IMPELLER

The impeller (Fig. 328) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving member of the system.

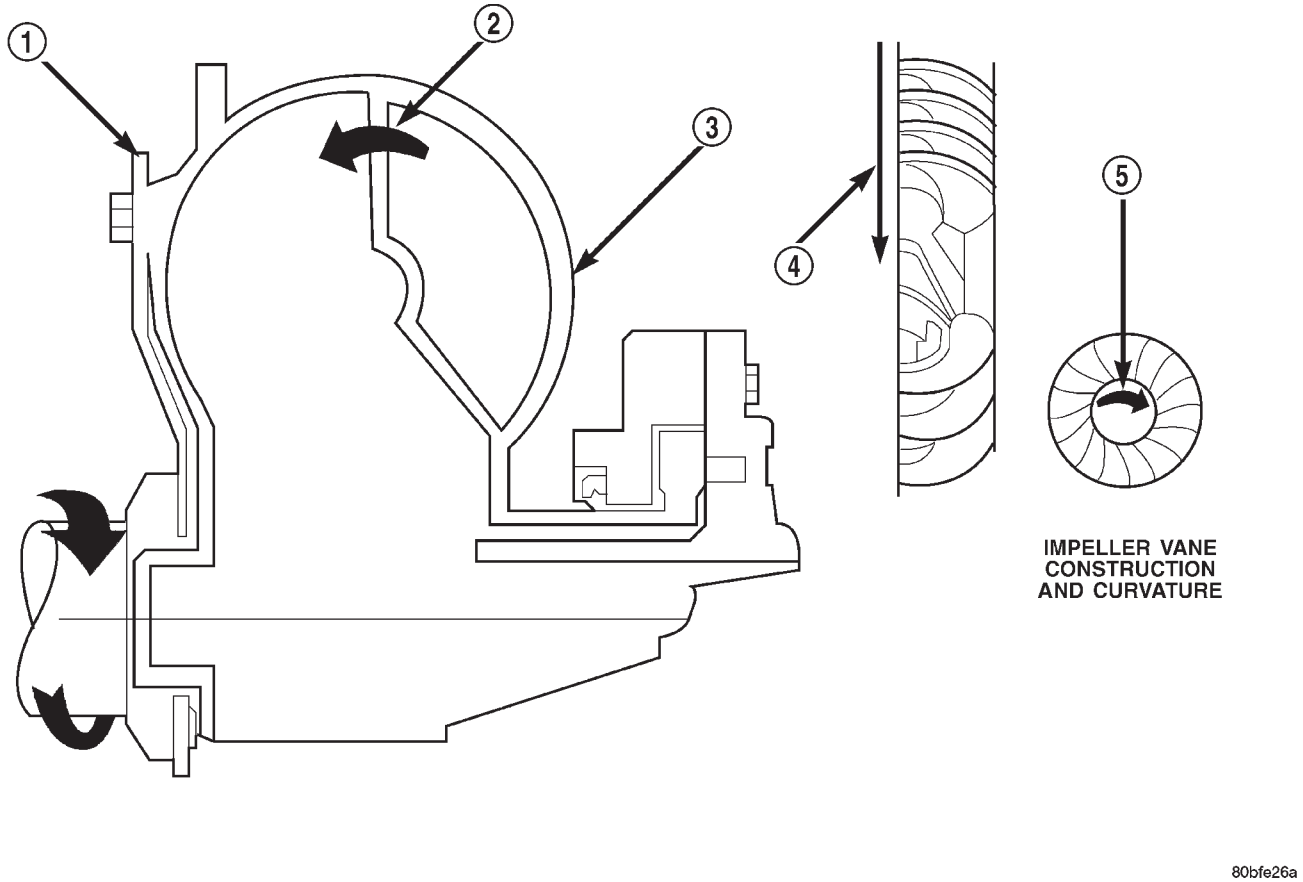

Fig. 328 Impeller

2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

TORQUE CONVERTER (Continued)

TURBINE

The turbine (Fig. 329) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 330) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 331). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

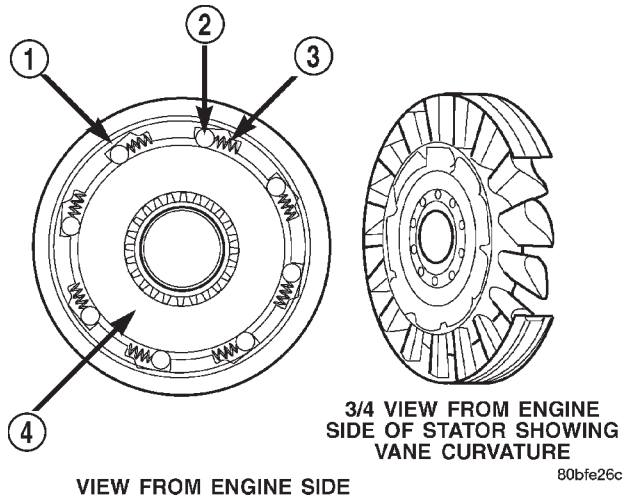

Fig. 330 Stator Components

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 332) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock–free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

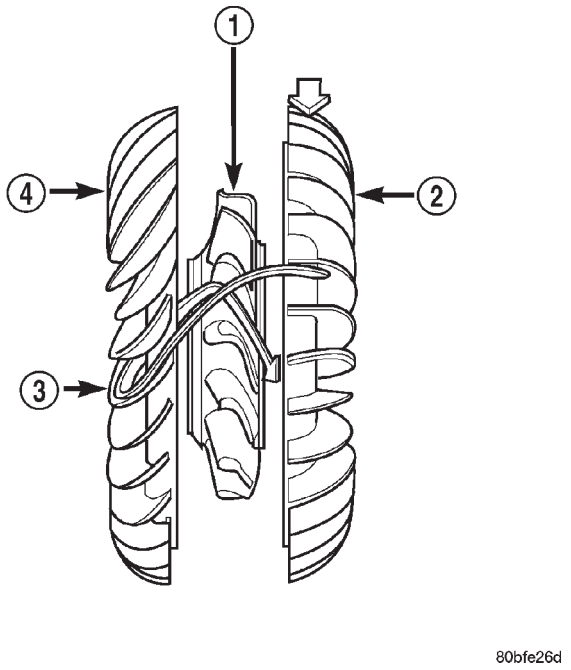

Fig. 331 Stator Location

7 - FRICTION DISC

TORQUE CONVERTER (Continued)

OPERATION

The converter impeller (Fig. 333) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 334). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over–running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock–up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the front cover's friction material, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Powertrain Control Module (PCM). The engagement cannot be activated in the lower gears because it eliminates the torque multiplication effect of the torque converter necessary for acceleration. Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. The torque converter

clutch is engaged by the clutch solenoid on the valve body. The clutch will engage at approximately 56 km/h (35 mph) with light throttle, after the shift to third gear.

REMOVAL

(1) Remove transmission and torque converter from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL)

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 335). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION)

(9) Fill the transmission with the recommended fluid. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

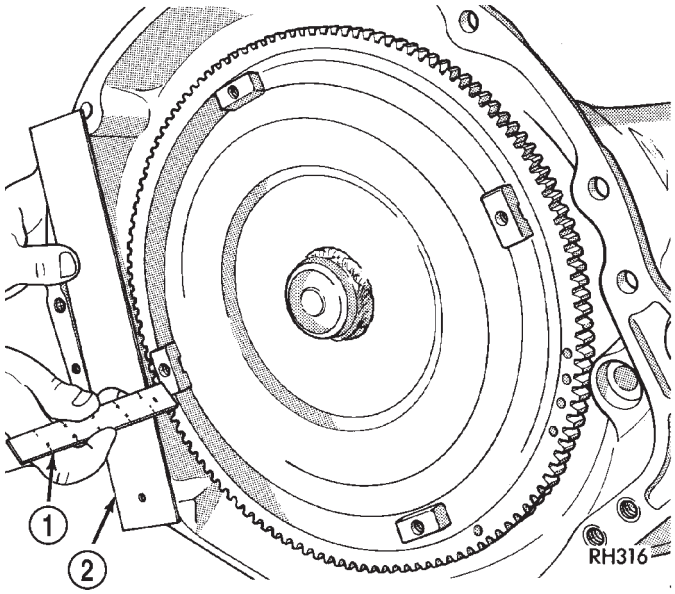

Fig. 335 Checking Torque Converter Seating

2 - STRAIGHTEDGE

TRANSMISSION CONTROL RELAY

DESCRIPTION

The transmission control relay (Fig. 336) is located in the Intelligent Power Module (IPM), which is located on the left side of the engine compartment between the battery and left fender.

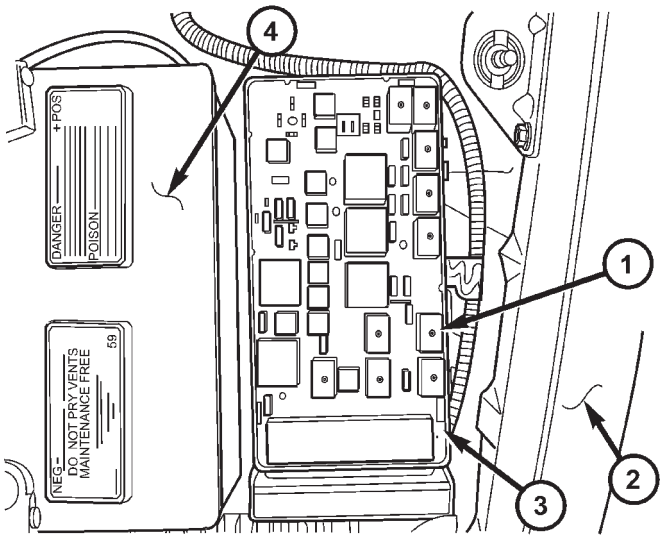

Fig. 336 Transmission Control Relay Location

1 - TRANSMISSION CONTROL RELAY
2 - LEFT FENDER
3 - INTELLIGENT POWER MODULE (IPM)
4 - BATTERY

OPERATION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is “off”, no power is supplied to the solenoid pack and the transmission is in “limp-in” mode. After a controller reset (ignition key turned to the “run” position or after cranking engine), the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) is mounted to the top of the valve body inside the transaxle and can only be serviced by removing the valve body. The electrical connector extends through the transaxle case (Fig. 337) .

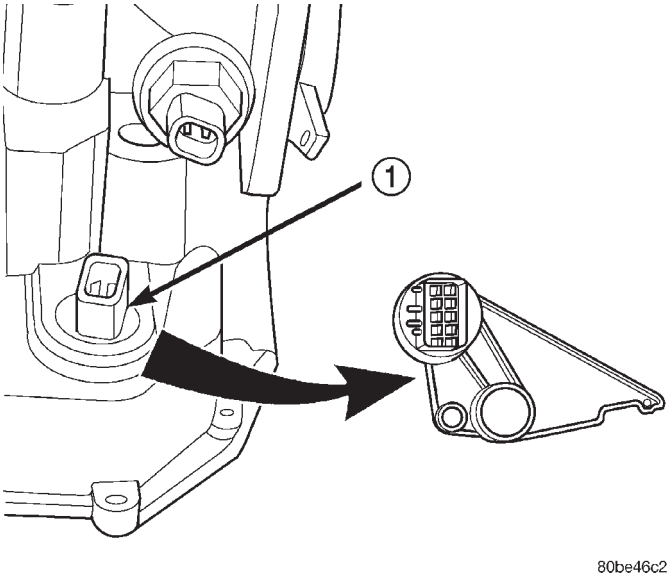

Fig. 337 Transmission Range Sensor (TRS) Location

1 - TRANSMISSION RANGE SENSOR

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the TCM.

The TRS also has an integrated temperature sensor (thermistor) that communicates transaxle temperature to the TCM and PCM (Fig. 338) .

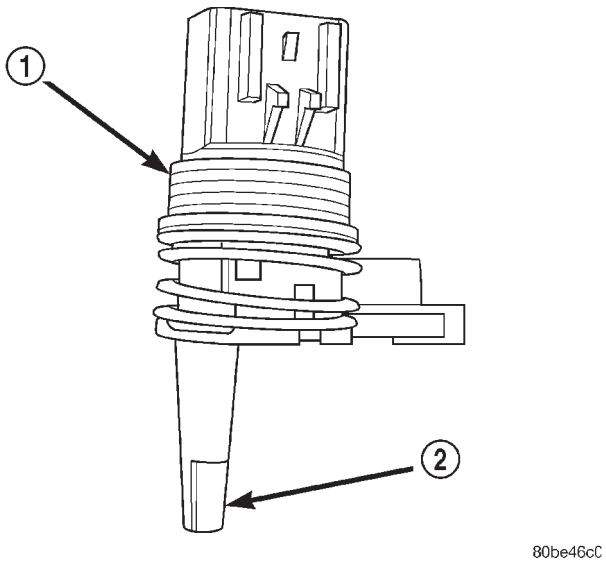

Fig. 338 Transmission Temperature Sensor

1 - TRANSMISSION RANGE SENSOR
2 - TEMPERATURE SENSOR

TRANSMISSION RANGE SENSOR (Continued)

OPERATION

The Transmission Range Sensor (TRS) (Fig. 337) communicates shift lever position (SLP) to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transaxle gear position and shift schedule.

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as “between gear” codes. This results in six codes which should never occur. These are called “invalid” codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRS SWITCH STATES

SLP	T42	T41	T3	T1
P	CL	CL	CL	OP
R	CL	OP	OP	OP
N	CL	CL	OP	CL
OD	OP	OP	OP	CL
3	OP	OP	CL	OP
L	CL	OP	CL	CL

TRANSMISSION TEMPERATURE SENSOR

The TRS has an integrated thermistor (Fig. 338) that the TCM uses to monitor the transmission’s sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in. The PCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission “overheat” condition exists. If the thermistor circuit fails, the TCM will revert to calculated oil temperature usage.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

REMOVAL

(1) Remove valve body assembly from transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/VALVE BODY - REMOVAL)

(2) Remove transmission range sensor retaining screw and remove sensor from valve body (Fig. 339).

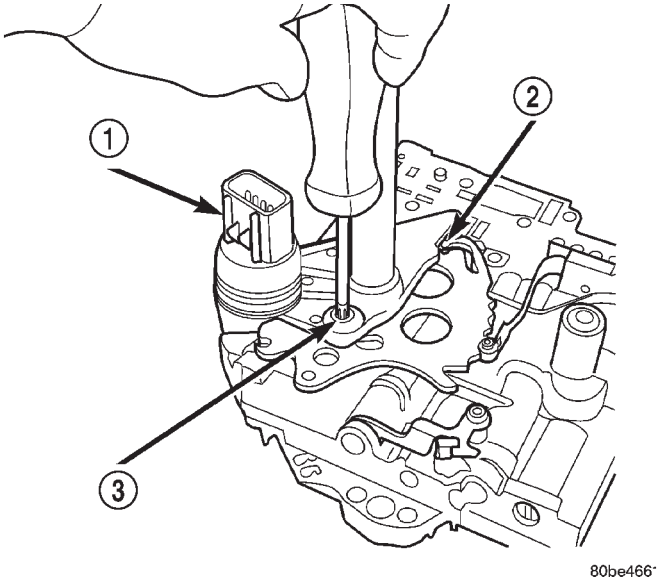

Fig. 339 Remove Transmission Range Sensor

1 - TRANSMISSION RANGE SENSOR
2 - MANUAL VALVE CONTROL PIN
3 - RETAINING SCREW

(3) Remove TRS from manual shaft.

INSTALLATION

(1) Install transmission range sensor (TRS) to the valve body and torque retaining screw (Fig. 339) to 5 N·m (45 in. lbs.).

(2) Install valve body to transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/VALVE BODY - INSTALLATION)

TRD LINK

DESCRIPTION

The Torque Reduction Link (TRD) is a wire between the PCM and TCM that is used by the TCM to request torque management. Torque management controls or reduces torque output of the engine during certain shift sequences, reducing torque applied to the transaxle clutches.

OPERATION

The torque management signal is basically a 12-volt pull-up supplied by the PCM to the TCM over the torque reduction link (TRD). Torque management

TRD LINK (Continued)

is requested when the TCM pulses this signal to ground. The PCM recognizes this request and responds by retarding ignition timing, killing fuel injectors, etc. The PCM sends a confirmation of the request to the TCM via the communication bus. Torque reduction is not noticable by the driver, and usually lasts for a very short period of time.

If the confirmation signal is not received by the TCM after two sequential request messages, a diagnostic trouble code will be set.

VALVE BODY

DESCRIPTION

The valve body assembly consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches. The valve body contains the following components (Fig. 340):

- Regulator valve
- Solenoid switch valve
- Manual valve
- Converter clutch switch valve
- Converter clutch control valve
- Torque converter regulator valve
- Low/Reverse switch valve

In addition, the valve body also contains the thermal valve, #2,3&4 check balls, the #5 (overdrive) check valve and the 2/4 accumulator assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/VALVE BODY - DISASSEMBLY)

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

REGULATOR VALVE

The regulator valve controls hydraulic pressure in the transaxle. It receives unregulated pressure from the pump, which works against spring tension to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as “line pressure.”

4 - CONVERTER CLUTCH CONTROL VALVE
5 - MANUAL VALVE
6 - CONVERTER CLUTCH SWITCH VALVE
7 - SOLENOID SWITCH VALVE
8 - REGULATOR VALVE

VALVE BODY (Continued)

SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid. In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves.

MANUAL VALVE

The manual valve is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve is fed to the torque converter regulator valve, where it passes through the valve, and is slightly regulated. The pressure is then directed to the converter clutch switch valve and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve controls the back (on) side of the torque converter clutch. When the TCM energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under all operating conditions.

REMOVAL

REMOVAL

NOTE: If valve body is replaced or reconditioned, the TCM Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect battery negative cable.
(2) Disconnect gearshift cable from manual valve lever.
(3) Remove manual valve lever from manual shaft.
(4) Raise vehicle on hoist.
(5) Remove oil pan bolts (Fig. 341).

T850 MANUAL TRANSAXLE

DESCRIPTION

The NV T850 5-speed transaxle (Fig. 1) is a constant-mesh manual transaxle that is synchronized in all gear ranges, including reverse.

The transaxle consists of three major sub-assemblies: the input shaft, intermediate shaft, and differential assembly. The transaxle shift system consists of a mechanical shift cover, rails, forks, and cables. The unique design of this shift system provides a higher mechanical advantage, resulting in less friction and lower shift cable loads for smoother, more positive operation.

T850 MANUAL TRANSAXLE (Continued)

The NV T850 transaxle is available with the 2.4L Gas and 2.5L Turbo Diesel engine options. Unique gearing tailored to the performance characteristics of each engine provides optimum driveability, gradability, and acceleration. The gear ratios are as follows:

GEAR	RATIO (2.4L Gas)	RATIO (2.5L TD)
1st	3.65	3.46
2nd	2.07	2.05
3rd	1.39	1.37
4th	1.03	0.97
5th	0.83	0.76
Reverse	3.47	3.47
Final Drive Ratio	3.77	3.53
Overall Top Gear	3.12	2.66

TRANSAXLE IDENTIFICATION

NOTE: Since transaxles use unique gear ratios for each of the two engine applications, it is imperative that the transaxle is properly identified, and the correct transaxle assembly number is used when ordering service parts.

The transaxle model, assembly part number, build date, and final drive ratio (FDR) can be found on a metal tag fastened to the transaxle case on the bellhousing (Fig. 2). A barcode label is also glued to the transaxle bellhousing, and it too includes the transaxle part number.

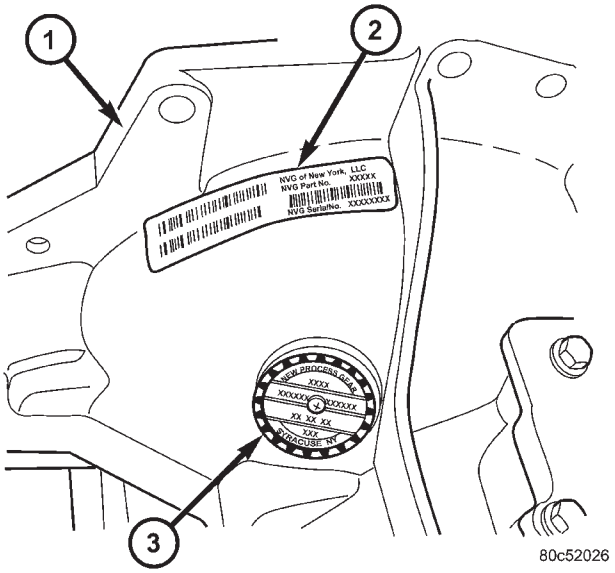

Fig. 2 T850 Transaxle Identification

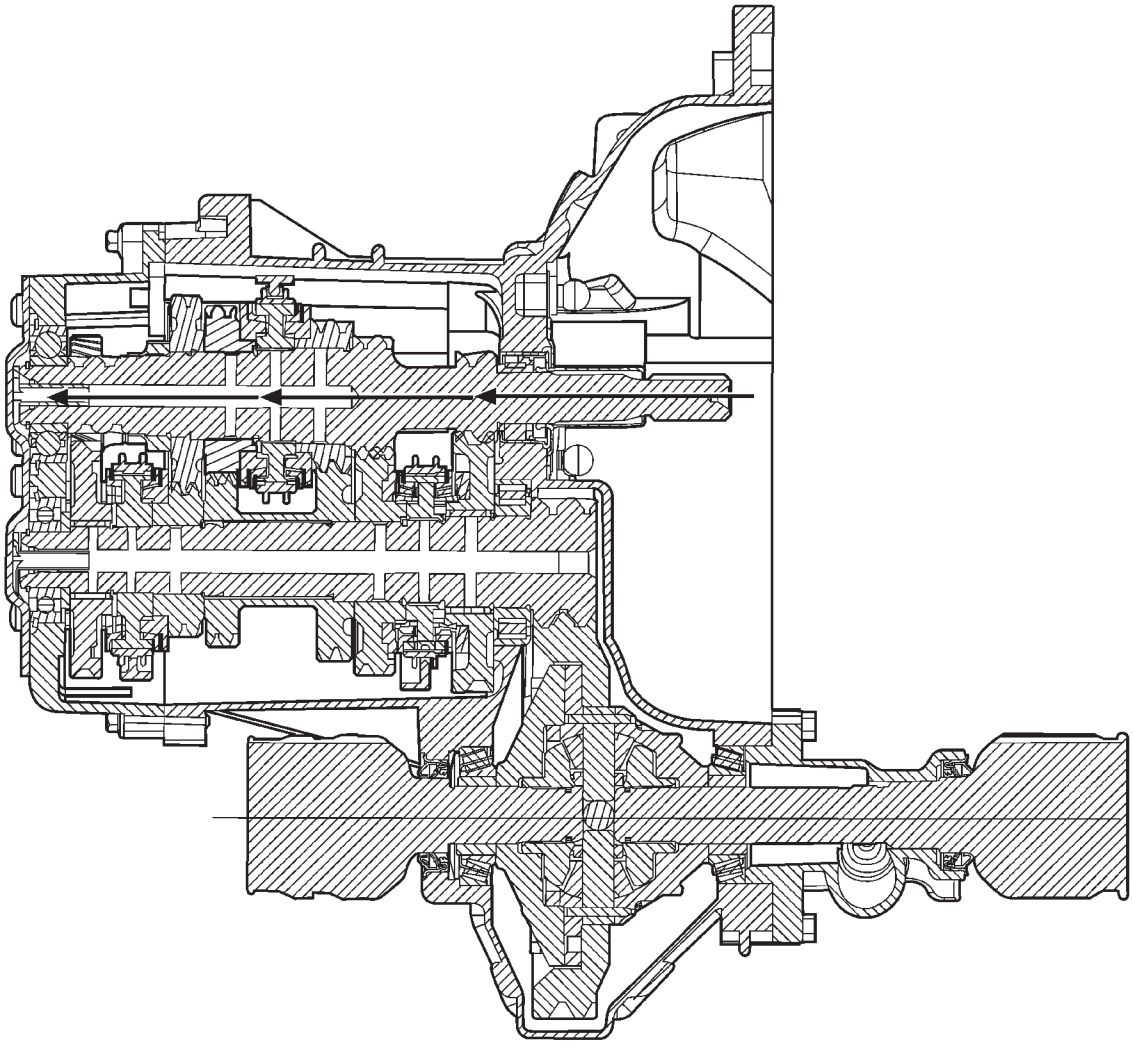
2 - BARCODE LABEL
3 - I.D. TAG

T850 MANUAL TRANSAXLE (Continued)

OPERATION

NEUTRAL

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. Since no synchronizers are engaged on either the input or intermediate shafts, power is not transmitted to the intermediate shaft and the differential does not turn (Fig. 3).



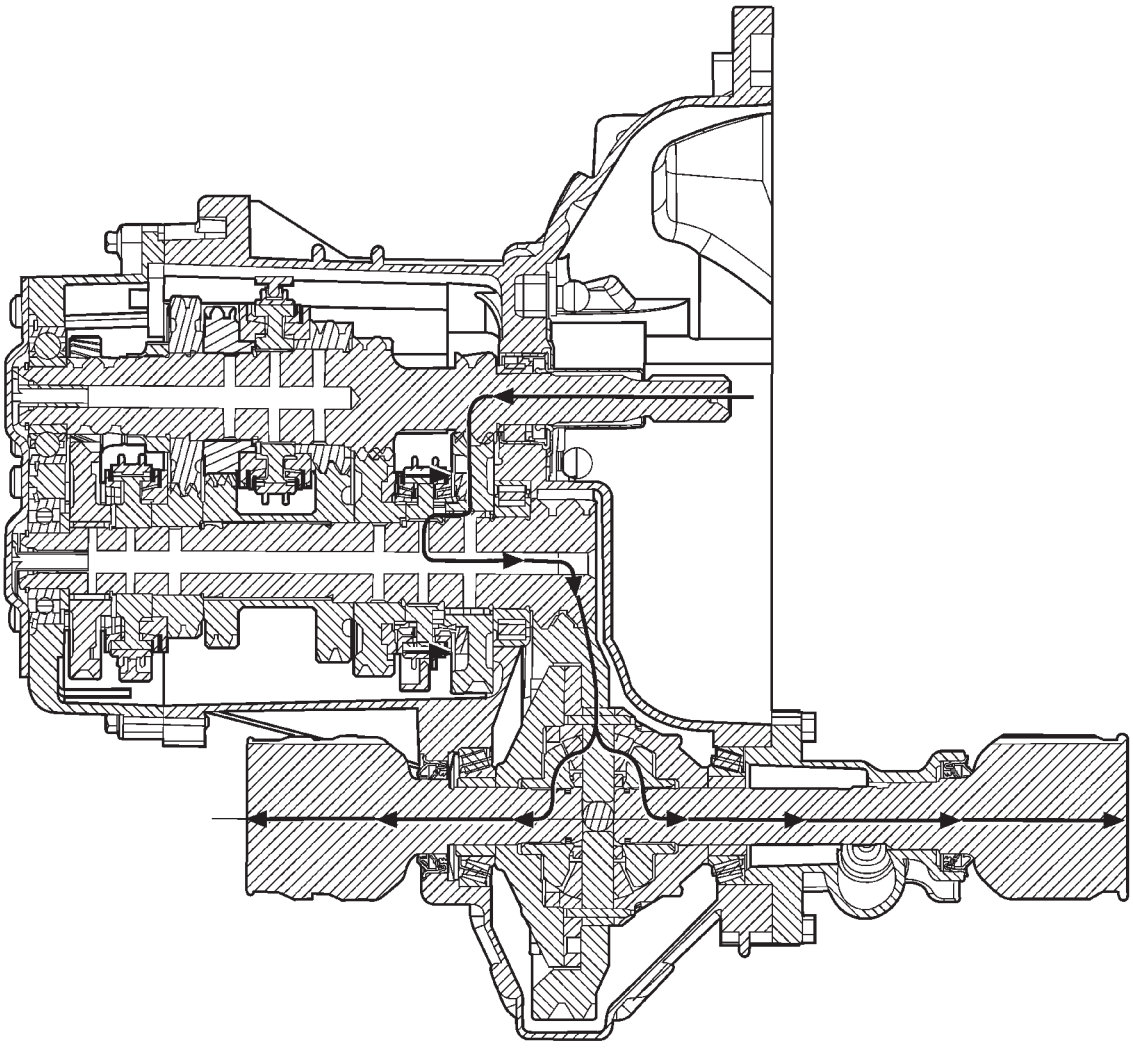
80c52005

Fig. 3 Neutral Gear Operation

T850 MANUAL TRANSAXLE (Continued)

1ST GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft first gear is integral to the input shaft, and is in constant mesh with the intermediate shaft first speed gear. Because of this constant mesh, the intermediate shaft first speed gear freewheels until first gear is selected. As the gearshift lever is moved to the first gear position, the 1-2 fork moves the 1-2 synchronizer sleeve towards first gear on the intermediate shaft. The synchronizer sleeve engages the first gear clutch teeth, fixing the gear to the intermediate shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 4).



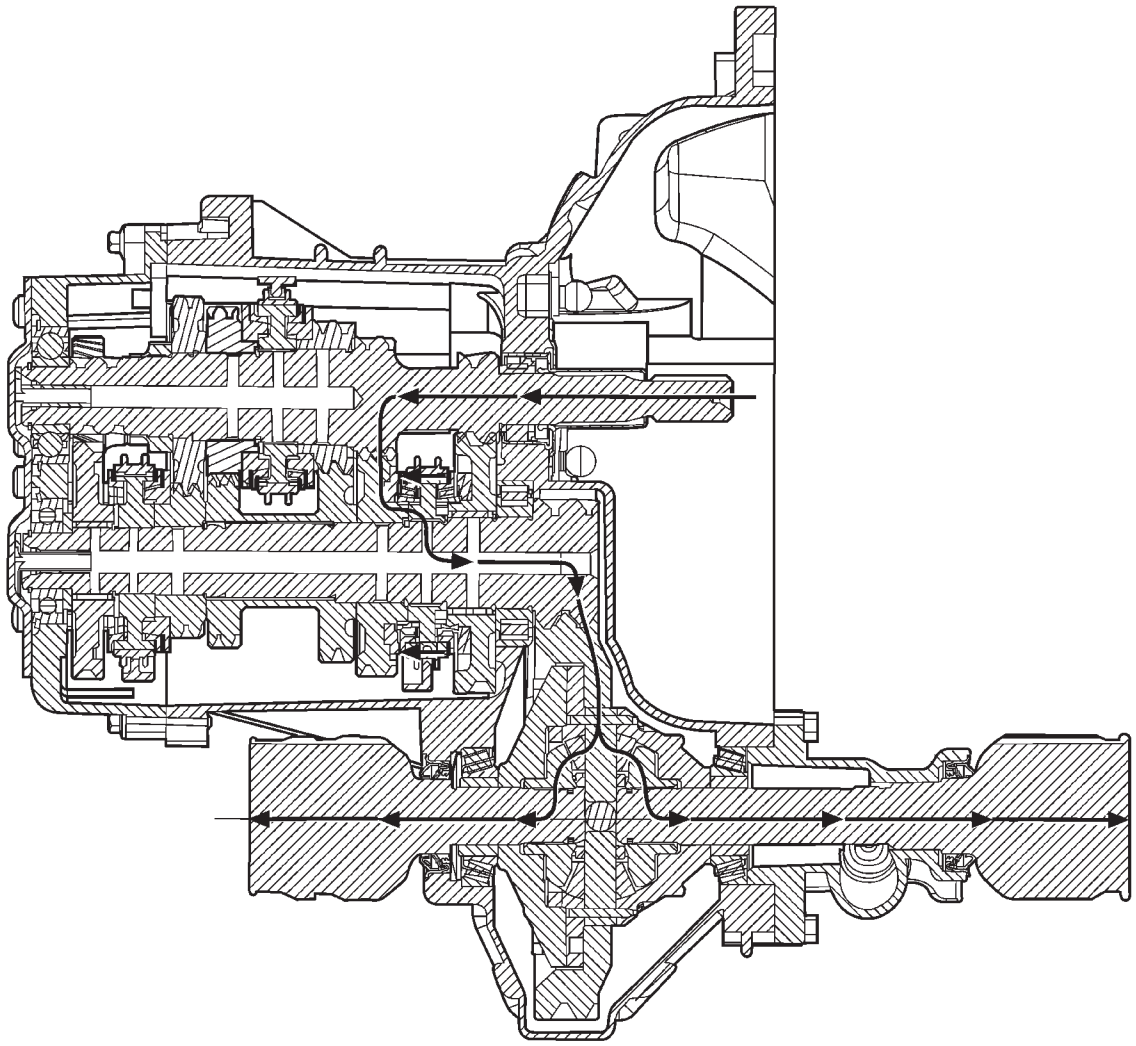
80c51d2f

Fig. 4 1st Gear Operation

T850 MANUAL TRANSAXLE (Continued)

2ND GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft second gear is integral to the input shaft, and is in constant mesh with the intermediate shaft second speed gear. Because of this constant mesh, the intermediate shaft second speed gear freewheels until second gear is selected. As the gearshift lever is moved to the second gear position, the 1-2 fork moves the 1-2 synchronizer sleeve towards second gear on the intermediate shaft. The synchronizer sleeve engages the second gear clutch teeth, fixing the gear to the intermediate shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 5).



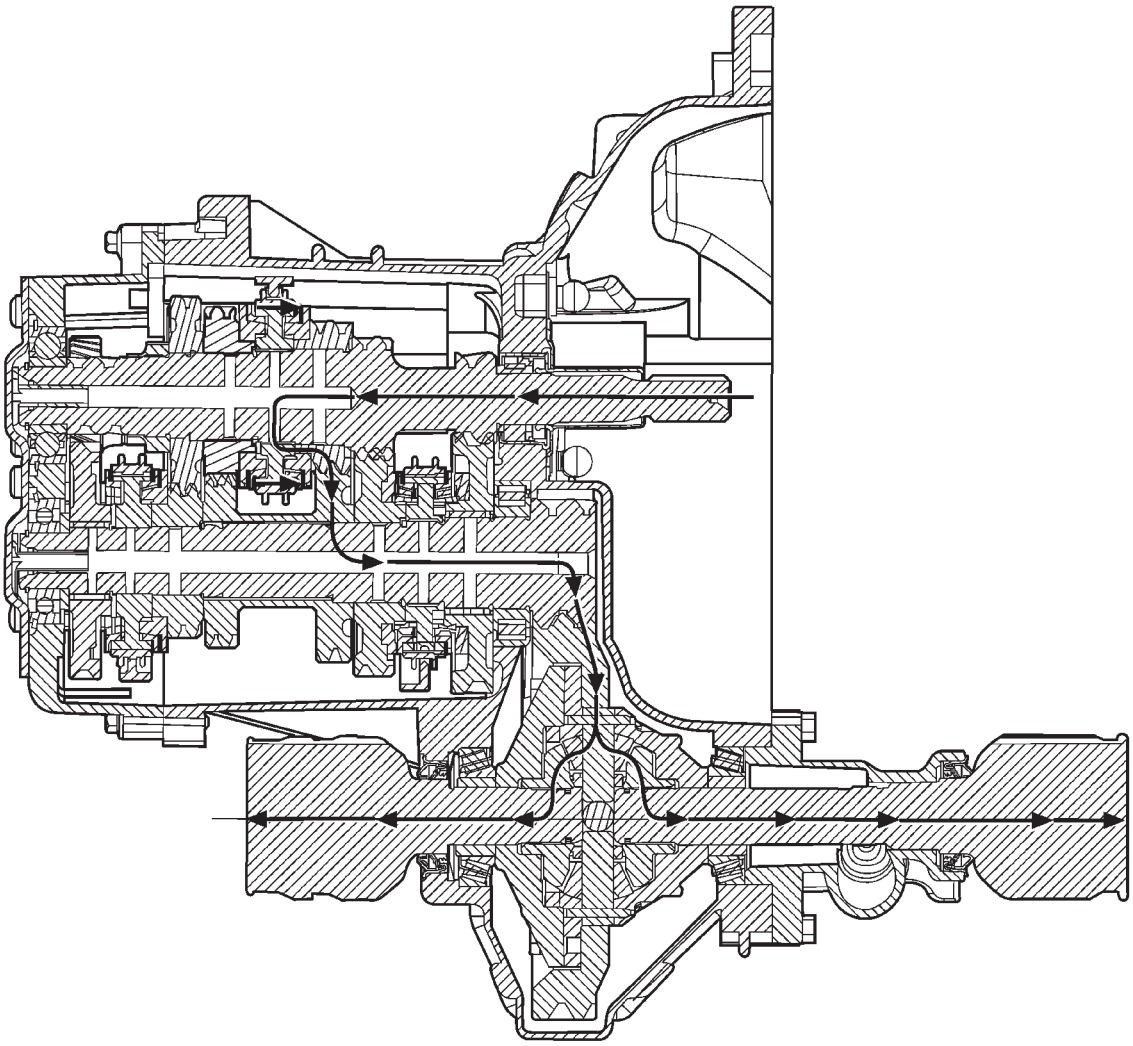
80c51d36

Fig. 5 2nd Gear Operation

T850 MANUAL TRANSAXLE (Continued)

3RD GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft third speed gear is in constant mesh with the intermediate shaft 3-4 cluster gear, which is fixed to the intermediate shaft. Because of this constant mesh, the input shaft third speed gear freewheels until third gear is selected. As the gearshift lever is moved to the third gear position, the 3-4 fork moves the 3-4 synchronizer sleeve towards third gear on the input shaft. The synchronizer sleeve engages the third gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 6).



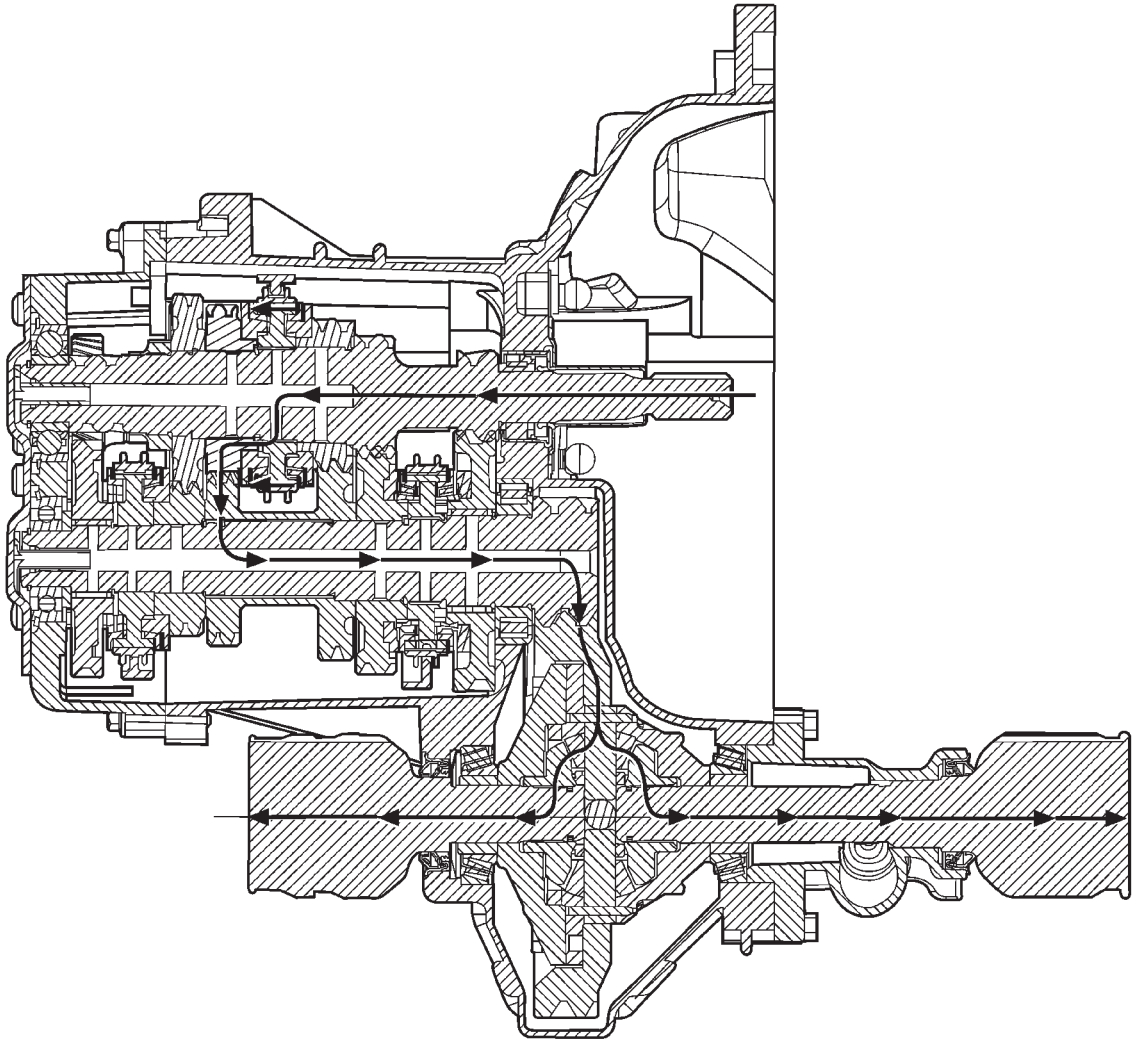
80c51d3a

Fig. 6 3rd Gear Operation

T850 MANUAL TRANSAXLE (Continued)

4TH GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft fourth speed gear is in constant mesh with the intermediate shaft 3-4 cluster gear, which is fixed to the intermediate shaft. Because of this constant mesh, the input shaft fourth speed gear freewheels until fourth gear is selected. As the gearshift lever is moved to the fourth gear position, the 3-4 fork moves the 3-4 synchronizer sleeve towards fourth gear on the input shaft. The synchronizer sleeve engages the fourth gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 7).



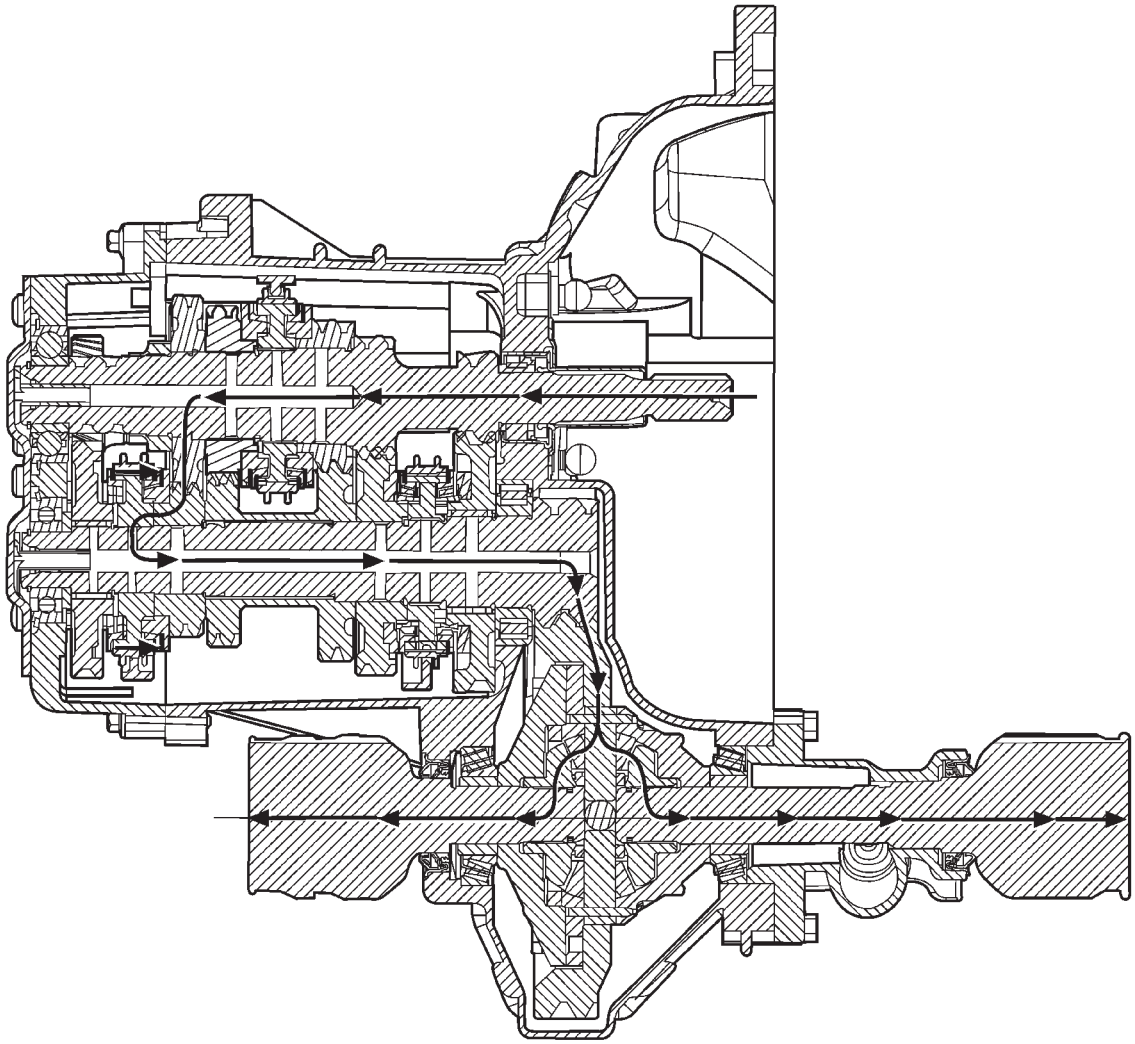
80c51d3e

Fig. 7 4th Gear Operation

T850 MANUAL TRANSAXLE (Continued)

5TH GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft fifth gear is pressed on to the input shaft, and is in constant mesh with the intermediate shaft fifth speed gear. Because of this constant mesh, the intermediate shaft fifth speed gear freewheels until fifth gear is selected. As the gearshift lever is moved to the fifth gear position, the 5-R fork moves the 5-R synchronizer sleeve towards the intermediate shaft fifth speed gear. The synchronizer sleeve engages the fifth gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 8).



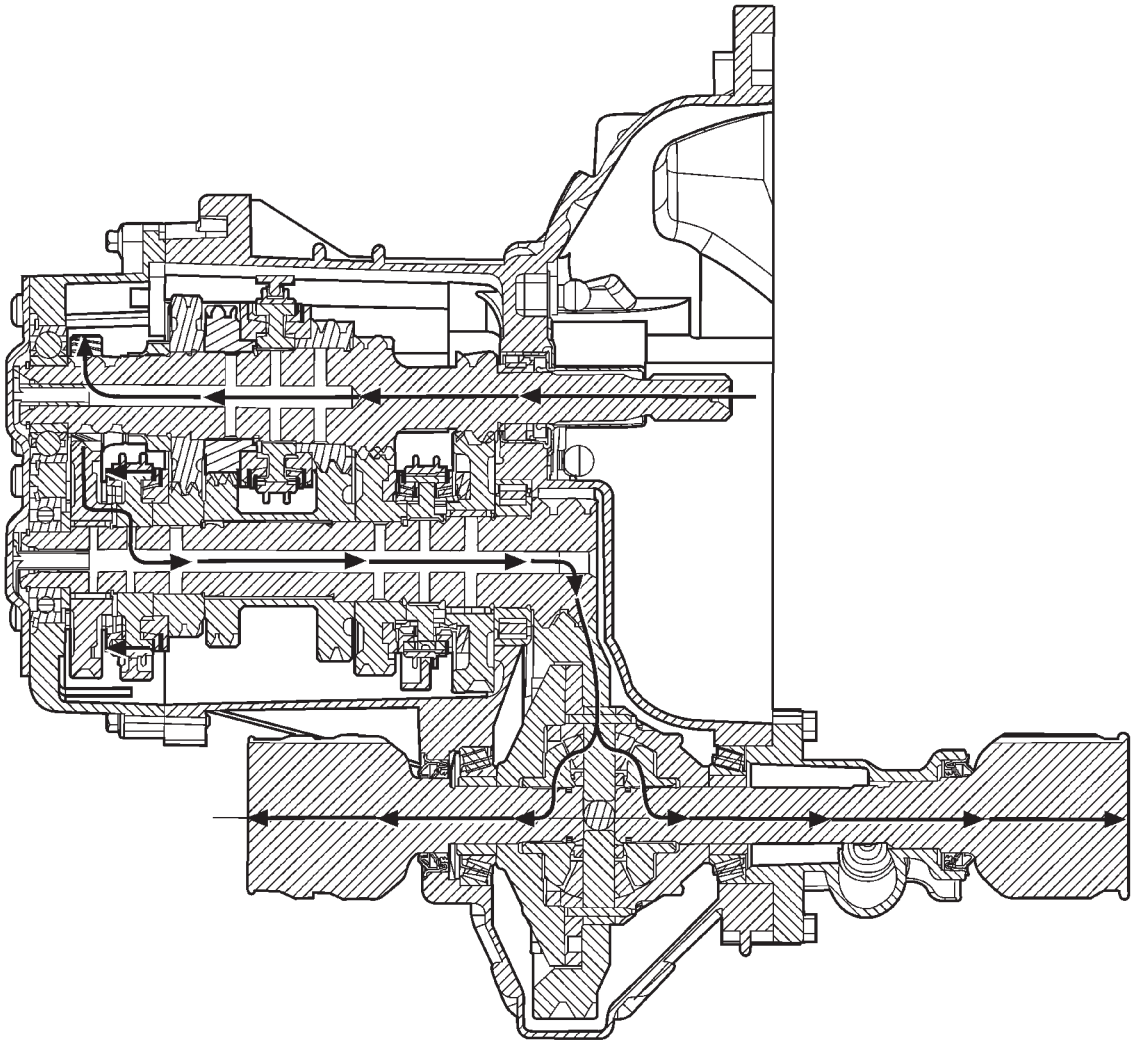
80c51d49

Fig. 8 5th Gear Operation

T850 MANUAL TRANSAXLE (Continued)

REVERSE GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft reverse gear is integral to the input shaft, and is in constant mesh with the reverse idler gear. The reverse idler gear, which reverses the rotation of the intermediate shaft, is in constant mesh with the intermediate shaft reverse gear. Because of this constant mesh, the intermediate shaft reverse gear freewheels until reverse gear is selected. As the gearshift lever is moved to the reverse gear position, the 5-R fork moves the 5-R synchronizer sleeve towards the intermediate shaft reverse gear. The synchronizer sleeve engages the reverse gear clutch teeth, fixing the gear to the intermediate shaft, and allowing power to transmit through the intermediate shaft to the differential (in reverse) (Fig. 9).



80c51d4d

Fig. 9 Reverse Gear Operation

T850 MANUAL TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - COMMON PROBLEM CAUSES

The majority of transaxle malfunctions are a result of:

- Insufficient lubrication
- Incorrect lubricant
- Misassembled or damaged internal components
- Improper operation

HARD SHIFTING

Hard shifting may be caused by a misadjusted crossover cable. If hard shifting is accompanied by gear clash, synchronizer clutch and stop rings or gear teeth may be worn or damaged.

Hard shifting may also be caused by a binding or broken shift cover mechanism. Remove shift cover and verify smooth operation. Replace as necessary.

Misassembled synchronizer components also cause shifting problems. Incorrectly installed synchronizer sleeves, keys, balls, or springs can cause shift problems.

NOISY OPERATION

Transaxle noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings all cause noise.

Abnormal wear and damage to the internal components is frequently the end result of insufficient lubricant.

SLIPS OUT OF GEAR

Transaxle disengagement may be caused by misaligned or damaged shift components, or worn teeth on the drive gears or synchronizer components. Incorrect assembly also causes gear disengagement. Check for missing snap rings.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of leaks, or inaccurate fluid level check or refill method. Leakage is evident by the presence of oil around the leak point. If leakage is not evident, the condition is probably the result of an underfill.

If air–powered lubrication equipment is used to fill a transaxle, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an underfill condition.

CLUTCH PROBLEMS

Worn, damaged, or misaligned clutch components can cause difficult shifting, gear clash, and noise.

A worn or damaged clutch disc, pressure plate, or release bearing can cause hard shifting and gear clash.

REMOVAL

REMOVAL - 2.4L GAS

(1) Raise hood.

(2) Disconnect gearshift cables from shift levers/cover assembly (Fig. 10).

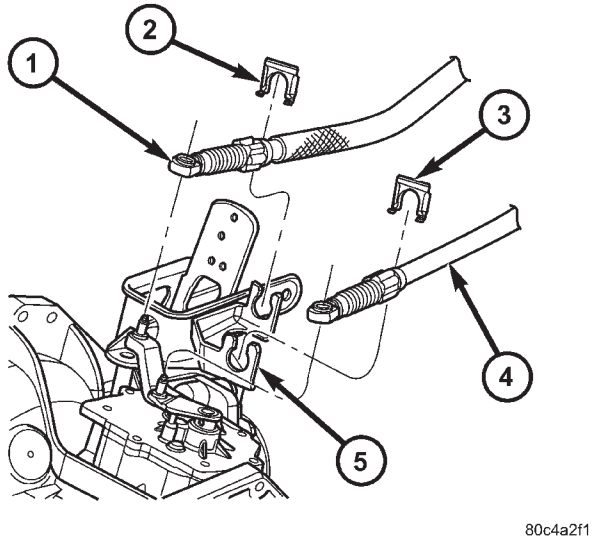


Fig. 10 Gearshift Cables at Transaxle

1 - SELECTOR CABLE
2 - CABLE RETAINER
3 - CABLE RETAINER
4 - CROSSOVER CABLE
5 - MOUNT BRACKET

(3) Remove gearshift cable retaining clips from mounting bracket (Fig. 10). Remove cables and secure out of way.

(4) Remove three (3) right engine mount bracket-to-transaxle bolts (Fig. 11).

(5) Raise vehicle on hoist.

(6) Remove front wheel/tires and halfshafts.

(7) Drain transaxle fluid into suitable container.

(8) Remove front harness retainer and secure harness out of way.

T850 MANUAL TRANSAXLE (Continued)

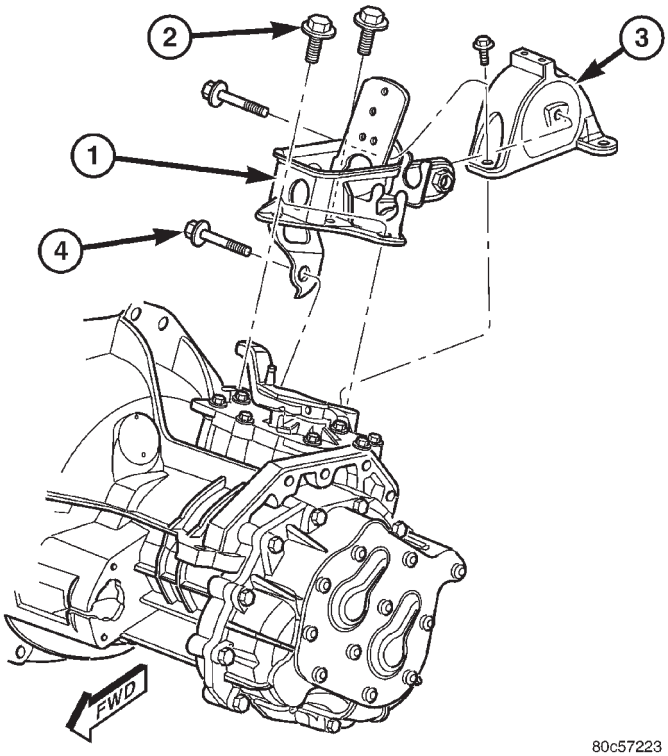

Fig. 11 Transaxle Right Mount and Bracket

1 - MOUNT BRACKET
2 - BOLT (3)
3 - MOUNT
4 - BOLT (1)

(9) Using Tool 6638A, disconnect clutch hydraulic circuit quick connect (located on slave cylinder tube). Remove clutch slave cylinder by depressing towards case and rotating counter-clockwise 60°, while lifting anti-rotation tab out of case slot with screwdriver (Fig. 12).

(10) Remove engine left mount bracket.

(11) Remove starter motor (Fig. 13).

(12) Disconnect back-up lamp switch connector.

(13) Remove structural collar.

(14) Remove modular clutch assembly-to-drive plate bolts.

(15) Position screw jack and wood block to engine oil pan.

(16) Remove transmission upper mount through-bolt from left frame rail.

(17) Lower engine/transaxle assembly on screw jack.

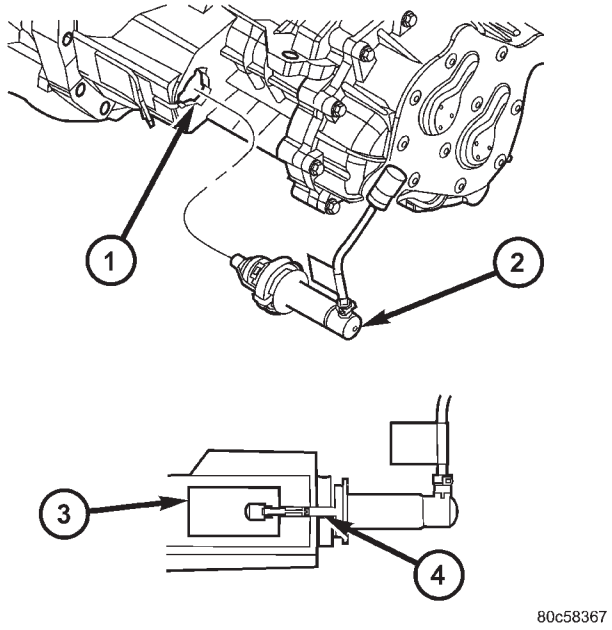

Fig. 12 Slave Cylinder Removal/Installation

(18) Remove four (4) upper mount-to-transaxle bolts and remove mount (Fig. 14).

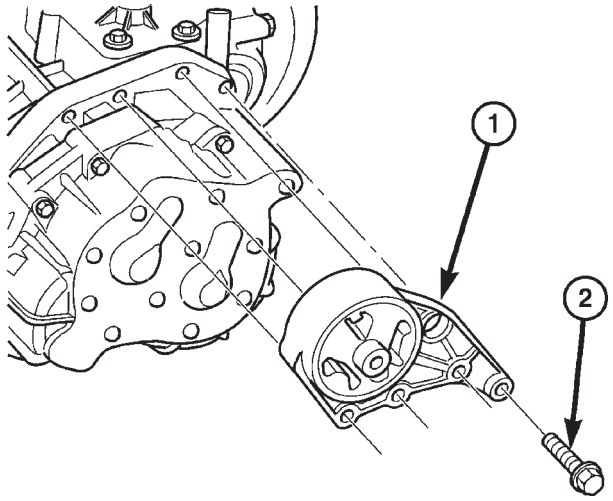

Fig. 14 Transaxle Upper Mount

1 - MOUNT
2 - BOLT (4)

(19) Obtain helper and transmission jack. Secure transaxle to transmission jack and remove transaxle-to-engine bolts.

(20) Remove transaxle from engine.

(21) Inspect modular clutch assembly, clutch release components, and engine drive plate.

REMOVAL - 2.5L TD

(1) Raise hood.

(2) Disconnect both battery cables.

(3) Remove battery thermal shield (Fig. 15).

(4) Remove battery hold down bolt, clamp, and battery (Fig. 16).

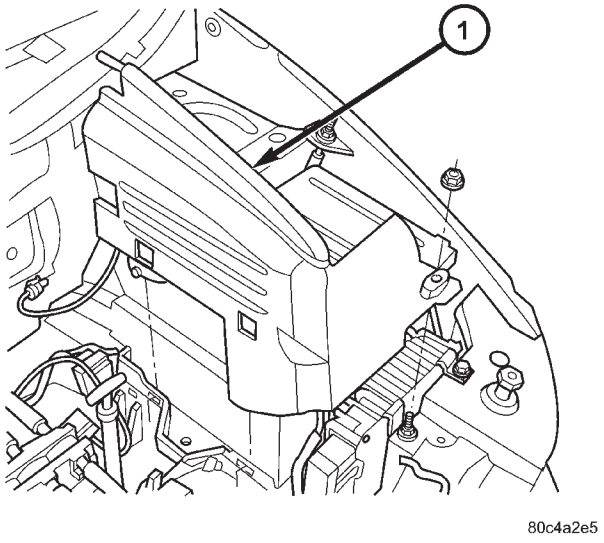

Fig. 15 Battery Thermal Shield

1 - BATTERY THERMAL SHIELD

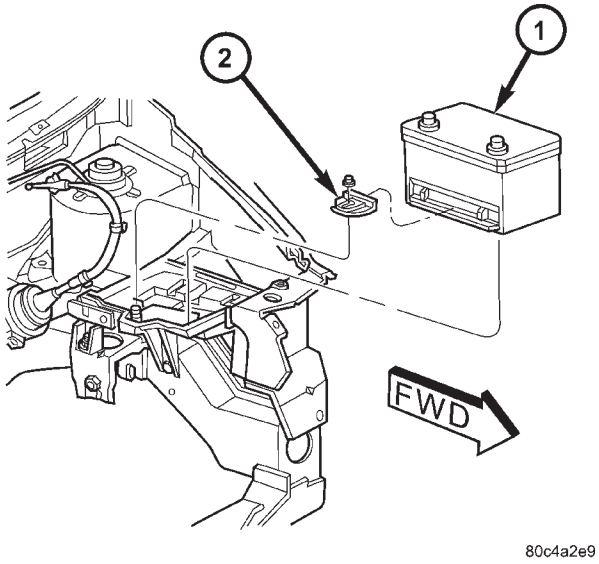

Fig. 16 Battery and Hold-Down Clamp

(23) Remove four (4) upper mount-to-transaxle bolts and remove mount (Fig. 24).

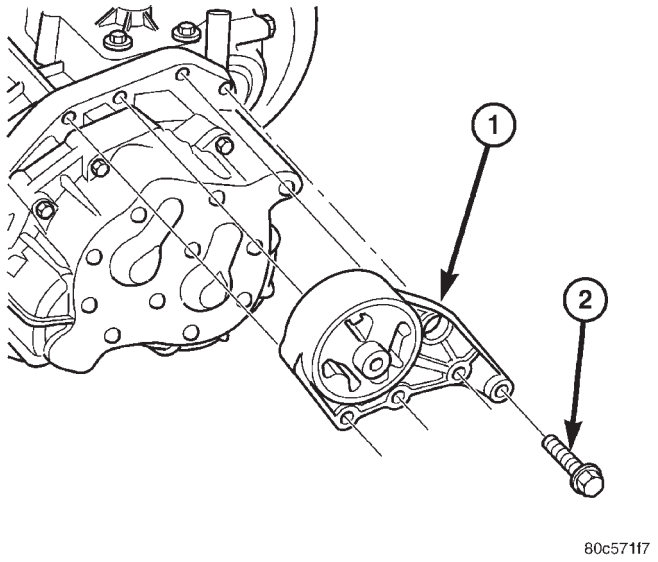

Fig. 24 Transaxle Upper Mount

1 - MOUNT
2 - BOLT (4)

(24) Obtain helper and transmission jack. Secure transaxle to transmission jack and remove transaxle-to-engine bolts.

(25) Remove transaxle from engine (Fig. 25).

(26) Inspect clutch, clutch release components, and flywheel.

DISASSEMBLY

(1) Remove clutch release lever and bearing (Fig. 26). Inspect release lever pivot balls and replace if necessary (Fig. 27). Use slide hammer C-3752 and remover/installer 6891 (Fig. 28) if pivot ball replacement is necessary.

T850 MANUAL TRANSAXLE (Continued)

(16) Remove reverse idler bolt (Fig. 39). Remove reverse idler gear, washers, and shaft upon geartrain removal.

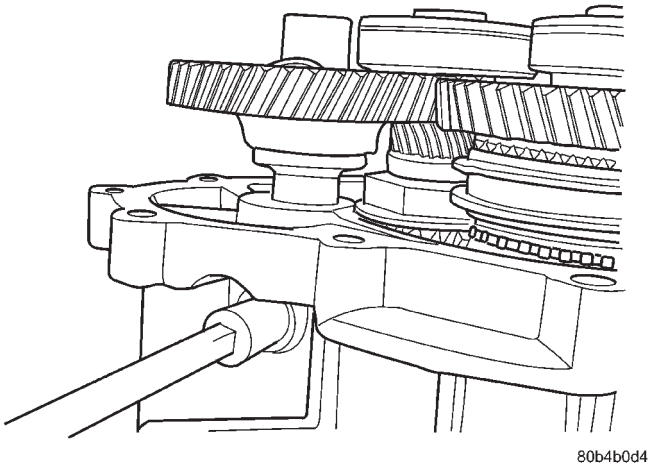

Fig. 39 Reverse Idler Shaft Bolt

(17) Remove 1-2/5-R shift rail (Fig. 40).

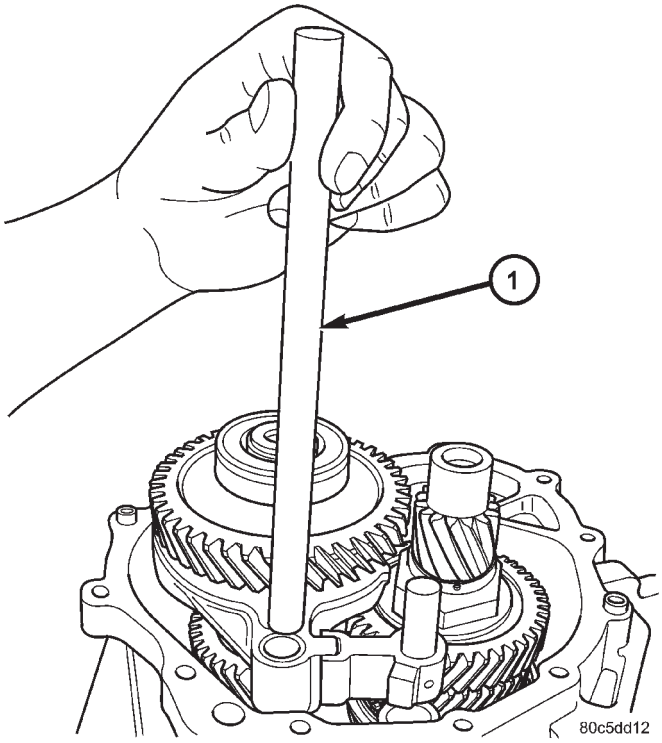

Fig. 40 1/2-5/R Shift Rail Removal/Installation

1 - 1/2-5/R SHIFT RAIL

(18) Install lifting bar 8489.

(19) Lift geartrain (w/reverse idler gear assy.) out of transaxle and install on fixture 8487 (Fig. 41).

(20) Remove remaining shift rail and forks from geartrain (Fig. 41).

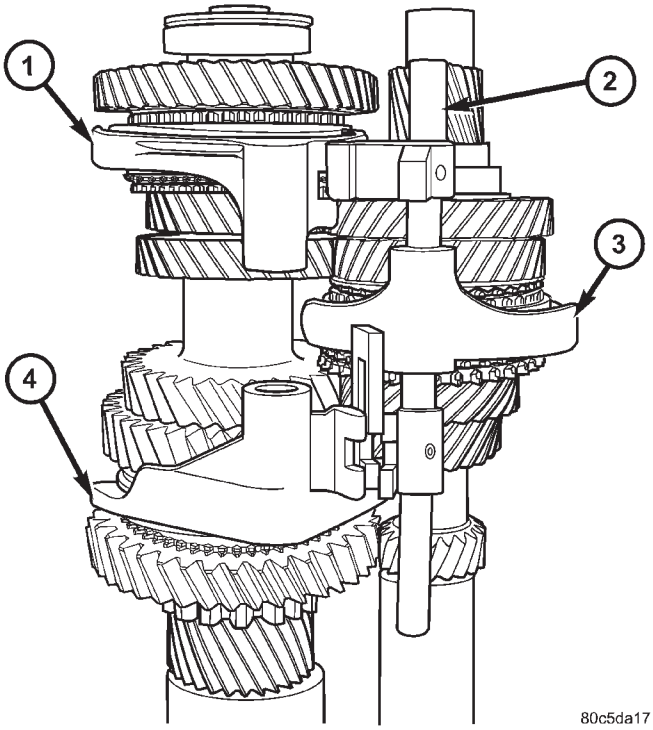

Fig. 41 Shift Fork/Rail Orientation

1 - 5/R FORK
2 - 3/4 RAIL ASSEMBLY
3 - 3/4 FORK
4 - 1/2 FORK

(21) Remove lifting bar from geartrain.

NOTE: At this point, differential bearing turning torque should be measured to ensure proper shim selection upon reassembly.

(22) Reinstall and torque extension housing and measure differential turning torque. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/DIFFERENTIAL - ADJUSTMENTS)

(23) Remove differential cover bolts.

(24) Remove differential cover. If necessary, use a soft tipped hammer to aid in removal.

(25) Remove extension housing.

T850 MANUAL TRANSAXLE (Continued)

(26) Remove differential assembly. Note orientation of shim, oil slinger, and differential side bearing races (Fig. 42).

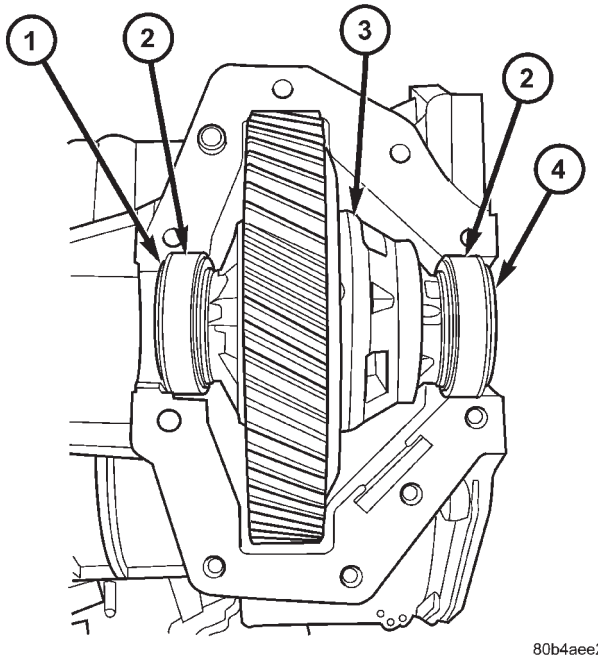

Fig. 42 Differential Shim/Slinger Orientation

3 - REMOVER/INSTALLER 8474

ASSEMBLY

NOTE: When assembling this transaxle, always use NEW snap rings.

NOTE: Before assembling transaxle, differential turning torque must be measured and adjusted. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/DIFFERENTIAL - ADJUSTMENTS). Differential turning torque must be measured with geartrain out of case.

(1) Install input shaft bearing using an arbor press and remover/installer 8474 (Fig. 47).

(2) Install shift shaft bushing to case using installer 8475 (Fig. 48).

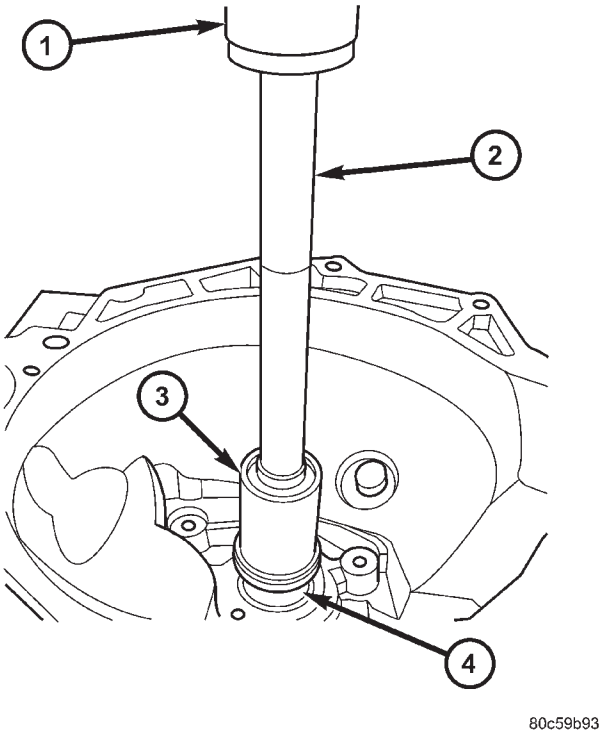

Fig. 47 Input Shaft Bearing Installation

T850 MANUAL TRANSAXLE (Continued)

(3) Install intermediate shaft bearing race to case with an arbor press, driver handle C-4171, and installer 8471 (Fig. 49). Press until installer 8471 bottoms on transaxle case.

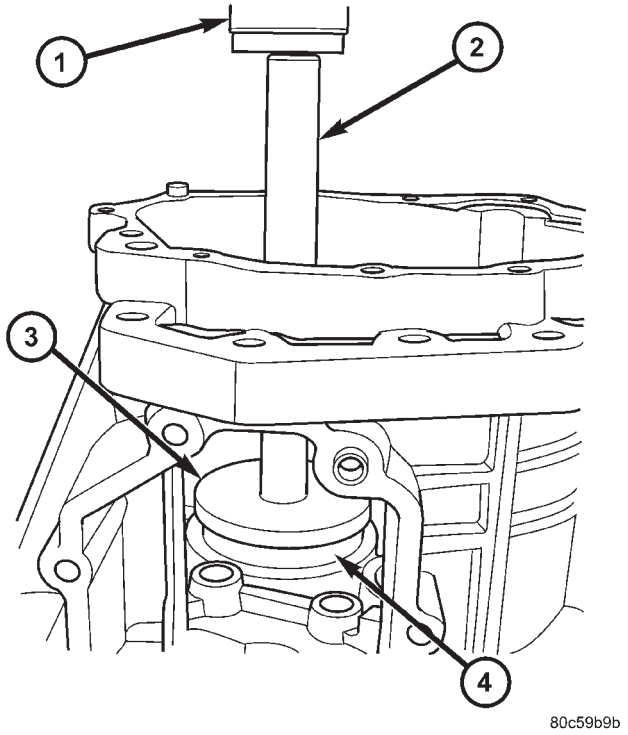

Fig. 49 Install Intermediate Shaft Bearing Race

1 - ARBOR PRESS
2 - DRIVER HANDLE C-4171
3 - INSTALLER 8471
4 - INTERMEDIATE SHAFT BEARING RACE

NOTE: If input shaft assembly was not disassembled, it is necessary to remove input shaft sealed ball bearing before assembling transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/INPUT SHAFT - DISASSEMBLY)

(4) Install assembled input and intermediate shafts to fixture 8487 (Fig. 50).

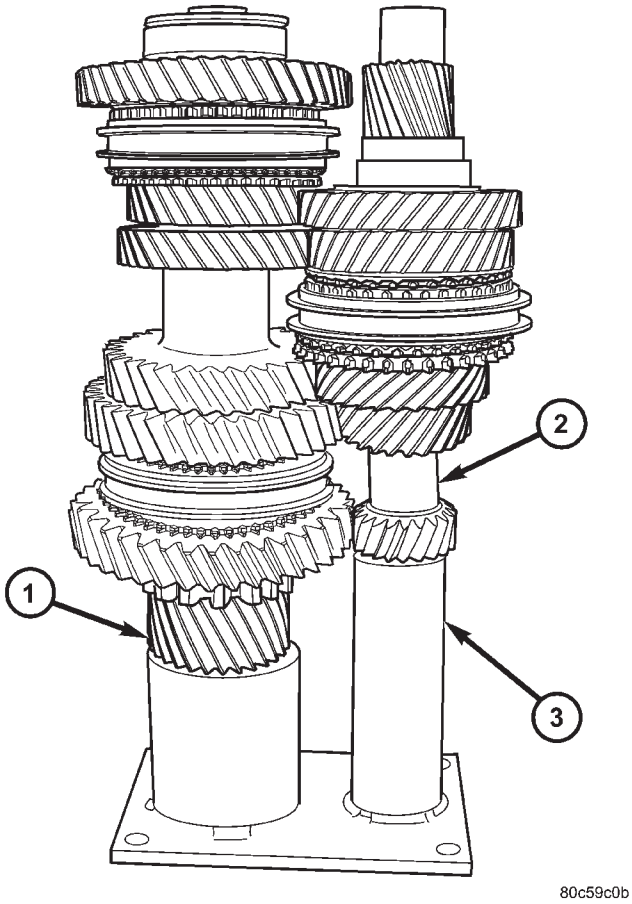

Fig. 50 Install Geartrain to Fixture 8487

1 - INTERMEDIATE SHAFT
2 - INPUT SHAFT
2 - FIXTURE 8487

T850 MANUAL TRANSAXLE (Continued)

(5) Install shift forks and 3/4 rail assembly to geartrain as shown in (Fig. 51).

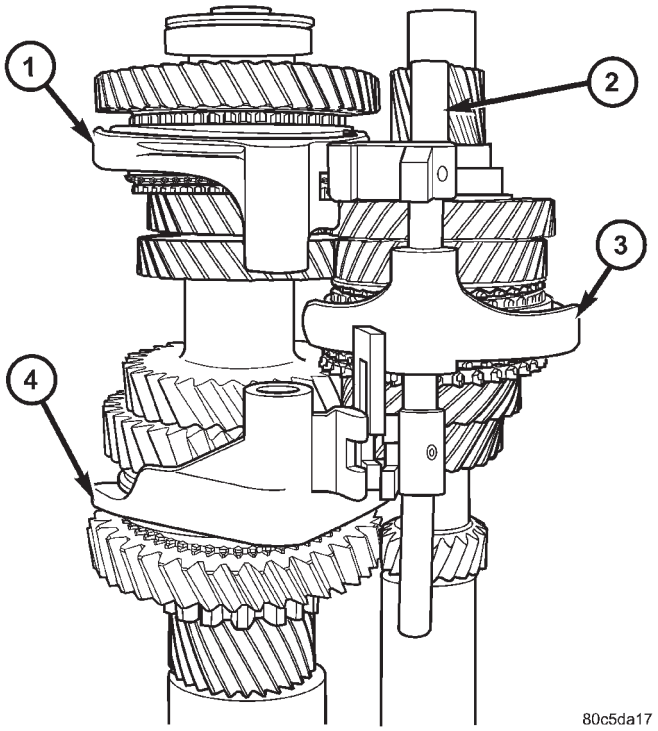

Fig. 51 Shift Fork/Rail Orientation

1 - 5/R FORK
2 - 3/4 RAIL ASSEMBLY
3 - 3/4 FORK
4 - 1/2 FORK

NOTE: Before installing geartrain, make sure that input shaft sealed roller bearing is not installed, otherwise reverse idler assembly installation will be difficult. (Refer to 21 - TRANSMISSION/TRANSAXLE/ MANUAL/INPUT SHAFT - DISASSEMBLY)

(6) Install lifting bar 8489 to geartrain. Install geartrain to case. **When installing geartrain to case, use care not to damage bearing surfaces.**

(7) Remove lifting bar 8489 from geartrain.

(8) Install shift 1/2-5/R rail as shown in (Fig. 52).

(9) Install reverse idler shaft into position (Fig. 53). Install and torque shaft-to-case bolt to 54 N·m (40 ft. lbs.).

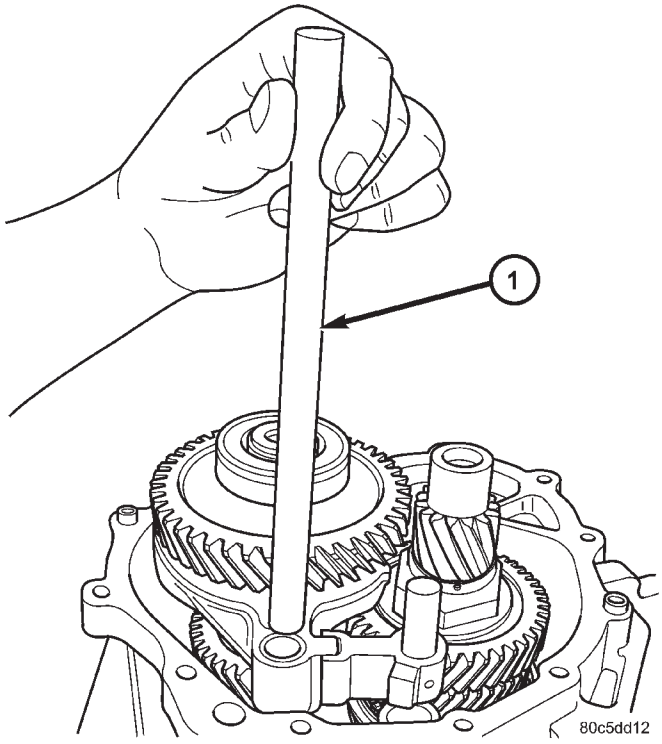

Fig. 52 Shift Rail Installation

1 - 1/2-5/R SHIFT RAIL

INSTALLATION

INSTALLATION - 2.4L GAS

(1) Install modular clutch assembly to transaxle. Assemble transaxle to engine.

(2) Install and torque transaxle-to-engine bolts to 95 N·m (70 ft. lbs.).

(3) Raise transaxle/engine assembly into position and install upper mount through-bolt. Torque through-bolt to 75 N·m (55 ft. lbs.).

(4) Remove screw jack.

(5) Install and torque modular clutch assembly-to-drive plate bolts to 88 N·m (65 ft. lbs.)

(6) Install structural collar.

(7) Connect back-up lamp switch connector.

(8) Install starter motor into position (Fig. 78). Install and torque bolts to 54 N·m (40 ft. lbs.).

(9) Install engine front mount bracket. Install and torque bracket-to-transaxle bolts to 102 N·m (75 ft. lbs.). Install and torque bracket-to-engine bolts to 68 N·m (50 ft. lbs.). Torque through-bolt and nut to 68 N·m (50 ft. lbs.).

(10) Install clutch slave cylinder into position, noting orientation of different sized lugs (Fig. 79). While depressing inward, rotate slave cylinder clockwise 60®° into position until nylon locating tab rests within transaxle case cutout, and hydraulic tube is vertical. Connect “quick-connect” connection until an audible “click” is heard. Verify connection by pulling outward on connection.

INSTALLATION

(1) Install back-up lamp switch (Fig. 95) and torque to 23 N·m (17 ft. lbs.) using Tool 8827.
(2) Connect back-up lamp switch connector.
(3) Lower vehicle.

DIFFERENTIAL

DESCRIPTION

The T850 differential is a conventional open design. It consists of a ring gear and a two-piece differential case. The differential case contains the pinion and side gears, three floating pinion shafts, and a pinion shaft retaining ring (Fig. 96). The differential case is supported in the transaxle by tapered roller bearings.

OPERATION

The differential assembly is driven by the intermediate shaft via the ring gear. The ring gear drives the differential case, and the case drives the halfshafts through the differential gears. The differential pinion and side gears are supported in the case by pinion shafts and thrust washers. Differential pinion and side gears make it possible for front wheels to rotate at different speeds while cornering.

(14) Measure and verify differential side gear end play. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/DIFFERENTIAL - ADJUSTMENTS).

ADJUSTMENTS

ADJUSTMENT - DIFFERENTIAL TURNING TORQUE

NOTE: Differential turning torque should only be measured with the geartrain out of the transaxle. If measurement is taken with transaxle assembled, an inaccurate measurement will result.

NOTE: All differential cover-to-case bolts and extension housing-to-case bolts must be installed and torqued to obtain accurate measurement.

(1) If transaxle is assembled, remove geartrain and leave differential in place. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - DISASSEMBLY)

(2) Install differential cover and torque differential cover-to-case bolts to 54 N·m (40 ft. lbs.).

(3) Install extension housing and torque extension housing-to-case bolts to 28 N·m (250 in. lbs.).

(4) Place transaxle on work bench so axle centerline is parallel to the ground.

(5) Install turning torque tool C-4995 to differential at side opposite extension housing.

(6) Using in. lb./N·m dial indicator, rotate differential case multiple times and record measurement (Fig. 123). Differential turning torque should be within 2.3-3.4 N·m (20-30 in. lbs.). Refer to shim chart for proper shim selection. If turning torque measured is less than 2.3 N·m (20 in. lbs.), install a thicker shim. If turning torque measured is greater than 3.4 N·m (30 in. lbs.), install a thinner shim.

DIFFERENTIAL (Continued)

ADJUSTMENT - DIFFERENTIAL SIDE GEAR END PLAY

Measure side gear end play: Insert feeler gauges 180° apart between differential side gear and thrust washer as shown in (Fig. 124). Measurement taken here applies to both sides. Side gear end play should be between 0.025-0.152 mm (0.001-0.006 in.). If clearance is greater than 0.152 mm (0.006 in.), install a thicker thrust washer (both sides). If clearance is less than 0.025 mm (0.001), install a thinner thrust washer (both sides). Refer to (Fig. 125) for available side gear shim thicknesses.

If end play measurement indicates a thrust washer change is necessary, the differential must be disassembled. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/DIFFERENTIAL - DISASSEMBLY)

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL CHECK

NOTE: For proper fluid level check intervals, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

The fluid required in this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602). Use of substitute fluids may result in improper transaxle operation and/or failure.

(1) Raise vehicle on hoist.

(2) Remove transaxle fill plug (Fig. 126).

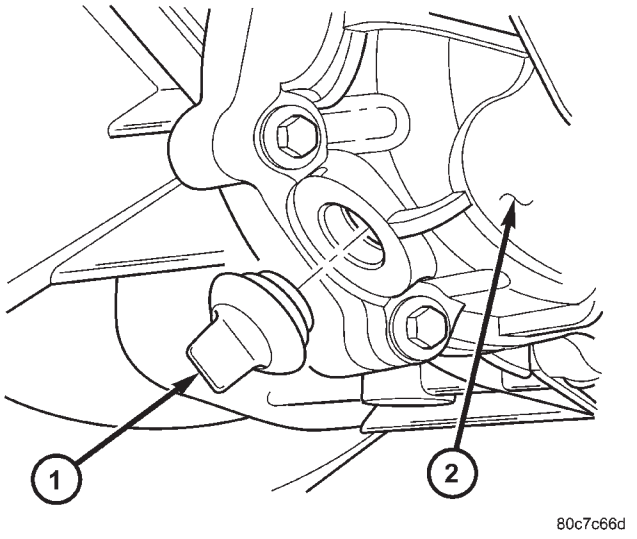

Fig. 126 Transaxle Fill Plug

1 - FILL PLUG
2 - END COVER

(3) Inspect fluid level. Fluid should be within 1/8” below fill hole. Add Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602) as neccessary.

(4) Install fill plug, ensuring it is properly seated.

(5) Lower vehicle.

FLUID (Continued)

STANDARD PROCEDURE - FLUID DRAIN AND FILL

NOTE: For proper fluid change intervals, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

The fluid required in this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602). Use of substitute fluids may result in improper transaxle operation and/or failure.

FLUID DRAIN

(1) Raise vehicle on hoist.
(2) Remove transaxle drain plug (Fig. 127) and drain fluid into suitable container.
(3) Install drain plug and torque to 23 N·m (17 ft. lbs.).

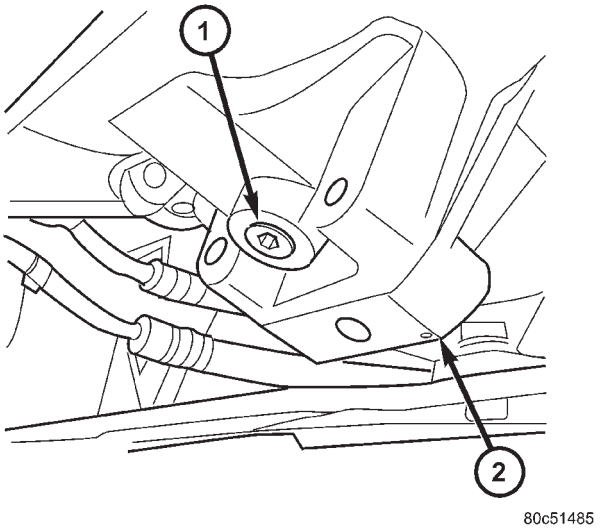

Fig. 127 Transaxle Drain Plug

1 - TRANSAXLE DRAIN PLUG
2 - DIFFERENTIAL COVER

FLUID FILL

(1) Remove transaxle fill plug (Fig. 128).
(2) Add 2.4-2.7L (2.5-2.9 qts.) of Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602) until fluid is within 1/8" below fill hole.
(3) Install fill plug, ensuring it is properly seated.
(4) Lower vehicle.

GEARSHIFT BOOT

REMOVAL

(1) Remove gearshift knob by pushing down and rotating ¼-turn clockwise (Fig. 129).

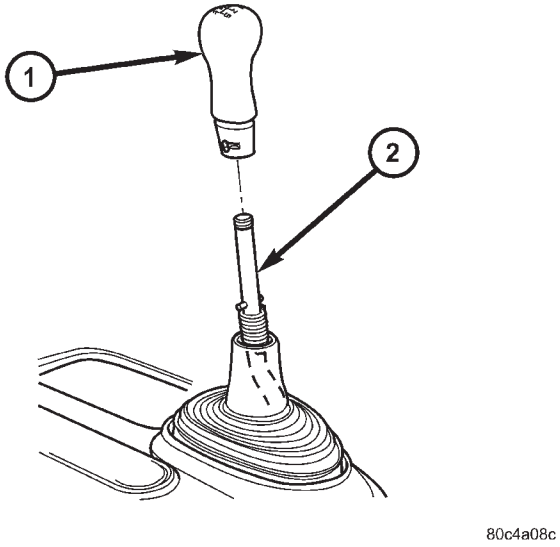

Fig. 129 Gearshift Knob Removal/Installation

1 - GEARSHIFT KNOB
2 - GEARSHIFT LEVER

GEARSHIFT BOOT (Continued)

(2) Remove gearshift boot from center console by disengaging three (3) retaining clips (Fig. 130).

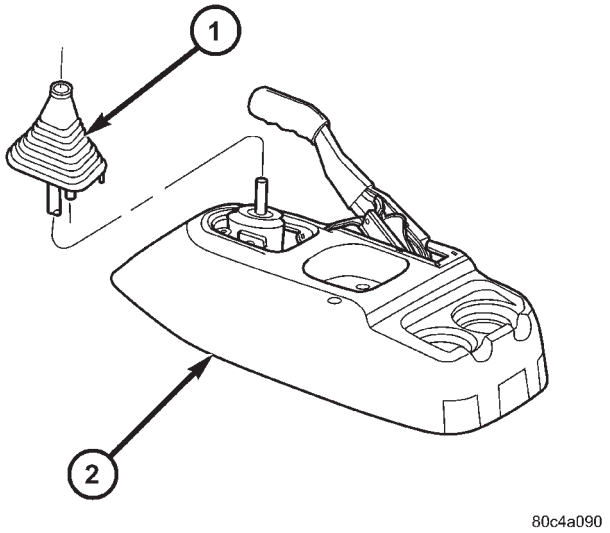

Fig. 130 Gearshift Boot Removal/Installation

1 - GEARSHIFT BOOT
2 - CENTER CONSOLE

INSTALLATION

(1) Install gearshift boot to console and secure with three (3) retaining clips (Fig. 130).

(2) Install gearshift knob (Fig. 129). Orient shift pattern ¼-turn clockwise, press down, and rotate ¼-turn counter-clockwise.

(3) Secure gearshift boot to base of knob.

GEARSHIFT CABLE - CROSSOVER

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove gearshift knob by pushing down and rotating ¼-turn clock-wise (Fig. 131).

(3) Remove gearshift boot from center console by disengaging at three (3) retaining clips (Fig. 132).

(4) Apply park brake to allow park brake handle to clear center console upon removal.

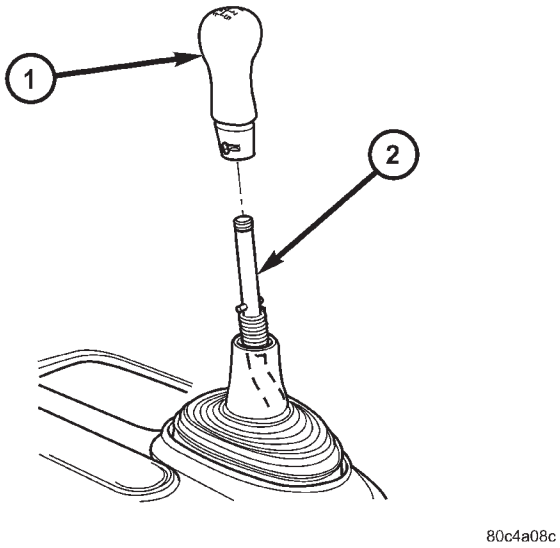

Fig. 131 Gearshift Knob Removal/Installation

INPUT SHAFT

DESCRIPTION

The input shaft assembly (Fig. 205) is part of the transaxle geartrain, is driven by the clutch assembly, and consists of the following components:

- Input Mainshaft
- 3rd Speed Gear
- 4th Speed Gear
- 3/4 Synchronizer
- 5th Input Gear

The input shaft meshes with the intermediate shaft, and is supported by a needle bearing at the front of the transaxle, and a sealed roller bearing at the rear of the transaxle.

DISASSEMBLY

NOTE: When servicing the input shaft assembly, all snap rings which are removed MUST be replaced with new snap rings upon reassembly. The 5th gear nut must be replaced also.

(1) Invert input shaft assembly and place in fixture 8487.

(2) Remove input bearing snap ring (Fig. 206).

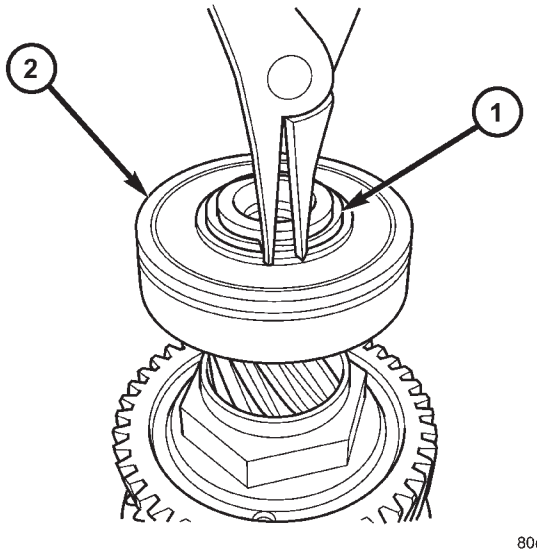

Fig. 206 Input Bearing Snap Ring Removal

10 - 3/4 SYNCHRONIZER

INPUT SHAFT (Continued)

(3) Remove input bearing. Place input shaft assembly onto arbor press table, with the input bearing supported by bearing splitter (Fig. 207). Using adapter 8486-4, press bearing off of shaft, while helper supports shaft to prevent dropping.

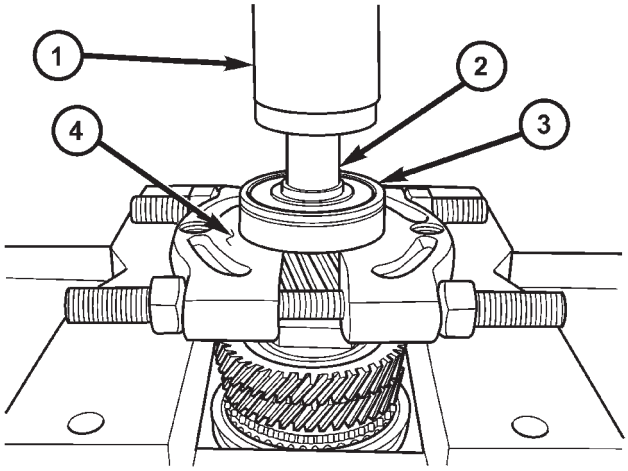

Fig. 207 Input Bearing Removal

1 - ARBOR PRESS RAM
2 - ADAPTER 8486-4
3 - INPUT BEARING
4 - BEARING SPLITTER

(4) Place input shaft assembly back into fixture 8487. Secure fixture to bench with fasteners, or secure to bench vise.

NOTE: 5th gear nut is staked to the shaft. If necessary, grind stake area to ease removal, but use care not to contact gear.

(5) Remove 5th gear nut with wrench 8478 (Fig. 208). Discard nut and use a new one upon assembly.

(6) Remove 5th gear with arbor press and bearing splitter.

(7) Remove 4th gear (Fig. 209).

INPUT SHAFT (Continued)

(12) Remove 3rd gear (Fig. 214).

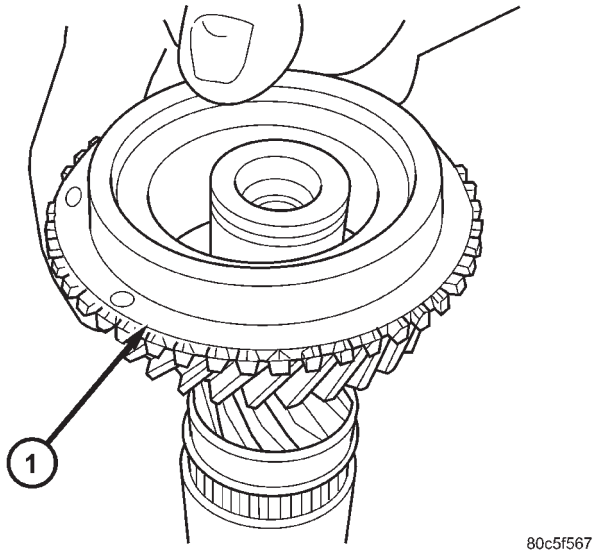

Fig. 214 3rd Gear Removal/Installation

1 - 3RD GEAR

(13) Inspect third gear thrust washer for signs of excessive wear. To replace, drive off of input shaft with suitable drift and hammer.

ASSEMBLY

NOTE: When servicing the input shaft assembly, all snap rings MUST be replaced with new ones upon assembly. 5th gear nut must also be replaced.

NOTE: When installing 3/4 synchronizer hub to shaft, make sure to align oil slots on synchronizer hub face with oil hole in the shaft splined hub journal.

NOTE: Refer to (Fig. 215) for input shaft assembly reference.

INTERMEDIATE SHAFT

DESCRIPTION

The intermediate shaft assembly (Fig. 227) is part of the transaxle geartrain, meshes with and is driven by the input shaft, drives the differential via an integrated pinion gear, and consists of the following components:

- Intermediate Mainshaft
- 1st Speed Gear
- 2nd Speed Gear
- 3/4 Cluster Gear
- 5th Speed Gear
- Reverse Gear
- 1/2 Synchronizer
- 5/R Synchronizer

The intermediate shaft is supported by a caged roller bearing at the front of the transaxle, and a sealed roller bearing at the rear of the transaxle.

DISASSEMBLY

CAUTION: Do not re-use snap rings when servicing the intermediate shaft assembly. Discard upon disassembly and install new ones provided with available snap ring service kit.

(1) Install intermediate shaft assembly to arbor press table with bearing splitter P-334 under the reverse gear.

(2) Install 8486-4 button to intermediate shaft. Using arbor press ram, press reverse gear and intermediate roller bearing off of shaft, while holding remaining assembly with hand (Fig. 228).

SHIFT COVER

DESCRIPTION

The shift cover assembly (Fig. 274) (Fig. 275) is operated by the gearshift crossover and selector cables, and operates the shift fork/shaft system. It consists of crossover and selector lever mechanisms, transaxle vent, a main shift selector shaft, and the 5-R blockout mechanism. The shift cover is only serviced as an assembly.

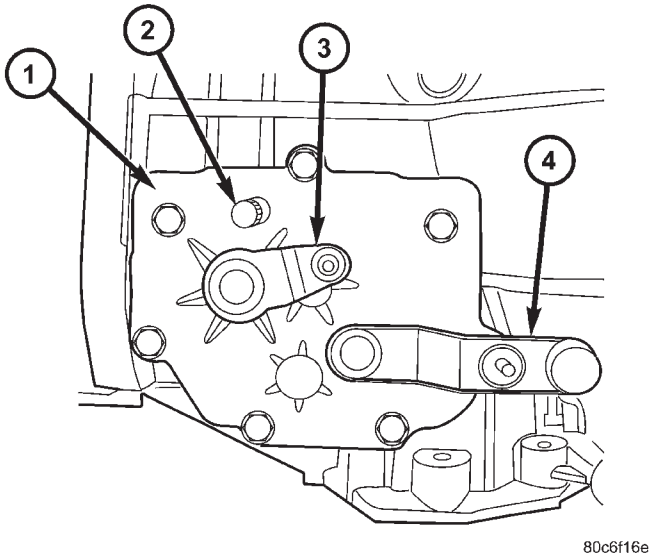

Fig. 274 Shift Lever Identification

5 - SELECTOR LEVER/DETENT

SHIFT FORK AND SHAFT

DESCRIPTION

The T850 utilizes a unique shift fork and shaft arrangement consisting of three shift forks and two shafts as shown in (Fig. 276). This system is operated by the shift cover assembly, which combined with a unique gearshift cable design, offers a higher mechanical advantage over traditional shift systems. This arrangement results in less friction and lower shift cable loads for smoother, more positive operation. The shift fork assemblies are constructed of brass, float about the shafts with the aid of needle bearings, and are serviced only as fork/bearing assemblies.

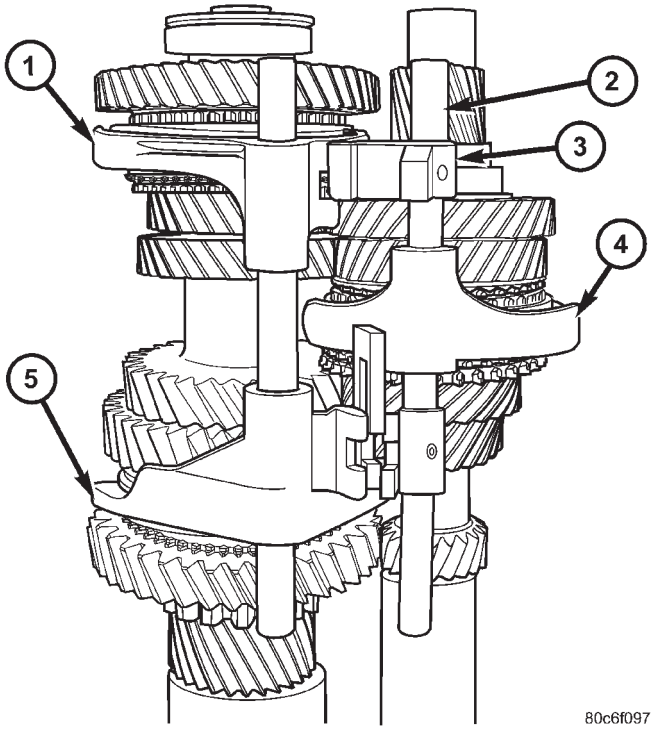

Fig. 276 Shift Fork/Shaft Components

1 - 5/R FORK
2 - SHAFT/LINK ASSEMBLY
3 - LINK
4 - 3/4 FORK
5 - 1/2 FORK

SYNCHRONIZER

DESCRIPTION

The T850 transaxle uses two styles of synchronizer assemblies; a conventional single-cone style is used for the 5th/Reverse and 3rd/4th applications (Fig. 277), and a dual-cone style for the 1st/2nd gear application (Fig. 278).

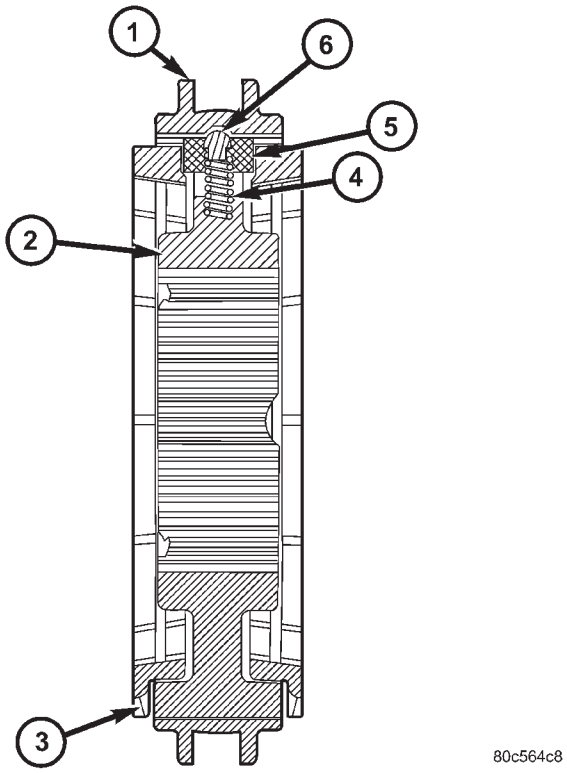

Fig. 277 3/4-5/R Synchronizer Assembly

1 - SLEEVE
2 - HUB
3 - BLOCKER RING (2)
4 - SPRING (3)
5 - KEY (3)
6 - BALL (3)

DISASSEMBLY

Place synchronizer in a clean shop towel and wrap. Press on inner hub. Carefully open up shop towel and remove springs, balls, keys, hub, and sleeve.

CLEANING

CLEAN

Do not attempt to clean the blocking rings in solvent. The friction material will become contaminated. Place synchronizer components in a suitable holder and clean with solvent. Air dry.

INSPECTION

INSPECT

Proper inspection of components involve:

- Teeth, for wear, scuffed, nicked, burred, or broken teeth
- Keys, for wear or distortion
- Balls and springs, for distortion, cracks, or wear

SYNCHRONIZER (Continued)

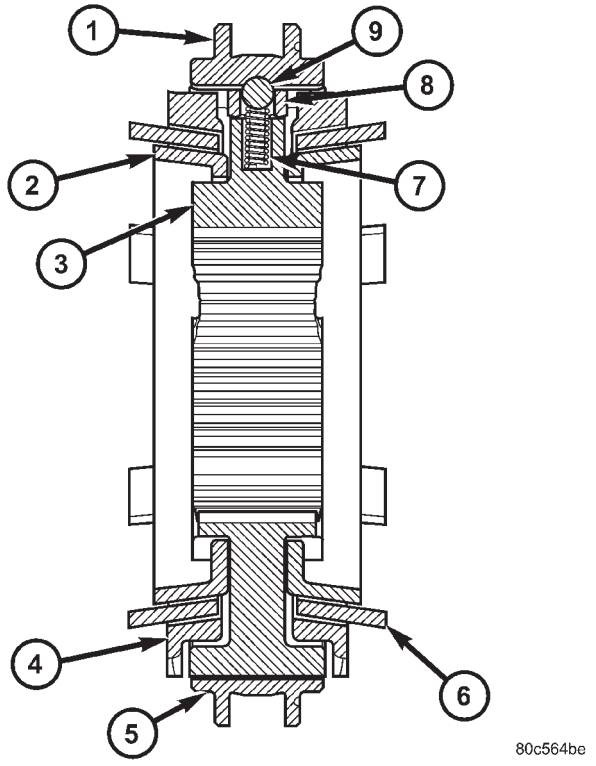

Fig. 278 1/2 Synchronizer Assembly

1 - SLEEVE
2 - REACTOR RING (2)
3 - HUB
4 - BLOCKER RING (2)
5 - SLEEVE
6 - FRICTION CONE (2)
7 - SPRING (3)
8 - KEY (3)
9 - BALL (3)

If any of these conditions exist in these components, replace as necessary.

ASSEMBLY

(1) Position synchronizer hub onto work bench. Hub is non-directional.
(2) Install springs into hub slot.
(3) Insert key into hub and spring.
(4) Apply petroleum jelly to the hole in the key. Insert balls into each key.
(5) Slide sleeve over the hub and depress balls as you carefully slip the sleeve into position.

VEHICLE SPEED SENSOR

REMOVAL

(1) Raise vehicle on hoist.
(2) Disconnect the speed sensor connector (Fig. 279).

CAUTION: Clean area around speed sensor before removing to prevent dirt from entering the transaxle during speed sensor removal.

(3) Remove speed sensor retaining bolt (Fig. 279).

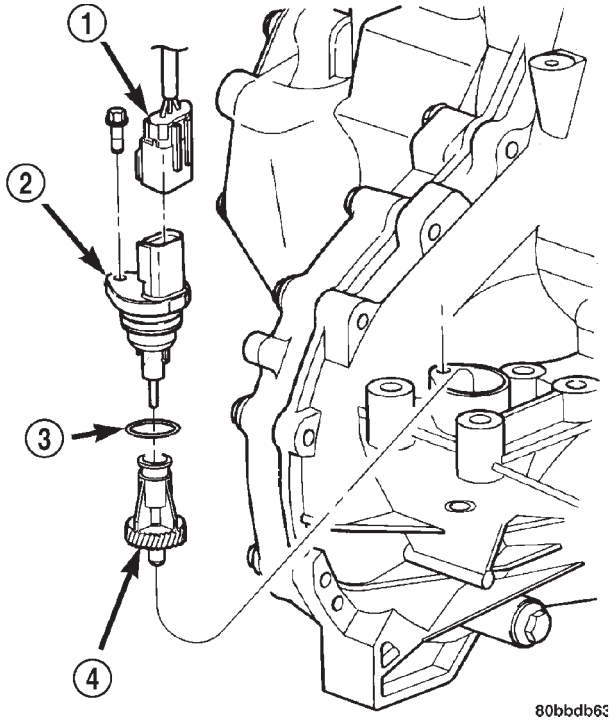

Fig. 279 Speed Sensor and Pinion Removal/ Installation—Typical

1 - CONNECTOR
2 - SENSOR
3 - O-RING
4 - GEAR

(4) Remove speed sensor from transaxle.

CAUTION: Carefully remove vehicle speed sensor so that sensor drive gear does not fall into transaxle. Should sensor drive gear fall into the transaxle during sensor removal, drive gear must be reattached to sensor.

(5) Remove speed sensor drive gear from speed sensor.

INSTALLATION

(1) Install pinion gear to speed sensor (Fig. 279) .
(2) Using a NEW o-ring, install the speed sensor to the transaxle (Fig. 279) .
(3) Install the bolt and torque to 7 N·m (60 in. lbs.).
(4) Connect speed sensor connector (Fig. 279) .
(5) Lower vehicle and road test to verify proper speedometer operation.

TIRES/WHEELS

DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and force variation can cause vehicles to exhibit steering wheel vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise vehicle on a suitable hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

TIRES/WHEELS (Continued)

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as correct wheel weights. Aluminum wheels require unique wheel weights. They are designed to fit the contour of the wheel (Fig. 1).
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the rear face of the driver's door.

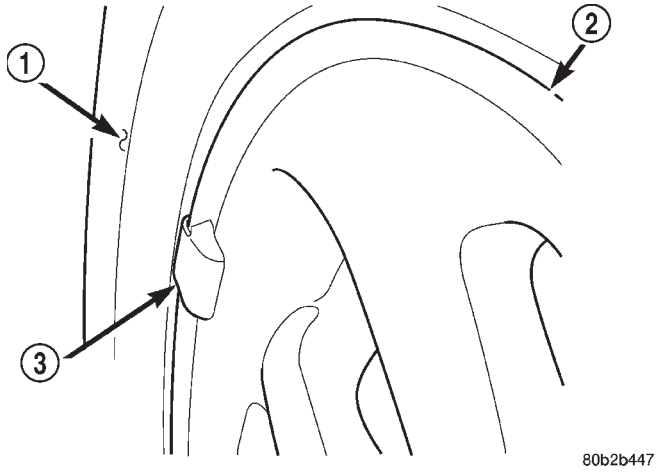

Fig. 1 Aluminum Wheel Weight

1 - TIRE
2 - WHEEL
3 - WHEEL WEIGHT

ROAD TEST

Road test vehicle on a smooth road for a least five miles to warm tires (remove any flat spots). Lightly place hands on steering wheel at the 10:00 and 2:00 positions while slowly sweeping up and down from 90 to 110 km/h (55 to 70 mph) where legal speed limits allow.

Observe the steering wheel for:

- Visual Nibble (oscillation: clockwise/counterclockwise, usually due to tire imbalance)
- Visual Buzziness (high frequency, rapid vibration up and down)

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at speed; if vibration occurs or is enhanced, vibration is likely due to causes other than tire and wheel assemblies.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to causes other than tire and wheel assemblies.

For brake vibrations, (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).

For powertrain vibrations, (Refer to 3 - DIFFERENTIAL & DRIVELINE - DIAGNOSIS AND TESTING).

For tire and wheel assembly vibrations, continue with this diagnosis and testing procedure.

TIRE AND WHEEL BALANCE

(1) Balance the tire and wheel assemblies as necessary following the wheel balancer manufacturer's instructions and using the information listed in Standard Procedure - Tire And Wheel Balance. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)

(2) Road test the vehicle for at least 5 miles, following the format described in Road Test.

(3) If the vibration persists, continue with this diagnosis and testing procedure.

TIRE AND WHEEL RUNOUT/MATCH MOUNTING

(1) **System Radial Runout.** This on-the-vehicle system check will measure the radial runout including the hub, wheel and tire.

(a) Raise vehicle so tires clear floor. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(b) Apply masking tape around the circumference of the tire in the locations to be measured (Fig. 2). Do not overlap the tape.

(c) Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) (Fig. 2) and rotate the tire and wheel. System radial runout should not exceed 0.76 mm (0.030 inch) with no tread “dips” or “steps.” Tread “dips” and “steps” can be identified by spikes of the dial indicator gauge.

- Tread ″dips″; Rapid decrease then increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.
- Tread ″steps″; Rapid decrease or increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.

(d) If system runout is excessive, re-index the tire and wheel assembly on the hub. Remove assembly from vehicle and install it back on the hub two studs over from original mounting position. If re-indexing the tire and wheel assembly corrects or reduces system runout, check hub runout and repair as necessary (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).

(e) If system runout is still excessive, continue with this diagnosis and testing procedure.

(2) **Tire and Wheel Assembly Radial Runout.** This radial runout check is performed with the tire and wheel assembly off the vehicle.

(a) Remove tire and wheel assembly from vehicle and install it on a suitable wheel balancer.

(b) Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) (Fig. 2) and rotate the tire and wheel. Radial runout should not

TIRES/WHEELS (Continued)

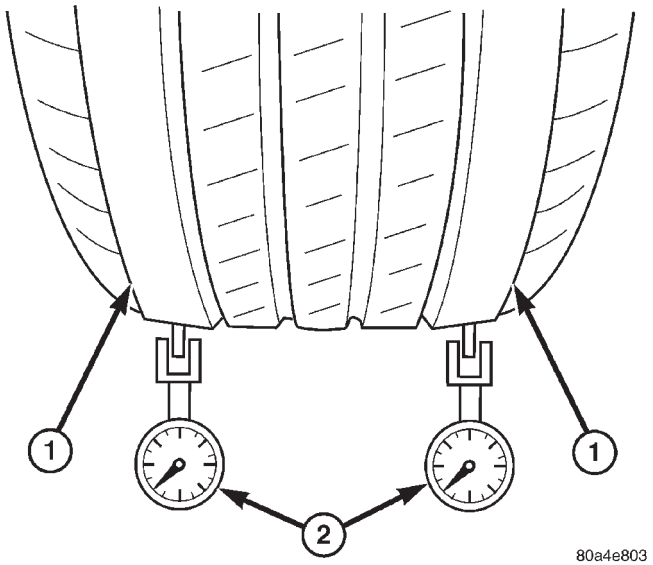

Fig. 2 Radial Runout Measurement

1 - MASKING TAPE
2 - DIAL INDICATOR

exceed 0.76 mm (0.030 inch) with no tread “dips” or “steps.” Tread “dips” and “steps” can be identified by spikes of the dial indicator gauge.

(c) If runout exceeds limits, mark the original location of the tire on the wheel at the valve stem (Fig. 3). Also, mark the tire and wheel to indicate the original high spot of the assembly and record the runout measurement.

(d) If runout exceeds limits, the tire will need to be dismounted from the wheel to verify wheel vs. tire contribution. Refer to Wheel Runout below.

(3) **Lateral Runout.** Lateral runout for the vehicle system as well as the tire and wheel assembly should be less than 0.76 mm (0.030 inch). The same procedure and theory described for radial runout can also be applied to identify and reduce lateral runout.

(4) **Wheel Runout.** This runout check is performed as follows:

(a) Dismount the tire from the wheel.

(b) Mount the wheel back on the wheel balancer.

(c) Measure radial runout of the wheel at the tire bead seat (Fig. 4). Runout should not exceed 0.254 mm (0.010 inch) for aluminum wheels and 0.508 mm (.020 inch) for steel wheels. Replace the wheel if it exceeds the limit.

(d) Measure lateral runout of the wheel at the tire bead seat (Fig. 5). Runout should not exceed 0.762 mm (0.030 inch) for all wheels. Replace the wheel if it exceeds the limit.

(5) **Match Mounting.** If the wheel runout is within specifications, tire and wheel assembly runout can be improved by re-indexing (match mounting) the tire to the wheel as described below.

(a) Remount the tire on the rim 180 degrees from its original location (Fig. 6). Ensure the tire bead is properly seated.

(b) Re-measure the total runout. Mark the tire at the high spot and record the measurement.

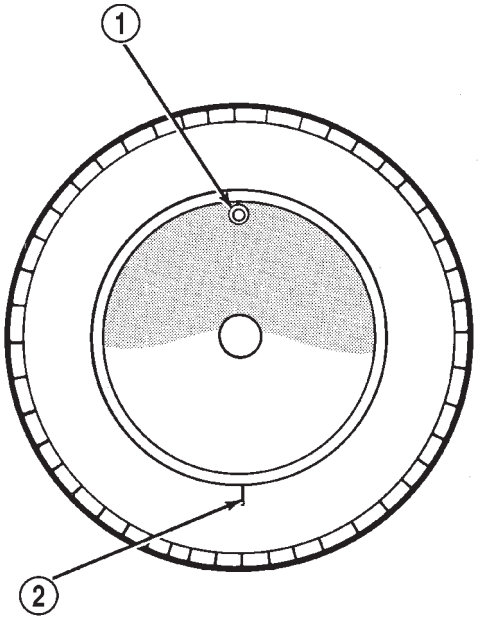

Fig. 6 Remount Tire 180 Degrees

1 - VALVE STEM
2 - REFERENCE MARK

If runout is still excessive, perform the following:

- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the tire, replace the tire.
- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the wheel, the wheel may be out of specification. Refer to Wheel Runout above.
- If the new high spot is NOT within 102 mm (4.0 inch) of either high spot, draw an arrow on the tread from new high spot toward the original (Fig. 7). Break down the tire and remount it 90 degrees on rim in that direction, then re-measure runout. This will normally reduce the runout to an acceptable amount.

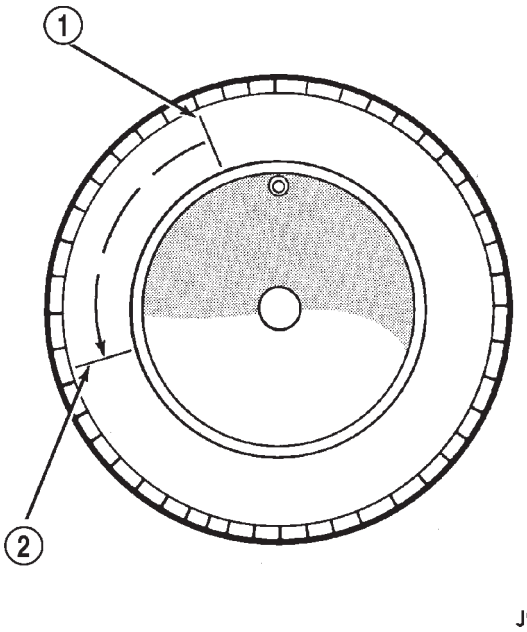

Fig. 7 Remount Tire 90 Degrees In Direction of Arrow

1 - 2ND HIGH SPOT ON TIRE
2 - 1ST HIGH SPOT ON TIRE

(6) Once back together, road test the vehicle for at least 5 miles, following the format described in Road Test. If vibration persists, and all components tested are within specification, the tires may have an excessive radial force condition. Radial force variation can only be checked as indicated below. If this equipment is not available, consult with the tire manufacturer.

RADIAL FORCE VARIATION

Radial Force Variation can be checked using the Hunter GSP 9700 Vibration Control System (Wheel Balancer) or equivalent, if available. This type of equipment helps to correct ride disturbances by reducing the radial force variation of an assembly through re-indexing of the tire to wheel.

The equipment manufacturer or DaimlerChrysler Corporation may supply reference values as guide-

lines. Radial force measurements above the reference value may not always result in a ride disturbance, nor do they automatically mean the assembly components are out of specification. Do not replace components based on radial force values alone. Balancing, runout diagnosis, re-indexing, and subjective road testing must be performed as outlined in previous sections of this diagnosis and testing procedure.

Use the Radial Force equipment to identify suspect assemblies and minimize the radial forces. After all suspect assemblies are optimized, reinstall the assemblies and road test the vehicle. If a disturbance still exists and all other vibration diagnostic procedures have been completed, replace one tire or one wheel at a time, starting with the assembly having the highest force variation. Be sure to minimize each new assembly. Road test the vehicle following each replacement. Continue this process until the disturbance is resolved.

NOTE: When using Radial Force equipment, it is critically important to set proper tire inflation pressure and ensure centering of the wheel on the equipment spindle.

RADIAL FORCE VARIATION REFERENCE VALUES

DESCRIPTION	SPECIFICATION
Total Radial Force Variation (RFV)	Less Than 22 Lbs. ± 2 Lbs.
Radial First Harmonic (R1H)	Less Than 16 Lbs. ± 2 Lbs.
Radial Second Harmonic (R2H)	Less Than 12 Lbs. ± 2 Lbs.

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE AND WHEEL BALANCE

NOTE: Balance equipment must be calibrated and maintained per equipment manufacturer's specifications.

Wheel balancing can be accomplished with either on-vehicle or off-vehicle equipment.

NOTE: If using on-vehicle balancing equipment, on the driving axle, remove the opposite wheel and tire assembly.

It is recommended that a two-plane dynamic balancer be used when a wheel and tire assembly requires balancing. A static balancer should only be used when a two-plane balancer is not available.

Balance wheel and tire assemblies dynamically and statically to less than 0.25 (¼) ounce.

For static balancing, find location of heavy spot causing imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 8).

For dynamic balancing, the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (Fig. 9).

The aluminum wheels on this vehicle use a unique wheel weight (Fig. 10). This wheel weight is designed to fit the contoured surface of the wheel (Fig. 10). When balancing an aluminum wheel, this wheel weight must be used. Do not use any other type of wheel weight. It will not properly fit the contour of the wheel.

Always verify the Balance. When using off-vehicle equipment, rotate assembly 180 degrees on balance equipment to verify balance. Variation should not be more than 0.125 (⅛) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning.

If difficult to balance, break down the wheel and tire assembly and check for loose debris inside tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

STANDARD PROCEDURE - TIRE AND WHEEL MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. This technique is used to reduce runout in the wheel and tire assembly. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the wheel is identified with a label on the outside of the rim and a dot or line in the drop well area of the rim (inside where the tire mounts). If the outside label has been removed, the tire will have to be removed to locate the dot or line on the inside of the rim. The tire can then be match mounted to the tire.

Information on match mounting the tire to the wheel can be found in Tire and Wheel Runout/Match Mounting, items (2) through (5), within Diagnosis And Testing - Tire And Wheel Vibration. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

STANDARD PROCEDURE - TIRE AND WHEEL ROTATION

NON-DIRECTIONAL TREAD PATTERN TIRES

Tires on the front and rear axles operate at different loads and perform different functions. For these reasons, they wear at unequal rates, and tend to develop irregular wear patterns. These effects can be reduced by timely rotation of tires. The benefits of rotation are especially worthwhile. Rotation will increase tread life, help to maintain mud, snow, and wet traction levels, and contribute to a smooth, quiet ride.

The suggested rotation method is the forward-cross tire rotation method (Fig. 11). This method takes advantage of current tire industry practice which allows rotation of radial-ply tires. Other rotation methods may be used, but may not have all the benefits of the recommended method.

NOTE: Only the 4 tire rotation method may be used if the vehicle is equipped with a low mileage or temporary spare tire.

DIRECTIONAL TREAD PATTERN TIRES

Some vehicles are fitted with special high-performance tires having a directional tread pattern. These tires are designed to improve traction on wet pavement. To obtain the full benefits of this design, the tires must be installed so that they rotate in the correct direction. This is indicated by arrows on the tire sidewalls.

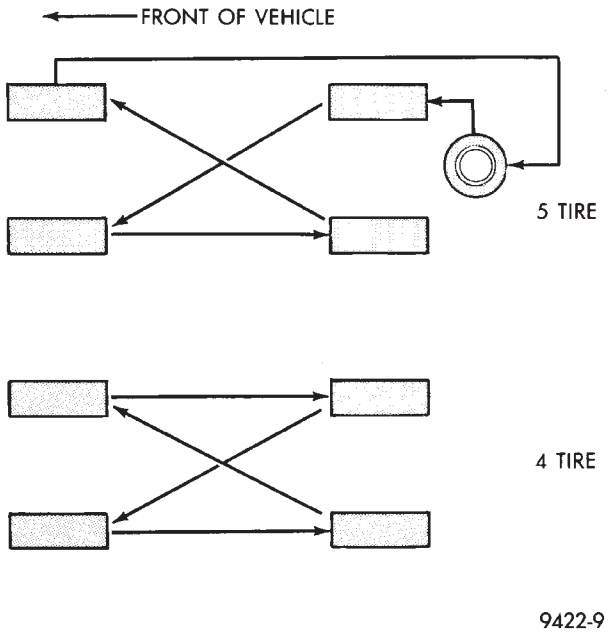

Fig. 11 Forward-Cross Tire Rotation Method

When wheels and tires are being installed, extra care is needed to ensure that this direction of rotation is maintained.

Refer to Owner's Manual for rotation schedule.

REMOVAL

REMOVAL - TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

(1) Raise the vehicle so the tire and wheel assembly clears ground level.

(2) Remove the 5 wheel mounting nuts from the studs.

(3) Remove the tire and wheel from the hub.

REMOVAL - TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

(1) Raise the vehicle so the tire and wheel assembly clears ground level.

(2) Noting the location of the valve stem in relationship to the wheel mounting nuts, remove the three wheel mounting nuts securing the wheel cover to the wheel and hub (Fig. 12).

CAUTION: When removing the wheel cover, do not pry the wheel cover from the wheel. This can result in damage to the wheel cover. The wheel cover is removed by pulling it off the wheel by hand.

TIRES/WHEELS (Continued)

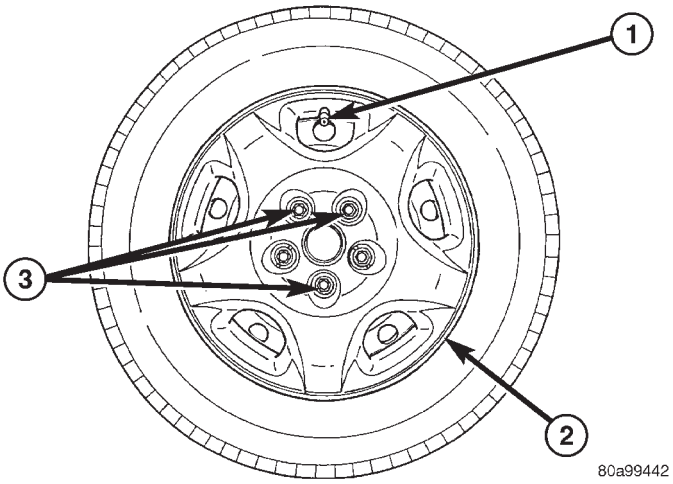

Fig. 12 NUTS SECURING WHEEL COVER

1 - VALVE STEM
2 - BOLT-ON WHEEL COVER
3 - NUTS SECURING WHEEL COVER

(3) Grasp the wheel cover at the edges in line with the remaining installed wheel mounting nuts and pull straight outward from the wheel. This will pop the wheel cover retaining tabs over the two remaining wheel nuts, removing the wheel cover from the vehicle.

(4) Remove the two remaining wheel mounting nuts from the hub's studs.

(5) Remove the wheel and tire from the hub.

INSTALLATION

INSTALLATION - TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

NOTE: Never use oil or grease on studs or wheel mounting nuts.

(1) Position the tire and wheel assembly on the wheel mounting studs using the hub pilot as a guide. Place and hold the wheel flush up against the mounting surface.

(2) Loosely install all 5 wheel mounting nuts. Lightly snug the wheel nuts, then progressively tighten them in the proper sequence (Fig. 13). Tighten wheel mounting nuts to 135 N·m (100 ft. lbs.).

(3) Lower the vehicle.

INSTALLATION - TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

NOTE: Never use oil or grease on studs or wheel mounting nuts.

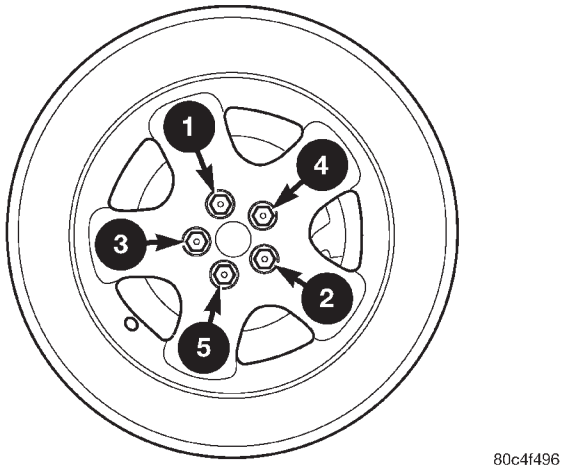

Fig. 13 Tightening Sequence

(1) Position the tire and wheel assembly on the wheel mounting studs using the hub pilot as a guide. Place and hold the wheel flush up against the mounting surface.

NOTE: Wheel mounting nuts must be installed on the studs as shown (Fig. 14) to allow proper installation of the wheel cover.

(2) Using the valve stem as an index placed at the 12 O'clock position, install and **lightly tighten** two wheel mounting nuts on the studs located at the 4 O'clock and 8 O'clock positions as shown (Fig. 14).

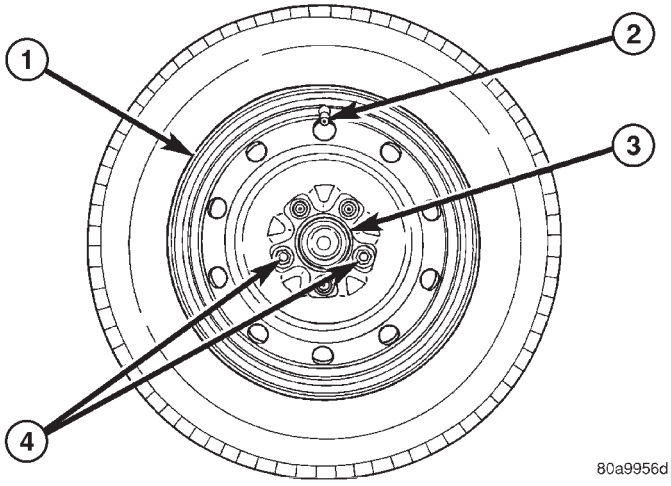

Fig. 14 TWO WHEEL MOUNTING NUTS INSTALLED

1 - WHEEL
2 - VALVE STEM
3 - HUB PILOT
4 - NUTS

(3) Place the wheel cover on the wheel in the following fashion:

(a) Align the valve notch in the wheel cover with the valve stem on the wheel.

(b) At the same time, align the two holes in the wheel cover having the retaining tabs with the two installed wheel nuts (Fig. 15).

(c) Press in on center of wheel cover until wheel cover retaining tabs push past and engage rear of previously installed wheel mounting nuts (Fig. 15). This will hold the wheel cover in place.

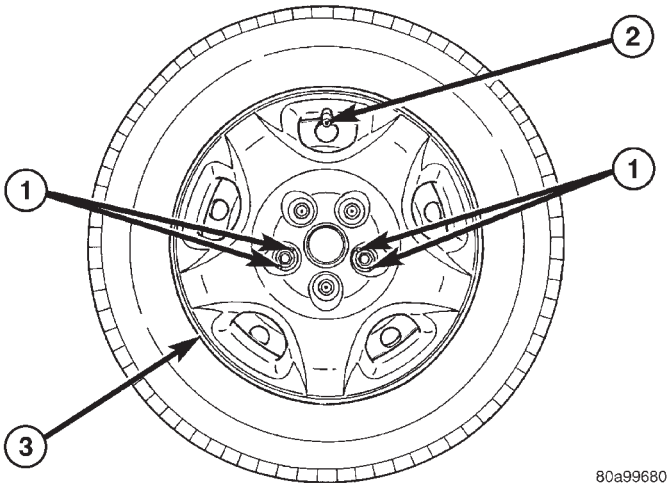

Fig. 15 WHEEL COVER INSTALLATION OVER TWO NUTS

1 - RETAINING TABS
2 - VALVE STEM
3 - BOLT-ON WHEEL COVER

(4) Install and **lightly tighten** the three remaining wheel mounting nuts, securing the wheel cover in place (Fig. 12).

(5) Progressively tighten all five wheel mounting nuts in the proper sequence (Fig. 16). Tighten wheel nuts to a torque of 135 N·m (100 ft. lbs.).

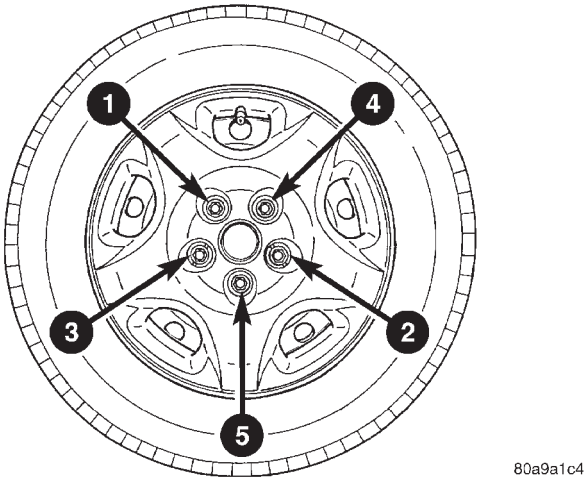

Fig. 16 NUT TIGHTENING SEQUENCE

(6) Lower the vehicle.

TIRE PRESSURE MONITORING (TPM)

DESCRIPTION

Some versions of this vehicle are equipped with a Tire Pressure Monitoring (TPM) system. It monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is not monitored.

There is a sensor (transmitter) in each of the vehicle's four road wheels. The system alerts the driver when tire pressure falls outside predetermined thresholds (pressure too low or too high). A message is then displayed on the Electronic Vehicle Information Center (EVIC) located in the overhead console.

For further information, refer to the Owners Manual or the appropriate diagnostic information.

OPERATION

The Tire Pressure Monitoring (TPM) system uses radio and sensor technology to monitor tire air pressure levels. Sensors, mounted to each road wheel as part of the valve stem, transmit tire pressure readings to a receiver located in the overhead console. These transmissions occur once every minute at speeds over 20 mph (32 km/h). The Tire Pressure Monitoring system remains active even if no tire pressure related message is displayed in the EVIC.

If any road tire pressure has exceeded the low or high pressure threshold (refer to chart below), the TPM system will display a message in the EVIC and sound a chime. This message will be displayed for the rest of the ignition cycle, or until either the Low/High Tire pressure condition has been corrected. If the C/T, MENU, STEP or RESET button is pressed, the message is replaced by the new message requested; however, if the Low/High Tire condition has not been corrected, the Low/High Tire pressure message will again be displayed.

If a road tire is replaced by the spare, the TPM system will detect the swap and the message ″SPARE TIRE IN USE? Y/N″ (along with a chime) will be displayed.

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

TPM THRESHOLD PRESSURES

High Pressure ON Threshold	48 PSI (331 kPa)
High Pressure OFF Threshold	43 PSI (296 kPa)
Placard Pressure (Cold)	36 PSI (248 kPa)
Low Pressure OFF Threshold	33 PSI (228 kPa)
Low Pressure ON Threshold	28 PSI (193 kPa)

SENSOR - TPM

DESCRIPTION

On vehicles equipped with Tire Pressure Monitoring, one tire pressure sensor is mounted to each wheel (Fig. 19). Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced. The serviceable components of the tire pressure sensor are:

- Sensor-To-Wheel Grommet
- Valve Stem Cap
- Valve Stem Core

Valve stem caps and cores are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different.

CAUTION: Do not use a standard valve stem cap or core in a tire pressure sensor. Always use the original equipment style sensor cap and core.

CAUTION: Do not reuse the Sensor-To Wheel Grommet. Always use a new grommet when installing a pressure sensor and properly torque the sensor nut.

CAUTION: Do not try to install a tire pressure sensor in a steel wheel or aftermarket wheel. Use only in original style factory wheels.

OPERATION

Tire pressure sensors are battery operated. They transmit tire pressure data once every minute at speeds above 20 mph (32 km/h) or up to once every hour when stationary (parked). For additional information, refer to Appropriate Diagnostic Information.

CAUTION

CAUTION: The use of tire sealants is strictly prohibited for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants can clog tire pressure sensors.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Do not attempt to install a tire pressure sensor in a steel wheel or aftermarket wheel. Use tire pressure sensors in original style factory wheels only.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

DIAGNOSIS AND TESTING - TIRE PRESSURE SENSOR

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.

If a fault in the system is detected, always check air pressure in the tires first with a known accurate air gauge and correct the inflation pressure. If any tire is low, inspect **all** tires.

If gauge-read pressure in the tires does not reflect the reading on the EVIC, retrain the sensors, then reevaluate (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE). Refer to the appropriate diagnostic information for complete diagnosis of the Tire Pressure Monitoring System.

STANDARD PROCEDURE - TIRE PRESSURE SENSOR RETRAIN

WARNING: DEATH OR SERIOUS INJURY CAN OCCUR IF MAGNETICALLY SENSITIVE DEVICES ARE EXPOSED TO THE RELEARN MAGNET. MAGNETS CAN AFFECT PACEMAKERS.

CAUTION: Never attempt to train more than one vehicle at a time. System is capable of reading tire pressure sensor transmissions from other near-by vehicles.

Each time a wheel rotation or tire pressure sensor replacement occurs the tire pressure sensors must be retrained. This is necessary to inform the Electronic Vehicle Information Center (EVIC) that a sensor change was made and where. Retraining is accomplished through the EVIC used in conjunction with a Re-learn Magnet, Special Tool 8821.

SENSOR - TPM (Continued)

NOTE: Use the following procedure to retrain all four (4) road wheel tire pressure sensors. No attempt should be made to retrain individual sensors.

(1) Retrieve Re-learn Magnet, Special Tool 8821.
(2) Press MENU Button on EVIC until ″RETRAIN TIRE SENSORS - NO″ is displayed.
(3) Press STEP button to select ″YES″.

NOTE: There is a 60 second timer for training the first sensor and a 30 second timer between training the remaining sensors. If either of these timers expire, the EVIC will abort the training procedure.

NOTE: If at any time the EVIC display reads ″TRAINING ABORTED″, move the vehicle ahead at least one foot and repeat the entire retraining procedure.

(4) Press MENU button to start retraining. Display will read ″TRAIN LEFT FRONT TIRE″

NOTE: The order for retraining all five sensors is:
- **Left Front**
- **Right Front**
- **Right Rear**
- **Left Rear**

(5) Starting at left front tire, place Re-learn Magnet over valve stem (Fig. 17). Within approximately 5 seconds, vehicle horn will chirp indicating training complete at that particular sensor. Remove the magnet.

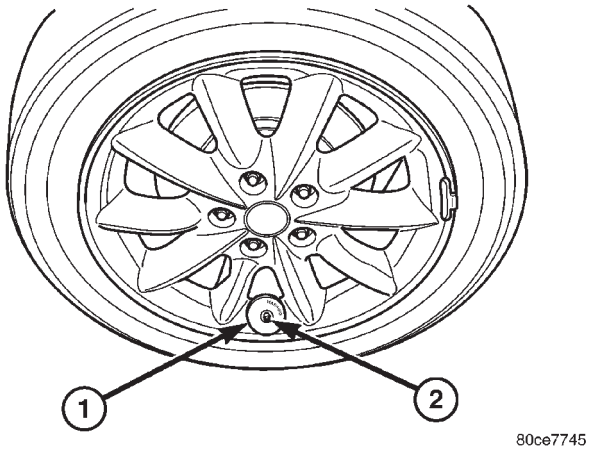

Fig. 17 Magnet Placement Over Valve Stem

1 - RE-LEARN MAGNET
2 - VALVE STEM

(6) Repeat step (6) on remaining sensors as indicated by EVIC until all four TPM sensors positions are trained.

(7) Once EVIC displays ″TRAINING COMPLETE″, pressing either STEP, C/T, RESET or MENU button will exit training routine.

REMOVAL

(1) Remove tire and wheel assembly from vehicle. (Refer to 22 - TIRES/WHEELS - REMOVAL)

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

(2) Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
(a) When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire.
(b) When preparing to dismount the tire from the wheel, carefully insert the mounting/dimounting tool at the valve stem ± 10° (Fig. 18), then proceed to dismount the tire from the wheel. Use this process on both the upper an lower tire beads.
(3) Using a thin wall socket, remove special nut retaining sensor to wheel (Fig. 19).
(4) Remove sensor from wheel (Fig. 19).

INSTALLATION

NOTE: Before reinstalling a tire pressure sensor, replace sealing grommet at base of valve stem.

(1) Wipe area clean where sensor sealing grommet contacts wheel. Make sure surface of wheel is not damaged.
(2) Install sensor in wheel as shown (Fig. 19). Do not attempt to mount sensor otherwise, damage may occur.
(3) Using a thin wall socket, install special sensor nut (Fig. 19). Tighten nut to 4 N·m (35 in. lbs.) torque.

SENSOR - TPM (Continued)

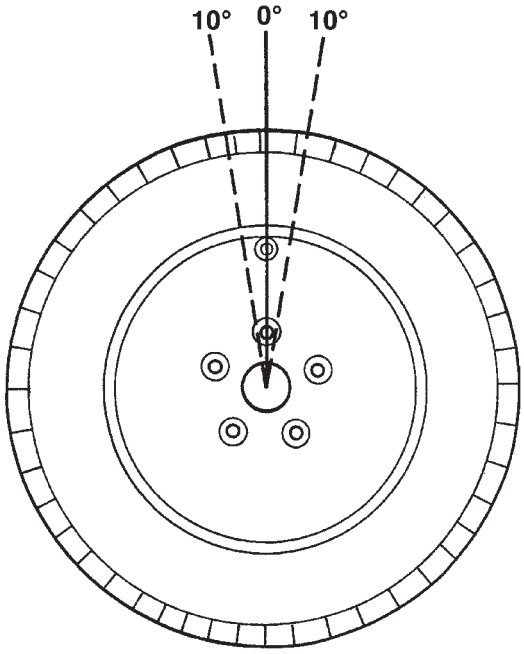

Fig. 18 Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem

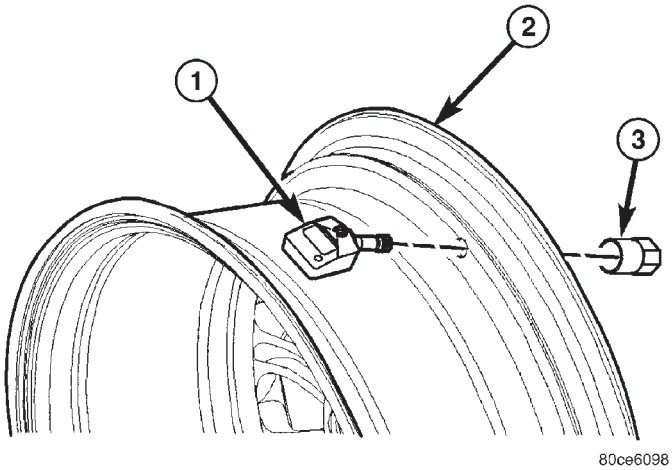

Fig. 19 Sensor Mounting To Wheel

1 - TIRE PRESSURE SENSOR
2 - WHEEL
3 - NUT

CAUTION: Over-torquing the sensor nut by as little as 12 N·m (106 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function, however, the condition should be corrected immediately.

(4) Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

(a) Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem approximately 210° from the head of the changer in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire (Fig. 20). Use this procedure on both the upper and lower tire beads.

(b) Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem is approximately 210° from the head of the changer in a clockwise direction from the mounting end of the tool (Fig. 21) Make sure the sensor is clear of the lower bead breaker area to avoid damaging the sensor when the breaker rises (Fig. 21). Rotate the tool in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.

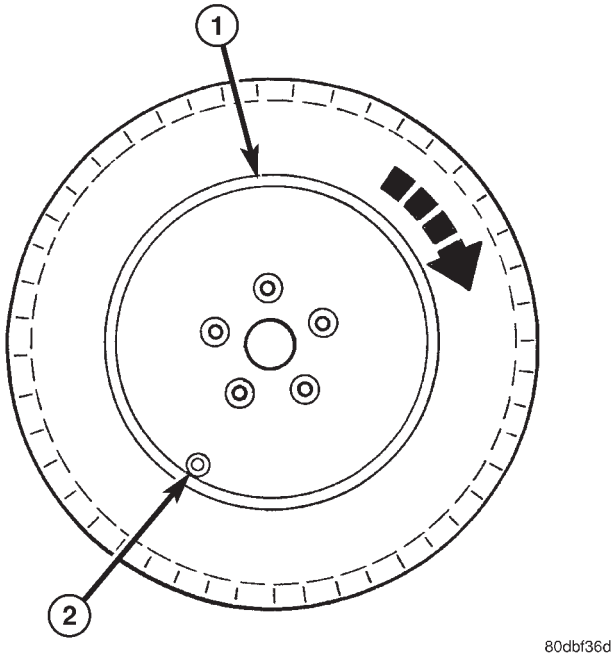

Fig. 20 Mounting Tire Using Rotating Wheel Machine

1 - HEAD OF CHANGER LOCATED HERE
2 - VALVE STEM

(5) Install wheel and tire assembly on vehicle. (Refer to 22 - TIRES/WHEELS - INSTALLATION)

SENSOR - TPM (Continued)

3 - BEAD BREAKER (KEEP CLEAR OF SENSOR)

(6) Retrain tire pressure sensors. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/ SENSOR - STANDARD PROCEDURE)

TIRES

DESCRIPTION

DESCRIPTION - TIRE

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION

Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code (Fig. 22). An All Season type tire will have either M + S, M & S or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking “XL” or “LL” may also be listed on the sidewall. The absence of an “XL” or “LL” marking infers a standard load tire.

Consult the tire manufacturer regarding any questions on tire specifications or capabilities.

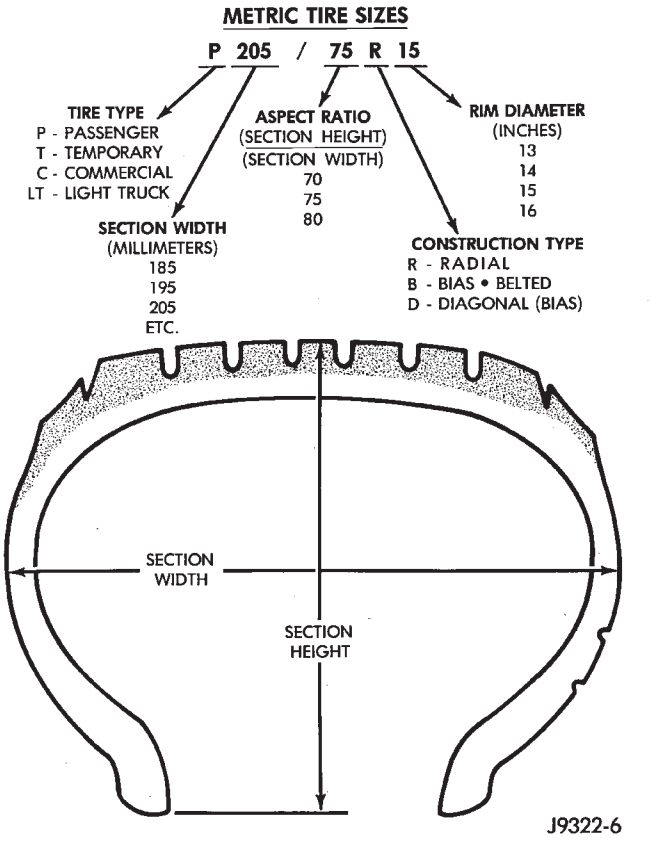

Fig. 22 Tire Identification (Typical)

TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

DESCRIPTION - RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life, ride quality and decrease rolling resistance.

TIRES (Continued)

Radial-ply tires must always be used in sets of four and under no circumstances should they be used on the front only. It is recommended that tires from different manufacturers NOT be mixed. They may be mixed with a temporary spare tire when necessary. A maximum speed of 80 km/h (50 mph) is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

DESCRIPTION - REPLACEMENT TIRES

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

DESCRIPTION - SPARE TIRE (TEMPORARY)

The temporary (convenience) spare tire is designed for emergency use only. The original tire should be repaired and reinstalled, or replaced with a new, at the first opportunity.

The temporary (convenience) spare tire should be inflated to the pressure listed on its sidewall. Do not exceed speeds of 80 km/h (50 mph) when the temporary spare tire is in use on the vehicle. Refer to the Owner's Manual for more details.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration, (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING). For irregular tire wear, (Refer to 22 - TIRES/WHEELS/TIRES - DIAGNOSIS AND TESTING).

DIAGNOSIS AND TESTING - TIRE/VEHICLE LEAD

Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem.

DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 23).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 23).

DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 24).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire Inflation Pressure Label provided with the vehicle (usually on the rear face of the driver's door).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the out-

Fig. 23 Tire Wear Patterns

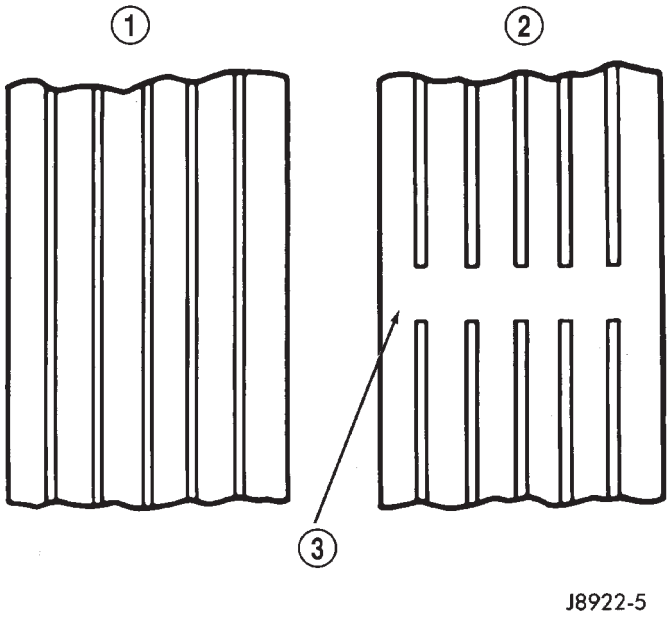

Fig. 24 Tread Wear Indicators

1 - TREAD ACCEPTABLE
2 - TREAD UNACCEPTABLE
3 - WEAR INDICATOR

door temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) (14 to 41 kPa) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- The vehicle to drift.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING. THE TIRE CAN FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (Fig. 25).

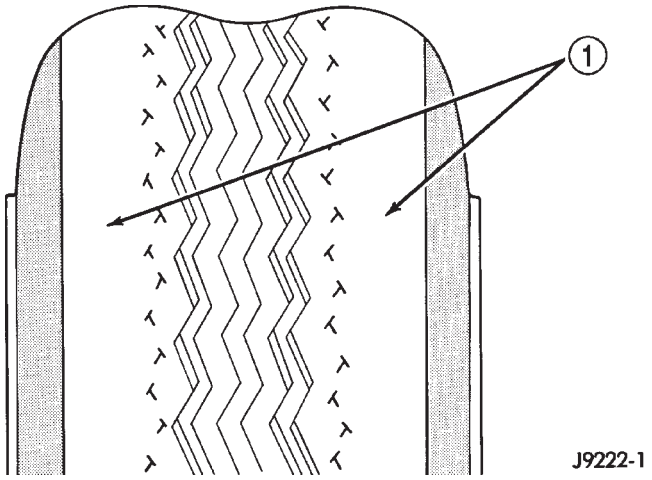

Fig. 25 Under Inflation Wear

1 - THIN TIRE TREAD AREAS

TIRES (Continued)

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (Fig. 26).

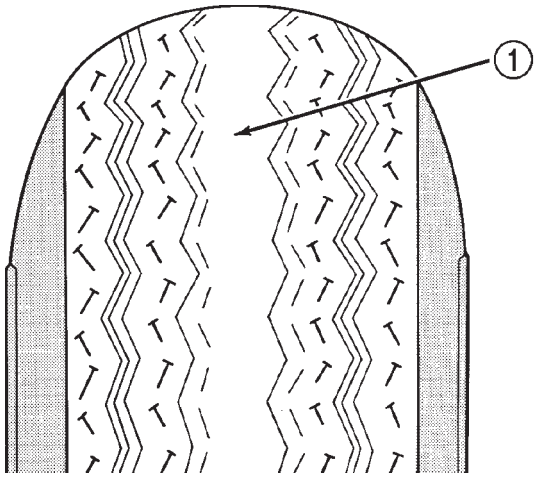

Fig. 26 Over Inflation Wear

1 - THIN TIRE TREAD AREA

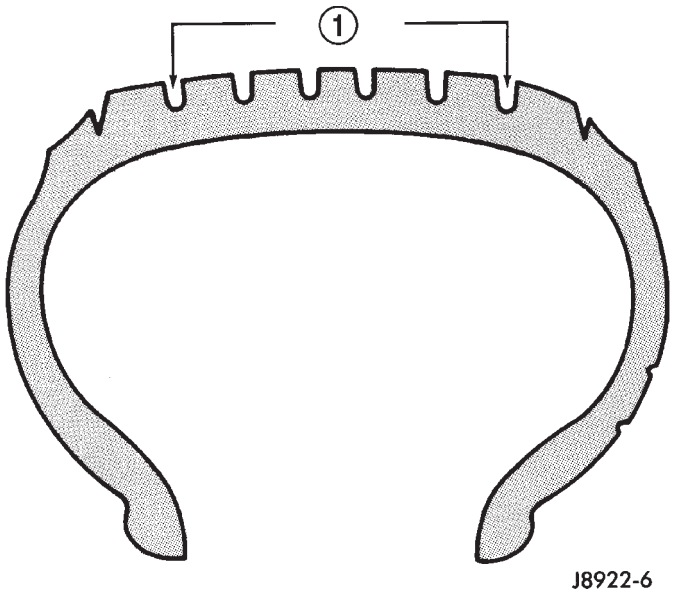

Fig. 27 Tire Repair Area

1 - REPAIRABLE AREA

STANDARD PROCEDURE - TIRE PRESSURE FOR HIGH SPEED OPERATION

DaimlerChrysler Corporation advocates driving at safe speeds within posted speed limits. Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. Vehicles loaded to maximum capacity should not be driven at continuous speeds over 120 km/h (75 mph). Never exceed the maximum speed capacity of the tire. For information on tire identification and speed ratings, (Refer to 22 - TIRES/WHEELS/TIRES - DESCRIPTION).

STANDARD PROCEDURE - TIRE LEAK REPAIRING

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 27). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and progressively tighten the 5 wheel nuts to a torque of 135 N·m (100 ft. lbs.).

CLEANING - TIRES

Before delivery of a vehicle, remove the protective coating on the tires with white sidewalls or raised white letters. To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

CAUTION: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

WHEELS

DESCRIPTION - WHEEL

Original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

All models use either steel or aluminum drop-center wheels. Every wheel has raised sections between the rim flanges and rim drop well called safety humps (Fig. 28). Initial inflation of the tires forces the bead over these raised sections. In case of air loss, the safety humps hold the tire in position on the wheel until the vehicle can be brought to a safe stop.

Cast aluminum wheels require special balance weights to fit on the flange of the rim (Fig. 29).

When wheel alignment is necessary on a vehicle with cast aluminum wheels, special wheel clamps are required to avoid damage to the wheel's finish.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts.

WHEELS (Continued)

1 - TIRE
2 - WELL
3 - SAFETY HUMPS
4 - FLANGE

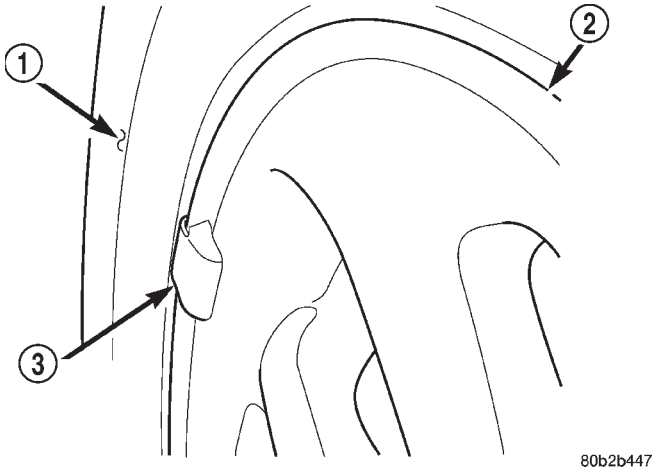

Fig. 29 Styled Aluminum Wheel Weight

1 - TIRE
2 - WHEEL
3 - STYLED WHEEL WEIGHT

All aluminum wheels have wheel mounting (lug) nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they must be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE.

WARNING: REPLACEMENT WITH USED WHEELS IS NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

CLEANING - ALUMINUM WHEEL CARE

Chrome plated and painted aluminum wheels should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion.

Care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Any of the “DO NOT USE” items listed below WILL damage chrome plated and painted aluminum wheels.

DO NOT USE:

- any abrasive metal cleaner
- any abrasive cleaning pad or brush
- any cleaner that contains an acid (this will immediately react with and discolor the chromium surface)
- chrome polish (unless it is buffed off immediately after application)
- oven cleaner
- a car wash that uses carbide-tipped wheel cleaning brushes

WHEEL COVER

DESCRIPTION

This vehicle uses a bolt-on type wheel cover (Fig. 30).

This bolt-on wheel cover cannot be removed from the wheel until three of the five wheel mounting nuts shown are removed (Fig. 30). The bolt-on wheel cover can then be removed with the remaining two wheel nuts tightened in place.

REMOVAL

(1) Noting the location of the valve stem in relationship to the wheel mounting nuts, remove the three wheel mounting nuts securing the wheel cover to the wheel and hub (Fig. 30).

CAUTION: When removing the wheel cover, do not pry the wheel cover from the wheel. This can result in damage to the wheel cover. The wheel cover is removed by pulling it off the wheel by hand.

(2) Grasp the wheel cover at the edges in line with the remaining installed wheel nuts and pull straight outward from the wheel. This will pop the wheel cover retaining tabs over the two remaining wheel nuts, removing the wheel cover from the wheel.

INSTALLATION

NOTE: Wheel mounting nuts must be installed on the studs as shown to allow installation of the wheel cover (Fig. 31).

(1) Place the wheel cover on the wheel in the following fashion:

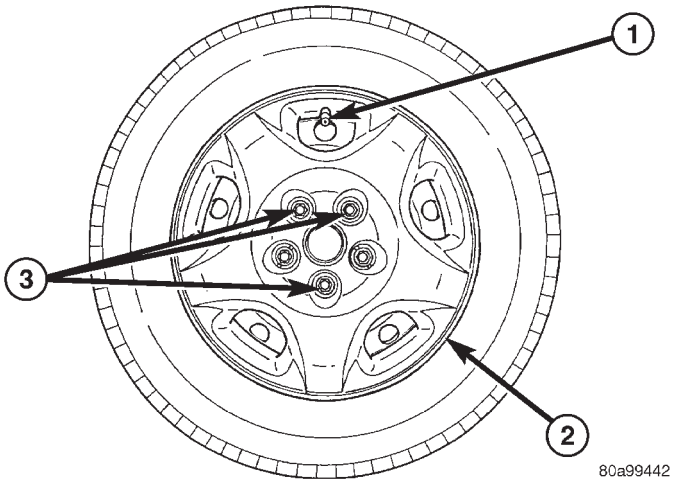

Fig. 30 Nuts Securing Wheel Cover

1 - VALVE STEM
2 - BOLT-ON WHEEL COVER
3 - NUTS SECURING WHEEL COVER

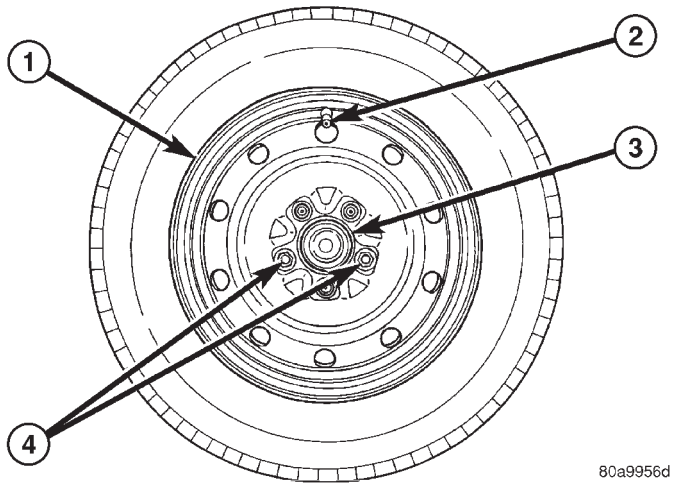

Fig. 31 Two Wheel Mounting Nuts Installed

1 - WHEEL
2 - VALVE STEM
3 - HUB PILOT
4 - NUTS

(a) Align the valve notch in the wheel cover with the valve stem on the wheel.

(b) At the same time, align the two holes in the wheel cover having the retaining tabs with the two installed wheel nuts (Fig. 32).

(c) Press in on center of wheel cover until wheel cover retaining tabs push past and engage rear of previously installed wheel mounting nuts (Fig. 32). This will hold the wheel cover in place.

(2) Install and **lightly tighten** the three remaining wheel mounting nuts, securing the wheel cover in place (Fig. 30).

WHEEL COVER (Continued)

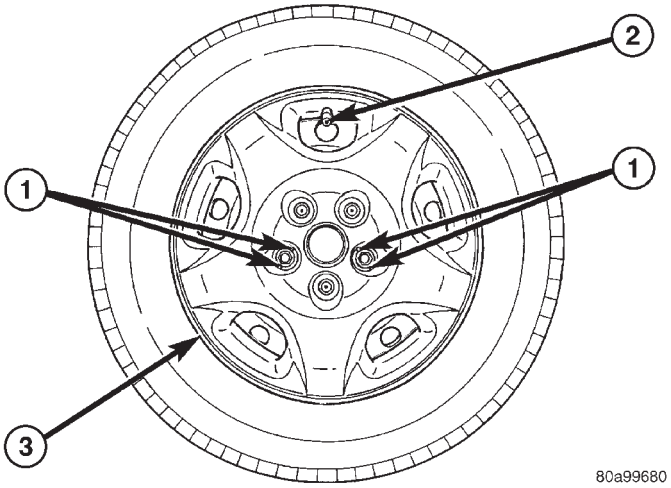

Fig. 32 Wheel Cover Installation Over Two Nuts

1 - RETAINING TABS
2 - VALVE STEM
3 - BOLT-ON WHEEL COVER

(3) Tighten all five wheel mounting nuts in the proper sequence (Fig. 33). Tighten wheel nuts to a torque of 135 N·m (100 ft. lbs.).

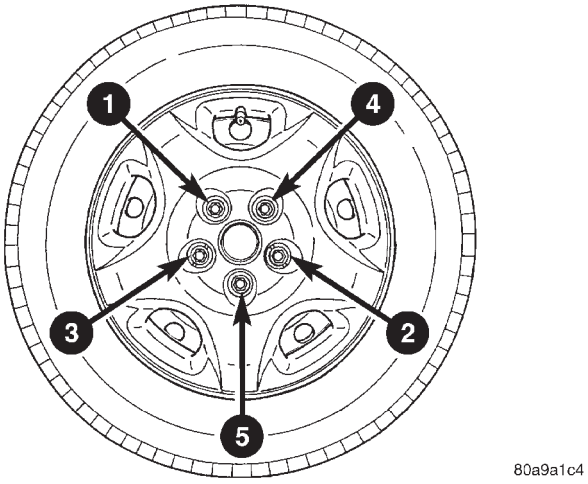

Fig. 33 Nut Tightening Sequence

WHEEL MOUNTING STUDS - FRONT

REMOVAL

CAUTION: If a wheel mounting stud needs to be replaced in the hub and bearing assembly, the studs MUST NOT be hammered out of the hub flange. If a stud is removed by hammering it out of the bearing flange, damage to the hub and bearing assembly will occur leading to premature bearing failure.

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the front wheel and tire assembly from the vehicle.

(3) Remove the two adapter mounting bolts securing both the disc brake caliper adapter to the steering knuckle (Fig. 34).

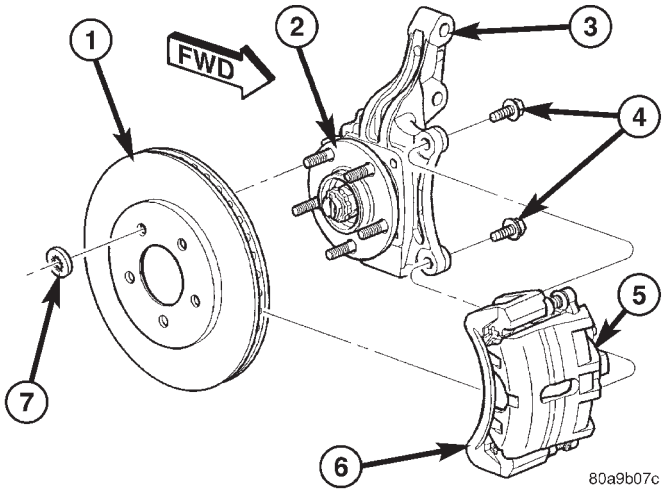

Fig. 34 Front Brake Mounting

1 - BRAKE ROTOR
2 - HUB AND BEARING
3 - STEERING KNUCKLE
4 - ADAPTER MOUNTING BOLTS
5 - BRAKE CALIPER
6 - ADAPTER
7 - CLIP

(4) Remove the disc brake caliper and adapter as an assembly from the steering knuckle (Fig. 34). Hang the assembly out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.

(5) Remove brake rotor from hub by pulling it straight off wheel mounting studs (Fig. 34).

(6) On the wheel mounting stud to be removed, install a wheel mounting (lug) nut far enough so the threads on the stud are even with end of nut. Install Remover, Special Tool C-4150A on hub and bearing assembly flange and wheel stud (Fig. 35).

(7) Tighten down on special tool, pushing wheel stud out of the hub flange. When shoulder of wheel stud is past flange, remove special tool from hub and bearing. Remove nut from stud and remove stud from hub flange.

WHEEL MOUNTING STUDS - FRONT (Continued)

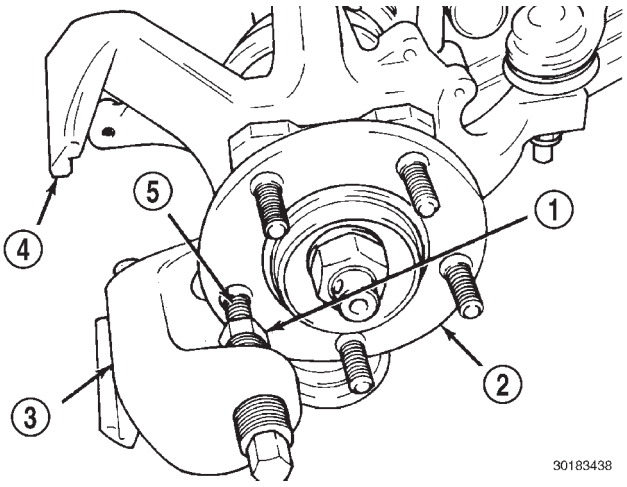

Fig. 35 Wheel Stud Removal (Typical)

1 - WHEEL MOUNTING (LUG) NUT
2 - HUB AND BEARING ASSEMBLY
3 - SPECIAL TOOL C-4150A
4 - STEERING KNUCKLE
5 - WHEEL STUD

INSTALLATION

(1) Install replacement wheel stud into flange of hub and bearing assembly. Install washers on wheel stud, then install a wheel mounting (lug) nut on stud with flat side of lug nut against washers as shown (Fig. 36).

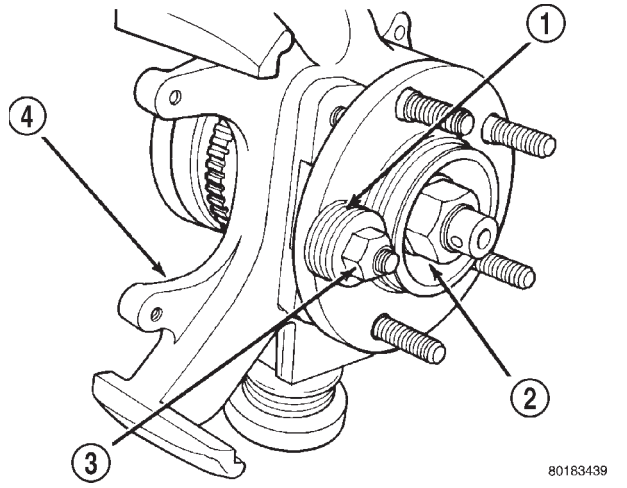

Fig. 36 Installing Wheel Stud (Typical)

1 - WASHERS
2 - HUB AND BEARING ASSEMBLY
3 - WHEEL MOUNTING (LUG) NUT
4 - STEERING KNUCKLE

(2) Tighten the nut, pulling the wheel stud into the flange of the hub and bearing. When the head of the stud is fully seated against the rear of the hub flange, remove nut and washers from stud.

(3) Install the brake rotor back on the hub and bearing (Fig. 34).

(4) Install brake caliper and adapter back over brake rotor aligning adapter with mounting holes on steering knuckle (Fig. 34).

(5) Install the two adapter mounting bolts securing the adapter to the steering knuckle. Tighten the mounting bolts to 169 N·m (125 ft. lbs.) torque.

(6) Install wheel and tire assembly on vehicle. Tighten the wheel mounting lug nuts in proper sequence until all nuts are torqued to half specification, then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(7) Lower vehicle to the ground.

WHEEL MOUNTING STUDS - REAR

REMOVAL

CAUTION: If a wheel attaching stud needs to be replaced in the hub and bearing assembly the studs MUST NOT be hammered out of the hub flange. If a stud is removed by hammering it out of the bearing flange, damage to the hub and bearing assembly will occur leading to premature hub and bearing failure.

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the rear wheel and tire assembly.

(3) Remove the brake drum or disc brake caliper and rotor. Refer to Brakes.

(4) Install a lug nut on the wheel stud to be removed from the hub and bearing assembly (Fig. 37) so the threads on stud are even with end of lug nut. Install Remover, Special Tool C-4150A on hub and bearing assembly flange and wheel stud (Fig. 37).

(5) Tightening down on special tool will push wheel stud out of the hub and bearing assembly flange.

(6) Remove lug nut from stud and remove wheel stud from flange.

WHEEL MOUNTING STUDS - REAR (Continued)

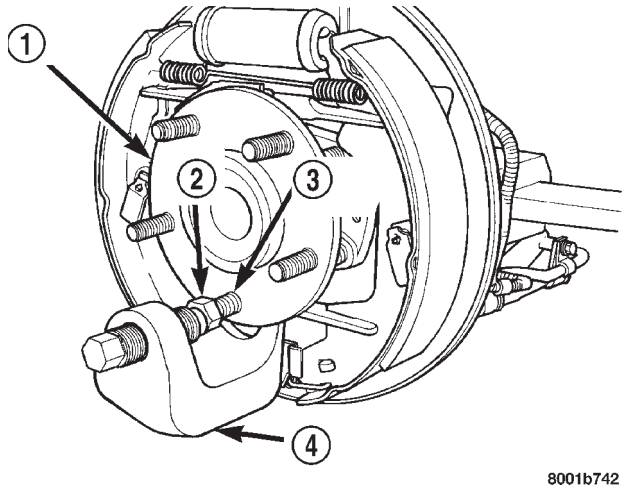

Fig. 37 Wheel Stud Removal From Hub And Bearing

4 - SPECIAL TOOL C-4150A

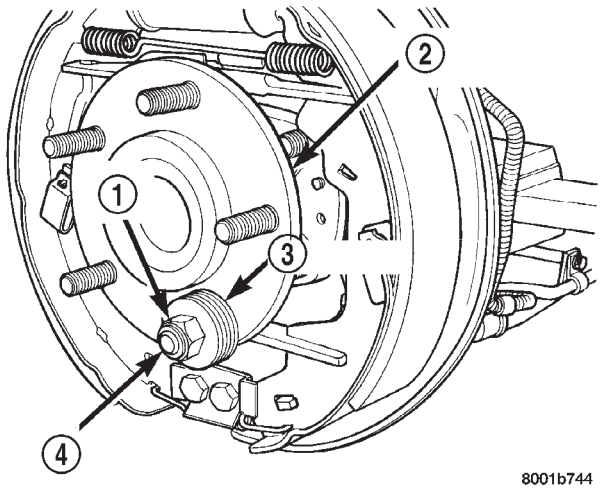

Fig. 38 Wheel Stud Installation

1 - WHEEL MOUNTING (LUG) NUT
2 - HUB AND BEARING ASSEMBLY
3 - WASHERS
4 - WHEEL STUD

INSTALLATION

(1) Install replacement wheel stud into flange of hub and bearing assembly. Install washers on wheel stud, then install a wheel lug nut on stud with flat side of lug nut against washers (Fig. 38).

(2) Tighten the wheel lug nut, pulling the wheel stud into the flange of the hub and bearing assembly. When the head of the stud is fully seated against the bearing flange, remove lug nut and washers from wheel stud.

(3) Install the brake drum or disc brake rotor and caliper on the hub and bearing assembly.

(4) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(5) Lower vehicle to the ground.

BODY

DESCRIPTION - VEHICLE IDENTIFICATION

Throughout this group, references to the DaimlerChrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. Refer to Introduction Group of this manual for detailed information on vehicle identification. If a procedure is common to all vehicles covered in this manual, no reference will be made to a vehicle family code.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.
AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.
DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.
Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.
Always have a fire extinguisher ready for use when welding.
Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.
Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.
Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to

enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

DIAGNOSIS AND TESTING - WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair pro-

cedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

STANDARD PROCEDURE - PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **EYE PROTECTION SHOULD BE USED WHEN SERVICING COMPONENTS. PERSONAL INJURY CAN RESULT.**
- **USE AN OSHA APPROVED BREATHING MASK WHEN MIXING EPOXY, GRINDING, AND SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**
- **AVOID PROLONGED SKIN CONTACT WITH RESIN, PETROLEUM, OR ALCOHOL BASED SOLVENTS. PERSONAL INJURY CAN RESULT.**
- **DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

BODY (Continued)

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel (Fig. 1). To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

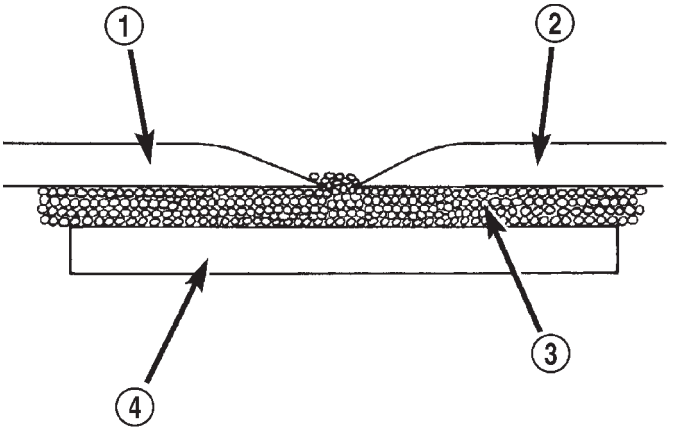

Fig. 1 PANEL SECTIONING

1 - EXISTING PANEL
2 - NEW PANEL
3 - PANEL ADHESIVE
4 - BONDING STRIP

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement (Fig. 2) and (Fig. 3). Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair (Fig. 4). It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

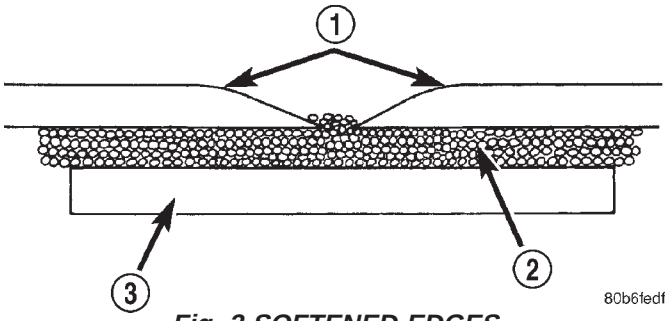

Fig. 2 SOFTENED EDGES

1 - SOFTENED EDGES
2 - PANEL ADHESIVE
3 - BONDING STRIP

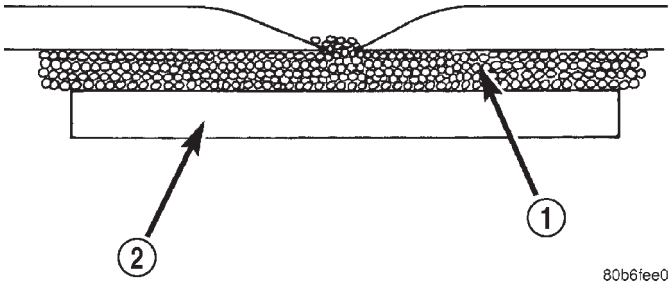

Fig. 3 PANEL REINFORCEMENT

1 - PANEL ADHESIVE
2 - REINFORCEMENT

BODY (Continued)

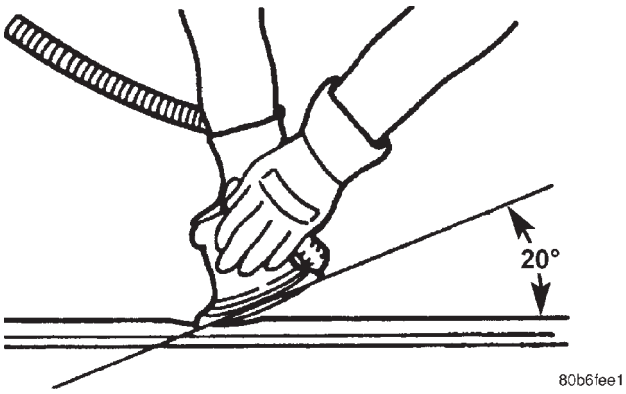

Fig. 4 BEVELING ANGLE - 20 DEGREE

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used (Fig. 5).
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when every possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

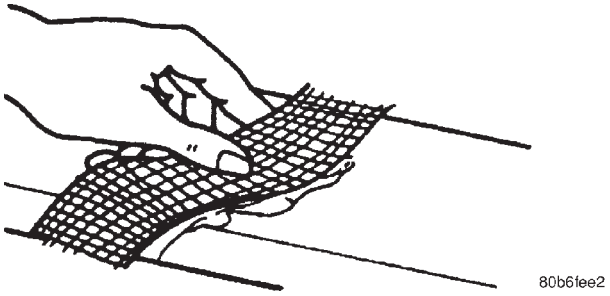

Fig. 5 FIBERGLASS TAPE

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind (Fig. 7) (Fig. 6).

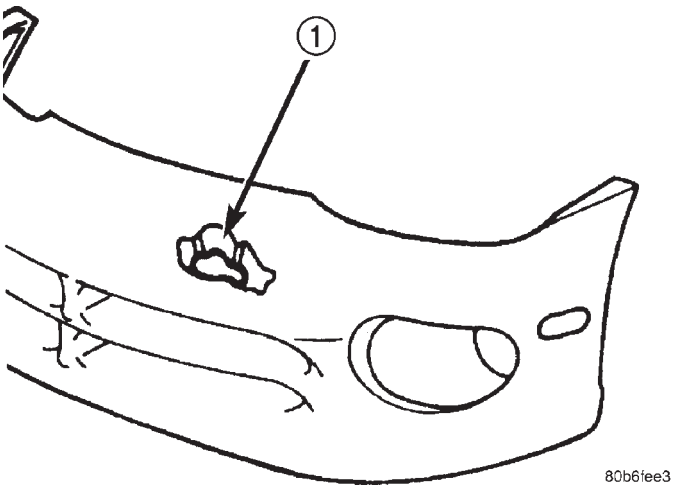

Fig. 6 DAMAGE COMPONENT

1 - PUNCTURE

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material (Fig. 7). Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

BODY (Continued)

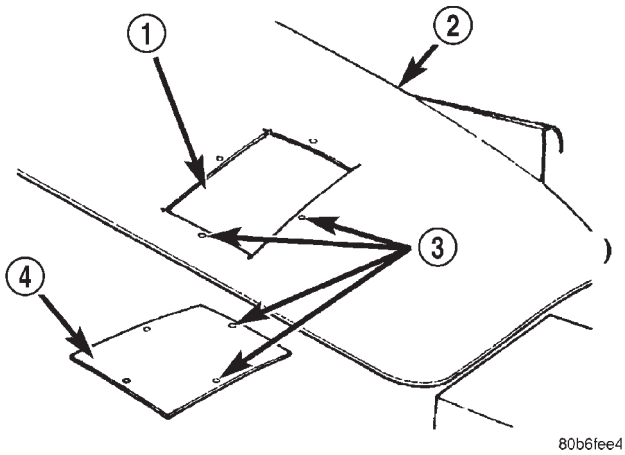

Fig. 7 DAMAGED PANEL CUTOUT AND PATCH

1 - CUTOUT

4 - PATCH CUT TO SIZE

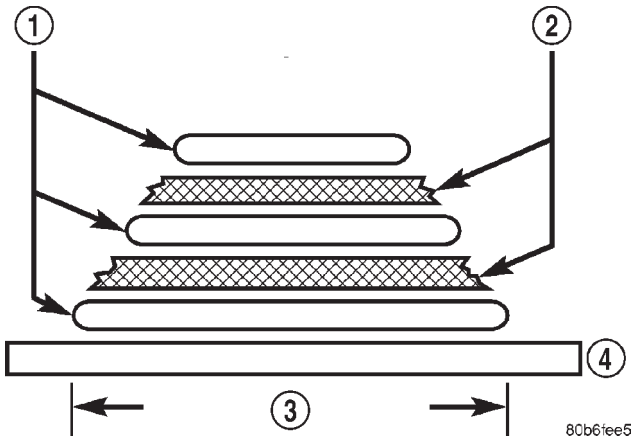

Fig. 8 FABRICATED PANEL

1 - STRUCTURAL ADHESIVE
2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE
3 - WIDTH OF V-GROOVE
4 - WAXED PAPER

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

(1) Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required (Fig. 8).

(2) Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.

(3) Apply a liberal coat of adhesive over the reinforcement mesh (Fig. 8). If necessary apply a second or third coat of adhesive and mesh after firs coat has cured. The thickness of the patch should be the same as the repair area.

(4) After patch has cured, peel waxed paper or plastic from the back of the patch.

(5) If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

(1) Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.

(2) Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.

(3) Using the pattern as a guide, cut the patch to size.

(4) Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.

(5) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole (Fig. 7).

(6) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.

(7) Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.

(8) Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.

(9) Mix enough adhesive to cover one side of all support squares.

(10) Apply adhesive to cover one side of all support squares.

(11) Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares (Fig. 9).

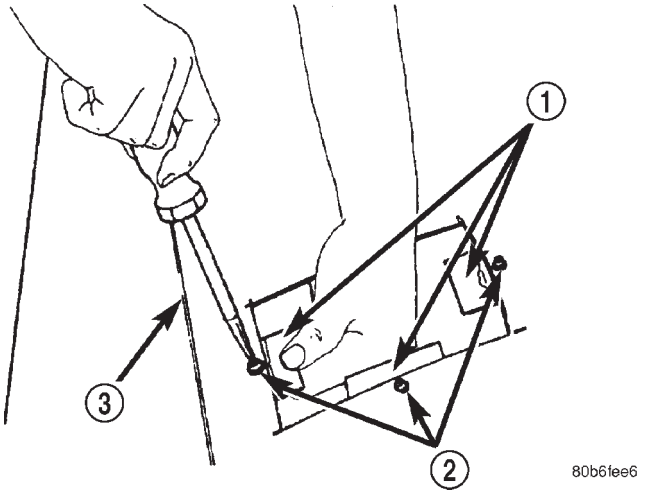

Fig. 9 SECURE SUPPORT SQUARES TO BODY PANEL

1 - SUPPORT SQUARES
2 - SCREWS
3 - DAMAGED BODY PANEL

BODY (Continued)

(12) Position patch in cutout against support squares and adjust patch until the gap is equal along all sides (Fig. 10).

(13) Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

(14) Apply a coat of adhesive to the exposed ends of the support squares (Fig. 11).

(15) Install screws to hold the patch to support squares (Fig. 12). Tighten screws until patch surface is flush with panel surface.

(16) Allow adhesive to cure, and remove all screws.

(17) Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch (Fig. 13). With compressed air, blow dust from around patch.

(18) Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch (Fig. 14).

(19) Mix enough adhesive to cover the entire patch area.

(20) Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair (Fig. 15).

2 - PATCH
3 - MESH

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

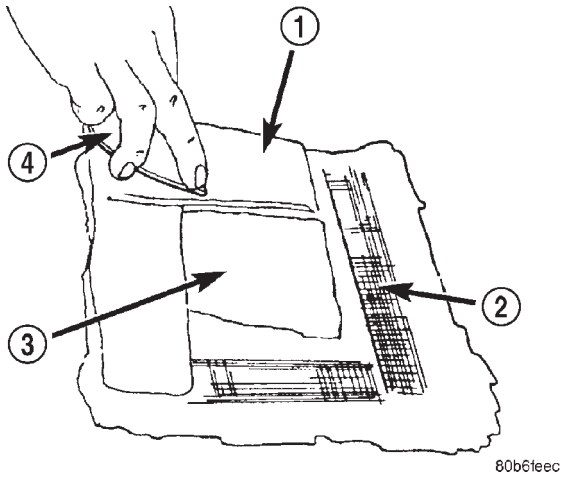

Fig. 15 COVER MESH WITH ADHESIVE

1 - ADHESIVE

3 - PATCH
4 - SPREADER

STANDARD PROCEDURE - HEAT STAKING

(1) Remove trim panel.

(2) Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.

(3) Heat stake the components.

(a) If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(b) If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(4) Allow the repaired area to cool and verify the repair.

(5) Install trim panel.

BODY LUBRICATION

LUBRICATION REQUIREMENTS

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to assure proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After lubricating a component, any excess oil or grease should be removed.

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

(1) Apply a small amount of lubricant directly into the lock cylinder.

(2) Apply a small amount of lubricant to the key.

(3) Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

(4) Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.

(5) Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

(1) Clean component as described above.

(2) Apply specified lubricant to all pivoting and sliding contact areas of component.

LUBRICANT USAGE

ENGINE OIL

- Door Hinges – Hinge Pin and Pivot Contact Areas
- Hood Hinges – Pivot Points
- Liftgate Hinges

APPLIQUE

REMOVAL

(1) Roll door glass down.
(2) Remove outer door belt molding.
(3) Disengage clips holding front edge of applique to door frame.
(4) Remove applique from vehicle (Fig. 1).

INSTALLATION

(1) Position applique on vehicle.
(2) Hook rear edge of applique over rear edge of door frame and seat applique bottom edge on sheet metal.
(3) Engage clips to hold front edge of applique to door frame.
(4) Install outer door belt molding.

CHECK STRAP

REMOVAL

(1) Remove front door trim panel.
(2) Remove front door watershield (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL).
(3) Remove front door speaker, if equipped.
(4) Remove bolts attaching door check strap to A-pillar.
(5) Remove nuts attaching check strap to door end frame (Fig. 2).
(6) Remove check strap from door through speaker hole.

INSTALLATION

(1) Position check strap on door through speaker hole.
(2) Install nuts to attach check strap to door end frame. Tighten nuts to 11 N·m (90 in. lbs.) torque.
(3) Install bolts to attach check strap to A-pillar. Tighten bolts to 12 N·m (105 in. lbs.) torque.
(4) Install door speaker, if equipped.
(5) Install front door trim panel.

CHECK STRAP (Continued)

DOOR

REMOVAL

(1) Remove front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - REMOVAL)

(2) Disengage clips attaching door harness wire connector to inner fender brace.

(3) Disconnect positive lock slide on the side of the wire connectors (Fig. 3).

(4) Depress lock tab attaching wire connector halves together.

(5) Disconnect door harness from body wiring harness.

(6) Remove bolts attaching door check strap to A-pillar (Fig. 4).

(7) Support door on suitable lifting device.

(8) Remove bolts attaching lower hinge to door end frame (Fig. 5).

(9) Steady door on lifting device and remove bolts attaching upper hinge to door end frame.

(10) Remove door from vehicle.

5 - CLIP
6 - DOOR CHECK STRAP

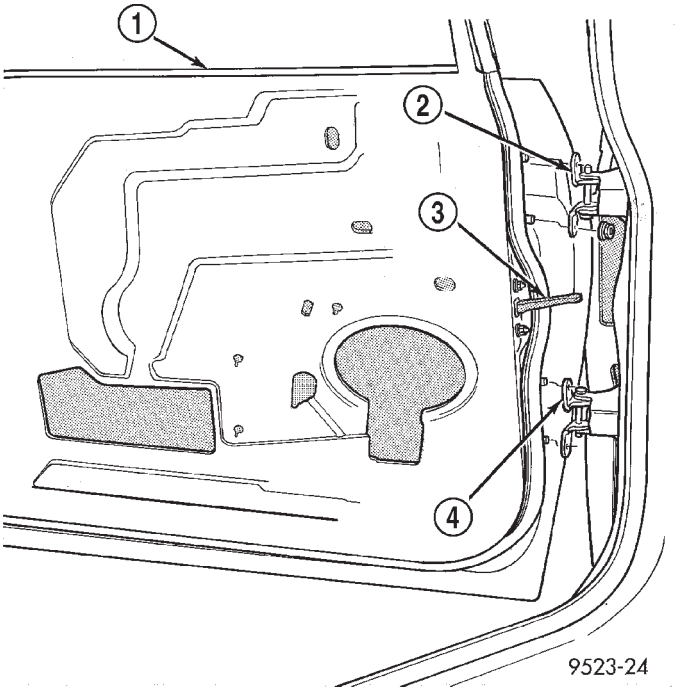

Fig. 5 FRONT DOOR - HINGE BOLT REMOVAL

1 - FRONT DOOR
2 - UPPER HINGE
3 - CHECK STRAP
4 - LOWER HINGE

INSTALLATION

NOTE: If new hinge pins are to be used, verify that the knurling on the hinge pin is aligned with the knurling on in the door hinge prior to driving in the pin. Also, verify that the hinge pin is fully seated to the door hinge and a new retaining clip is installed.

(1) Support door on suitable lifting device.
(2) Position door to vehicle. Verify net pierce nubbin is engaged if reusing original hinges.
(3) Steady door on lifting device and install bolts attaching upper hinge to door end frame. Tighten bolts to 34 N·m (25 ft. lbs.) torque.
(4) Install bolts attaching door check strap to A-pillar. Tighten bolts to 12 N·m (105 in. lbs.) torque.
(5) Install bolts attaching lower hinge to door end frame. Tighten bolts to 34 N·m (25 ft. lbs.) torque. Align door to achieve equal spacing to surrounding body panels. Panels should be flush across all gaps.
(6) Connect door harness into body wiring harness.
(7) Connect positive lock slide on the side of the wire connectors.
(8) Connect clips attaching door harness wire connector to inner fender brace.
(9) Install front wheelhouse splash shield.
(10) Verify door operation and alignment. Adjust as necessary.

DOOR GLASS

REMOVAL

(1) Remove watershield. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL)
(2) Remove inner belt molding.(Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - REMOVAL)
(3) Remove outer belt molding.(Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT MOLDING - REMOVAL)
(4) Position glass to gain access to front and rear regulator lift plates through front and rear access holes in door panel.
(5) Remove clips attaching door glass to regulator lift plates (Fig. 6).
(6) Remove glass from regulator lift plates.
(7) Disengage glass from glass run weatherstrip.
(8) Insert front of glass between glass run channel and outer door panel.
(9) Lift glass upward and out of exterior side of the opening at top of door (Fig. 7).
(10) Remove glass from vehicle.

DOOR GLASS (Continued)

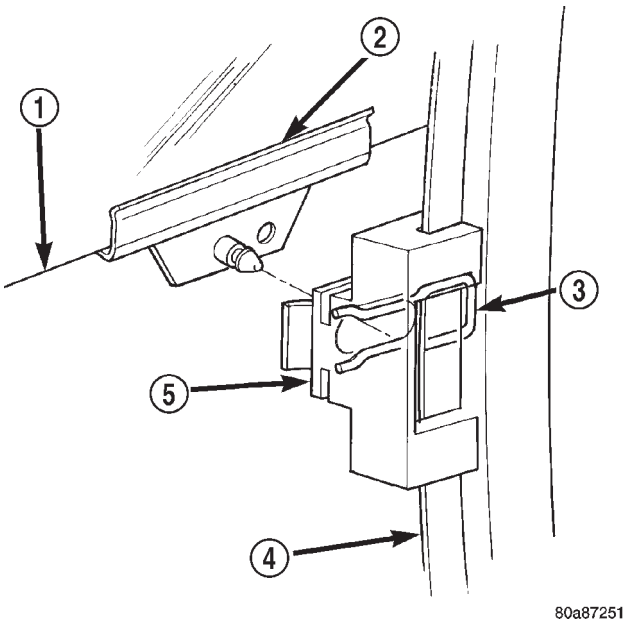

Fig. 6 FRONT DOOR GLASS CLIPS

1 - DOOR GLASS
2 - GLASS LIFT PLATE
3 - CLIP
4 - GUIDE RAIL
5 - REGULATOR LIFT PLATE

INSTALLATION

(1) Install clips that attach door glass to regulator lift plates (Fig. 6).

(2) Place glass in window opening with front inserted between run channel and outer door panel (Fig. 7).

(3) Lower glass downward into door.

(4) Insert ends of glass into glass run weatherstrip channels at front and rear of door.

(5) Place glass in position on regulator lift plates.

(6) Snap glass mounting studs into clips on regulator lift plates.

(7) Install radio speaker, if equipped.

(8) Install outer belt molding. (Refer to 23 - BODY/ WEATHERSTRIP/SEALS/FRONT DOOR OUTER BELT MOLDING - INSTALLATION)

(9) Install inner belt molding.(Refer to 23 - BODY/ WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT MOLDING - INSTALLATION)

(10) Verify door glass operation and fit.

(11) Install watershield. (Refer to 23 - BODY/ DOOR - FRONT/WATERSHIELD - INSTALLATION)

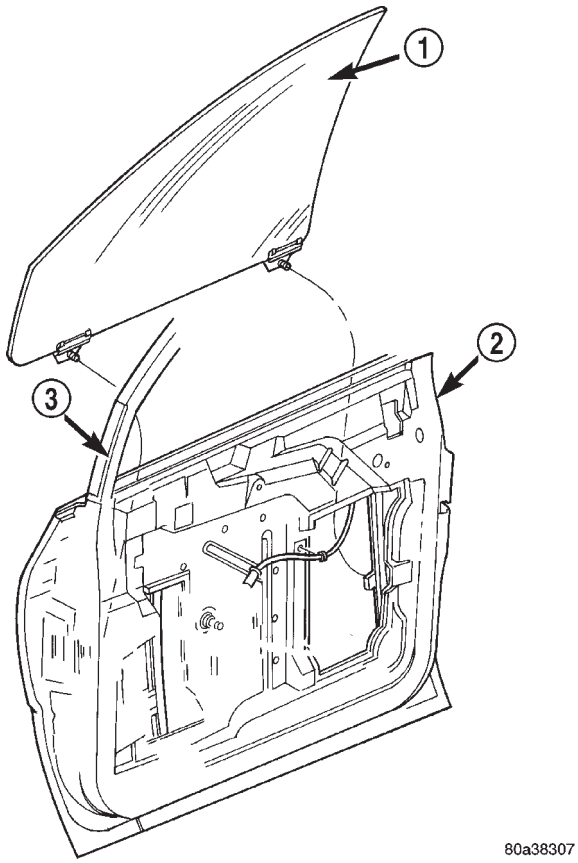

Fig. 7 FRONT DOOR GLASS

1 - DOOR GLASS
2 - FRONT DOOR
3 - GLASS RUN CHANNEL

FRAME CLOSEOUT MOLDING

REMOVAL – A-PILLAR, HEADER, OR B-PILLAR

(1) Roll door glass down.

(2) Using a hook tool, pull front door frame closeout molding from window frame channel (Fig. 8).

(3) Remove closeout molding from vehicle.

INSTALLATION – A-PILLAR, HEADER, OR B-PILLAR

(1) Position closeout molding in window frame.

(2) Insert closeout molding into window frame channel starting at the corners and working inward.

(3) Verify door glass operation.

FRAME CLOSEOUT MOLDING (Continued)

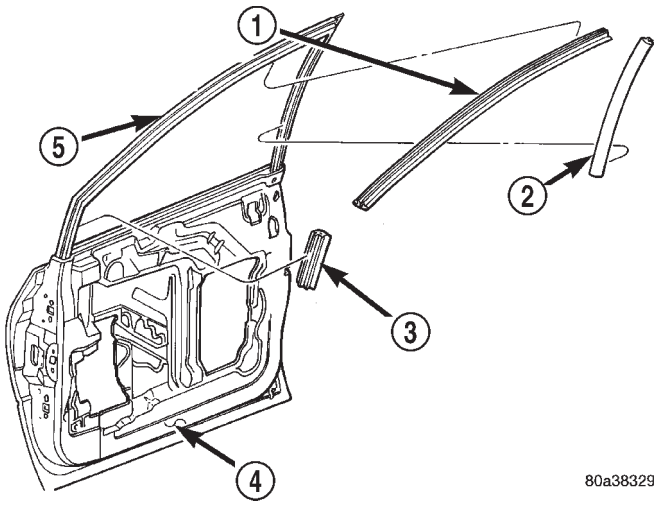

Fig. 8 FRONT DOOR FRAME CLOSEOUT MOLDINGS

1 - FRONT DOOR FRAME HEADER CLOSEOUT MOLDING
2 - FRONT DOOR FRAME B-PILLAR CLOSEOUT MOLDING
3 - FRONT DOOR FRAME A-PILLAR CLOSEOUT MOLDING
4 - FRONT DOOR
5 - FRONT DOOR FRAME

HINGE

REMOVAL

(1) Release front door latch and open door.
(2) Mark hinge foot print on both door and pillar to aid when installing door.
(3) Support door on suitable lifting device.
(4) Remove bolts attaching front door to door hinge.
(5) Remove bolts attaching hinge to pillar.
(6) Remove door hinge from vehicle.

INSTALLATION

CAUTION: When installing a new hinge, make sure that the head of each hinge pin is fully seated into the door hinge. Also, remove the plastic shipping clip and replace it with the correct metal retaining clip once the hinge pin is seated.

(1) Paint hinge prior to installation, if necessary.
(2) Position door hinge on vehicle.
(3) Install bolts attaching hinge to pillar. Tighten bolts to 34 N·m (25 ft. lbs.).
(4) Install bolts attaching front door to door hinge. Tighten bolts to 34 N·m (25 ft. lbs.).
(5) Align door to achieve equal spacing to surrounding body panels. Panels should be flush across all gaps.
(6) Verify door alignment and operation. Adjust as necessary.

LATCH

REMOVAL

(1) Roll door glass up.
(2) Remove front door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
(3) Remove watershield as necessary to gain access to the outside door handle.
(4) Through access hole at rear of inner door panel, disconnect wire connector from power door lock motor, if equipped.
(5) Disengage clips holding linkage to door latch (Fig. 9).
(6) Remove linkages from door latch.
(7) Remove screws attaching door latch to door end frame (Fig. 10).
(8) Remove door latch from door.

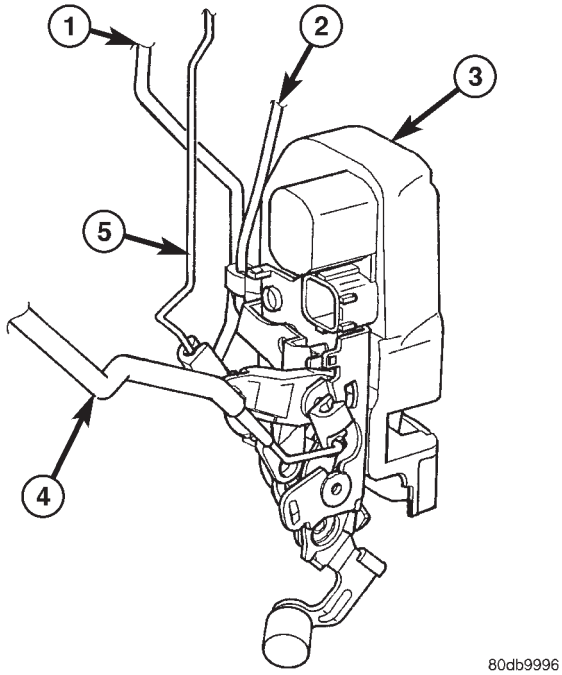

Fig. 9 LATCH ASSEMBLY

1 - OUTSIDE HANDLE TO LATCH LINK
2 - KEY CYLINDER TO LATCH LINK
3 - LATCH ASSEMBLY
4 - INSIDE HANDLE LINK AND SLEEVE
5 - LOCK KNOB LINK

INSTALLATION

NOTE: The screws attaching the door latch to the door end frame have nylon patches on the threads. All screws must be replaced when the latch has been removed.

(1) Insert inside handle latch link to door latch and engage clip (Fig. 9).

LATCH (Continued)

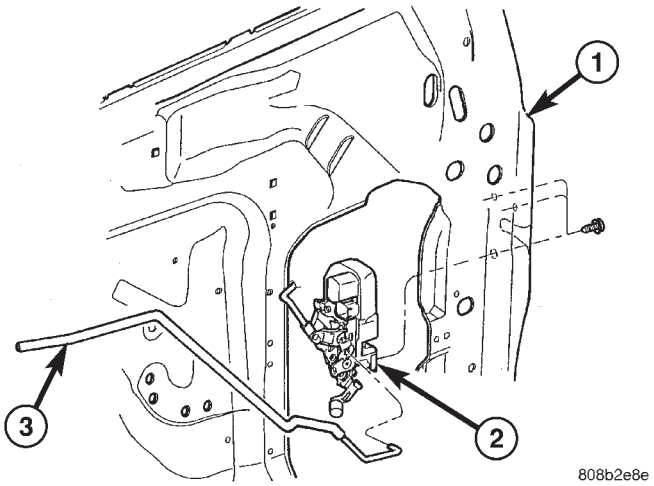

Fig. 10 FRONT DOOR LATCH

1 - FRONT DOOR
2 - LATCH ASSEMBLY
7 - INSIDE HANDLE LINK

(2) Place door latch in position on door end frame.
(3) Install screws attaching door latch to door end frame. Tighten screws to 10 N·m (90 in. lbs.) torque (Fig. 10).
(4) Insert other linkages to door latch and engage clips.
(5) Connect wire connector into power door lock motor, if equipped.
(6) Insert a hex wrench through the elongated hole located in the door shut face above the latch.
(7) Loosen allen head screw.
(8) Pull outward on the outside door handle and release.
(9) Tighten allen head screw.
(10) Verify door latch and power door lock operation.
(11) Install watershield and front door trim panel.

LATCH STRIKER

REMOVAL

(1) Mark outline of door striker on B-pillar to aid in installation.
(2) Remove screws attaching door latch striker to B-pillar (Fig. 11).
(3) Remove door latch striker from vehicle.
(4) Retrieve any shims found between latch striker and B-pillar.

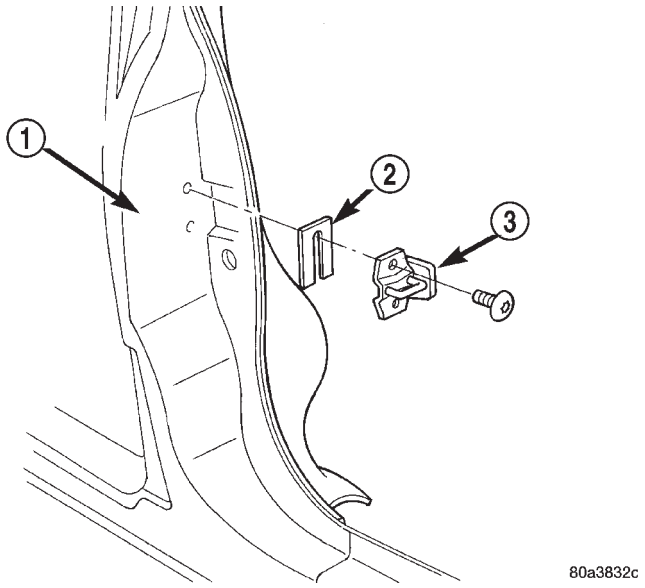

Fig. 11 DOOR LATCH STRIKER

1 - B-PILLAR
2 - SHIM
3 - DOOR LATCH STRIKER

INSTALLATION

(1) Position latch striker and any shims retrieved on vehicle.
(2) Loosely install screws attaching latch striker to B-pillar.
(3) Align latch striker to outline on B-pillar made previously.
(4) Tighten fasteners to 28 N·m (21 ft. lbs.) torque.
(5) Verify door fit and operation. Adjust latch striker as necessary.

LOCK CYLINDER

REMOVAL

(1) Roll door glass up.
(2) Remove front door watershield as necessary to gain access to the outside door handle. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL)
(3) Through access hole at rear of inner door panel, disconnect Vehicle Theft Security System (VTSS) switch connector from door harness, if equipped.
(4) Disengage push in fasteners attaching VTSS switch harness to inner door reinforcement bar, if equipped.

LOCK CYLINDER (Continued)

(5) Disengage clip holding door latch linkage to door latch (Fig. 12).
(6) Remove latch linkage from latch.
(7) Disengage clip holding door lock linkage to door latch.
(8) Remove lock linkage from latch.
(9) Remove nuts attaching outside door handle to door outer panel.
(10) Remove outside door handle from vehicle.
(11) Disengage clip holding lock cylinder into outside handle.
(12) Pull lock cylinder from door handle.

INSTALLATION

(1) Engage clip into outside handle to hold lock cylinder (Fig. 12).
(2) With link arm toward rear of vehicle, push lock cylinder into door handle until clip snaps into place.
(3) Insert lock linkage into door latch.
(4) Engage clip to hold door lock linkage to latch.
(5) Insert latch linkage into door latch.
(6) Engage clip to hold door latch linkage to latch.
(7) Install push in fasteners attaching VTSS switch harness to inner door reinforcement bar, if equipped.
(8) Connect VTSS switch connector into door harness, if equipped.
(9) Verify door latch operation.
(10) Install watershield and door trim panel.

TRIM PANEL

REMOVAL

(1) Remove the plug and remove screw attaching door pull cup to inner door panel.
(2) Remove switch bezel and disconnect power window/memory switch.
(3) Remove screws attaching trim panel to door from below map pocket.
(4) If equipped, remove window crank. (Refer to 23 - BODY/DOOR - FRONT/WINDOW CRANK - REMOVAL)
(5) Remove screw holding door trim to door panel from behind inside latch release handle.
(6) Disengage clips attaching door trim to door frame around perimeter of panel.
(7) Lift trim panel upward to disengage flange from inner belt molding at top of door.
(8) Tilt top of trim panel away from door to gain access to latch linkage.
(9) Disengage clip attaching linkage rod to inside latch release handle (Fig. 13).
(10) Separate linkage rod from latch handle.
(11) Disconnect the power door switch, courtesy lamp electrical connectors.

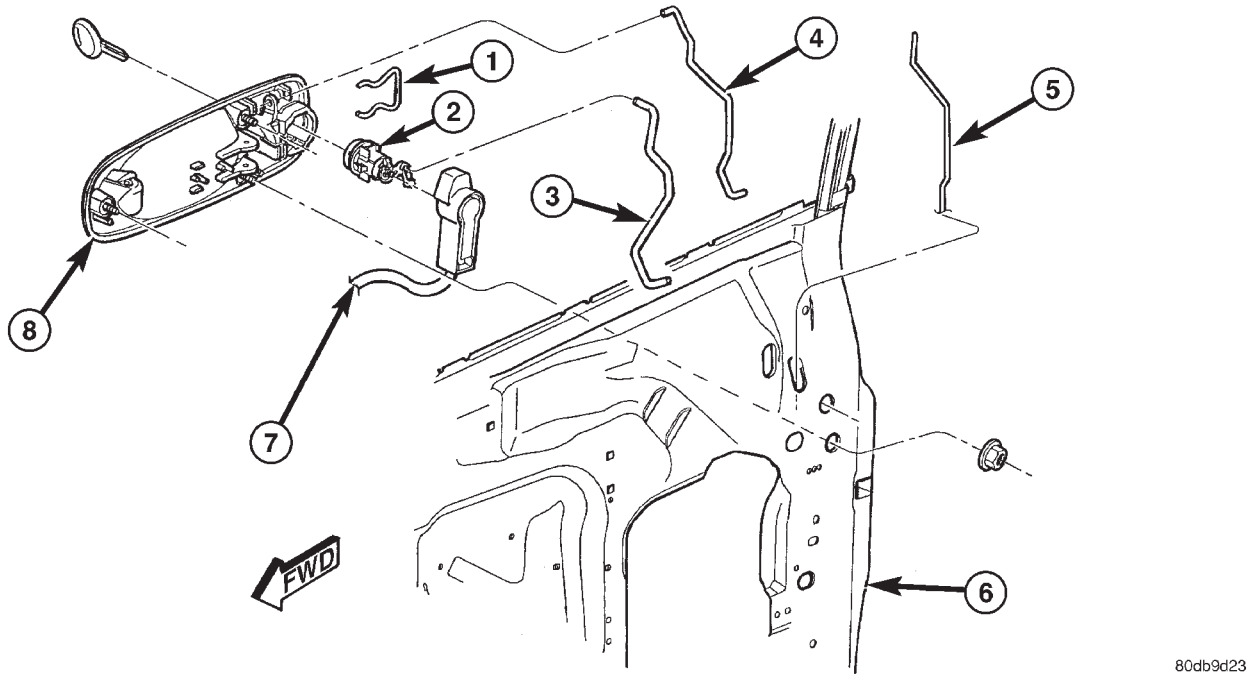

Fig. 12 OUTSIDE DOOR HANDLE

TRIM PANEL (Continued)

(12) Remove front door trim panel from vehicle.

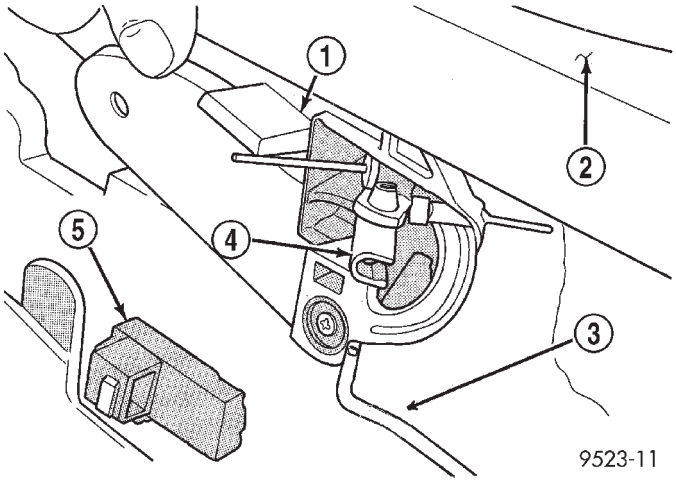

Fig. 13 INSIDE DOOR HANDLE LINKAGE

1 - DOOR LATCH HANDLE
2 - DOOR TRIM
3 - LATCH LINKAGE
4 - CLIP
5 - MEMORY SEAT SWITCH

INSTALLATION

(1) Hold top of trim panel away from door to gain access to latch linkage.
(2) Place linkage rod in position on latch handle.
(3) Engage clip to hold linkage rod to inside latch release handle.
(4) Place front door trim panel in position on door.
(5) Install trim panel into inner belt molding at top of door.
(6) Install clips to attach door trim to door frame around perimeter of panel.
(7) If equipped, install screw to attach door trim to door panel behind inside latch release handle.
(8) If equipped, connect power switch into wire connector.
(9) Place power accessary switch in position on door trim.
(10) Connect wire connector into memory seat/mirror switch and install switch into trim panel.
(11) Install screws to attach accessary switch panel to door trim.
(12) Install screw cover into switch panel.
(13) If equipped, install window crank.
(14) If equipped, install screws to attach trim panel to door inside map pocket.
(15) If equipped, install screw to attach door pull cup to inner door panel.
(16) If equipped, install screws to attach door assist handle to inner door panel.
(17) Connect wire connector into courtesy lamp.
(18) Install lamp in door trim.
(19) Install switch bezel.

WATERSHIELD

REMOVAL

(1) Remove door trim panel.
(2) Remove the front door speaker.
(3) Peel watershield away from adhesive around perimeter of inner door panel.

INSTALLATION

(1) Insure that enough adhesive remains to securely retain the water dam. Replace as necessary.
(2) Place the sound shield into position and press securely to adhesive making sure to properly route wiring and linkages.
(3) Install door trim panel.

WINDOW CRANK

REMOVAL

(1) Using a window crank removal tool, disengage clip attaching window crank to regulator shaft (Fig. 14).

NOTE: Wrap a shop towel around the window crank to catch the clip when it springs out.

(2) Pull window crank from regulator shaft.

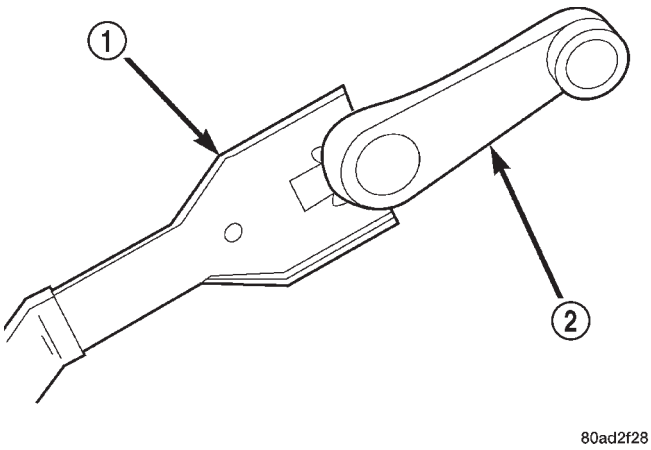

Fig. 14 WINDOW CRANK - TYPICAL

1 - WINDOW CRANK REMOVAL TOOL
2 - WINDOW CRANK

INSTALLATION

(1) Place the clip on to the window crank handle.
(2) Position window crank to regulator shaft.
(3) Push window crank onto regulator shaft to engage retaining clip.

WINDOW REGULATOR

REMOVAL

(1) Remove the watershield. (Refer to 23 - BODY/ DOOR - FRONT/WATERSHIELD - REMOVAL)

(2) Remove door glass retaining clips and secure the window in the up position using masking tape or equivalent (Fig. 15).

(3) Disconnect wire connector from power window motor, if equipped.

(4) Loosen screws attaching front and rear window guide rails to inner door panel (Fig. 16).

(5) Remove screw heads on guide rails from key hole slots in inner door panel.

(6) Loosen screws attaching regulator to inner door panel.

(7) Remove regulator from inner door panel.

(8) Extract rear guide rail through inner door panel rear access hole (Fig. 17).

(9) Extract front guide rail through front access hole.

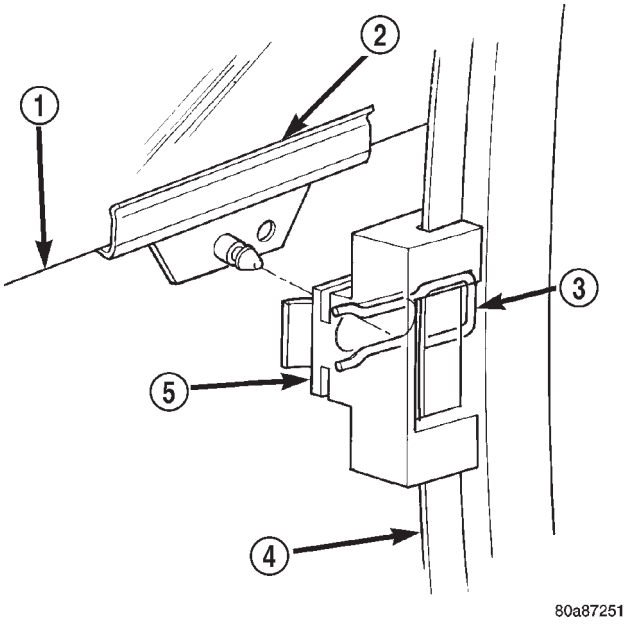

Fig. 15 FRONT DOOR GLASS CLIPS

1 - DOOR GLASS
2 - GLASS LIFT PLATE
3 - CLIP
4 - GUIDE RAIL
5 - REGULATOR LIFT PLATE

INSTALLATION

(1) Insert front guide rail through front access hole.

(2) Insert rear guide rail through rear access hole.

(3) Place window regulator in position on inner door panel.

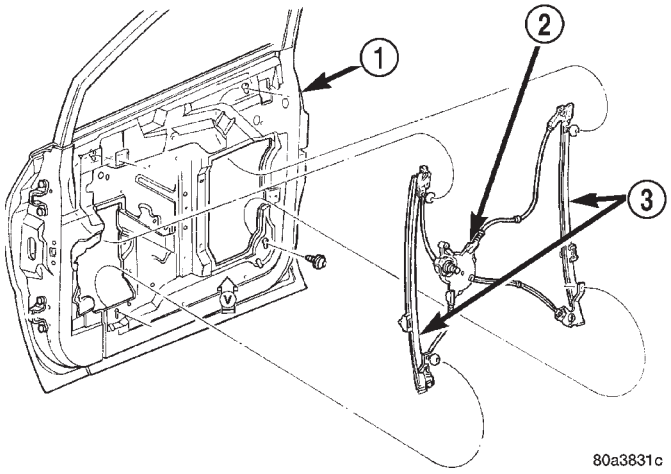

Fig. 16 FRONT DOOR MANUAL WINDOW REGULATOR - TYPICAL

1 - FRONT DOOR
2 - MANUAL WINDOW REGULATOR
3 - GUIDE RAILS

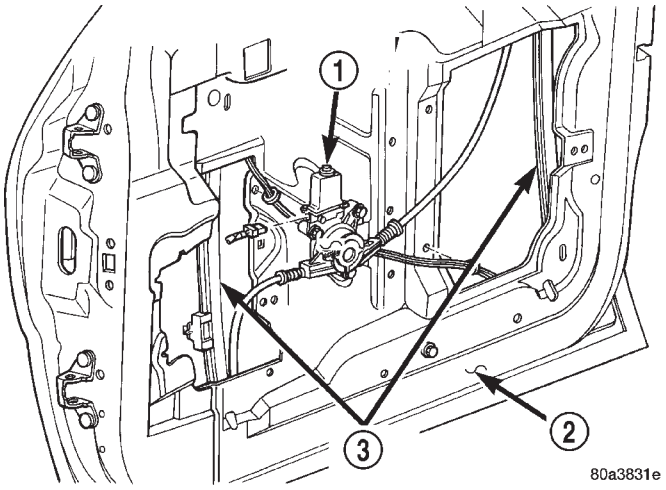

Fig. 17 FRONT DOOR POWER WINDOW - TYPICAL

1 - POWER WINDOW MOTOR
2 - FRONT DOOR
3 - GUIDE RAILS

(4) Place screw heads on guide rails in position through key hole slots in inner door panel.

(5) Tighten screws to attach front and rear guide rails to inner door panel.

(6) Connect wire connector into power window motor, if equipped.

(7) Install door glass.

(8) Verify door glass alignment and operation.

(9) Install sound shield and door trim panel.

EXTERIOR HANDLE

REMOVAL

(1) Roll door glass up.
(2) Remove the watershield. (Refer to 23 - BODY/ DOOR - FRONT/WATERSHIELD - REMOVAL)
(3) Through access hole at rear of inner door panel, disconnect Vehicle Theft Security System (VTSS) switch connector from door harness, if equipped.
(4) Disengage push in fasteners attaching VTSS switch harness to inner door reinforcement bar, if equipped.
(5) Disengage clip holding door latch linkage to door latch (Fig. 12).
(6) Remove latch linkage from latch.
(7) Disengage clip holding door lock linkage to door latch.
(8) Remove lock linkage from latch.
(9) Remove nuts holding outside door handle to door outer panel.
(10) Remove outside door handle from vehicle.

INSTALLATION

If outside door handle replacement is necessary, transfer lock cylinder from the original handle to the new one.
(1) Place outside door handle in position on vehicle.
(2) Install nuts attaching outside door handle to door outer panel (Fig. 12). Tighten nuts to 6 N·m (50 in. lbs.).
(3) Insert lock linkage into door latch.
(4) Engage clip to hold door lock linkage to latch.
(5) Insert latch linkage into door latch.
(6) Engage clip to hold door latch linkage to latch.
(7) Install push-in fasteners to hold VTSS switch harness to inner door reinforcement bar, if equipped.
(8) Connect VTSS switch connector into door harness, if equipped.
(9) Verify door latch operation.
(10) Install sound shield and door trim panel.

CENTER HINGE

REMOVAL

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Open sliding door to the mid point of its travel.
(2) Support sliding door on a suitable lifting device.
(3) Mark outline of center hinge of inner door panel to aid installation.
(4) Remove bolts attaching center hinge to sliding door.
(5) Remove center hinge from sliding door.
(6) Roll center hinge to rear of roller channel.
(7) Remove center hinge from vehicle.

INSTALLATION

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

NOTE: Center hinge has an adjustable bolt for up/down alignment. (Refer to 23 - BODY/DOORS - SLIDING/SLIDING DOOR - ADJUSTMENTS)

(1) Place center hinge in position on vehicle.

CENTER HINGE (Continued)

(2) Roll center hinge forward in roller channel.
(3) Place center hinge in position on sliding door and align marks.
(4) Install bolts attaching center hinge to sliding door.
(5) Verify sliding door alignment and operation.

SLIDING DOOR STOP BUMPER BEZEL

REMOVAL

(1) Using a trim stick (C-4755), disengage clips attaching door stop bumper bezel to the door trim panel.
(2) Remove bezel from vehicle (Fig. 1).

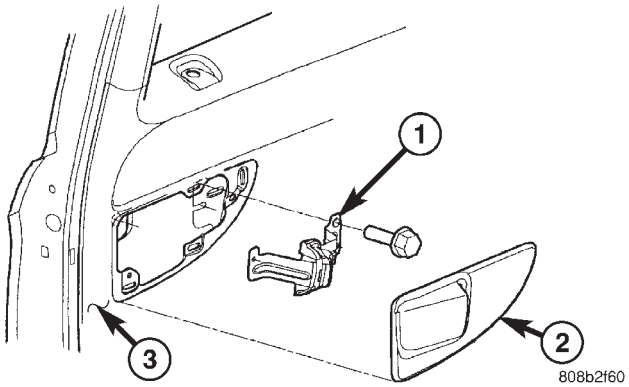

Fig. 1 SLIDING DOOR STOP BUMPER

1 - DOOR STOP BUMPER
2 - DOOR STOP BUMPER BEZEL
3 - SLIDING DOOR

INSTALLATION

(1) Place door stop bumper bezel into position (Fig. 1).
(2) Engage clips attaching door stop bumper bezel to the door trim panel.

STOP BUMPER

REMOVAL

(1) Remove door stop bumper bezel.
(2) Loosen screws attaching rear of stop bumper to door inner panel (Fig. 1).
(3) Remove screw attaching front of door stop bumper to door inner panel.
(4) Remove door stop bumper from vehicle.

INSTALLATION

(1) Place stop bumper in position on vehicle.
(2) Install screw attaching front of stop bumper to door inner panel (Fig. 1).
(3) Tighten screws attaching rear of stop bumper to door inner panel.
(4) Install door stop bumper bezel.

HOLD OPEN LATCH

REMOVAL

(1) Open sliding door.
(2) Remove sliding door sill plate. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - REMOVAL)
(3) Remove nuts attaching hold open latch to lower roller arm (Fig. 2).
(4) Remove hold open latch from lower arm.
(5) Disconnect cable from hold open latch.
(6) Remove hold open latch from vehicle.

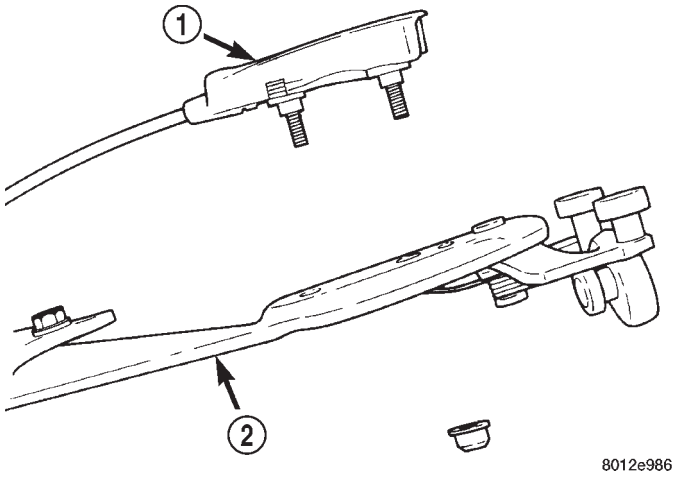

Fig. 2 SLIDING DOOR HOLD OPEN LATCH

1 - SLIDING DOOR HOLD OPEN LATCH - MANUAL DOOR
2 - LOWER ROLLER ARM

INSTALLATION

(1) Place hold open latch in position on vehicle.
(2) Connect cable to hold open latch.
(3) Place hold open latch in position on lower arm.
(4) Install nuts attaching the hold open latch to lower roller arm. Tighten nuts to 5 N·m (45 in. lbs.) torque.
(5) Install sliding door sill plate. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - INSTALLATION)
(6) Verify sliding door operation.

HOLD OPEN LATCH STRIKER

REMOVAL

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Open sliding door, do not latch open.
(2) Remove sliding door sill plate. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - REMOVAL)
(3) Remove two bolts attaching sliding door hold open latch striker to door sill (Fig. 3).
(4) Remove hold open latch striker from vehicle.

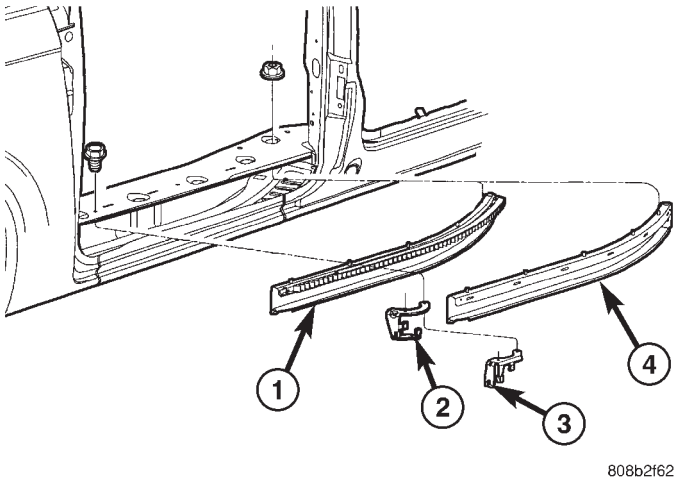

Fig. 3 SLIDING DOOR HOLD OPEN LATCH STRIKER

1 - POWER DOOR LOWER TRACK
2 - POWER DOOR HOLDING STRIKER
3 - MANUAL DOOR HOLDING STRIKER
4 - MANUAL DOOR LOWER TRACK

INSTALLATION

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Place hold open latch striker in position on vehicle.
(2) Install two bolts attaching sliding door hold open latch striker to door sill.
(3) Install sliding door sill plate. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - INSTALLATION)
(4) Verify sliding door operation.

LATCH / LOCK ASSEMBLY

REMOVAL

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Remove sliding door trim panel. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL)
(2) Remove sliding door stop bumper. (Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - REMOVAL)
(3) Peel watershield away from adhesive around perimeter of inner door panel.

CAUTION: Replace the latch/lock control if any of the metal clips on the latch/lock control are bent or broken. DO NOT attempt to repair the clips to retain the links.

(4) Disengage external cable from latch/lock assembly (Fig. 4).
(5) Remove foam block.
(6) Remove inside door handle assembly (Refer to 23 - BODY/DOORS - SLIDING/INSIDE LATCH HANDLE - REMOVAL).
(7) Disengage inside cable from latch/lock assembly.
(8) Disengage link from bellcrank.
(9) Disengage hold open latch cable from lower hinge.
(10) Remove bolts attaching latch/lock control to sliding door (Fig. 5).
(11) If equipped, lower latch and disconnect wire connector from power door lock motor.
(12) Remove latch/lock from door.

INSTALLATION

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Position latch/lock locking lever in unlocked position.
(2) Place latch/lock in position on door (Fig. 5).
(3) If equipped, engage wire connector into power door lock motor (Fig. 4).
(4) Insert bolt into slots in sliding door inner panel.
(5) Tighten bolts attaching latch/lock assembly to sliding door.
(6) Engage inside cable into latch/lock assembly.

LATCH / LOCK ASSEMBLY (Continued)

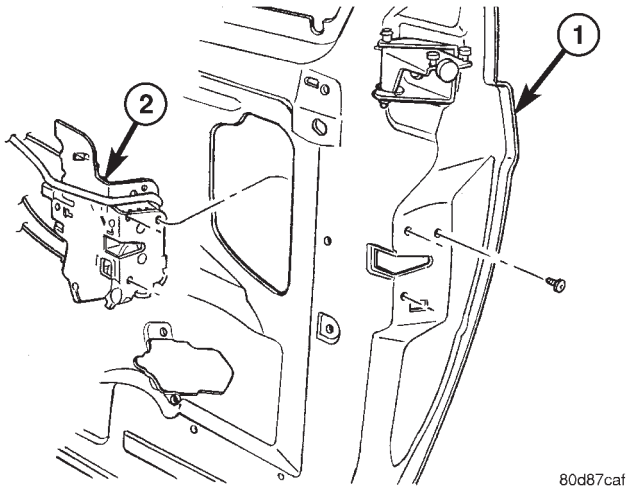

Fig. 4 SLIDING DOOR LATCH/LOCK ASSEMBLY

1 - SLIDING DOOR
2 - LATCH LOCK ASSEMBLY

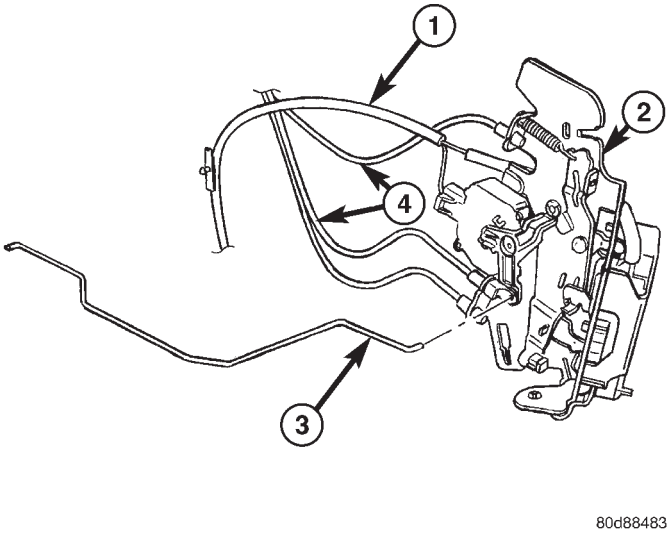

Fig. 5 REMOVING SLIDING DOOR LATCH/LOCK ASSEMBLY

1 - WIRE HARNESS
2 - LATCH/LOCK ASSEMBLY
3 - BELLCRANK LINK ROD
4 - LINK AND SLEEVE ASSEMBLY

(7) Install inside door handle assembly (Refer to 23 - BODY/DOORS - SLIDING/INSIDE LATCH HANDLE - INSTALLATION).

(8) Install foam block.

(9) Engage external cable to latch/lock assembly.

(10) Engage link rod to bellcrank.

(11) Engage hold open latch cable from lower hinge.

(12) Engage clip to hold bellcrank link to latch/lock control.

(13) Verify sliding door operation.

(14) Install latch/lock cover.

(15) Insure that enough adhesive remains to securely retain the watershield. Replace as necessary.

(16) Place the watershield into position and press securely to adhesive making sure to properly route wiring and linkages.

(17) Install sliding door stop bumper.(Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - INSTALLATION)

(18) Install sliding door trim panel.(Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - INSTALLATION)

CENTER STRIKER

REMOVAL

(1) Remove sliding door trim panel. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL)

(2) Remove bolts attaching stop bumper. Remove stop bumper from door.

(3) Remove screws attaching center striker assembly to door end frame (Fig. 6).

(4) Remove center striker assembly from door through access hole.

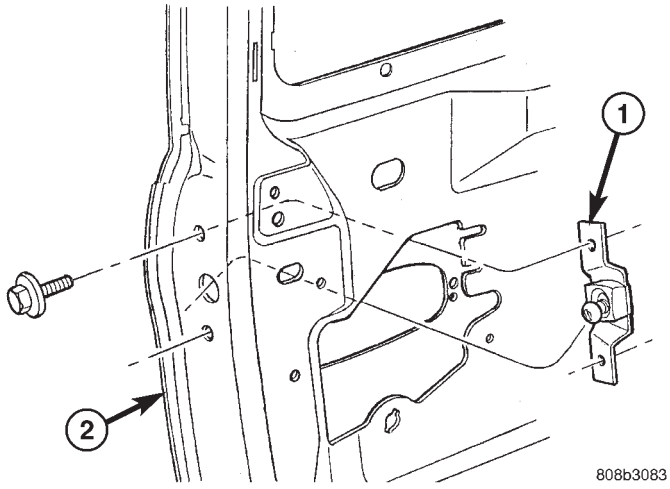

Fig. 6 SLIDING DOOR CENTER STRIKER ASSEMBLY

1 - STRIKER BOLT ASSEMBLY
2 - SLIDING DOOR

INSTALLATION

(1) Place center striker in position on door through access hole (Fig. 6).

(2) Install screws to attach center striker to door end frame.

CENTER STRIKER (Continued)

(3) Install bolts attaching stop bumper.
(4) Install sliding door trim panel (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - INSTALLATION).

LOWER HINGE

REMOVAL

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Open sliding door.
(2) Mark outline of roller arm on sliding door to aid installation (Fig. 7).
(3) Remove sliding door sill plate. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - REMOVAL)
(4) Remove screws attaching open latch to lower roller arm.
(5) Remove open latch from lower arm.
(6) Support sliding door on a suitable lifting device with a padded upper surface. The door must be moveable with lifting device in place.
(7) Remove hold open latch striker.
(8) Remove bolts attaching lower roller arm to sliding door.
(9) Remove roller arm from sliding door.
(10) Disengage roller arm from lower channel.
(11) Remove roller arm from vehicle.

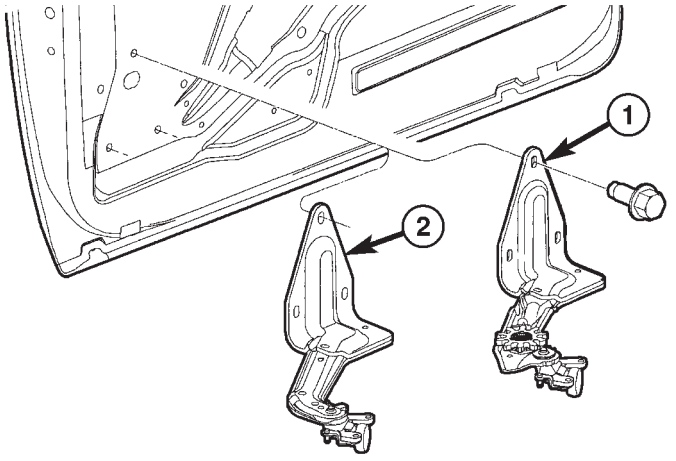

Fig. 7 SLIDING DOOR LOWER ROLLER ARM

1 - POWER LOWER ROLLER ARM
2 - MANUAL LOWER ROLLER ARM

INSTALLATION

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Place roller arm into position (Fig. 7).
(2) Engage roller arm to lower channel.
(3) Install roller arm to sliding door.
(4) Install bolts attaching lower roller arm to sliding door.
(5) Install hold open latch striker.
(6) Install screws attaching open latch to lower roller arm.
(7) Install sliding door sill plate. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - INSTALLATION)
(8) Check sliding door for proper operation.

REAR LATCH STRIKER

REMOVAL

(1) Open sliding door.
(2) Mark outline of striker on C-pillar door jamb face to aid installation.
(3) Remove screws attaching striker to C-pillar (Fig. 8).
(4) Remove striker from vehicle.

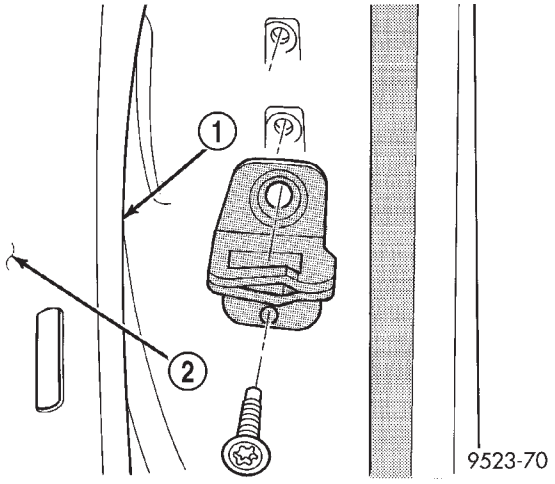

Fig. 8 SLIDING DOOR LATCH STRIKER

1 - LATCH STRIKER
2 - SLIDING DOOR

INSTALLATION

(1) Place striker in position on vehicle.
(2) Align striker to outline marks on C-pillar.
(3) Install screws attaching striker to C-pillar. Tighten screws to 28 N·m (21 ft. lbs.) torque.
(4) Verify sliding door alignment and operation.

SLIDING DOOR

REMOVAL

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Apply masking tape to outside surface of quarter panel below the center roller channel, rearward of the door opening.
(2) Release sliding door latch and open door.
(3) Apply masking tape to door jamb area, rearward of the upper roller channel.
(4) Remove screw attaching upper stop bumper to upper roller arm (Fig. 9).
(5) Remove upper stop from upper roller arm.
(6) Remove center stop from sliding door. (Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - REMOVAL)
(7) Remove sliding door sill plate. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - REMOVAL)
(8) Remove hold open latch striker (Refer to 23 - BODY/DOORS - SLIDING/HOLD OPEN LATCH STRIKER - REMOVAL).
(9) Open quarter glass.
(10) Remove center roller channel end cover (Fig. 10).
(11) Support sliding door on a suitable lifting device with a padded upper surface. The door must be moveable with lifting device in place.

CAUTION: Do not allow the center hinge roller to contact the quarter glass. Glass can break.

(12) Slide door rearward until the upper sliding door hinge roller disengages from the upper channel (Fig. 11).
(13) Continue moving the door rearward until the lower rollers exit the lower track.
(14) Continue moving door rearward till center hinge roller exits the channel (Fig. 12)
(15) Remove sliding door from vehicle.

INSTALLATION

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

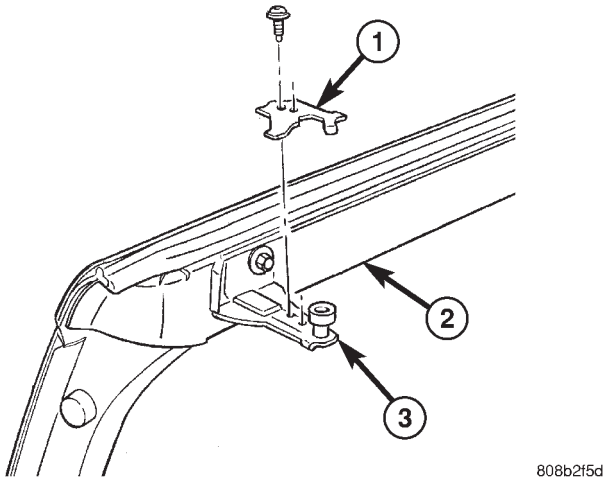

Fig. 9 SLIDING DOOR UPPER STOP

1 - UPPER STOP PLATE
2 - SLIDING DOOR
3 - UPPER SLIDING DOOR HINGE

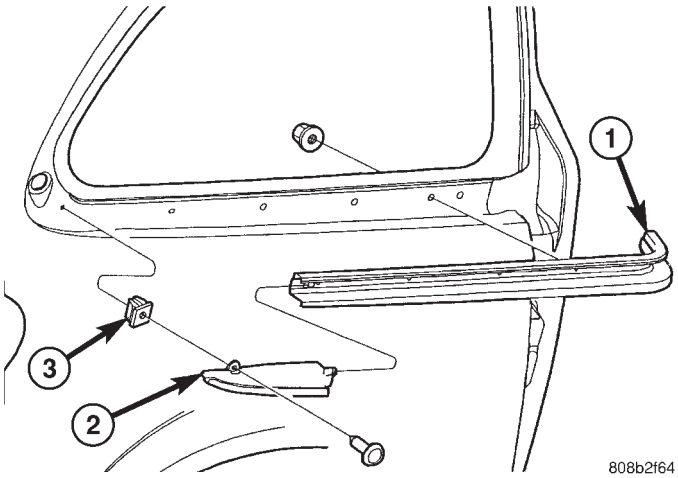

Fig. 10 CENTER CHANNEL END COVER

1 - CENTER CHANNEL
2 - CENTER CHANNEL END COVER
3 - PLASTIC NUT

(1) Place sliding door in position on lifting device.
(2) Engage center hinge roller into channel and move door forward (Fig. 12).
(3) Position door rearward of the sliding door opening.

CAUTION: Do not allow the center hinge roller to contact the quarter glass. Glass can break.

SLIDING DOOR (Continued)

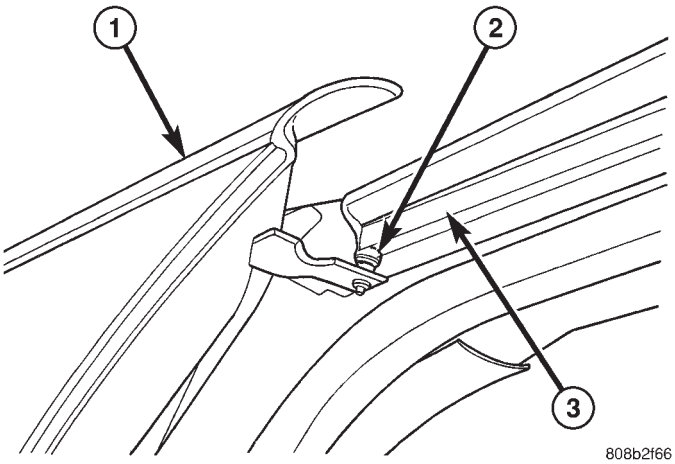

Fig. 11 SLIDING DOOR UPPER ROLLER

1 - SLIDING DOOR
2 - UPPER HINGE
3 - UPPER CHANNEL

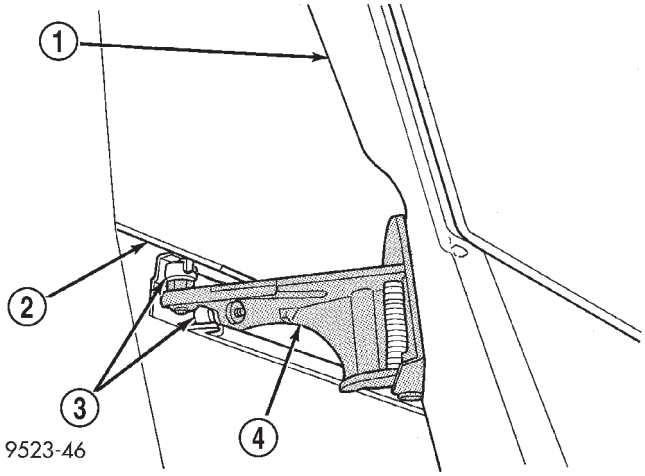

Fig. 12 SLIDING DOOR CENTER ROLLER

1 - SLIDING DOOR
2 - QUARTER GLASS
3 - CENTER HINGE ROLLERS
4 - CENTER HINGE

(4) Engage the center hinge roller into the channel (Fig. 12).

(5) Roll door forward until lower roller engage into rear of the track.

(6) Engage the upper sliding door hinge into the upper channels (Fig. 11).

(7) Install hold open latch striker(Refer to 23 - BODY/DOORS - SLIDING/HOLD OPEN LATCH STRIKER - INSTALLATION).

(8) Install sliding door sill plate.

(9) Install center roller channel end cover (Fig. 10).

(10) Install center stop on sliding door. (Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - INSTALLATION)

(11) Place upper roller stop bumper in position on upper roller arm.

(12) Install screw attaching upper roller arm stop bumper to upper roller arm (Fig. 9).

(13) Remove masking tape from body surfaces.

(14) Verify door operation and fit. Adjust as necessary. (Refer to 23 - BODY/DOORS - SLIDING/SLIDING DOOR - ADJUSTMENTS)

ADJUSTMENTS

SLIDING DOOR ADJUSTMENTS

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

PRELIMINARY CHECKS

(1) Close the sliding door, visually checking C-post striker alignment entry into latch. Striker at this point must not affect alignment. Striker should go straight into the latching mechanism.

(2) On vehicles with left sliding doors, check the fuel door blocker striker entry into latch. Striker at this point must not affect alignment.

(3) Check C-post and B-post for door to aperture gaps and door to door gaps. All gaps should be 5 mm ± 1 mm.

(4) Check door for height using character lines as a reference. Also check roof contour as a controlling factor.

Using the procedures noted below, adjust the side door in the order the individual steps are called out.

DOOR FLUSHNESS ADJUSTMENT

(1) Check sliding door flushness at the C-pillar striker.

(2) Adjust the C-pillar striker in or out until the door is flush.

(3) Check upper B-pillar flushness to A-pillar cover.

(4) Loosen one nut on upper hinge and adjust door in or out until the door is flush.

(5) Check flushness at upper C-pillar.

(6) If upper C-pillar flushness is out of specification use a heavy rubber mallet on the door assembly until door is in specifications.

DOOR GAP ADJUSTMENT - UP/DOWN

(1) Visually inspect the sliding door for fitting low at the top of the door by checking the alignment of the top contour of the door to the quarter panel.

SLIDING DOOR (Continued)

(2) Fully open the sliding door.
(3) Verify that all center hinge bolts are tight.
(4) Adjust the rear of the sliding door up by turning the center hinge bolt clockwise (Fig. 13).
(5) Close the door and check the sliding door alignment.
(6) Adjust the front of the sliding door up by adjusting lower hinge bolts.
(7) Open door half way and remove lower hinge bolt access plug.
(8) Loosen bolts as necessary to move the front of door up or down.
(9) Check the upper hinge for possible bind, adjust as necessary.
(10) Close the door and check the sliding door alignment.
(11) Fully open door and apply thread lock nut onto the center hinge bolt. Tighten nut until till it butts up against the welded nut on the center hinge. Tighten nut to 15 N·m (130 in. lbs.). It may be necessary to hold the center hinge bolt to prevent it from turning while tightening nut.
(12) Verify alignment, adjust as necessary.

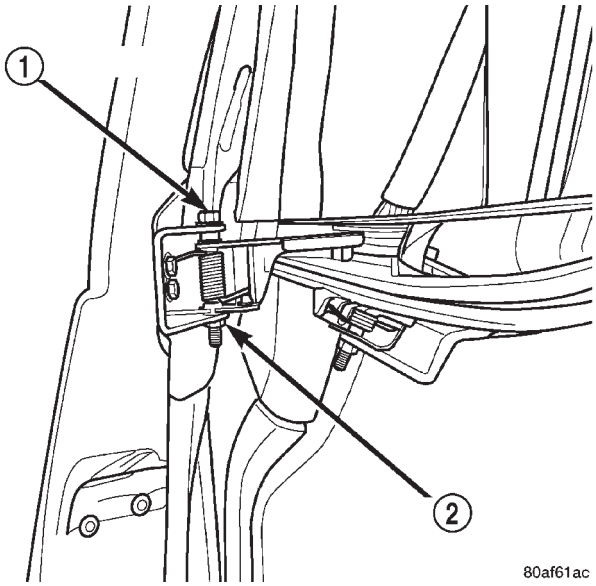

Fig. 13 SLIDING DOOR CENTER HINGE

1 - ADJUSTING BOLT
2 - WELD NUT

DOOR GAP ADJUSTMENT - FORE/AFT

(1) Check height of sliding door at the B-post and C-post to determine which area is contributing the greatest to the incorrect gaps.
(2) If the sliding door is high at the C-post;
(a) Open the door to mid-point of travel.
(b) Mark outline of center hinge on sliding door to assist in making adjustments.
(c) Loosen center hinge bolts (Fig. 13).
(d) Move hinge fore or aft to position the sliding door into the correct location.
(e) Tighten center hinge bolts.
(f) Verify alignmen, adjust as necessary.
(3) If the sliding door is low at the B-post;
(a) Remove access plug in the sliding door trim panel.
(b) Open the door to mid-point of travel.
(c) Mark outline of lower roller arm bracket on sliding door to assist in making adjustments.
(d) Loosen lower roller arm bracket bolts (Fig. 14).
(e) Move hinge downward to raise the door.
(f) Tighten lower roller arm bracket bolts.
(g) Verify alignment, adjust as necessary.

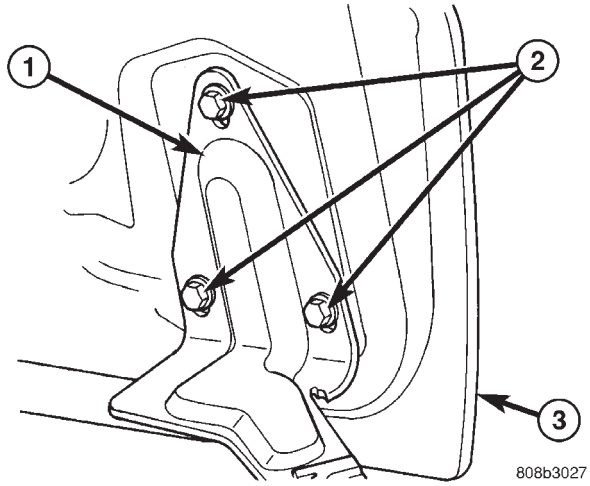

Fig. 14 SLIDING DOOR LOWER ROLLER ARM

1 - LOWER ROLLER ARM BRACKET
2 - BOLTS
2 - SLIDING DOOR

(4) If the sliding door is low at the C-post;
(a) Open the door to mid-point of travel.
(b) Mark outline of center hinge on sliding door to assist in making adjustments.
(c) Adjust the adjustment bolt up or down to move the door position. (Fig. 13).
(d) Move hinge downward to raise the door.
(e) Tighten center hinge bolts.
(f) Verify alignment adjust as necessary.
(5) If the sliding door is high at the B-post;
(a) Remove access plug in the sliding door trim panel.
(b) Open the door to mid-point of travel.
(c) Mark outline of lower roller arm bracket on sliding door to assist in making adjustments.
(d) Loosen lower roller arm bracket bolts (Fig. 14).
(e) Move hinge upward to raise the door.
(f) Tighten lower roller arm bracket bolts.
(g) Verify alignment, adjust as necessary.

SLIDING DOOR (Continued)

DOOR SEAL COMPRESSION

(1) First check Gap & Flush (Refer to 23 - BODY/ BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS). Check seal compression near the middle of the door even with the latch assembly. Using a piece of paper, place it across door seal and close door. Pull paper out of door opening. If paper tears setting is to tight, if paper slides thought to easily the compression is insufficient and needs to be adjusted.

(2) Adjust seal compression at the top of the B-post seal;

(a) Open door to mid-point of travel.

(b) Mark outline of upper roller arm on door to assist in making adjustments.

(c) Loosen bolts attaching upper roller arm to door (Fig. 9).

(d) Decrease the length of the upper roller arm to increase seal compression.

(e) Increase the length of the upper roller arm to decrease seal compression.

(f) Tighten all upper roller arm bolts.

(g) Verify door alignment, adjust as necessary.

(3) Adjust seal compression at the bottom of B-post seal.

(a) Open door to mid-point of travel.

(b) Mark outline of lower roller arm on lower roller arm bracket to assist in making adjustments (Fig. 15).

(c) Loosen bolts holding lower roller arm to lower roller arm bracket.

(d) Pivot lower roller arm toward center of vehicle to decrease seal compression.

(e) Pivot lower roller arm outward to increase seal compression.

(f) Tighten lower roller arm bolts.

(g) Verify alignment, adjust as necessary.

NOTE: Adjusting seal compression at the B-post can affect door flushness the C-post.

STABILIZER ADJUSTMENT - UPPER/LOWER

(1) Open sliding door.

(2) Loosen the bolts holding the male stabilizers to the sliding door enough that the stabilizers can move with some effort.

(3) Close and then reopen sliding door.

(4) Tighten all stabilizers bolts.

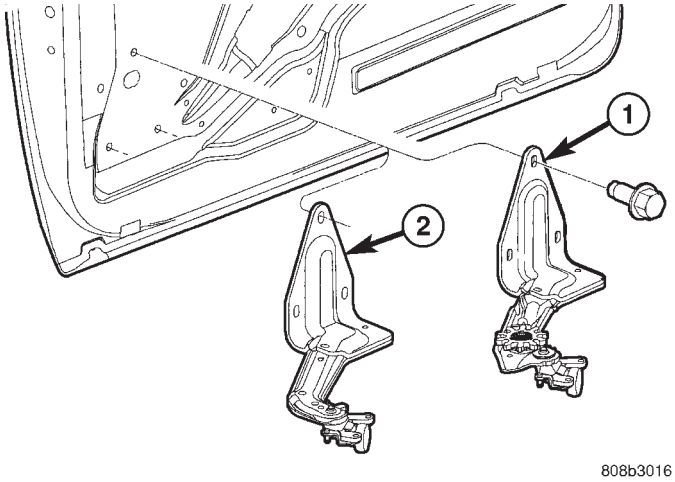

Fig. 15 Sliding Door Lower Roller Arm

1 - POWER LOWER ROLLER ARM
2 - MANUAL LOWER ROLLER ARM

STABILIZER

REMOVAL

(1) Open sliding door.

(2) Remove screws attaching stabilizer to door end frame (Fig. 16).

(3) Remove stabilizer from vehicle.

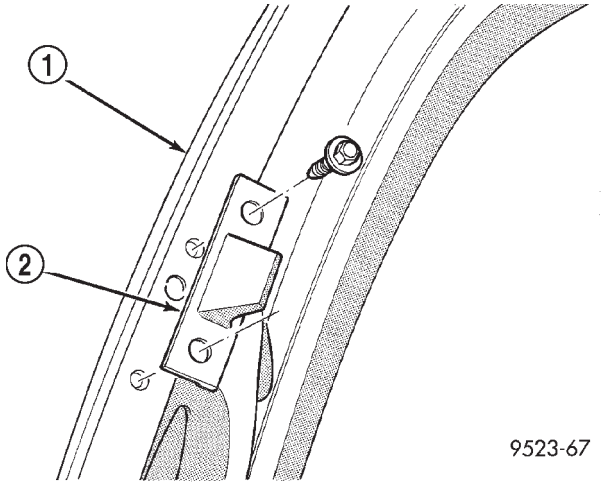

Fig. 16 SLIDING DOOR STABILIZER

1 - SLIDING DOOR
2 - STABILIZER

INSTALLATION

(1) Place stabilizer in position on vehicle.

NOTE: Loose install screws first. Fit should be snug but free to move when closing door to align to body half stabilizer.

STABILIZER (Continued)

(2) Install screws attaching stabilizer to door end frame.
(3) Open door and final tighten screws.
(4) Verify sliding door operation.

STABILIZER SOCKET

REMOVAL

(1) Open sliding door.
(2) Remove screws holding stabilizer socket to B-pillar (Fig. 17).
(3) Remove stabilizer socket from vehicle.

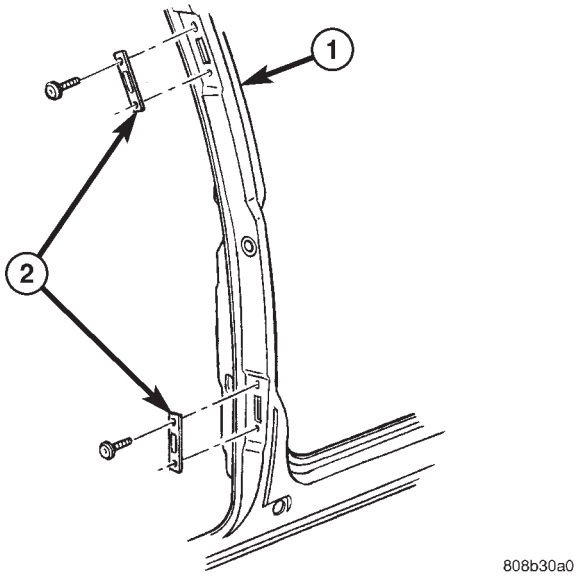

Fig. 17 SLIDING DOOR STABILIZER SOCKET

1 - B-PILLAR
2 - STABILIZER SOCKET

INSTALLATION

(1) Place stabilizer socket in position on vehicle.
(2) Install screws to hold stabilizer socket to B-pillar. Tighten nuts to 5 N·m (45 in. lbs.) torque.
(3) Close sliding door and verify operation.

TRIM PANEL

REMOVAL

(1) Remove sliding door upper frame molding.
(2) If removing the left sliding door trim panel, remove screw from inside ash receiver bezel.
(3) Remove screw from pull cup.
(4) Disengage push-in fasteners holding trim to door panel around perimeter and upper edge of door (Fig. 18).
(5) Remove sliding door trim panel from vehicle.

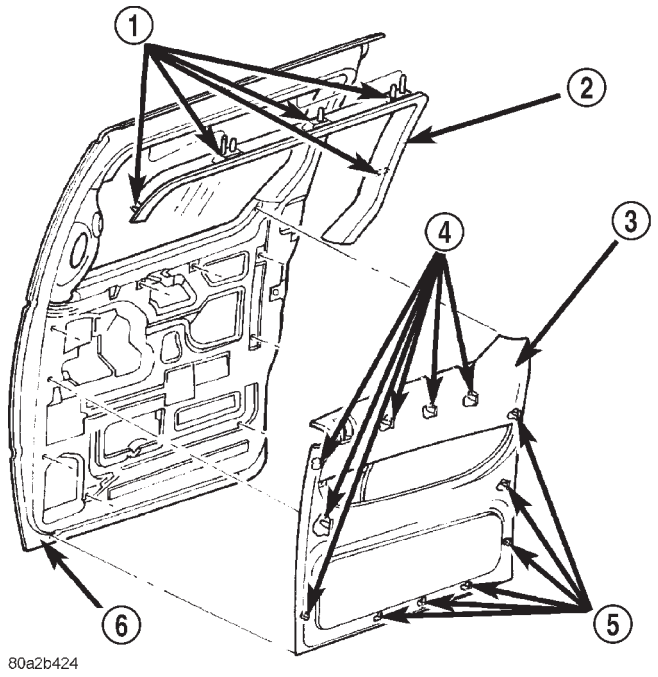

Fig. 18 SLIDING DOOR TRIM PANEL

1 - PUSH-IN FASTENERS
2 - SLIDING DOOR UPPER FRAME MOLDING
3 - SLIDING DOOR TRIM PANEL
4 - PUSH-IN FASTENERS
5 - PUSH-IN FASTENERS
6 - SLIDING DOOR

INSTALLATION

(1) Place sliding door trim panel in position on vehicle.
(2) Align locating pins on backside of trim panel to mating holes in the inner door panel.
(3) Engage push-in fasteners to hold trim to door panel around perimeter and upper edge of door (Fig. 18).
(4) Install pull cup screw.
(5) If necessary, install screw from inside ash receiver bezel on left sliding door trim panel.
(6) Install sliding door upper frame molding.

INSIDE LATCH HANDLE

REMOVAL

(1) Remove sliding door trim panel. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL)
(2) Remove screws attaching bottom of inside latch handle to sliding door (Fig. 19).
(3) Remove two screw attaching top of inside latch handle to sliding door.
(4) Remove latch handle from sliding door.

INSIDE LATCH HANDLE (Continued)

(5) Disengage cable end from clip on release handle mechanism.
(6) Disengage cable end from release handle mechanism.
(7) Remove push pin fastener attaching cable end to release handle.
(8) Disengage cable casing end from release handle (Fig. 20).
(9) Disengage cable end from latch handle.
(10) Remove handle from vehicle.

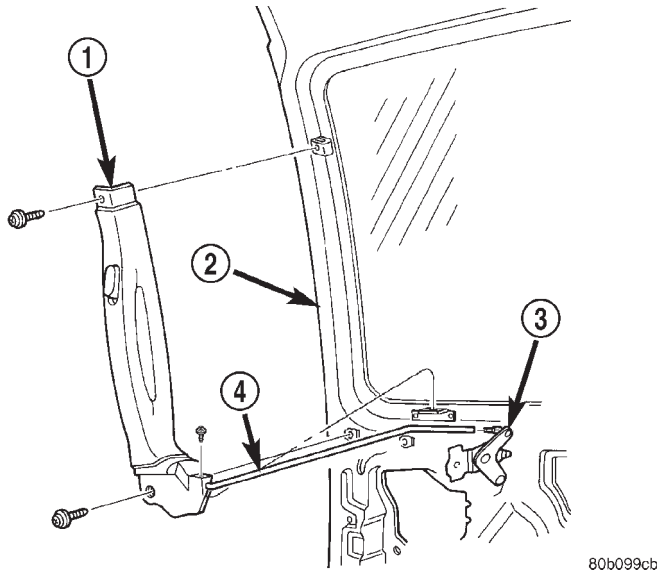

Fig. 19 SLIDING DOOR INSIDE HANDLE

1 - INSIDE ASSIST HANDLE
2 - SLIDING DOOR
3 - LATCH BELLCRANK
4 - INSIDE RELEASE HANDLE CABLE

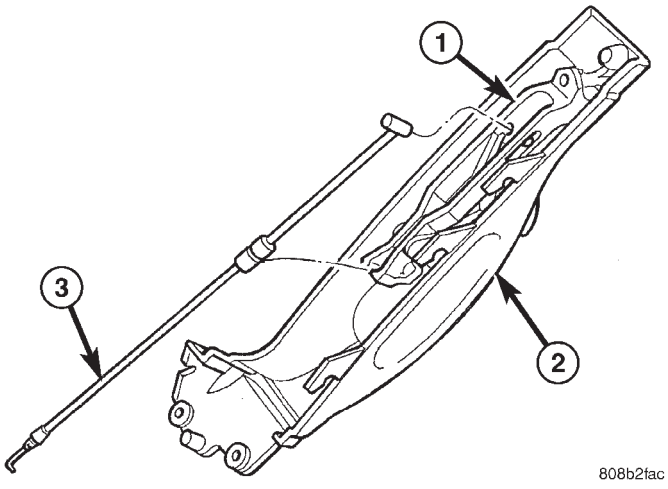

Fig. 20 RELEASE HANDLE CABLE

1 - ASSIST HANDLE MECHANISM
2 - SLIDING DOOR INSIDE ASSIST HANDLE
3 - RELEASE HANDLE CABLE

INSTALLATION

(1) Place inside latch handle in position on vehicle.
(2) Engage cable end into latch handle.
(3) Engage cable casing end into release handle.
(4) Install push pin fastener to hold cable into release handle.
(5) Engage cable end into release handle mechanism.
(6) Engage clip to hold cable end into release handle mechanism.
(7) Place latch handle in position on sliding door.
(8) Install screw to hold top of inside release handle to sliding door.
(9) Install screws to hold bottom of inside latch handle to sliding door.
(10) Verify sliding door operation. Adjust as necessary. (Refer to 23 - BODY/DOORS - SLIDING/SLIDING DOOR - ADJUSTMENTS)
(11) Install sliding door trim panel.(Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - INSTALLATION)

BELLCRANK

REMOVAL

(1) Remove stop bumper (Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - REMOVAL).
(2) Remove sliding door trim panel. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL)
(3) Peel watershield away from adhesive around perimeter of inner door panel as necessary to gain access to latch bellcrank.
(4) Disengage key cylinder link (Fig. 21).
(5) Disengage lock link.
(6) Disengage link and sleeve
(7) Remove bellcrank by rotating bellcrank to release it from door.
(8) Remove bellcrank from vehicle.

INSTALLATION

(1) Position bellcrank on vehicle.
(2) Rotate bellcrank into position.
(3) Place lock link into position and engage clip (Fig. 21).
(4) Place link and sleeve into position and engage clip.
(5) Place key cylinder link into position and engage clip.
(6) Place the watershield into position and press securely to adhesive making sure to properly route wiring and linkages.
(7) Install sliding door trim panel (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - INSTALLATION).

BELLCRANK (Continued)

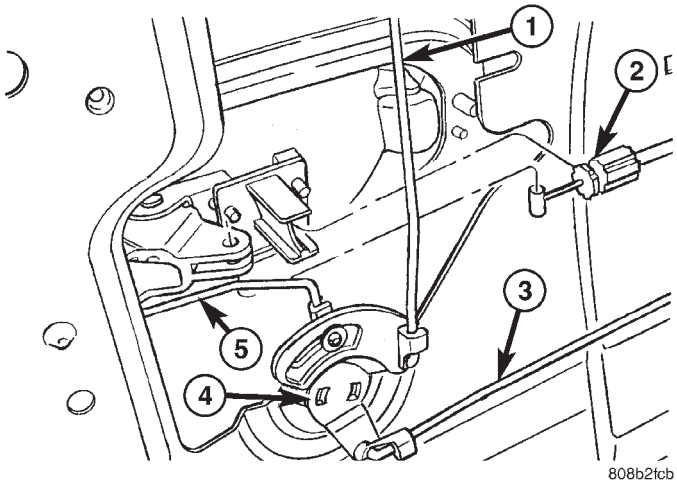

Fig. 21 BELLCRANK

1 - LOCK LINK
2 - LATCH LINK
3 - LINK AND SLEEVE - OUTSIDE HANDLE
4 - BELLCRANK
5 - KEY CYLINDER LINK

(8) Install stop bumper (Refer to 23 - BODY/ DOORS - SLIDING/STOP BUMPER - INSTALLATION).

OUTSIDE HANDLE

REMOVAL

(1) Remove sliding door trim panel. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL)

(2) Remove sliding door stop bumper. (Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - REMOVAL)

(3) Peel watershield away from adhesive around perimeter of inner door panel as necessary to access outside release handle fasteners.

(4) Disengage clip attaching outside door handle linkage to door cable.

(5) Remove linkage from outside door handle.

(6) Remove three nuts attaching outside door handle to outer door panel (Fig. 22).

(7) Remove outside door handle from vehicle.

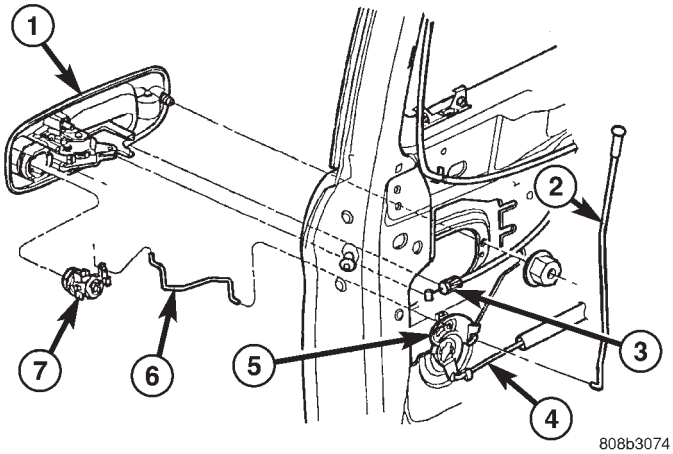

Fig. 22 SLIDING DOOR OUTSIDE LATCH RELEASE HANDLE

1 - OUTSIDE DOOR PANEL
2 - LOCK LINK
3 - LATCH LINK
4 - LOCKING LINK AND SLEEVE LINK
5 - BELLCRANK
6 - KEY CYLINDER LOCK LINK
7 - KEY CYLINDER

INSTALLATION

(1) Position outside door handle on vehicle.

(2) Install nuts attaching outside door handle to outer door panel.

(3) Engage clip attaching linkage to outside door handle.

(4) Engage rigging cam to latch/lock control mechanism.

(5) Move clip on latch/lock control to bottom of slot and engage linkage to latch/lock control.

(6) Verify sliding door operation. Adjust as necessary.

(7) Place the watershield into position and press securely to adhesive making sure to properly route wiring and linkages.

(8) Install sliding door stop bumper. (Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - INSTALLATION)

(9) Install sliding door trim panel. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - INSTALLATION)

UPPER HINGE

REMOVAL

(1) Open sliding door, do not latch open.
(2) Remove screw attaching upper stop bracket to upper roller bracket (Fig. 23).
(3) Remove stop bracket from vehicle.
(4) Place a padded block between the open sliding door and the roof rail.
(5) Mark outline of upper hinge bracket on sliding door.
(6) Remove bolts attaching upper roller to sliding door (Fig. 24).
(7) Remove upper hinge from door.
(8) Slide roller out of rear end of roof upper channel.
(9) Remove upper hinge from vehicle.

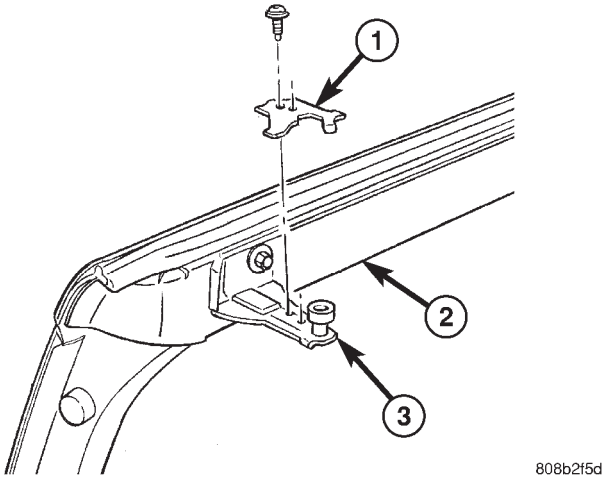

Fig. 23 SLIDING DOOR UPPER STOP

1 - UPPER STOP PLATE
2 - SLIDING DOOR
3 - UPPER SLIDING DOOR HINGE

INSTALLATION

(1) Place upper hinge in position on vehicle (Fig. 24).
(2) Slide roller into rear end of roof upper channel.
(3) Place upper hinge in position on door.
(4) Align outline marks on sliding door to upper roller bracket
(5) Install bolts attaching upper hinge to sliding door.
(6) Remove padded block from between sliding door and roof rail.
(7) Place stop bracket in position on vehicle.
(8) Install screw attaching upper stop bracket to upper roller bracket (Fig. 23).
(9) Verify sliding door alignment and operation. Adjust as necessary. (Refer to 23 - BODY/DOORS - SLIDING/SLIDING DOOR - ADJUSTMENTS)

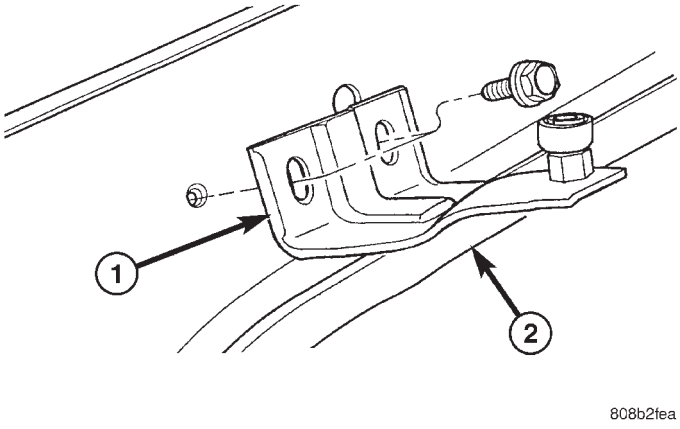

Fig. 24 SLIDING DOOR UPPER HINGE

1 - SLIDING DOOR UPPER HINGE
2 - SLIDING DOOR

OUTSIDE HANDLE CABLE

REMOVAL

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Disconnect and isolate the negative battery cable.
(2) Remove stop bumper (Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - REMOVAL).
(3) Remove the appropriate side door trim panel. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL)
(4) Peel watershield away from adhesive around perimeter of inner door panel.

CAUTION: Make note of cable routing and foam insulator placement. This will prove helpful when reinstalling replacement cable. Be certain replacement cable is routed and retained correctly.

(5) Trace the outside handle cable along its routing path and disconnect from its retaining clips.
(6) Disconnect the outside handle cable from the latch assembly. Gently pry cable sleeve retainer out of the latch mounting bracket and then unhook swedged cable end from the latch link.
(7) Disconnect the outside handle cable from the handle assembly. Gently pry cable sleeve retainer out of the handle bracket and then unhook swedged cable end from the handle link.
(8) Remove the outside handle cable from the side door.

OUTSIDE HANDLE CABLE (Continued)

INSTALLATION

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Match the replacement cable up against the old cable to verify the correct part.
(2) Position the outside handle cable on the side door.
(3) Connect the outside handle cable on the handle assembly. Hook the swedged cable end on the handle link and gently push the cable sleeve retainer in the handle bracket.

NOTE: The outside handle cable is marked with red tape. It must be attached to the latch at the lowest point. This is marked with a "R" on the latch.

(4) Connect the outside handle cable on the latch assembly. Hook the swedged cable end on the latch link and gently push the cable sleeve retainer in the latch bracket.
(5) Trace the outside handle cable along its routing path and install on its retaining clips and position foam insulators. Use previously made schematic as a guide or remove the opposite side door trim panel and use that door as a guide.

CAUTION: Be certain replacement cable is routed and retained correctly and foam insulators are properly positioned.

(6) Place the watershield into position and press securely to adhesive making sure to properly route wiring and linkages.
(7) Install the appropriate side door trim panel on the vehicle. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - INSTALLATION)
(8) Install stop bumper (Refer to 23 - BODY/DOORS - SLIDING/STOP BUMPER - INSTALLATION).
(9) Connect the negative battery cable.

INSIDE HANDLE CABLE

REMOVAL

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Disconnect and isolate the negative battery cable.
(2) Remove the appropriate side door trim panel from the vehicle. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL)
(3) Peel watershield away from adhesive around perimeter of inner door panel.
(4) Remove the inside handle assembly from the side door. (Refer to 23 - BODY/DOORS - SLIDING/INSIDE LATCH HANDLE - REMOVAL)
(5) Disconnect the inside handle cable from the handle assembly. Gently pry cable sleeve retainer out of the handle bracket and then unhook swedged cable end from the handle link.
(6) Open the side door and remove the latch assembly. Refer to the Power Side Doors section for the procedure.

CAUTION: Make note of cable routing and foam insulator placement. This will prove helpful when reinstalling replacement cable. Be certain replacement cable is routed and retained correctly.

(7) Trace the inside handle cable along its routing path and disconnect from its retaining clips.
(8) Disconnect the inside handle cable from the latch assembly. Gently pry cable sleeve retainer out of the latch mounting bracket and then unhook swedged cable end from the latch link.
(9) Remove the inside handle cable from the side door.

INSTALLATION

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Match the replacement cable up against the old cable to verify the correct part.
(2) Position the inside handle cable on the side door.
(3) Connect the inside handle cable on the handle assembly. Hook the swedged cable end on the handle link and gently push the cable sleeve retainer in the handle bracket.
(4) Install the inside handle assembly on the side door. (Refer to 23 - BODY/DOORS - SLIDING/INSIDE LATCH HANDLE - INSTALLATION)

NOTE: The inside handle cable is marked with blue tape and must be attached to the latch at the center (just above the lower cable). This position is marked with a "B" on the latch.

(5) Connect the inside handle cable on the latch assembly. Hook the swedged cable end on the latch link and gently push the cable sleeve retainer in the latch bracket.

INSIDE HANDLE CABLE (Continued)

(6) Trace the inside handle cable along its routing path and install on its retaining clips and position foam insulators. Use previously made schematic as a guide or remove the opposite side door trim panel and use that door as a guide.

CAUTION: Be certain replacement cable is routed and retained correctly and foam insulators are properly positioned.

(7) Install the latch assembly. Refer to the Power Side Doors section for the procedure.
(8) Place the watershield into position and press securely to adhesive making sure to properly route wiring and linkages.
(9) Install the appropriate side door trim panel on the vehicle. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - INSTALLATION)
(10) Connect the negative battery cable.

HOLD OPEN LATCH CABLE

REMOVAL

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Disconnect and isolate the negative battery cable.
(2) Remove the appropriate side door trim panel from the vehicle. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - REMOVAL)
(3) Peel watershield away from adhesive around perimeter of inner door panel.
(4) Open the side door and remove the latch assembly. (Refer to 8 - ELECTRICAL/POWER DOORS/LATCH - REMOVAL)

CAUTION: Make note of cable routing and foam insulator placement. This will prove helpful when reinstalling replacement cable. Be certain replacement cable is routed and retained correctly.

(5) Trace the hold open latch cable along its routing path and disconnect from its retaining clips.
(6) Disconnect the hold open latch cable from the latch assembly. Gently pry cable sleeve retainer out of the latch mounting bracket and then unhook swedged cable end from the latch link.
(7) Remove the hold open latch from the side door. (Refer to 23 - BODY/DOORS - SLIDING/HOLD OPEN LATCH - REMOVAL)
(8) Disconnect the hold open latch cable from the hold open latch. Gently pry cable sleeve retainer out of the handle bracket and then unhook swedged cable end from the latch link.
(9) Remove the hold open latch cable from the side door.

INSTALLATION

NOTE: For power sliding door procedures refer to POWER SLIDING DOOR SYSTEM in the ELECTRICAL section.

(1) Match the replacement cable up against the old cable to verify the correct part.
(2) Position the hold open latch cable on the side door.

NOTE: The hold open latch cable is marked with white tape. It must be attached to the upper most cable attachment at the latch. This position is marked with a “W” on the latch.

(3) Connect the hold open latch cable on the hold open latch assembly. Hook the swedged cable end on the latch link and gently push the cable sleeve retainer in the latch bracket.
(4) Install the hold open latch on the side door.(Refer to 23 - BODY/DOORS - SLIDING/HOLD OPEN LATCH - INSTALLATION)
(5) Connect the hold open latch cable on the latch assembly. Hook the swedged cable end on the latch link and gently push the cable sleeve retainer in the latch bracket.
(6) Trace the outside handle cable along its routing path and install on its retaining clips and position foam insulators. Use previously made schematic as a guide or remove the opposite side door trim panel and use that door as a guide.

CAUTION: Be certain replacement cable is routed and retained correctly and foam insulators are properly positioned.

(7) Install the latch assembly. (Refer to 8 - ELECTRICAL/POWER DOORS/LATCH - INSTALLATION)
(8) Place the watershield into position and press securely to adhesive making sure to properly route wiring and linkages.
(9) Install the appropriate side door trim panel on the vehicle. (Refer to 23 - BODY/DOORS - SLIDING/TRIM PANEL - INSTALLATION)
(10) Connect the negative battery cable.

INSTALLATION - LIFTGATE SIDE 43

EXTERIOR HANDLE

REMOVAL

(1) Remove liftgate trim panel. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/ TRIM PANEL - REMOVAL)

(2) Disconnect the exterior handle electrical connectors.

(3) Remove the two outer screws and the two inner screws.

(4) Remove the exterior handle/license plate light assembly.

INSTALLATION

(1) Route the exterior handle electrical connector through the door and position handle.

(2) Install the two out screws and tighten to 20 N·m (15 ft. lbs.).

(3) Install the two inner bolts and tighten to 40 N·m (30 ft. lbs.).

(4) Connect the electrical connector.

(5) Install the trim panel. (Refer to 23 - BODY/ DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION)

HINGE

REMOVAL

(1) Release liftgate latch and open liftgate.

(2) Support liftgate on a suitable lifting device in the full open position.

(3) Apply several layers of duct tape on the outside of to roof across the gap to the lift gate to hold the liftgate in position.

(4) Remove bolts attaching liftgate hinge to roof header.

(5) Disconnect VTSS switch from the body harness.

(6) Remove bolts attaching hinge to liftgate (Fig. 1).

(7) Remove hinge from vehicle.

INSTALLATION

(1) If necessary, paint replacement hinge before installation.

(2) Place hinge in position on vehicle.

(3) Align hinge to marks on liftgate.

(4) Install bolts attaching hinge to liftgate (Fig. 1) . Tighten bolts to 33 N·m (24 ft. lbs.) torque.

HINGE (Continued)

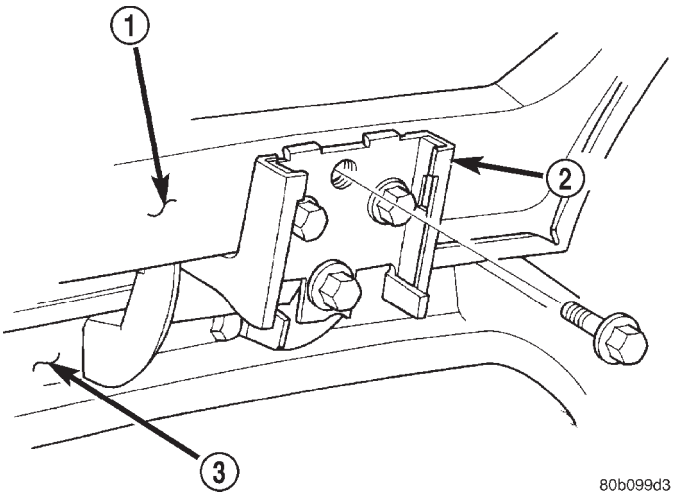

Fig. 1 LIFTGATE HINGE

1 - LIFTGATE
2 - HINGE
3 - REAR ROOF HEADER

(5) Align hinge to marks on roof header.

(6) Install bolts attaching liftgate hinge to roof header. Tighten outer two bolts to 33 N·m (24 ft. lbs.) torque. The sheet medal screw at center 12 N·m (105 in. lbs.)

(7) Remove duct tape from roof and liftgate.

(8) Verify liftgate alignment. Refer to Liftgate Remove and Installation for proper gap measurements.

LATCH

REMOVAL

(1) Remove liftgate trim panel.

(2) Disengage outside handle link from clip on latch.

(3) Disconnect wire connector from liftgate latch (Fig. 2).

(4) Remove screws attaching latch to liftgate.

(5) Remove latch from vehicle.

INSTALLATION

(1) Engage link and place latch in position on vehicle.

(2) Install screws attaching latch to liftgate. Tighten to 10 N·m (95 lb.in.) torque.

(3) Connect wire connector to liftgate latch.

(4) Verify liftgate fit and operation. Adjust as necessary.

(5) Install liftgate trim panel.

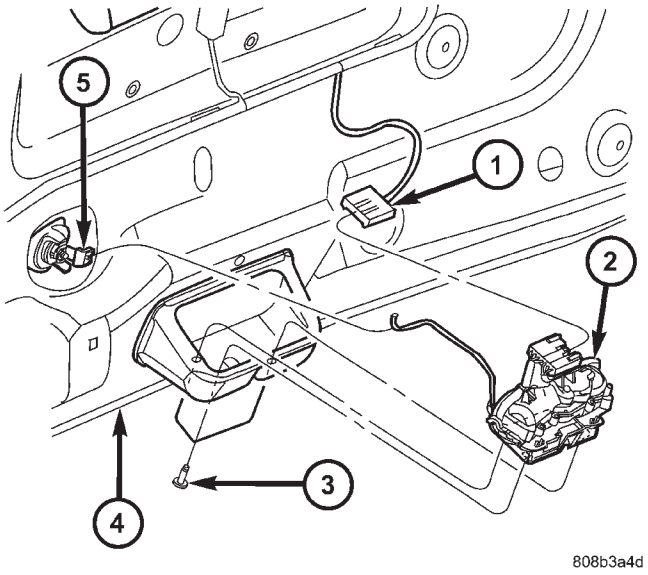

Fig. 2 LIFTGATE LATCH

1 - ELECTRICAL CONNECTOR
2 - LIFTGATE LATCH
3 - SCREW
4 - LIFTGATE
5 - LIFTGATE LOCK CYLINDER

LATCH STRIKER

REMOVAL

(1) Open liftgate.

(2) Mark outline of striker on sill to aid installation.

(3) Remove screws attaching striker to sill (Fig. 3).

(4) Remove striker from vehicle.

INSTALLATION

(1) Place striker in position on vehicle.

(2) Align striker to outline mark on sill.

(3) Install screws attaching striker to sill. Tighten screws to 28 N·m (21 ft. lbs.) torque.

(4) Verify liftgate alignment and operation.

LIFTGATE

REMOVAL

(1) Release liftgate latch and open liftgate.

(2) Remove screws attaching liftgate wire connector to rear header.

(3) Disconnect liftgate wire harness from body wire harness.

(4) Remove liftgate upper frame molding.

LIFTGATE (Continued)

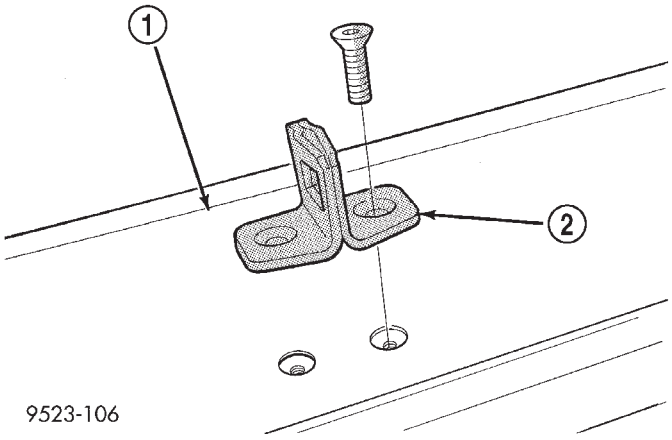

Fig. 3 LIFTGATE LATCH STRIKER

1 - LIFTGATE SILL
2 - LIFTGATE STRIKER

(5) Disconnect rear window washer hose from spray nozzle.
(6) Support liftgate on a suitable lifting device.
(7) Remove screws attaching support cylinders to liftgate.
(8) Remove bolts attaching liftgate hinge to roof header (Fig. 4).
(9) With assistance, remove liftgate from vehicle.

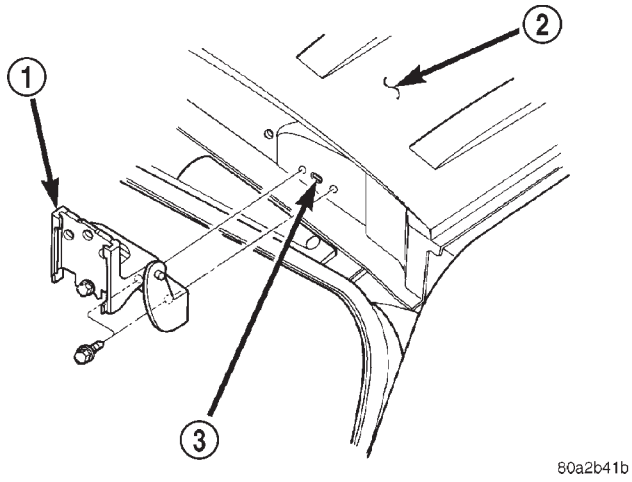

Fig. 4 LIFTGATE

1 - HINGE
2 - ROOF
3 - NET HOLE OR SLOT

INSTALLATION

(1) With assistance, place liftgate in position on vehicle.
(2) Install bolts attaching liftgate hinge to roof header. Tighten bolts to 33 N·m (24 ft. lbs.) torque.
(3) Install screws attaching support cylinders to liftgate. Tighten bolts to 28 N·m (21 ft. lbs.) torque.
(4) Remove lifting device from under liftgate.
(5) Connect liftgate wire harness into body wire harness.
(6) Install screws attaching wire connector to rear header.
(7) Connect rear window washer hose onto spray nozzle.
(8) Install liftgate upper frame molding.
(9) Verify liftgate alignment. The liftgate should have a gap to adjacent panels and fit flush across the gaps. The gap is;

- 7 mm (0.280 in.) to the fascia,
- 6 mm (0.240 in.) to the roof,
- 4 mm (0.160 in.) to the aperture.

LIFTGATE SPOILER

REMOVAL

(1) Remove nuts (Fig. 5).
(2) Remove spoiler from vehicle.

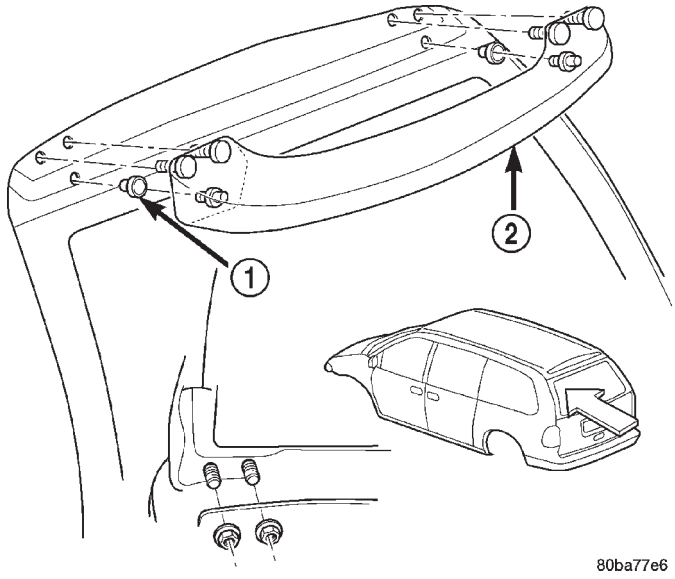

Fig. 5 LIFTGATE SPOILER

1 - RETAINER SEALER WASHER
2 - LIFT GATE SPOILER

INSTALLATION

(1) Place liftgate spoiler in position and install nuts.
(2) Tighten nuts to 9 N·m (80 in. lbs.) torque.

LOCK CYLINDER

REMOVAL

(1) Remove the liftgate trim panel. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/ TRIM PANEL - REMOVAL)
(2) Disconnect the electrical connector.
(3) Disconnect the latch rod.
(4) Rotate plastic lock cylinder nut one quarter turn and remove nut and spring washer.
(5) Remove the lock cylinder from the liftgate.

INSTALLATION

(1) Install lock cylinder into liftgate.
(2) Install the plastic lock cylinder lock nut, spring washer and rotate one quarter turn.
(3) Connect the electrical connector.
(4) Connect the latch rod.
(5) Install the trim panel. (Refer to 23 - BODY/ DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION)
(6) Verify lock cylinder operation.

SUPPORT CYLINDER

REMOVAL

(1) Release liftgate latch and open liftgate.
(2) Support liftgate on a suitable lifting device in the full open position.
(3) Pull liftgate opening weatherstrip from D-pillar flange next to prop assembly end pivot.
(4) Remove bolt attaching end pivot to D-pillar (Fig. 6).
(5) Remove bolt attaching prop assembly to liftgate.
(6) Remove prop assembly from vehicle.

INSTALLATION

Ensure that the cylinder end is attached to the D-pillar and the shaft end is attached to the liftgate.
(1) Place prop assembly in position.
(2) Install bolt attaching prop assembly to liftgate.
(3) Install bolt attaching end pivot to D-pillar. Tighten bolts to 28 N·m (21 ft. lbs.) torque.
(4) Install liftgate opening weatherstrip to D-pillar flange next to prop assembly end pivot.
(5) Close liftgate. Check liftgate operation.

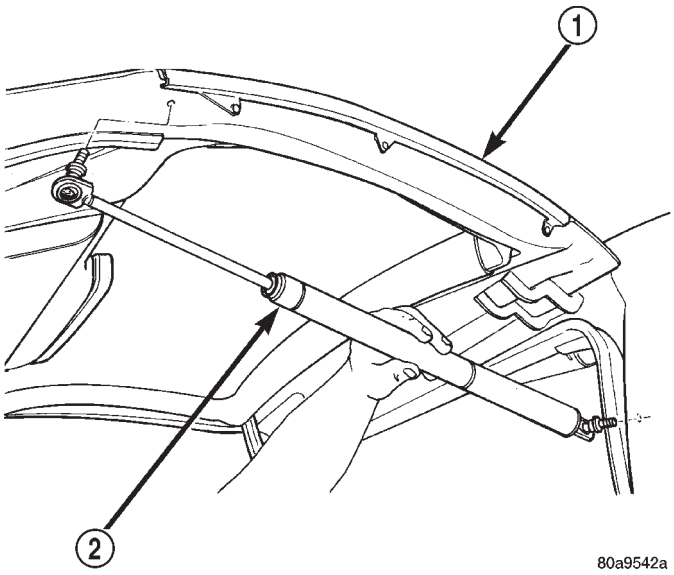

Fig. 6 LIFTGATE PROP ASSEMBLY

1 - LIFTGATE
2 - PROP ASSEMBLY

TRIM PANEL

REMOVAL

(1) Remove the bolt attaching the lift motor link, if equipped (Fig. 7).
(2) Remove liftgate upper frame molding (Fig. 8).
(3) Remove assist handle screws.
(4) Disengage hidden clips holding trim panel to liftgate from around perimeter or liftgate (Fig. 8).
(5) Disconnect wire connector from lamps.
(6) Remove liftgate trim panel from vehicle.

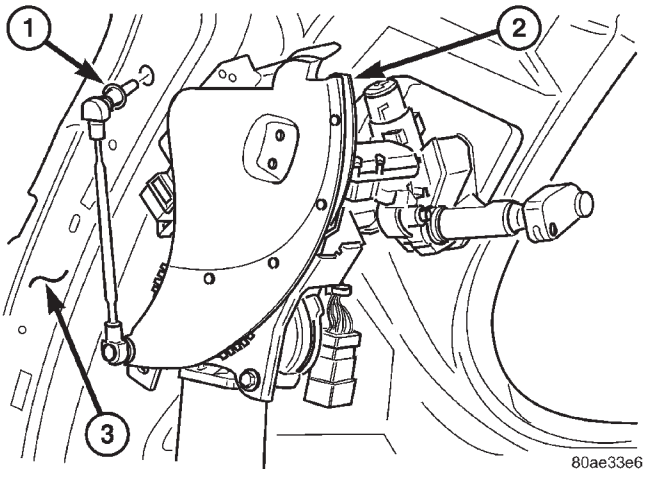

Fig. 7 LIFTGATE MOTOR

1 - LIFTGATE MOTOR LINK BOLT
2 - LIFTGATE MOTOR
3 - LIFTGATE

TRIM PANEL (Continued)

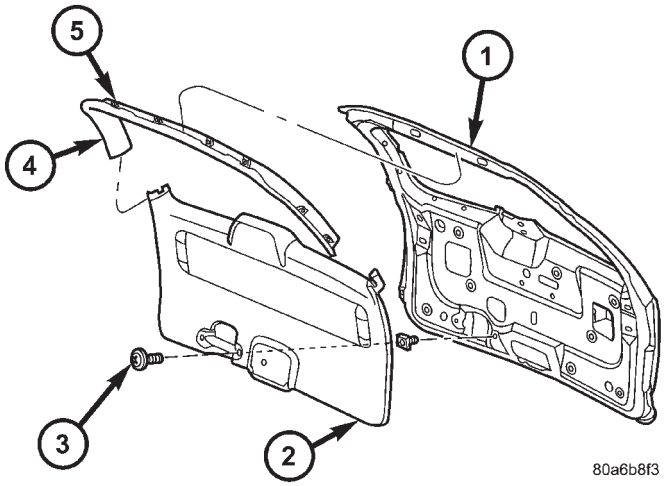

Fig. 8 LIFTGATE TRIM

1 - LIFTGATE
2 - LOWER TRIM PANEL
3 - ASSIST HANDLE SCREWS
4 - UPPER TRIM
5 - UPPER TRIM CLIPS

INSTALLATION

(1) Place liftgate trim panel in position on vehicle.
(2) Engage hidden clips to hold trim panel to liftgate and fasteners around perimeter of liftgate (Fig. 8).
(3) Connect wire connector into lamp.
(4) Install courtesy lamps into liftgate trim.
(5) Install screws to hold assist handle to liftgate.
(6) Install upper frame side moldings.
(7) Install liftgate upper frame molding.
(8) Install the bolt attaching the lifgate motor link and tighten to 28 N·m (21 ft. lbs.)

SLAM BUMPER

REMOVAL

REMOVAL

(1) Open liftgate.
(2) Remove liftgate stop bumper body side attaching bolts (Fig. 9).
(3) Remove liftgate stop bumper.

REMOVAL - LIFTGATE SIDE

(1) Open liftgate.
(2) Remove liftgate stop bumper liftgate side attaching bolts (Fig. 10).
(3) Remove liftgate stop bumper.

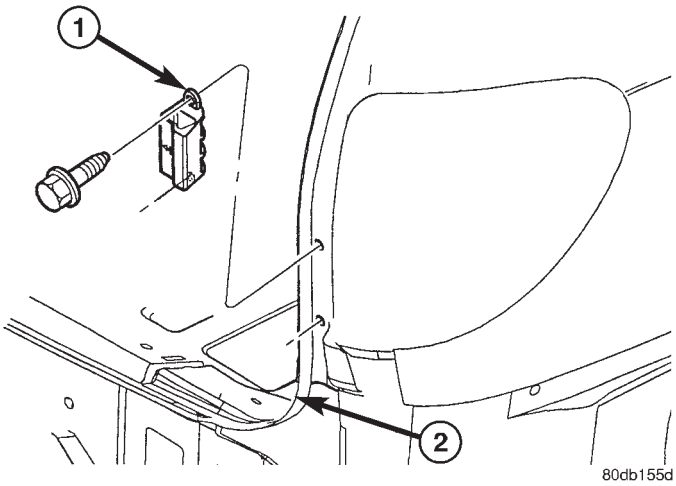

Fig. 9 LIFTGATE STOP BUMPER - BODY SIDE

1 - LIFTGATE STOP BUMPER
2 - LIFTGATE OPENING

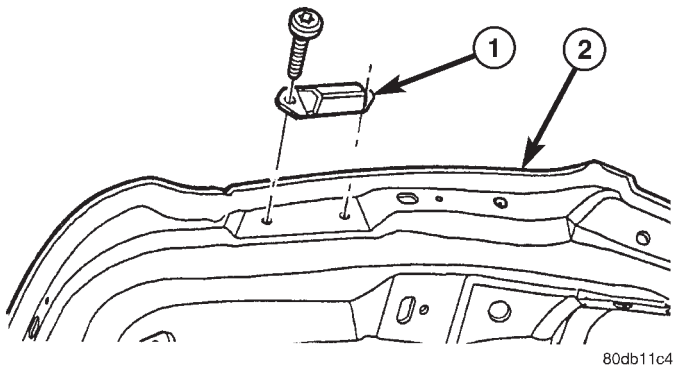

Fig. 10 LIFTGATE STOP BUMPER - LIFTGATE SIDE

1 - LIFTGATE STOP BUMPER
2 - LIFTGATE

INSTALLATION

INSTALLATION

(1) Place liftgate stop bumper into position.
(2) Install bolts attaching liftgate stop bumper to body side (Fig. 9).
(3) Close liftgate.

INSTALLATION - LIFTGATE SIDE

(1) Place liftgate stop bumper into position.
(2) Install bolts attaching liftgate stop bumper to liftgate (Fig. 10).
(3) Close liftgate.

BODY SIDE MOLDINGS

REMOVAL

Refer to (Fig. 1), (Fig. 2), (Fig. 3), (Fig. 4) or (Fig. 5)for proper location of fasteners holding the molding to the wheelhouse lip and rocker panels.

(1) Warm the affected stick on molding and body metal to approximately 38° C (100° F) using a suitable heat lamp or heat gun.

(2) If equipped, remove pop rivets holding molding edge to wheelhouse lip.

(3) Pull stick on molding from painted surface.

(4) Remove adhesive tape residue from painted surface of vehicle. Use a 3M Scotch-Brite™ Molding Adhesive and Stripe Removal Disc, or equivalent, to clean adhesive residue from painted surfaces. These products are available from automotive paint suppliers. Refer to instructions supplied with the specific product for proper usage.

800dfaa1

Fig. 1 BODY SIDE MOLDINGS - BASE TYPICAL

1 - GUIDE PINS
2 - FRONT DOOR MOLDING
3 - SLIDING DOOR MOLDING
4 - QUARTER PANEL MOLDING

INSTALLATION

Refer to (Fig. 1), (Fig. 2), (Fig. 3), (Fig. 4) or (Fig. 5)for proper location of fasteners to hold the molding to the wheelhouse lip and rocker panels.

(1) If molding is to be reused;

(a) Remove tape residue from molding.

(b) Clean back of molding with Mopar® Super Kleen, or equivalent.

(c) Wipe molding dry with lint free cloth.

(d) Apply a single coat of Mopar® TPO Molding Prep to tape side of molding and allow to dry thoroughly.

(e) Apply new body side molding (two sided adhesive) tape to back of molding.

(2) Clean body surface with Mopar® Super Kleen, or equivalent. Wipe surface dry with lint free cloth.

(3) Remove protective cover from tape on back of molding.

(4) Apply molding to body from front to rear, inserting locator pins into hole in body panel.

(5) Using a roller tool, roll molding onto body panel with enough force to assure adhesion. Do not apply excessive force, or damage to body panels may result.

(6) Install pop rivets to hold molding edge to wheelhouse lip, if necessary.

COWL GRILLE

REMOVAL

(1) Remove wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL)

(2) Remove four (4) screws securing cowl cover to wiper module (Fig. 6).

(3) Disengage quarter turn fasteners at outboard ends of cowl grill from body.

(4) Release hood latch and open hood.

CAUTION: To prevent hood scratching of cowl grille before removal, cover outboard exterior ends of cowl grille with masking tape or equivalent method.

NOTE: Do not over bend cowl grille during removal. Bend cowl grille just enough to clear top of wiper pivot shaft and bottom rear corner of hood.

(5) Remove cowl grill by raising above driver side wiper pivot shaft and swinging away towards engine compartment. The cowl grille will need to be bent on outboard end to clear simultaneously top of wiper pivot shaft and bottom corner of hood.

(6) Close hood. Do not latch. Remove outboard screws. (Fig. 7).

(7) Disconnect washer hose in line connector.

(8) Disconnect washer hose and grommet from hole in wiper module and pull out.

(9) Remove cowl grille by raising over opposite wiper pivot shaft and removing away from vehicle.

(10) Remove cowl cover from vehicle.

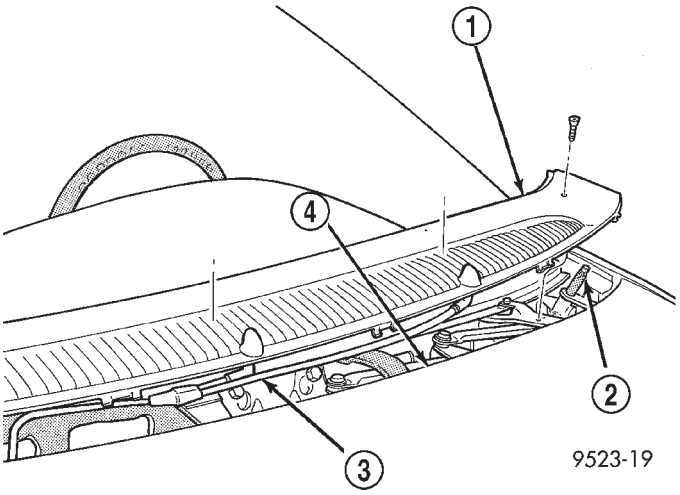

Fig. 6 COWL COVER

1 - COWL COVER

3 - WASHER HOSES
4 - HOOD

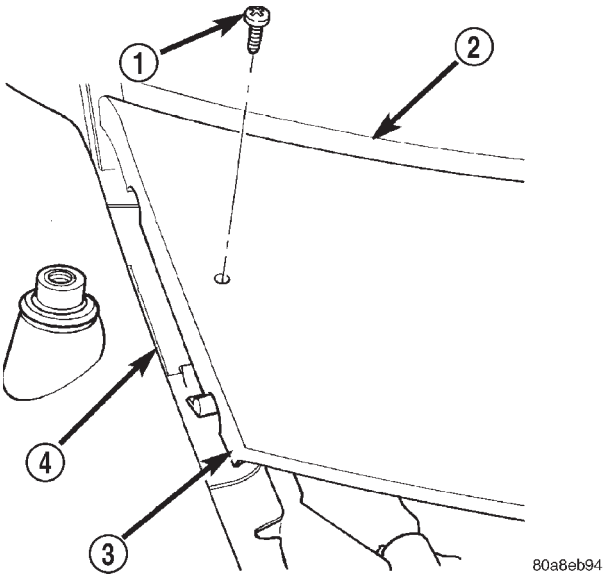

Fig. 7 COWL COVER RETAINERS

1 - SCREW
2 - WINDSHIELD
3 - COWL COVER
4 - FRONT FENDER

INSTALLATION

(1) Reverse removal procedure.

(2) When installing cowl cover over wiper module, make sure fore aft locator on the underside of cowl grill seat into the locator grooves on top of wiper module.

(3) Star all cowl grille mounting screws by hand before torquing to specifications.

(4) Assure washer hose is properly routed and not pinched.

(5) Center cowl grille to body and windshield.

(6) Assure “arrow” indicator head of quarter turn fasteners is pointing toward windshield.

(7) Tighten screw to 1.2 N·m (11 in. lbs.) torque.

(8) Install the wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION)

(9) Check for proper spray pattern from washer nozzles.

EXTERIOR NAME PLATES - TAPE ATTACHED

REMOVAL

(1) Mark reference points before removing.

(2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond.

(3) Using a nonmetallic prying device, such as a plastic or wood trim stick gently pry up at corners and remove.

EXTERIOR NAME PLATES - TAPE ATTACHED (Continued)

(4) Clean off all traces of adhesive or double sided tape from the panel with a general purpose adhesive remover.

INSTALLATION

(1) Clean panel surface with isopropy alcohol.
(2) Align badgeing to reference points.
(3) Install and press securely to full adhesive contact
(4) Clean away any reference points.

EXTERIOR NAME PLATES - ADHESIVE ATTACHED

REMOVAL

(1) Mark reference points before removing.
(2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond.
(3) With your fingernail lift up and peel away badgeing/tape from panel, using a heat gun as you go.
(4) Clean off all traces of adhesive from the panel(s) with a general purpose adhesive remover.

INSTALLATION

(1) Clean panel surface with isopropy alcohol.
(2) Remove paper carrier and align badgeing/tape to reference points or adjacent panel.
(3) Install and press securely, using a plastic spreader to eliminate all air bubbles.
(4) Remove top protective carrier.
(5) Clean away any reference points.

FRONT FENDER

REMOVAL

(1) Remove headlamp housing. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL)
(2) Remove mud guard.
(3) Remove inner splash shield.
(4) Remove fender to fascia nuts.
(5) Remove outboard cowl grille/fender bracket screw.
(6) Remove fender bolt to lower rocker panel.
(7) Remove fender bolt to lower cowl.
(8) Pull fascia away from fender.
(9) Remove bolts attaching fender to upper rail.
(10) Remove fender from vehicle (Fig. 8).

INSTALLATION

(1) Place fender in position on vehicle.
(2) From inside engine compartment, start the center upper rail bolt. install all the bolts attaching fender to upper rail and tighten.
(3) Install fender to lower cowl panel bolt.
(4) Install fender to rocker panel bolt.
(5) Place fascia into position.
(6) Install outboard cowl grille/fender bracket screw.
(7) Install fender to fascia nuts.
(8) Install inner splash shield.
(9) Install mud guard.
(10) Install headlamp assembly. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION)
(11) Check fender for flush and gap.

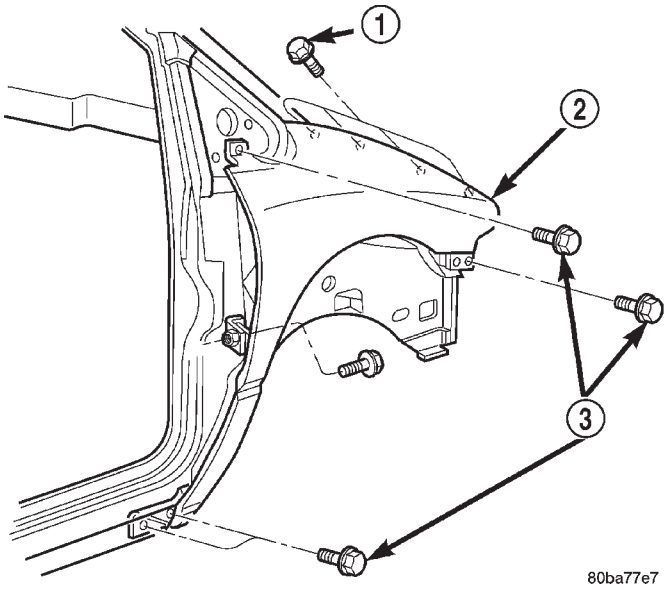

Fig. 8 FENDER

1 - FASTENERS
2 - FENDER
3 - FASTENERS

FUEL FILL DOOR

REMOVAL

(1) Remove left quarter trim panel.
(2) Remove water shield patch covering access hole in C-pillar.
(3) Disengage latch release link from clip on fuel fill blocker latch arm (Fig. 12).
(4) Open fuel fill door.
(5) Remove screws holding fuel fill neck to fuel filler housing.
(6) Position fuel fill neck out of the way.
(7) Reaching inside fuel filler housing, release clips holding housing to quarter panel (Fig. 9).
(8) Remove fuel fill door from vehicle.
(9) Disengage clip holding link to fuel fill door (Fig. 13).
(10) Remove link from fuel fill door.

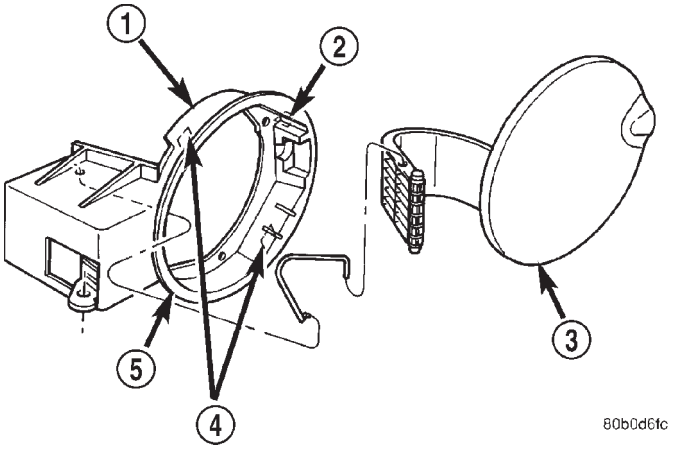

Fig. 9 FUEL FILLER HOUSING AND DOOR

1 - FUEL FILLER HOUSING W/LATCH
2 - CLIP
3 - FUEL FILLER HOUSING DOOR
4 - CLIPS
5 - FIX CLIP

INSTALLATION

(1) Install spring to housing and door
(2) Snap door into housing.
(3) Insert lockout link into clip on fuel fill door.
(4) Engage clip to hold link to fuel fill door.
(5) Insert lockout link through grommet in panel between inner and outer quarter panel.
(6) Close fuel fill door.
(7) Install fuel filler housing to outer quarter panel.
(8) Verify that all clips on fuel filler housing are fully engaged to outer quarter panel.
(9) Place fuel fill neck in position.
(10) Install screws to hold fuel fill neck to fuel filler housing.
(11) Engage latch release link into clip on fuel fill blocker latch arm.
(12) Verify fuel fill blocker latch operation.
(13) Install water shield patch to cover access hole in C-pillar.
(14) Install left quarter trim panel.

FUEL FILL DOOR BLOCKER LATCH

REMOVAL

(1) Remove left quarter trim panel.
(2) Remove water shield patch covering access hole in C-pillar.
(3) Disengage latch release link from clip on fuel fill blocker latch arm (Fig. 12).
(4) Remove screws holding fuel fill blocker latch to C-pillar (Fig. 10).
(5) Remove fuel fill blocker latch from vehicle.

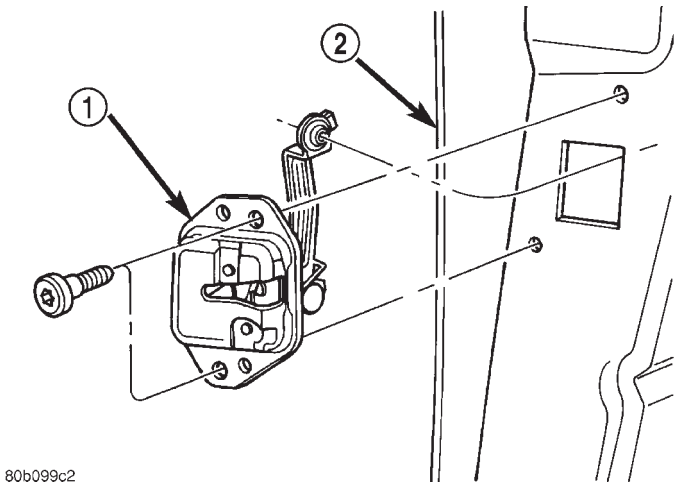

Fig. 10 FUEL FILL

1 - FUEL FILLER BLOCKER LATCH ARM
2 - C-PILLAR

INSTALLATION

(1) Position fuel fill blocker latch on vehicle.
(2) Install screws to hold fuel fill blocker latch to C-pillar.
(3) Engage latch release link into clip on fuel fill blocker latch arm with fuel door in the closed position.
(4) Install water shield patch to cover access hole in C-pillar.
(5) Verify fuel fill blocker latch operation.
(6) Install left quarter trim panel.

FUEL FILL DOOR BLOCKER LATCH STRIKER

REMOVAL

(1) Remove sliding door trim panel.
(2) Remove sound shield as necessary to access striker
(3) Remove screws attaching fuel fill door blocker latch striker to sliding door rear end frame (Fig. 11).
(4) Remove fuel fill door blocker latch striker from vehicle.

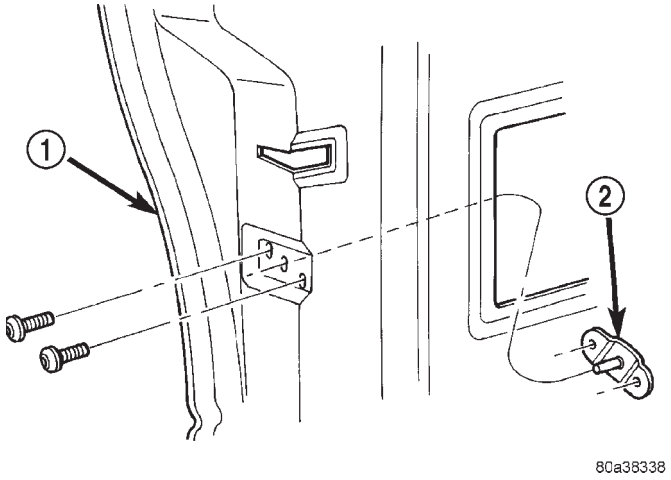

Fig. 11 FUEL FILL DOOR BLOCKER LATCH STRIKER

1 - LEFT SLIDING DOOR
2 - FUEL FILLER STOP STRIKER

INSTALLATION

(1) Position fuel fill door blocker latch striker on vehicle.
(2) Install screws attaching fuel fill door blocker latch striker to sliding door rear end frame.
(3) Install sliding door sound shield.
(4) Install sliding door trim panel.

FUEL FILL DOOR BLOCKER LOCKOUT LINK

REMOVAL

(1) Remove left quarter trim panel.
(2) Remove water shield patch covering access hole in C-pillar.
(3) Disengage fuel filler lockout link from clip on fuel fill blocker latch arm (Fig. 12).
(4) Open fuel fill door.
(5) Remove screws holding fuel filler housing to fuel filler tube neck.
(6) Reaching inside fuel filler housing, release clips holding housing to outer quarter panel.
(7) Remove fuel filler housing and lockout link from vehicle.
(8) Disengage clip holding link to fuel fill door (Fig. 13).
(9) Remove link from fuel fill door.

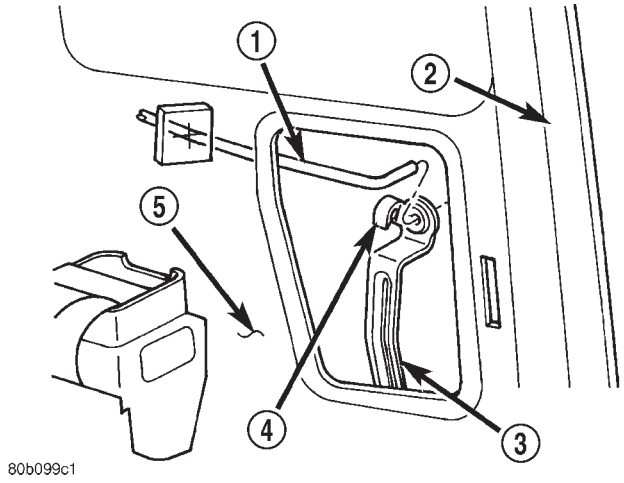

Fig. 12 FUEL FILLER LOCKOUT LINK AT LATCH ARM

1 - FUEL FILLER LOCKOUT LINK
2 - C-PILLAR
3 - FUEL FILLER BLOCKER LATCH ARM
4 - PLASTIC LINK CLIP
5 - INNER QUARTER PANEL

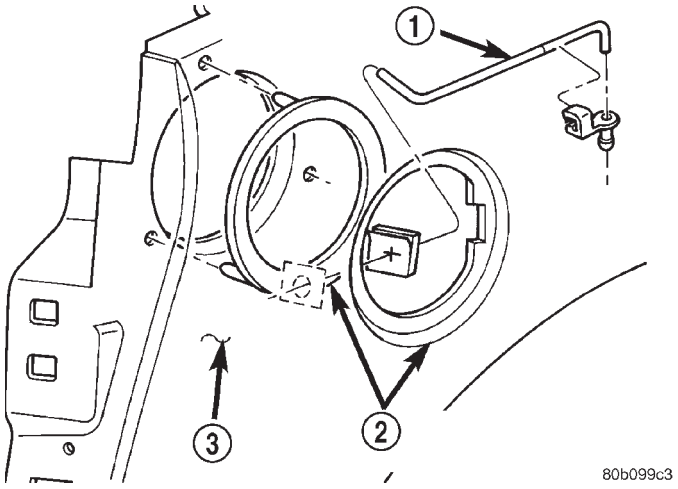

Fig. 13 FUEL FILLER LOCKOUT LINK

1 - FUEL FILLER LOCKOUT LINK
2 - FUEL FILLER OPENING
3 - QUARTER PANEL

FUEL FILL DOOR BLOCKER LOCKOUT LINK (Continued)

INSTALLATION

(1) Insert link into clip on fuel fill door.
(2) Engage clip to hold link to fuel fill door.
(3) Insert lockout link through grommet in panel between inner and outer quarter panel.
(4) Close fuel fill door.
(5) Install fuel filler housing to outer quarter panel.
(6) Verify that all clips on fuel filler housing are fully engaged to outer quarter panel.
(7) Engage fuel filler lockout link into clip on fuel fill blocker latch arm.
(8) Install water shield patch covering access hole in C-pillar.
(9) Install left quarter trim panel.

GRILLE OPENING REINFORCEMENT

REMOVAL

(1) Release hood latch and open hood.
(2) Remove bolts attaching hood latch to crossmember and position latch out of the way.
(3) Remove radiator sight shield.
(4) Remove engine air inlet resonator.
(5) Remove hood cable.
(6) Remove hood prop rod.
(7) Remove screw attaching coolant recovery bottle to crossmember.
(8) Remove bolts attaching radiator isolators to crossmember.
(9) Remove bolts attaching ends of crossmember to radiator closure panel (Fig. 14).
(10) Lift crossmember upward and away from radiator closure panel.
(11) Remove crossmember from vehicle.

INSTALLATION

(1) Place radiator closure panel crossmember in position on vehicle.
(2) Insert ends of crossmember between layered metal sections of radiator closure panel at each side of radiator.

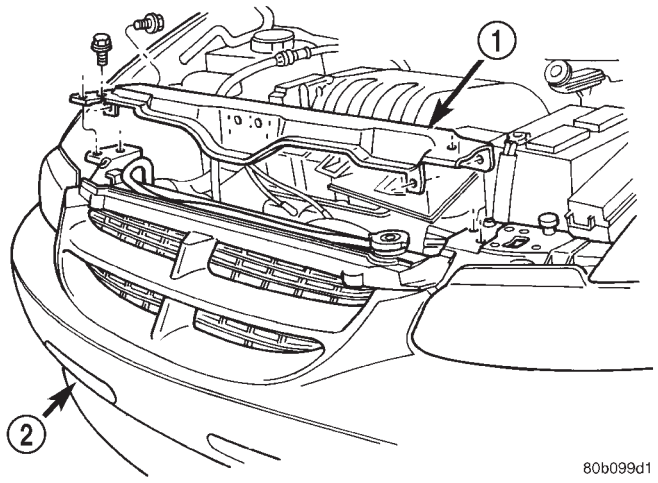

Fig. 14 RADIATOR CLOSURE PANEL CROSSMEMBER

1 - RADIATOR CLOSURE PANEL CROSSMEMBER
2 - FRONT FASCIA

(3) Align with paint breaks around bolt heads.
(4) Install bolts attaching ends of crossmember to radiator closure panel (Fig. 14) . Tighten bolts to 19 N·m (14 ft. lbs.) torque.
(5) Install bolts attaching radiator isolators to crossmember.
(6) Install screw attaching coolant recovery bottle to crossmember.
(7) Install bolt attaching air cleaner housing to crossmember.
(8) Install engine air inlet resonator.
(9) Install radiator sight shield.
(10) Install hood prop rod.
(11) Align hood latch by placing latch over net pierce tabs. If alignment is required, flatten tabs.
(12) Install bolts attaching hood latch to crossmember. Tighten bolts to 13.5 N·m (10 ft. lbs.) torque.
(13) Verify hood latch operation and hood alignment.

FRONT WHEELHOUSE SPLASH SHIELD

REMOVAL

(1) Hoist and support vehicle on safety stands. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove front wheel.

(3) Remove push pin fasteners attaching splash shield to frame rail forward of suspension.

(4) Remove push pin fasteners attaching splash shield to frame rail rearward of suspension.

(5) Remove screws attaching wheelhouse splash shield to front fender and front bumper fascia.

(6) Remove splash shield from vehicle (Fig. 15).

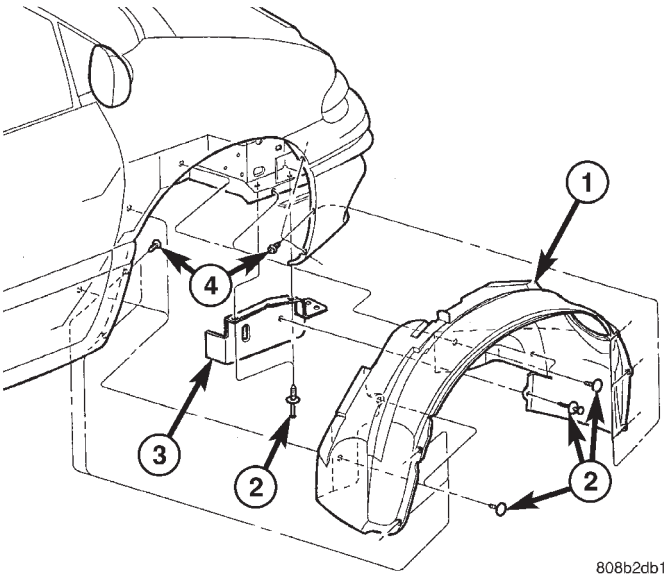

Fig. 15 FRONT WHEELHOUSE SPLASH SHIELD

1 - FRONT FENDER WHEELHOUSE SPLASH SHIELD
2 - PUSH PIN FASTENERS
3 - ACCESSORY DRIVE SPLASH SHIELD
4 - SCREWS

INSTALLATION

(1) Place splash shield in position on vehicle (Fig. 15).

(2) Install push pin fasteners attaching splash shield to frame rail forward of suspension.

(3) Install push pin fasteners attaching splash shield to frame rail rearward of suspension.

(4) Install screws attaching wheelhouse splash shield to front fender.

(5) Install front wheel.

(6) Lower vehicle.

LUGGAGE RACK RISER

REMOVAL

(1) Remove two fasteners from the front riser. Gently pull up on the luggage rack side rail and detach the riser snap to remove riser from the rail (Fig. 16).

(2) Repeat for the opposite side, if necessary.

(3) Remove front riser(s) from vehicle (Fig. 17).

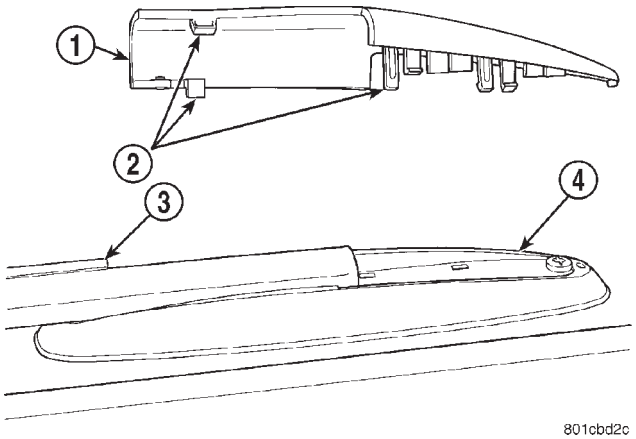

Fig. 16 LUGGAGE RACK RISER COVER

1 - FRONT RISER COVER
2 - LOCK TABS
3 - LUGGAGE RACK SIDE RAIL
4 - FRONT RISER

LUGGAGE RACK RISER (Continued)

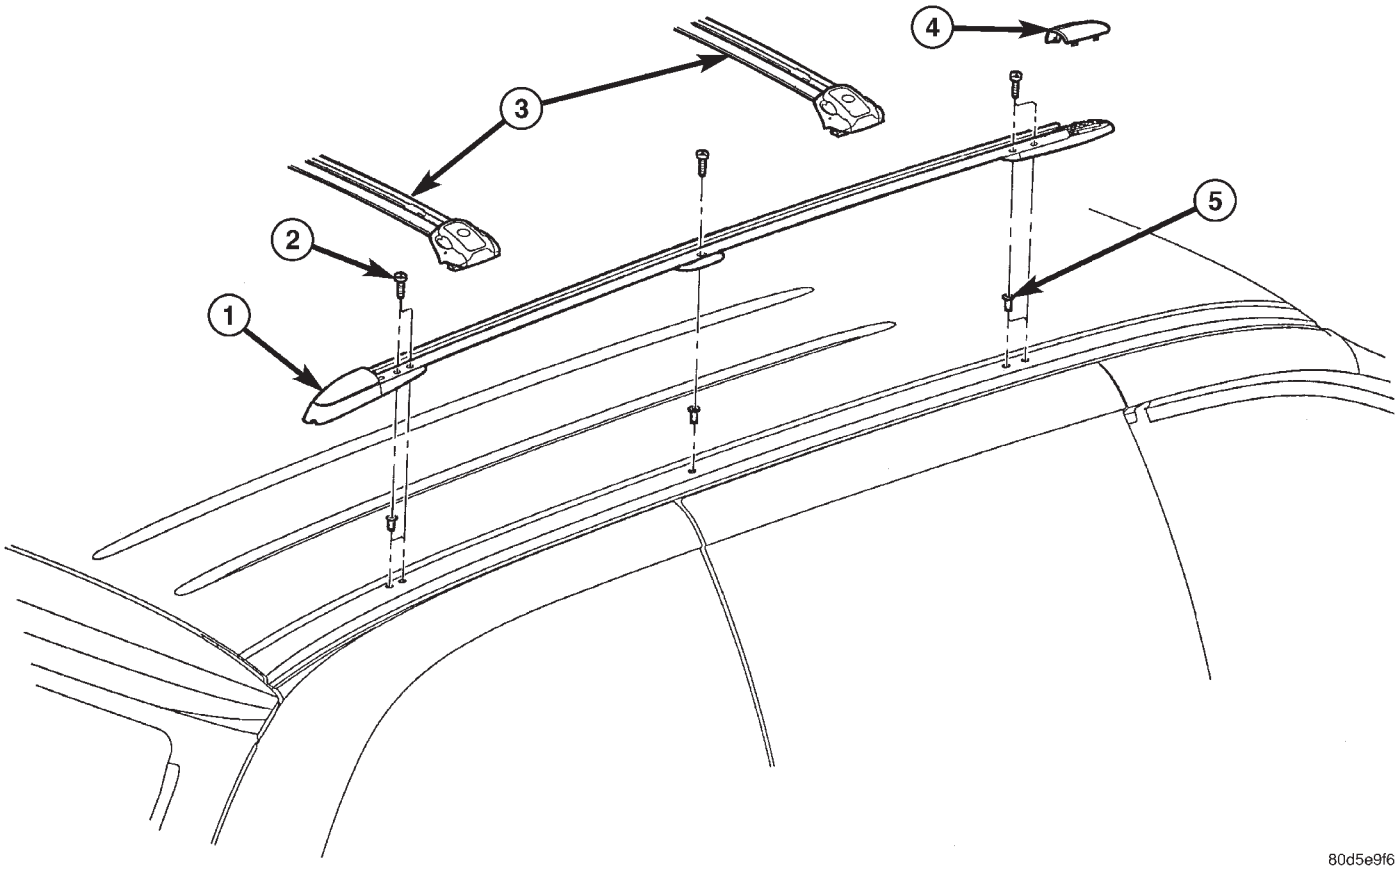

Fig. 17 LUGGAGE RACK, CROSSBARS AND RISER COVER

1 - LUGGAGE RACK SIDE RAILS
2 - SCREWS
3 - CROSSBARS
4 - FRONT RISER COVER
5 - RIV-NUTS

INSTALLATION

(1) Place front riser into position on luggage rack side rail.
(2) Install two fasteners into the riser.
(3) Repeat for the opposite side, if necessary.

LUGGAGE RACK CROSSBAR

REMOVAL

(1) Remove luggage rack front risers.
(2) Depress stanchion levers down until they click into the unlock position. (Fig. 18). Work from side to side sliding the crossbar assembly forward moving a little at a time to ensure it remains perpendicular to the side rails.
(3) Remove crossbar from vehicle.

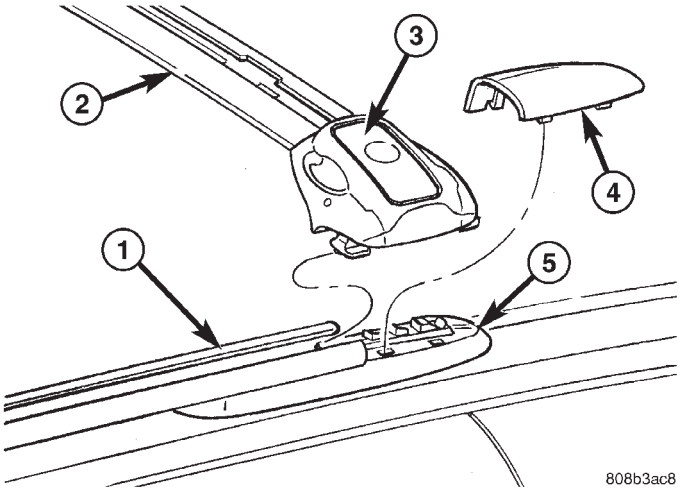

Fig. 18 LUGGAGE RACK CROSSBAR

1 - LUGGAGE RACK
2 - CROSSBAR
3 - SLIDE LOCK
4 - FRONT RISER COVER
5 - FRONT RISER

LUGGAGE RACK CROSSBAR (Continued)

INSTALLATION

NOTE: The crossbar assemblies are designed to be installed in only one way. Check top and bottom surfaces of the crossbar for the word FRONT and directional arrows. The directional arrows must point toward the front of the vehicle.

(1) Place crossbar in position on vehicle.
(2) Work from side to side sliding the crossbar assembly back a little at a time to ensure it remains perpendicular to the side rails.
(3) Position first crossbar assembly crossbar at the second most rearward locator holes. Press the top of the stanchion lever to lock it into position.
(4) Position the second crossbar assembly in the second hole from the front. Lock into place.
(5) Place luggage rack riser into position.
(6) Install two fasteners into riser. Tighten fasteners to 4 mm (35 in. lbs.) torque.

REAR QUARTER PANEL/ FENDER AIR EXHAUSTER

DESCRIPTION

Air exhausters, designed to conform to the body structure, allow air entering at the front of the vehicle to flow out the back. By reducing air pressure within the vehicle, the exhausters also reduce blower noise at any given air flow level compared to operating without them and help reduce door closing effort. They are located in the lower rear comers of the body.

REMOVAL

SHORT WHEELBASE

(1) Remove the rear fascia from the body. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL).
(2) Using a trim stick or another suitable wide flat bladed tool, carefully pry the air exhauster away from the opening in the lower aperture panel until the snap features release (Fig. 19).
(3) Remove the air exhauster from the hole in the lower aperture panel.

LONG WHEELBASE

NOTE: Models with the optional rear heater and air conditioner do not have an air exhauster on the right side of the vehicle, but have a plastic plug installed in the right lower aperture panel. This plug is removed using the same procedure used to remove the air exhauster from the short wheelbase model. Refer to SHORT WHEELBASE .

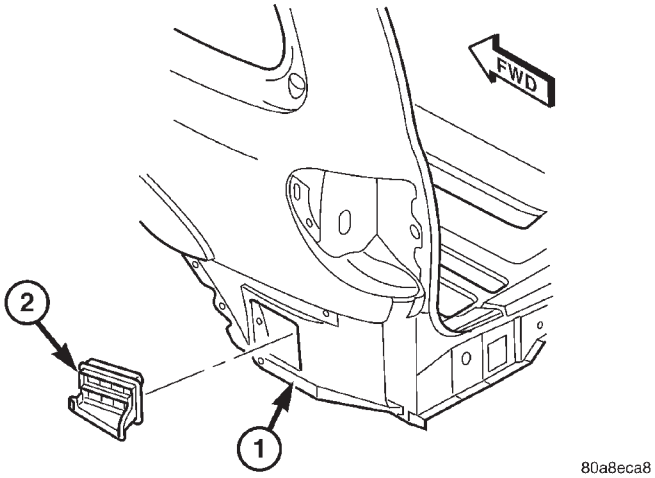

Fig. 19 AIR EXHAUSTER - SWB

1 - LOWER APERTURE PANEL
2 - AIR EXHAUSTER

(1) Remove the quarter trim panel from the inside of the left or right quarter inner panel (Refer to 23 - BODY/INTERIOR/RIGHT QUARTER TRIM PANEL - REMOVAL) or (Refer to 23 - BODY/INTERIOR/ LEFT QUARTER TRIM PANEL - REMOVAL).
(2) Using a trim stick or another suitable wide flat bladed tool, carefully pry the air exhauster away from the opening in the lower aperture panel until the snap features release (Fig. 20).

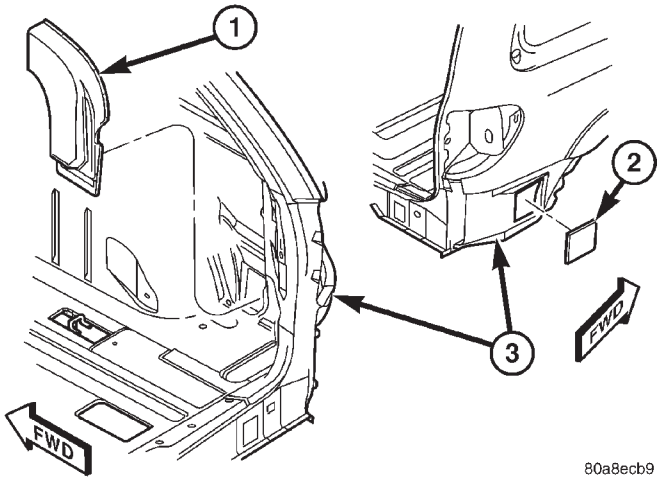

Fig. 20 AIR EXHAUSTER - LWB

1 - AIR EXHAUSTER
2 - PLUG
3 - LOWER APERTURE PANEL

(1) Remove the air exhauster from the hole in the lower aperture panel.

INSTALLATION

SHORT WHEELBASE

(1) Position the air exhauster to the hole in the lower aperture panel (Fig. 19).

(2) Using hand pressure, press the air exhauster into the opening in the lower aperture panel until the snap features are fully engaged.

(3) Reinstall the rear fascia onto the body. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).

LONG WHEELBASE

NOTE: Models with the optional rear heater and air conditioner do not have an air exhauster on the right side of the vehicle, but have a plastic plug installed in the right lower aperture panel. This plug is installed using the same procedure used to install the air exhauster onto the short wheelbase model. Refer to SHORT WHEELBASE .

(1) Position the air exhauster to the hole in the lower aperture panel (Fig. 20).

(2) Using hand pressure, press the air exhauster into the opening in the lower aperture panel until the snap features are fully engaged.

(3) Reinstall the quarter trim panel onto the inside of the left or right quarter inner panel. (Refer to 23 - BODY/INTERIOR/RIGHT QUARTER TRIM PANEL - INSTALLATION) or (Refer to 23 - BODY/INTERIOR/LEFT QUARTER TRIM PANEL - INSTALLATION).

ROOF JOINT MOLDING

REMOVAL

The RAP molding is set with body side molding tape. The temperature in the work area and the vehicle should be at least 21° C (70° F) to avoid damaging the RAP moldings.

(1) Warm the affected stick-on molding and body metal to approximately 38° C (100° F) using a suitable heat lamp or heat gun.

(2) Pull stick-on molding from painted surface.

(3) Remove adhesive tape residue from painted surface of vehicle. Use a 3M Scotch-Brite™ Molding Adhesive and Stripe Removal Discs, or equivalent, to clean adhesive residue from painted surfaces. The adhesive removal discs are available from automotive paint suppliers. Refer to instructions supplied with the discs for proper usage.

INSTALLATION

The RAP molding is set with body side molding tape. The temperature in the work area and the vehicle should be at least 21° C (70° F) to avoid damaging the RAP moldings.

(1) If molding is to be reused;

(a) Remove tape residue from molding.

(b) Clean back of molding with Mopar® Super Kleen solvent, or equivalent.

(c) Wipe molding dry with lint free cloth.

(d) Apply new body side molding (two sided adhesive) tape to back of molding.

(2) Clean body surface with Mopar® Super Kleen solvent, or equivalent. Wipe surface dry with lint free cloth.

(3) Remove protective cover from tape on back of molding.

(4) Apply molding to body from front of vehicle to rear.

(5) Using a roller tool, roll molding onto body panel with enough force to assure adhesion and not bend roof panels.

SIDE VIEW MIRROR

REMOVAL

(1) Using a trim stick or equivalent, remove the trim cover (Fig. 21).

(2) Remove the bolts.

(3) Remove the mirror from the pillar.

(4) Disconnect the electrical connector, if equipped.

INSTALLATION

(1) Connect the electrical connector, if equipped.

(2) Place side view mirror in position on vehicle (Fig. 21).

(3) Install the bolts.

(4) Install the trim cover.

SIDE VIEW MIRROR (Continued)

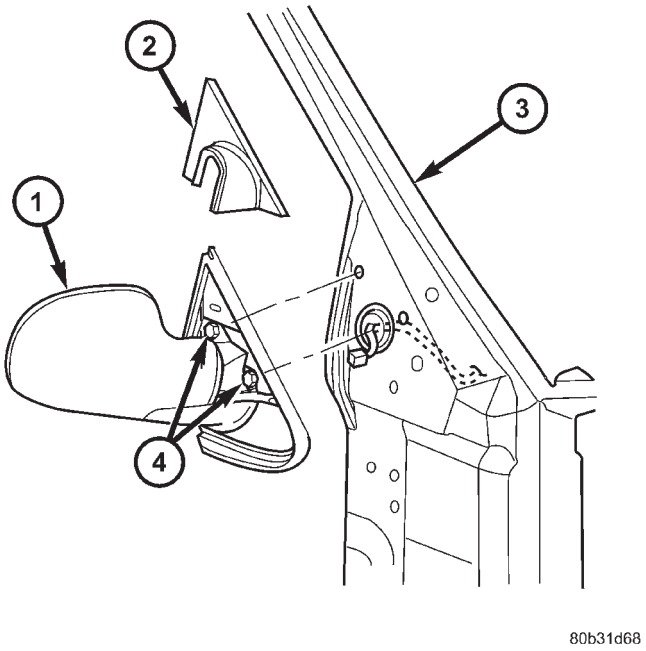

Fig. 21 SIDE VIEW MIRROR

1 - MIRROR
2 - MIRROR TRIM COVER
3 - A-PILLAR
4 - BOLTS

SIDE VIEW MIRROR GLASS

REMOVAL

WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.

(1) Carefully pull/pry the broken glass holder from the mirror assembly.

(2) Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

INSTALLATION

CAUTION: It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.

(1) Position the new mirror glass holder to the mirror assembly.

NOTE: Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.

(2) Align the mirror glass holder's attaching fingers to the mirror motor housing.

NOTE: Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.

(3) Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.

(4) Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

HINGE

REMOVAL

(1) Remove Front Wiper Unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL) for procedure.

(2) Raise hood.

(3) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to provide reference marks for installation.

(4) Remove pivot bolt from the body half of hood hinge and use suitable device to support the hood.

(5) Remove bolts attaching body half of hood hinge to front fender flange and remove hinge from vehicle (Fig. 1).

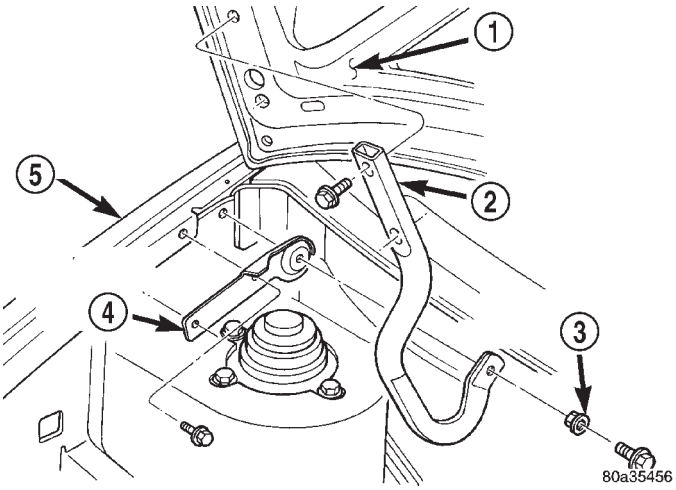

Fig. 1 HOOD HINGE

1 - HOOD
2 - HOOD HALF OF HOOD HINGE
3 - HOOD HINGE PIVOT BUSHING
4 - BODY HALF OF HOOD HINGE
5 - FENDER

INSTALLATION

(1) If necessary, paint new hinge before installation.

(2) Place body half of hood hinge in position on vehicle.

(3) Install bolts attaching hood hinge to front fender flange. Tighten bolts to 8 N·m (70 in. lbs.) torque.

(4) Install pivot bolt to the body half of hood hinge. Tighten bolts to 28 N·m (21 ft. lbs.) torque.

(5) Install Front Wiper Unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION) for proper procedures.

(6) Align all marks and secure bolts. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders. Shims can be added or removed under hood hinge to achieve proper hood height. Tighten bolts to 13.5 N·m (10 ft. lbs.) torque.Close hood.

HOOD

REMOVAL

(1) Raise hood to full up position.

(2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to provide reference marks for installation.

(3) Remove the top bolts attaching hood to hinge and loosen the bottom bolts until they can be removed by hand (Fig. 2).

(4) With assistance from a helper at the opposite side of the vehicle to support the hood, remove bottom bolts attaching hood to hinge.

(5) Remove the hood from the vehicle.

HOOD (Continued)

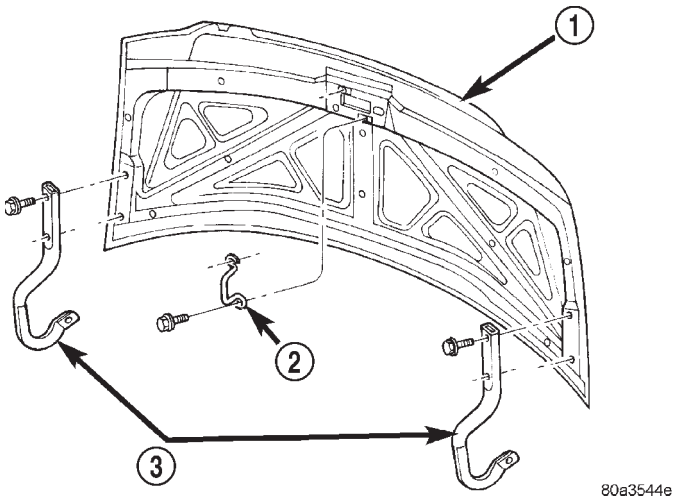

Fig. 2 HOOD

1 - HOOD
2 - HOOD LATCH STRIKER
3 - HOOD HALF OF HOOD HINGE

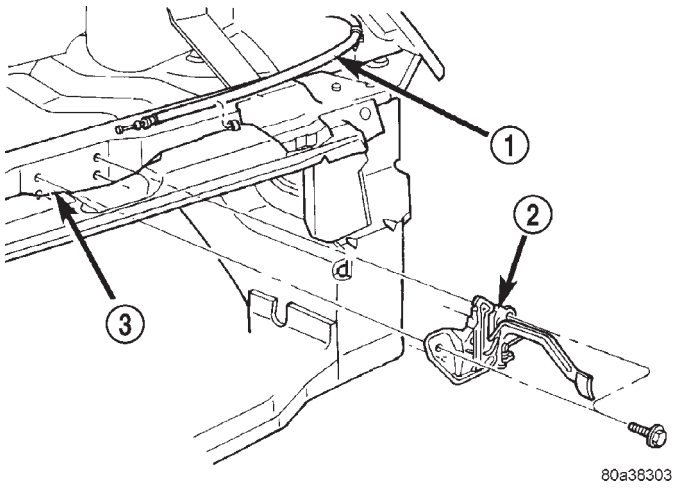

Fig. 3 HOOD LATCH

1 - HOOD RELEASE CABLE
2 - HOOD LATCH
3 - RADIATOR CLOSURE PANEL CROSSMEMBER

INSTALLATION

(1) Place hood in position on vehicle. With assistance from a helper at the opposite side of the vehicle to support the hood, install bottom bolts attaching hood to hinge finger tight.

(2) Install top bolts attaching hood to hinge finger tight.

(3) Position bolts at marks and tighten. Tighten bolts to 13.5 N·m (120 in. lbs.) torque. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders.

(4) Verify hood operation and alignment.

LATCH

REMOVAL

(1) Release hood latch and open hood.

(2) Remove bolts attaching hood latch to radiator closure panel crossmember (Fig. 3).

(3) Remove hood latch from crossmember.

(4) Disconnect hood release cable from hood latch (Fig. 4).

(5) Remove hood latch from vehicle.

INSTALLATION

(1) Position hood latch on vehicle.

(2) Connect hood release cable from hood latch.

(3) Position hood latch on crossmember.

(4) Align hood latch by placing latch over net pierced tabs. If alignment is required, flatten or grind tabs.

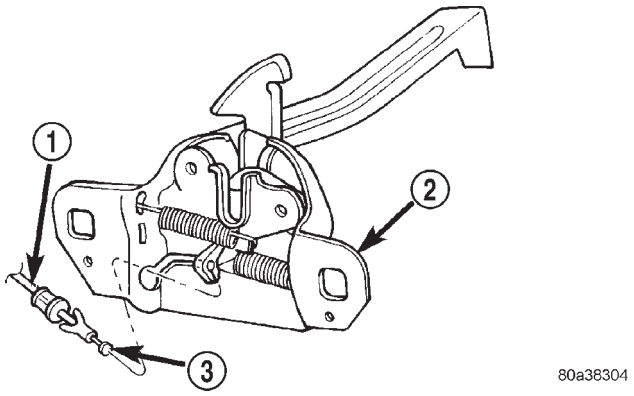

Fig. 4 HOOD

1 - RELEASE CABLE CASE
2 - HOOD LATCH
3 - RELEASE CABLE END

(5) Verify hood operation and alignment. Adjust as necessary.

(6) Tighten attaching bolts to 13.5 N·m (10 ft. lbs.) torque.

LATCH RELEASE CABLE

REMOVAL

(1) Remove hood latch.

(2) Disengage cable end from hood latch locking mechanism.

(3) Slide cable case end sideways in keyhole slot of hood latch while pinching barb on cable case closed.

(4) Remove cable from latch (Fig. 4).

(5) Remove hood release handle from instrument panel.

LATCH RELEASE CABLE (Continued)

(6) Disengage rubber grommet cable insulator from hole in dash panel.

(7) Attach a suitable length of mechanic's wire to latch end of cable to assist cable installation.

(8) Route cable back from latch through engine compartment toward dash panel near power brake booster (Fig. 5).

(9) Remove attaching clips from cable case.

(10) From inside vehicle, pull cable through dash panel until mechanic's wire is exposed.

(11) Disconnect cable from mechanic's wire.

(12) Remove hood release cable from vehicle.

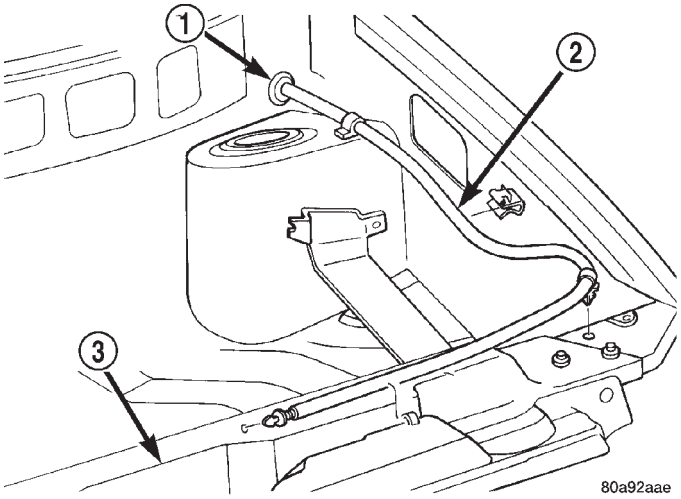

Fig. 5 HOOD RELEASE CABLE ROUTING

1 - GROMMET
2 - HOOD RELEASE CABLE
3 - RADIATOR CLOSURE PANEL CROSSMEMBER

INSTALLATION

(1) Place hood release cable in position under instrument panel.

(2) Attach latch end of hood release cable to mechanic's wire protruding through dash panel.

(3) Route cable forward through engine compartment toward latch by pulling on mechanic's wire (Fig. 5) .

(4) Disconnect mechanic's wire from cable.

(5) Engage rubber grommet cable insulator into hole in dash panel.

(6) Install hood release handle into instrument panel.

(7) Place cable in position on latch.

(8) Slide cable case end sideways into keyhole slot of hood latch.

(9) Engage cable end into hood latch locking mechanism.

(10) Install hood latch.

(11) Install attaching clips to cable case and install clips into original holes in strut tower, fender, headlamp area, and radiator closure panel crossmember.

LATCH STRIKER

REMOVAL

(1) Release hood latch and open hood.

(2) Remove bolts attaching striker to inside of hood.

(3) Remove hood latch striker from vehicle.

INSTALLATION

(1) Position hood latch striker on vehicle.

(2) Install bolts attaching hood latch striker to hood.

(3) Align hood latch striker to engage smoothly into hood latch.

(4) Verify hood operation and alignment. Adjust as necessary.

(5) Tighten attaching bolts to 13.5 N·m (10 ft. lbs.) torque.

CLUSTER BEZEL

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove Over Steering Column Bezel by lifting it straight up with a firm pull.

(3) Remove the four bezel attaching screws (Fig. 1).

(4) Tilt the steering column in the full down position.

(5) Pull rearward on the cluster bezel and remove.

INSTALLATION

(1) Maneuver cluster bezel over steering column and into position (Fig. 1).

(2) Install the four bezel attaching screws.

(3) Install the Over Steering Column Bezel by positioning it over the retaining slots and firmly snapping it into place.

(4) Connect the battery negative cable.

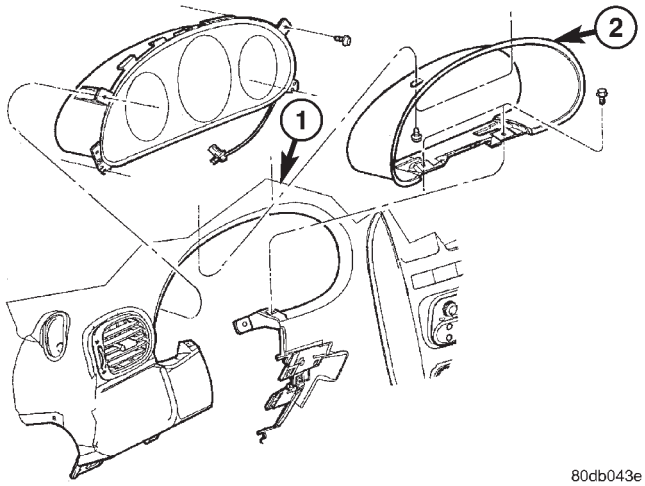

Fig. 1 CLUSTER BEZEL

1 - INSTRUMENT PANEL
2 - CLUSTER BEZEL

CUP HOLDER

REMOVAL

(1) Remove the screw access cover from the bottom of the center bezel.

(2) Remove the center bezel attaching screws.

(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the edge of the instrument panel center bezel. Hang off to the side leaving the accessory switches connected.

(4) Pull the cup holder assembly rearward to disengage the rear guide studs from instrument panel (Fig. 2).

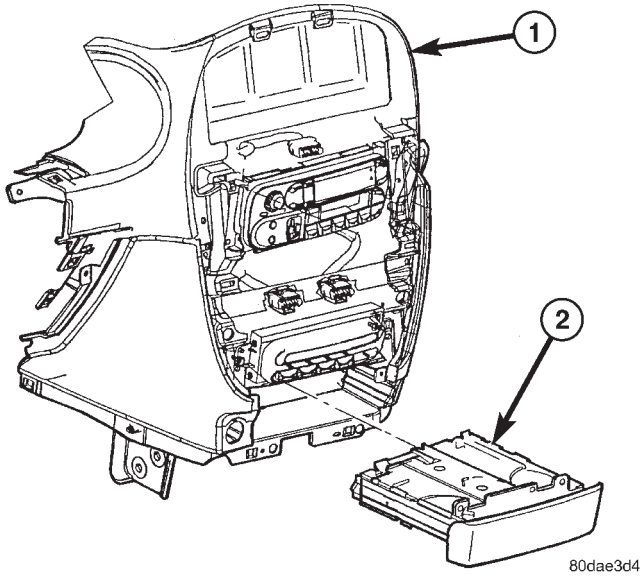

Fig. 2 CUP HOLDER

1 - LOWER INSTRUMENT PANEL
2 - CUPHOLDER AND TRACK

INSTALLATION

(1) Ensure the cup holder assembly is in the closed position. The cup holder assembly must be installed as an assembly to ensure proper track position.

(2) Place the cup holder assembly into position in the lower instrument panel and slide into opening until the rear guide struts snap into place (Fig. 2).

(3) Install the center bezel.

(4) Install the center bezel attaching screws

(5) Install the cup holder. Align the cup holder assembly with the track and firmly slide shut to engage retaining tang.

(6) Install the screw access cover to the bottom of the center bezel.

GLOVE BOX

REMOVAL

(1) Open glove box.

(2) Push in on sides of glove box bin and lower door.

(3) Pivot glove box downward and disengage hinge hooks from instrument panel.

(4) Remove glove box.

INSTALLATION

(1) Place glove box in position.

(2) Engage hinge hooks into instrument panel and pivot glove box upward.

(3) Push in sides of glove box bin and snap glove box assembly into instrument panel.

(4) Close glove box door.

GLOVE BOX LATCH

REMOVAL

(1) Open glove box.

(2) Push in on sides of glove box bin and lower door.

(3) Pivot glove box downward and disengage hinge hooks from instrument panel.

(4) Remove glove box.

(5) Remove the assembly screws.

(6) Disassemble the glove box.

(7) Separate the latch from the glove box assembly.

INSTALLATION

(1) Install the latch onto the glove box assembly.

(2) Assemble the glove box.

(3) Install the assembly screws.

(4) Engage hinge hooks into instrument panel and pivot glove box upward.

(5) Push in sides of glove box bin and snap glove box assembly into instrument panel.

(6) Close glove box door.

GLOVE BOX LATCH STRIKER

REMOVAL

(1) Open glove box door.

(2) Remove screws holding lock striker to instrument panel.

(3) Remove glove box latch striker.

GLOVE BOX LATCH STRIKER (Continued)

INSTALLATION

(1) Install the glove box latch striker.
(2) Install the screws holding latch striker to instrument panel.
(3) Close glove box door.

INSTRUMENT PANEL ASSEMBLY

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the lower console:
(a) Remove six retaining screws.
(b) Pull rearward and disconnect the auxiliary power outlet.
(c) Remove lower console from vehicle.
(3) Remove the bolts attaching the lower supports to the instrument panel frame (Fig. 3).
(4) Remove the bolts attaching the lower supports to the floor pan.
(5) Disconnect the wire connectors from the Passenger Airbag.
(6) Remove the two screws to each right and left cowl trim covers.
(7) Remove the both left and right side A-pillar trim covers using a trim stick (special tool #C-4755) or equivalent gently pry out on the trim covers and remove.
(8) Remove the glove box:
(a) Push in on sides of glove box bin and lower door.
(b) Pivot glove box downward and disengage hinge hooks from instrument panel.
(c) Remove glove box from vehicle.
(9) Disconnect the antenna lead connector from behind the glove box.
(10) Remove the four screws to the lower steering column cover.
(11) Remove the eight screws to the steering column backing plate.
(12) Unclip the Data Link Connector (DLC) from the steering column backing plate.
(13) Remove two screws to the left side instrument panel silencer and remove (Fig. 4).
(14) Disconnect the left side wiring:
(a) Brake switch.
(b) Main bulkhead connector.
(c) Five harness connectors.
(d) Driver airbag connector.
(15) Remove the two screws to the hood release handle.
(16) Remove five screws to steering column backing plate and remove (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).
(17) Remove the two steering column shroud retaining screws. Separate the shrouds and remove from vehicle.
(18) Remove the screws attaching the instrument panel reinforcement and remove (Fig. 5).
(19) Disconnect the steering column wiring. There are seven connectors and then unclip the harness from the column.
(20) Disconnect the Occupant Restraint Controller (ORC) harness connector.
(21) Remove the four nuts retaining the steering column to the dash panel steering column mounting bracket and lower column to the floor (Fig. 6).
(22) Remove the four nuts attaching the instrument panel to the brake pedal support bracket.
(23) Loosen the left side roll down bolt (Fig. 7).
(24) Remove the left side A-pillar retaining bolts. There are two 13 mm bolts and one 10 mm bolt.
(25) If equipped with a mechanical transmission range indicator:
(a) Remove the indicator cable loop.
(b) Remove the clip holding gear shift cable end to the gear selector adapter.
(c) Pull the cable end from gear selector.
(d) Disconnect the clip for the indicator cable and guide tube from the shift cable bracket and move out of the way.
(26) Remove the instrument panel top cover. Using a trim stick or equivalent, gently pry up on the front edge of the top cover, pull rearward and remove from vehicle.
(27) Disconnect the right side wire connectors from the HVAC behind the glove box area and the two antenna connectors behind the glove box hinge.
(28) Remove the right end cover by pulling outboard.
(29) Remove the right side A-pillar retaining bolts. There are two 13 mm bolts and one 10 mm bolt.
(30) Loosen the right side roll down bolt.
(31) Disconnect the two front window defroster grid wire connectors. One on each side of vehicle.
(32) Remove both the left and right power mirrors:
(a) Using a trim stick or equivalent, gently pry out on mirror trim cover.
(b) Open door and remove the three torx retaining screws.
(c) Disconnect the wire connector and remove mirror from the vehicle.
(33) Feed power mirror wire harness inboard through the A-pillar.
(34) Remove the bolts attaching the instrument panel frame to the dash panel below windshield opening.
(35) With the help of an assistant remove the instrument panel from vehicle. Lift the instrument

panel up off the HVAC so you won't damage the sealing surface of the distribution duct.

If the instrument panel is being replaced, transfer all parts to the new instrument panel assembly.

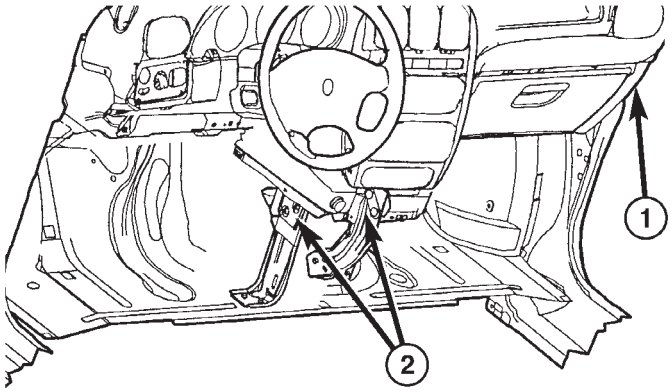

Fig. 3 INSTRUMENT PANEL CENTER STACK RIGHT & LEFT REINFORCEMENTS

1 - INSTRUMENT PANEL

4 - DASH PANEL STEERING COLUMN MOUNTING BRACKET

INSTRUMENT PANEL ASSEMBLY (Continued)

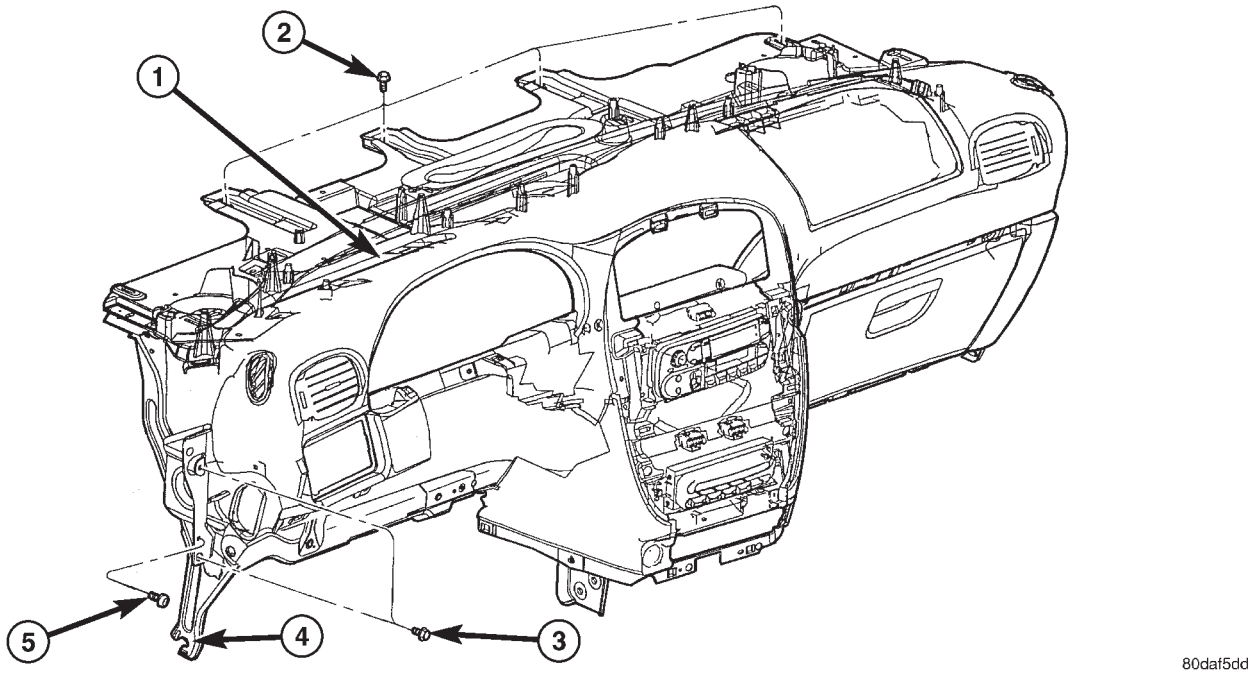

Fig. 7 INSTRUMENT PANEL REMOVAL

1 - INSTRUMENT PANEL
2 - FIVE ATTACHING SCREWS
3 - 13 mm BOLT - TWO ON EACH SIDE
4 - ROLL DOWN BRACKET
5 - 10 mm BOLT - STARTING BOLT ONE EACH SIDE

INSTALLATION

(1) With the help of an assistant place the instrument panel into vehicle on roll down bolts. As you roll the instrument panel up, lift the instrument panel up so the duct work does not bind or bend and you can set it down on the HVAC housing to get the proper seal at the distribution duct. Get one bolt started in the dash panel.

(2) Install the left and right side A-pillar retaining bolts. There are two 13 mm bolts and one 10 mm bolt. The 10 mm bolts need to be installed first to insure proper positioning of the Instrument panel in the vehicle. Start the right side 10 mm bolt first (Fig. 7).

(3) Feed power mirror wire harness outboard through the A-pillar.

(4) Install both the left and right power mirrors:

(a) Connect the wire connector and install the mirror onto the vehicle.

(b) Install the three torx retaining screws.

(c) Using a firm push, snap the mirror trim cover into place.

(5) Connect the two front window defroster grid wire connectors. One on each side of vehicle.

(6) Tighten the right side roll down bolt.

(7) Install the right end cover. Position over retaining slots and firmly snap into place.

(8) Connect the right side wire connectors to the HVAC behind the glove box area and the two antenna connectors behind the glove box hinge.

(9) Install the bolts attaching the instrument panel frame to the dash panel below windshield opening.

(10) Install the instrument panel top cover. Slide the front edge of the top cover toward dash panel, and firmly snap down the rear edge of the to cover to engage clips.

(11) If equipped with a mechanical transmission range indicator:

(a) Connect the clip for the indicator cable and guide tube to the shift cable bracket.

(b) Install the cable end to the gear selector.

(c) Install the clip holding the gear shift cable end to the gear selector adapter.

(d) Install the indicator cable loop.

(12) Tighten the left side roll down bolt.

(13) Install the four nuts attaching the instrument panel to the brake pedal support bracket.

(14) Install the four nuts retaining the steering column and lower to the floor (Fig. 6).

(15) Connect the Occupant Restraint Controller (ORC) harness connector.

(16) Connect the steering column wiring. There are seven connectors and then clip the harness to the column.

(17) Install the screws attaching the instrument panel reinforcement (Fig. 5).

(18) Connect the shrouds and install the two steering column shroud retaining screws.

(19) Install five screws to the left under column instrument panel reinforcement brace.

(20) Install the two screws to the hood release handle.

(21) Connect the left side wiring:

(a) Brake switch.

(b) Main bulkhead connector.

(c) Five harness connectors.

(d) Driver airbag connector.

(22) Install two screws to the left side instrument panel silencer (Fig. 4).

(23) Clip the Data Link Connector (DLC) to the steering column backing plate.

(24) Install the eight screws to the steering column backing plate.

(25) Install the four screws to the lower steering column cover.

(26) Install the glove box:

(a) Install glove box into the vehicle. Line up the hinges and firmly snap together.

(b) Push in on sides of glove box bin and raise door.

(27) Install the both left and right side A-pillar trim covers. Position trim cover over slots and firmly snap into place.

(28) Install the two screws to each right and left cowl trim covers.

(29) Connect the wire connectors to the Passenger Airbag.

(30) Install the bolts attaching the lower supports to the floor pan.

(31) Install the bolts attaching the lower supports to the instrument panel frame (Fig. 3).

(32) Install the lower console:

(a) Install lower console to vehicle.

(b) Connect the auxiliary power outlet.

(c) Install the six retaining screws.

(33) Connect the battery negative cable.

INSTRUMENT PANEL CENTER BEZEL

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Insert the trim stick (special tool #C-4755) or equivalent between access cover and center bezel gently pry outward.

(3) Carefully pry the access cover from the instrument panel (Fig. 8).

(4) Remove the two center bezel attaching screws.

(5) Using a trim stick or equivalent, gently pry out on the edge of the instrument panel center bezel and pull outward.

(6) Disconnect the wire connectors to the accessory switches and HVAC control.

(7) Remove the instrument panel center bezel from the vehicle.

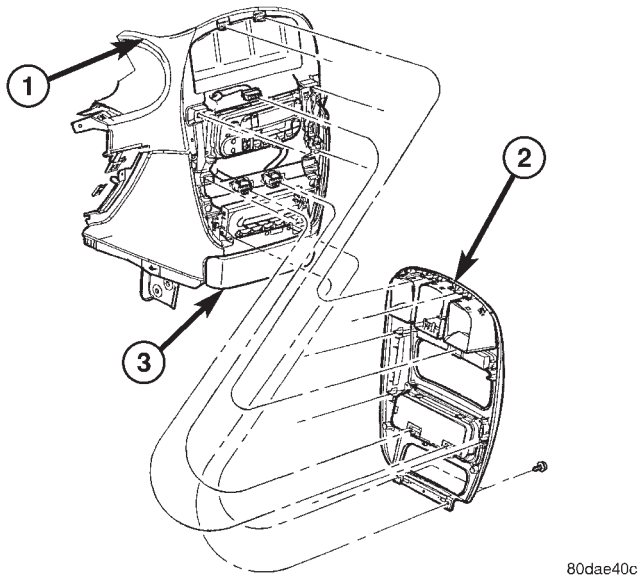

Fig. 8 INSTRUMENT PANEL CENTER BEZEL

1 - LOWER INSTRUMENT PANEL
2 - INSTRUMENT PANEL CENTER BEZEL
3 - CUPHOLDER

INSTALLATION

(1) Place center bezel near opening and connect the wire connectors to the accessory switches and HVAC control.

(2) Position the center bezel over the retaining slots and firmly snap the instrument panel center bezel into place (Fig. 8).

(3) Install the two center bezel attaching screws.

(4) Install the screw access cover to the bottom of the center bezel.

INSTRUMENT PANEL END CAP

REMOVAL

(1) Open passenger side front door.

(2) Using a trim stick, disengage clips holding end cover to instrument panel (Fig. 9).

INSTALLATION

(1) Position end cover over retaining slots and firmly snap into place (Fig. 9).

(2) Close passenger side front door.

INSTRUMENT PANEL END CAP (Continued)

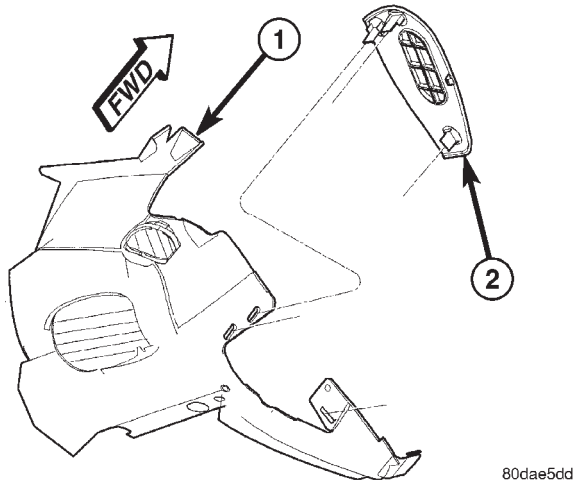

Fig. 9 INSTRUMENT PANEL END CAP

1 - INSTRUMENT PANEL
2 - INSTRUMENT PANEL END CAP

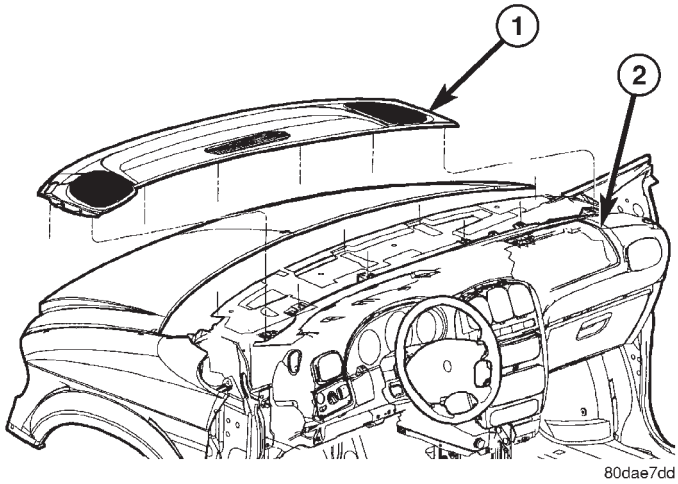

Fig. 10 INSTRUMENT PANEL TOP COVER

1 - INSTRUMENT PANEL TOP COVER
2 - INSTRUMENT PANEL

INSTRUMENT PANEL TOP COVER

REMOVAL

(1) Remove A-pillar trim. Using a trim stick (special tool #C-4755) or equivalent, gently pry out and remove.

(2) Using a trim stick, disengage clips attaching rear edge of top cover to instrument panel (Fig. 10).

NOTE: The Instrument Panel Top Cover may be hard to unsnap from the instrument panel. Be sure not to mar, scuff, or damage the instrument panel pad.

(3) Pull top cover rearward to disengage hooks attaching front of top cover to instrument panel.

(4) Remove top cover from vehicle.

INSTALLATION

(1) Place instrument panel top cover in position on vehicle (Fig. 10).

(2) Push top cover forward to engage hooks attaching front of top cover to instrument panel.

(3) Engage clips attaching rear edge of top cover to instrument panel.

(4) Pull top cover rearward.

(5) Install A-pillar trim.

LOWER CONSOLE

REMOVAL

(1) Remove screws attaching the lower console to floor bracket and instrument panel (Fig. 11).

(2) Slide lower console rearward from around instrument panel supports.

(3) Disconnect the auxiliary power outlet wire connector (if equipped).

(4) Remove lower console from vehicle.

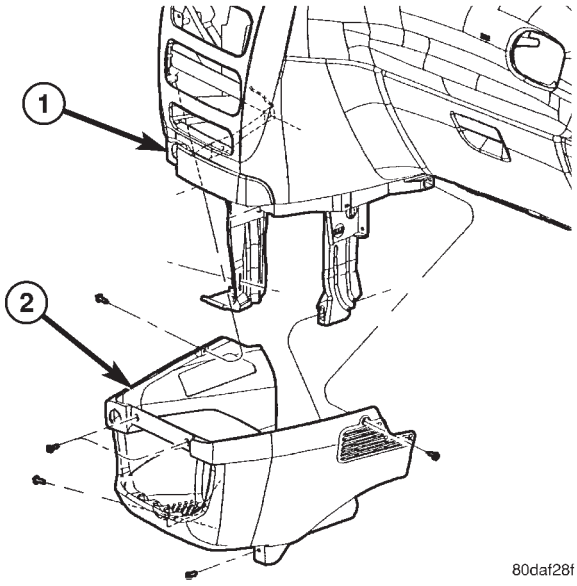

Fig. 11 INSTRUMENT PANEL FLOOR CONSOLE

1 - INSTRUMENT PANEL
2 - INSTRUMENT PANEL FLOOR CONSOLE

INSTALLATION

(1) Connect the auxiliary power outlet wire connector (if equipped).

(2) Install the lower console into the vehicle (Fig. 11).

(3) Slide console forward around instrument panel supports.

(4) Install the screws attaching lower console to floor bracket and instrument panel.

LOWER INSTRUMENT PANEL

REMOVAL

When servicing the lower instrument panel, refer to Body, Instrument Panel, and then the appropriate removal procedure.

(1) Remove the right end cover.
(2) Remove the lower steering column cover.
(3) Remove the center bezel.
(4) Remove the lower console.
(5) Remove the cup holder and track.
(6) Remove the glove box.
(7) Remove the glove box latch striker.
(8) Remove the glove box lamp.
(9) Remove the eighteen screws holding the lower instrument panel to the reinforcement frame (Fig. 12).
(10) Remove the lower instrument panel from vehicle.

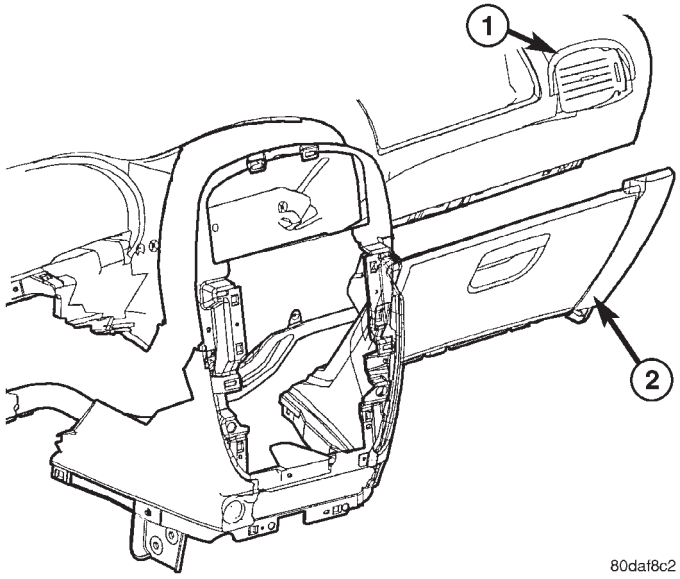

Fig. 12 LOWER INSTRUMENT PANEL

1 - INSTRUMENT PANEL
2 - LOWER INSTRUMENT PANEL

INSTALLATION

When servicing the lower instrument panel, refer to Body, Instrument Panel, and then the appropriate removal procedure.

(1) Install the lower instrument panel into the vehicle (Fig. 12).
(2) Install the eighteen screws holding the lower instrument panel to the reinforcement frame.
(3) Install the glove box lamp.
(4) Install the glove box latch striker.
(5) Install the glove box.
(6) Install the cup holder and track.
(7) Install the lower console.
(8) Install the center bezel.
(9) Install the lower steering column cover.
(10) Install the right end cover.

LOWER STEERING COLUMN COVER

REMOVAL

(1) Remove the four screws attaching the lower steering column cover to instrument panel (Fig. 13).
(2) Remove the lower steering column cover from the vehicle.

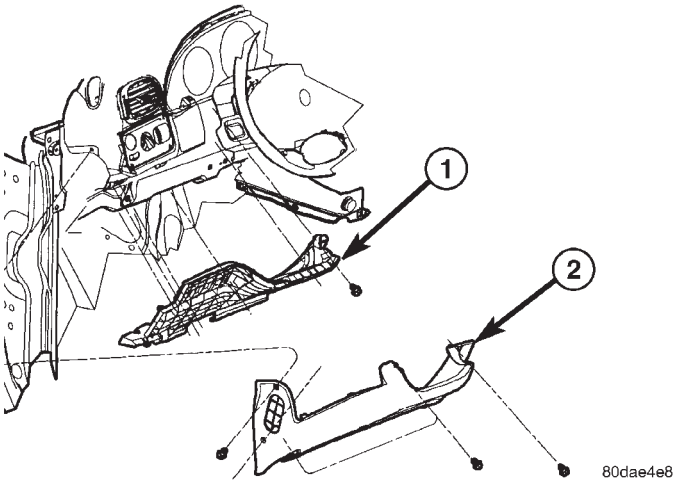

Fig. 13 LOWER STEERING COLUMN COVER

1 - STEERING COLUMN COVER BACKING PLATE
2 - STEERING COLUMN COVER

INSTALLATION

(1) Install the lower steering column cover into the vehicle (Fig. 13).
(2) Install the four screws attaching the lower steering column cover to instrument panel.

STEERING COLUMN COVER BACKING PLATE

REMOVAL

(1) Remove lower steering column cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
(2) Remove the park brake release handle link from the park brake release handle.
(3) Remove screws attaching lower steering column backing plate to instrument panel (Fig. 13).
(4) Unclip the Data Link Connector (DLC) from the lower steering column backing plate.

STEERING COLUMN COVER BACKING PLATE (Continued)

(5) Remove lower steering column backing plate from vehicle.

INSTALLATION

(1) Install the steering column cover backing plate into vehicle (Fig. 13).

(2) Clip the Data Link Connector (DLC) to the steering column cover backing plate

(3) Install the screws attaching steering column cover backing plate to instrument panel.

(4) Connect the park brake release handle link to the park release handle.

(5) Install the lower steering column cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

OVER STEERING COLUMN COVER

REMOVAL

(1) Taking a firm grasp of the over steering column cover front edge, give a quick upward pulling motion to disengage the cover from the instrument panel (Fig. 14).

(2) Remove the over steering column cover from the vehicle.

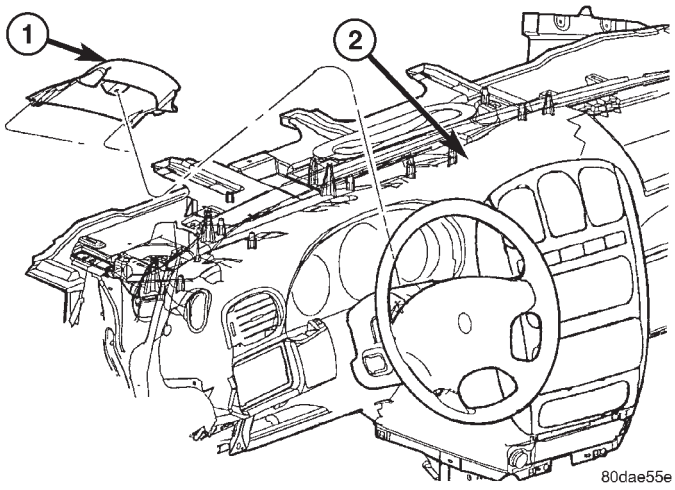

Fig. 14 OVER STEERING COLUMN COVER

1 - INSTRUMENT PANEL OVER STEERING COLUMN COVER
2 - INSTRUMENT PANEL

INSTALLATION

(1) Place the over steering column cover into position over the retaining slots and firmly snap into place (Fig. 14).

A-PILLAR LOWER EXTENSION TRIM

REMOVAL

(1) Remove instrument panel side cover.
(2) Remove A-pillar extension trim from vehicle by disengaging hidden clips (Fig. 1).

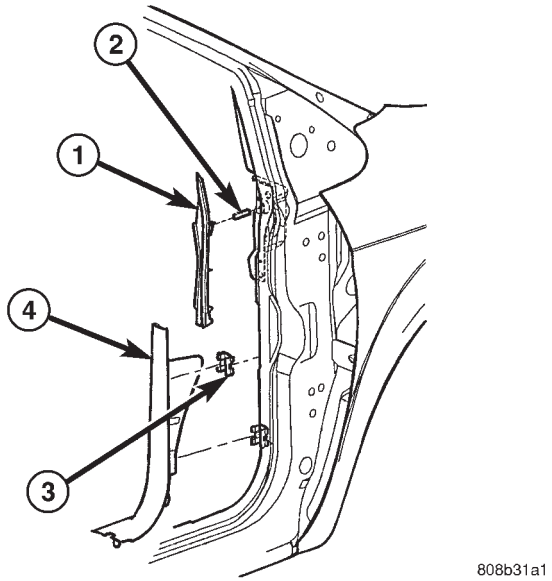

Fig. 1 A-PILLAR LOWER EXTENSION TRIM

1 - FRONT LOWER EXTENSION TRIM
2 - FRONT EXTENSION TRIM TO INSTRUMENT PANEL RETAINER
3 - CLIP
4 - COWL TRIM PANEL

INSTALLATION

(1) Place A-pillar extension trim in position on vehicle (Fig. 1).
(2) Install instrument panel side cover.

A-PILLAR TRIM

REMOVAL

(1) Remove the assist handle if equipped. (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL)
(2) Disengage hidden clips holding A-pillar trim panel to A-pillar (Fig. 2).
(3) Remove A-pillar trim from vehicle.

INSTALLATION

(1) Position foot on A-pillar trim panel into instrument panel top cover channel.
(2) Position A-pillar trim in vehicle.
(3) Align locator pins.
(4) Engage hidden clips.

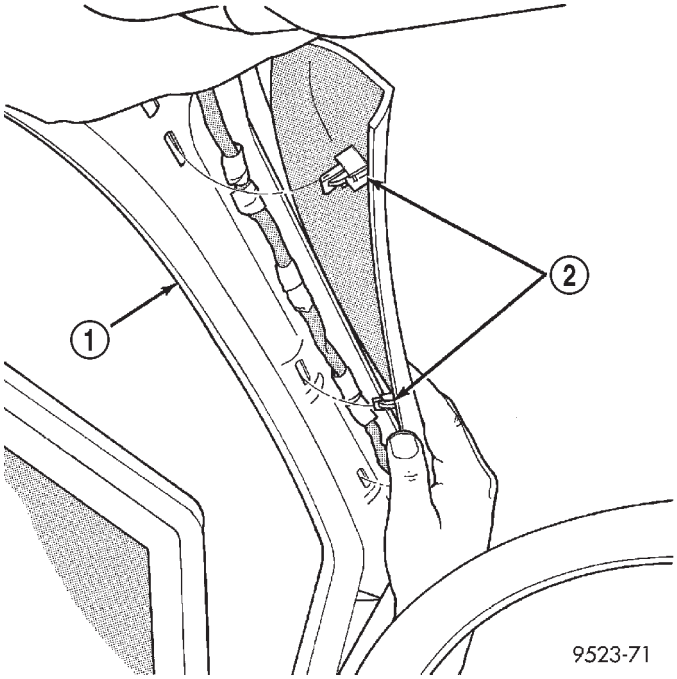

Fig. 2 A-PILLAR TRIM

1 - A-PILLAR
2 - CLIPS

(5) Install the assist handle, if equipped. (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - INSTALLATION)

ASSIST HANDLE

REMOVAL

(1) Using a trim stick (C-4755), remove screw access covers from grab-handle.
(2) Remove screws holding grab-handle to roof rail.
(3) Remove grab-handle from vehicle.

INSTALLATION

(1) Place grab-handle in position on vehicle.
(2) Install screws to hold grab-handle to roof rail.
(3) Install screw access covers into grab-handle.

B-PILLAR LOWER TRIM

REMOVAL

(1) Slide lower seat belt cover rearward to expose anchor bolt.
(2) Remove bolt attaching lower seat belt anchor to floor.
(3) Remove upper B-pillar trim cover.
(4) Remove access panel from B-pillar trim (Fig. 3).

B-PILLAR LOWER TRIM (Continued)

(5) Disengage hidden clips attaching lower trim cover to B-pillar.

(6) Remove lower B-pillar trim cover from vehicle.

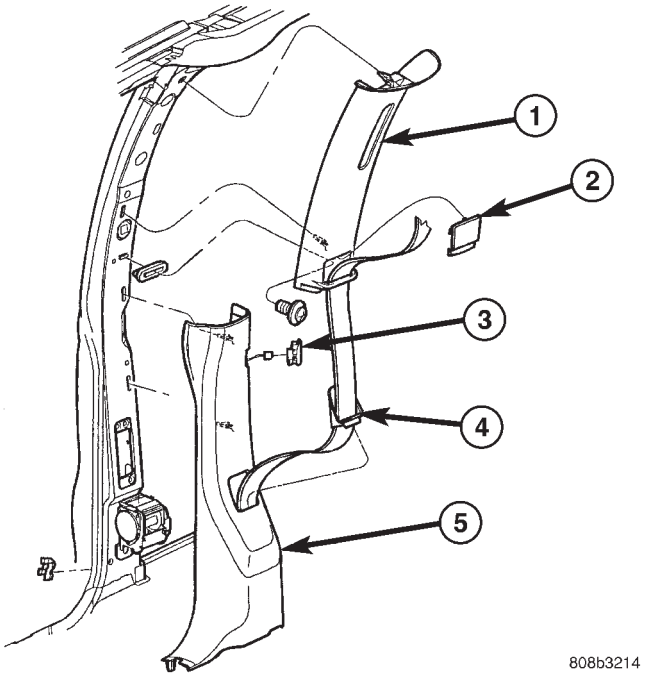

Fig. 3 LOWER B-PILLAR TRIM COVER

1 - B-PILLAR UPPER TRIM
2 - B-PILLAR UPPER PLUG
3 - POWER SLIDING DOOR SWITCH AND BEZEL
4 - BELT ASSEMBLY
5 - B-PILLAR LOWER TRIM

INSTALLATION

(1) Place lower B-pillar trim cover in position on vehicle (Fig. 3).

(2) Insert seat belt through hole in lower B-pillar trim.

(3) Engage hidden clips attaching lower trim cover to B-pillar.

(4) Install access cover.

(5) Install upper B-pillar trim cover.

(6) Place seat belt anchor in position on floor so webbing is pointed rearward and slightly outboard.

(7) Install bolt attaching lower seat belt anchor to floor. Tighten all seat belt bolts to 39 N·m (29 ft. lbs.) torque.

(8) Verify that seat belt anchor does not interfere with seat track travel.

B-PILLAR UPPER TRIM

REMOVAL

(1) Remove bolt attaching lower seat belt anchor to floor.

(2) Lower shoulder belt height adjuster to the bottom of travel.

(3) Remove shoulder belt turning loop from height adjuster.

(4) Use a Snap-on® Trim Pad Remover tool (A179A), or equivalent, and remove shoulder belt height adjuster knob.

(5) Remove shoulder belt bezel from trim cover (Fig. 3).

(6) Remove screw attaching trim cover to B-pillar from inside bezel cavity.

(7) Disengage hidden clips attaching trim cover to B-pillar.

(8) Remove B-pillar trim cover from vehicle.

INSTALLATION

(1) Insert seat belt through B-pillar trim and web guide (Fig. 3).

(2) Place B-pillar trim cover in position on vehicle.

(3) Engage hidden clips attaching trim cover to B-pillar.

(4) Install shoulder belt bezel into trim cover.

(5) Install height adjuster knob.

(6) Install shoulder belt turning loop onto height adjuster. Tighten bolt to 39 N·m (29 ft. lbs.) torque.

(7) Place seat anchor in position on floor so webbing is pointed rearward and slightly outboard.

(8) Install bolt attaching lower seat belt anchor to floor. Tighten seat belt bolt to 39 N·m (29 ft. lbs.) torque.

CARPETS AND FLOOR MATS

REMOVAL

(1) Remove front seats. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)

(2) Remove front center console.

(3) Remove the remaining seats. Refer to the Owner's Manual for the proper procedures.

(4) Remove front cowl panels and sill plates.

(5) Remove sliding door sill plates. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - REMOVAL)

(6) Remove the cargo organizer, if equipped.

(7) Remove liftgate scuff plate. (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - REMOVAL)

(8) Remove lower B-pillar trim covers.

(9) Remove D-pillar trim covers.

(10) Remove Quarter trim panels.

(11) Remove floor escutcheons (Fig. 4).

(12) Remove the floor console trays. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE TRAY - REMOVAL)

CARPETS AND FLOOR MATS (Continued)

(13) Remove push pin fasteners attaching carpet to floor in front seat and rear area.

(14) Roll carpet from under instrument panel to center of sliding door.

(15) Roll and fold carpet forward away from rear door opening.

(16) Extract carpet through sliding door opening (Fig. 5).

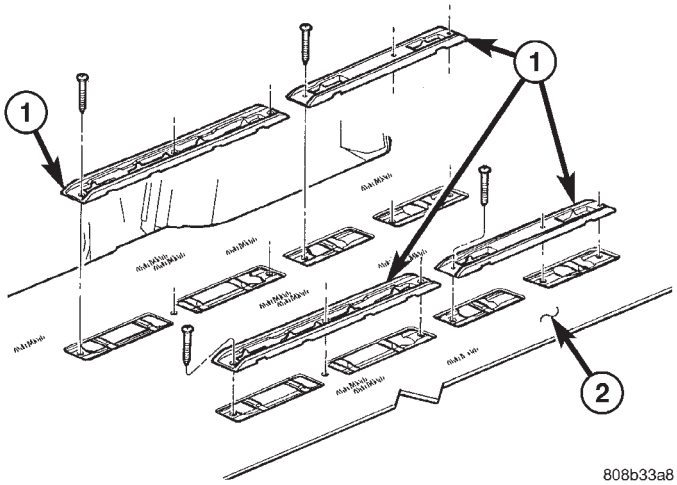

Fig. 4 SEAT ESCUTCHEONS

1 - SEAT ESCUTCHEON
2 - FLOOR CARPET

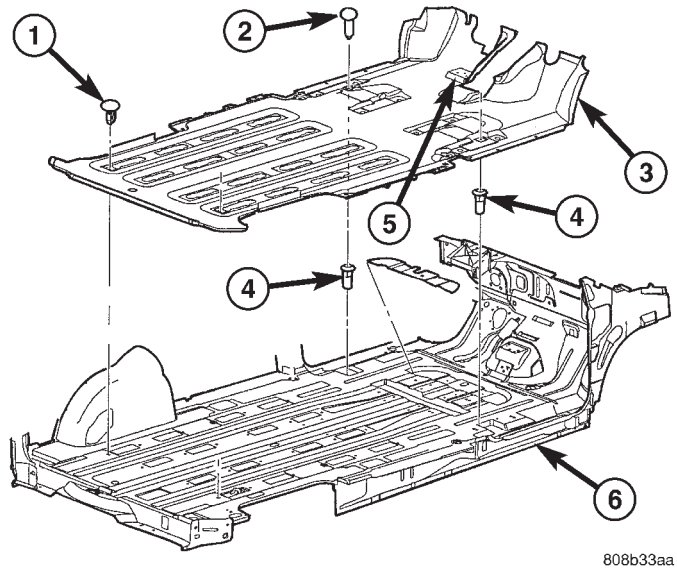

Fig. 5 FLOOR CARPET

1 - CARPET LOCATOR GROMMET
2 - PUSH PIN
3 - CARPET
4 - CARPET GROMMET
5 - HEEL PROTECTOR PAD
6 - BODY ASSEMBLY

INSTALLATION

(1) Insert carpet through sliding door opening.

(2) Roll carpet rearward toward rear door opening.

(3) Roll carpet under instrument panel.

(4) Install push pins fasteners through carpet and grommet into floor to attach carpet to floor in front seat area (Fig. 5).

(5) Install push pins fasteners in the rear area.

CAUTION: Ensure that the correct fasteners are installed in the proper locations. Damage to the fuel tank may result.

(6) Install floor escutcheons (Fig. 4).

(7) Install the floor console trays. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE TRAY - INSTALLATION)

(8) Install Quarter trim panels.

(9) Install D-pillar trim covers.

(10) Install lower B-pillar trim covers.

(11) Install rear door sill plate.

(12) Install sliding door sill plates. (Refer to 23 - BODY/INTERIOR/SLIDING DOOR SILL PLATE - INSTALLATION)

(13) Install front cowl panels and sill plates.

(14) Install the passenger seats. Refer to the Owner's Manual for proper procedures.

(15) Install front center console.

(16) Install front seats. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

COWL TRIM

REMOVAL

(1) Remove door sill plate.

(2) Disengage hidden clips holding cowl trim to cowl panel (Fig. 1).

(3) Remove cowl trim from vehicle.

INSTALLATION

(1) Place cowl trim panel in position on vehicle (Fig. 1).

(2) Engage hidden clips attaching cowl trim to cowl panel.

(3) Install door sill plate.

C-PILLAR TRIM

REMOVAL

(1) Remove quarter trim panel.

(2) Remove seat belt turning loop from height adjuster.

(3) Remove screw attaching C-pillar trim panel to C-pillar (Fig. 6).

C-PILLAR TRIM (Continued)

(4) Disengage hidden clips attaching trim to upper C-pillar.
(5) Remove upper C-pillar trim from vehicle.

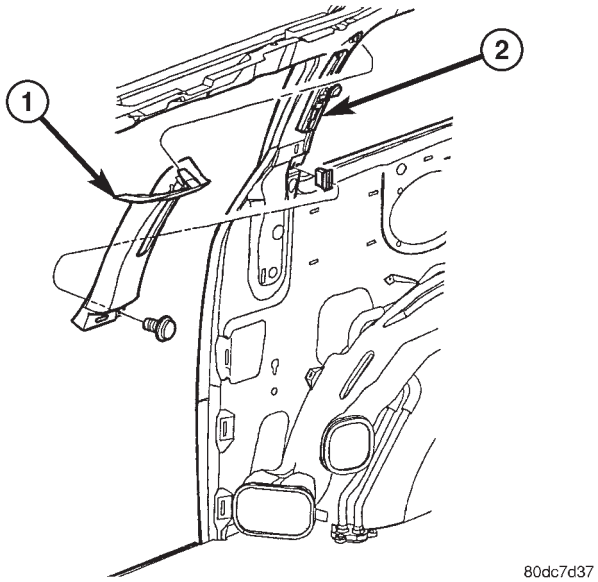

Fig. 6 C-PILLAR

1 - C-PILLAR TRIM PANEL
2 - C-PILLAR

INSTALLATION

(1) Place upper C-pillar trim in position on vehicle (Fig. 6).
(2) Engage hidden clips attaching trim to upper C-pillar.
(3) Install screw attaching C-pillar trim panel to C-pillar.
(4) Install seat belt turning loop onto height adjuster. Tighten all seat belt bolts to 39 N·m (29 ft. lbs.) torque.
(5) Install quarter trim panel.

DOOR SILL TRIM PLATE

REMOVAL

(1) Using trim stick (C-4755), disengage hidden clips holding door sill plate from door sill.
(2) Remove sill plate from vehicle (Fig. 7).

INSTALLATION

(1) Place sill plate in position on vehicle (Fig. 7).
(2) Align interlock tabs at front and rear to mating trim.
(3) Engage hidden clips to hold door sill plate to door sill.

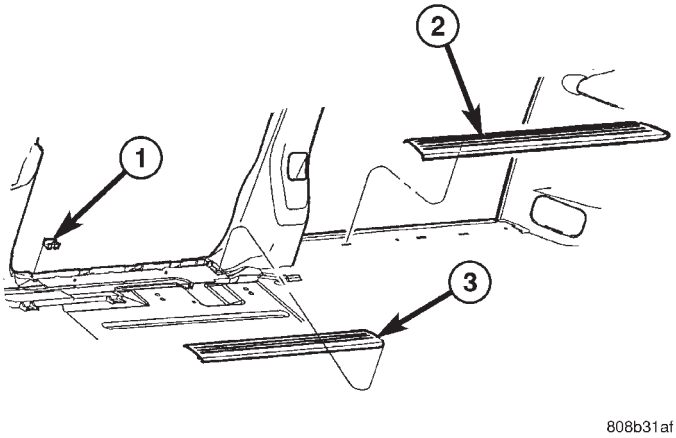

Fig. 7 DOOR SILL PLATE

1 - CLIPS
2 - SLIDING DOOR SILL TRIM PLATE
3 - FRONT DOOR SILL TRIM PLATE

HEADLINER

REMOVAL

(1) Remove sun visors and vanity mirrors.
(2) Remove sun visor center supports.
(3) If equipped, remove coat hooks.
(4) If equipped, remove roof rail modules.
(5) Remove A-pillar trim covers.
(6) Remove B-pillar upper trim covers.
(7) Remove C-pillar upper trim covers.
(8) Remove D-pillar trim covers.
(9) Remove liftgate opening header trim.
(10) If equipped, remove overhead console screw.
(11) If equipped, remove reading lamp.
(12) Remove dome lamp.
(13) Remove push in locking fasteners attaching headlining to rear roof header and roof bows (Fig. 8).
(14) Remove wiring connections.
(15) Remove headlining from roof.
(16) Extract headlining through liftgate opening.

INSTALLATION

(1) Insert headlining through liftgate opening.
(2) Place headlining in position on roof.
(3) Connect wire connectors.
(4) Install left sun visor support.
(5) Install push in locking fasteners attaching headlining to rear roof header and bows (Fig. 8).
(6) Install right sun visor support.
(7) Install sun visors and vanity mirrors.
(8) If equipped, install roof rail modules.
(9) If equipped, install coat hooks.
(10) Install dome lamp.
(11) If equipped, install reading lamp.

HEADLINER (Continued)

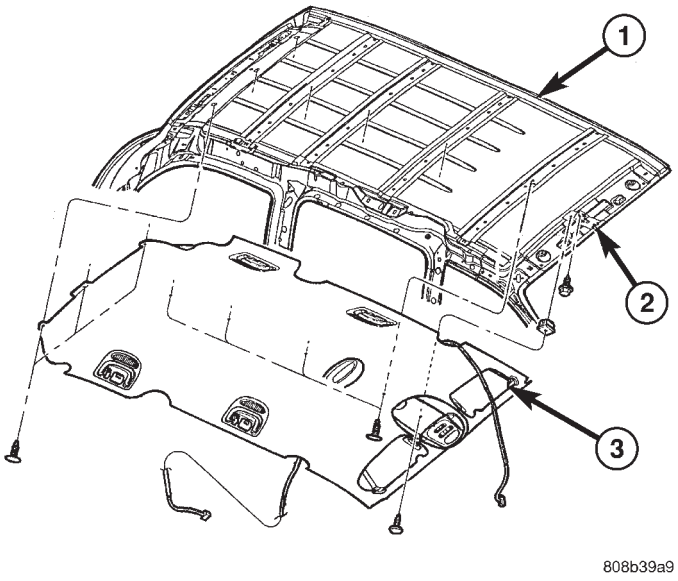

Fig. 8 HEADLINING

1 - ROOF
2 - OVERHEAD CONSOLE BRACKET
3 - HEADLINING ASSEMBLY

(12) If equipped, install overhead console.
(13) Install liftgate opening header trim.
(14) Install D-pillar trim covers.
(15) Install C-pillar upper trim covers.
(16) Install B-pillar upper trim covers.
(17) Install A-pillar trim covers.

LEFT D-PILLAR TRIM PANEL

REMOVAL

(1) Remove rear header trim cover.
(2) Remove liftgate sill plate.
(3) Remove second row seat belt turning loop on long wheel base vehicle.
(4) Remove bolt attaching second row seat belt lower anchor to quarter on short wheel base vehicle.
(5) Disengage hidden clips attaching trim to D-pillar.
(6) Disconnect speaker wire connector, if equipped.
(7) Pass seat belt through slot in D-pillar trim panel on short wheel base vehicle.
(8) Remove D-pillar trim from vehicle.

INSTALLATION

(1) Pass seat belt through slot in D-pillar trim panel on short wheel base vehicle.
(2) Position D-pillar trim panel on vehicle.
(3) Connect speaker wire connector to speaker, if equipped.
(4) Align locating pins on backside of trim panel to mating holes in inner quarter panel.
(5) Engage hidden clips attaching trim to D-pillar.
(6) Install bolt attaching second row seat belt lower anchor to quarter on short wheel base vehicle. Tighten all seat belt bolts to 39 N·m (29 ft. lbs.).
(7) Install second row seat belt turning loop on long wheel base vehicle.
(8) Install liftgate sill plate.
(9) Install rear header trim cover.

LIFTGATE SILL PLATE

REMOVAL

(1) Disengage hidden clips holding sill plate to liftgate door opening sill (Fig. 9).
(2) Remove sill plate from vehicle.

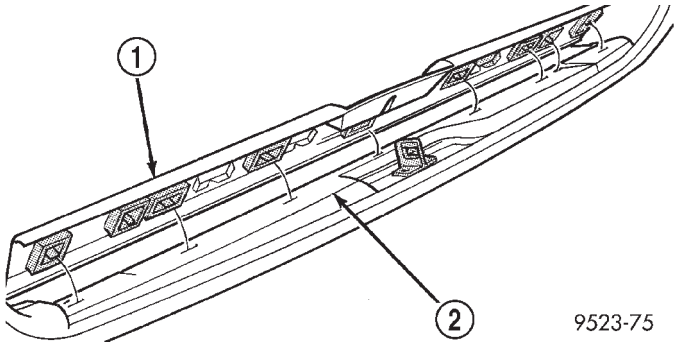

Fig. 9 LIFTGATE SILL PLATE

1 - LIFTGATE SILL PLATE
2 - LIFTGATE SILL

INSTALLATION

(1) Place sill plate in position on vehicle.
(2) Align engage hook tabs at end of liftgate sill plate to D-pillar trim.
(3) Engage hidden clips to hold sill plate to liftgate door opening sill.

QUARTER TRIM BOLSTER

REMOVAL

The speaker grille in the quarter trim panel is not removable. The trim panel must be removed to service the speaker.
(1) Disengage hidden clips attaching trim bolster to quarter trim panel.
(2) Remove quarter trim panel from vehicle.

INSTALLATION

The speaker grille in the quarter trim bolster is not removable. The trim bolster must removed to service the speaker.
(1) Place quarter trim bolster in position on vehicle.

QUARTER TRIM BOLSTER (Continued)

(2) Engage hook retainer attaching front of trim bolster to quarter trim panel, if applicable.
(3) Engage hidden clips attaching trim bolster to quarter trim panel.

RIGHT QUARTER TRIM PANEL

REMOVAL

CAUTION: Disconnect the battery negative cable. Damage to accessory feed circuit can result.

(1) Remove first row seat.
(2) Remove second row seat.
(3) Remove sliding door sill trim panel.
(4) Remove quarter trim bolster.
(5) Remove D-pillar trim panel.
(6) Remove first row seat belt anchor.
(7) Remove second row seat belt anchor.
(8) Remove screws attaching quarter trim to quarter panel from bolster area.
(9) Remove screws attaching rear edge of quarter trim to attaching bracket.
(10) Disengage hidden clips attaching front of quarter trim to quarter panel rearward of sliding door opening and at locators.
(11) Remove quarter trim from quarter panel.
(12) Disconnect speaker wire connector on LWB quarter trim panel with rear air conditioning.
(13) Pass second row seat belt through slot in trim panel on long wheel base vehicle.
(14) Pass first row seat belt through slot in trim panel.
(15) Remove quarter trim panel from vehicle.

INSTALLATION

(1) Position quarter trim panel on vehicle.
(2) Pass first row seat belt through slot in trim panel.
(3) Pass second row seat belt through access hole in trim panel on long wheel base vehicle.
(4) Connect wire connector into speaker on LWB with rear air conditioning.
(5) Align locating pins on backside of trim panel to mating holes in inner quarter panel.
(6) Engage hidden clips attaching front of quarter trim to quarter panel rearward of sliding door opening and at locators.
(7) Install screws attaching rear edge of quarter trim to attaching bracket.
(8) Install screws attaching quarter trim to inner quarter panel in bolster area.
(9) Install second row seat belt anchor on long wheel base vehicle. Tighten all seat belt bolts to 39 N·m (29 ft. lbs.) torque.
(10) Install first row seat belt anchor.
(11) Install D-pillar trim panel.
(12) Install C-pillar trim panel.
(13) Install quarter trim bolster.
(14) Install sliding door sill trim panel.
(15) Install second row seat, if equipped.
(16) Install first row seat.
(17) Connect the battery negative cable.

LEFT QUARTER TRIM PANEL

REMOVAL

CAUTION: Disconnect the negative cable clamp from battery post. Damage to accessory feed circuit can result.

(1) Remove first row seat.
(2) Remove second row seat, if equipped.
(3) Remove front door sill plate on three door vehicle.
(4) Remove sliding door sill plate on four door vehicle.
(5) Remove left quarter trim bolster.
(6) Remove C-pillar trim panel.
(7) Remove left D-pillar trim panel.
(8) Remove first row seat belt anchor.
(9) Remove second row seat belt anchor on long wheel base vehicle.
(10) Remove screws attaching quarter trim to quarter panel from bolster area.
(11) Remove screws attaching rear edge of quarter trim to attaching bracket or inner quarter trim panel.
(12) Disconnect wire connector from accessory power outlet, if equipped.
(13) Remove quarter trim from quarter panel.
(14) Pass front seat belt and turning loop through slot in quarter trim panel on three door vehicle.
(15) Pass first row seat belt through slot in quarter trim panel.
(16) Pass second row seat belt, if equipped, through slot in quarter trim panel on long wheel base vehicle.
(17) Remove quarter trim panel from vehicle.

INSTALLATION

(1) Position quarter trim panel on vehicle.
(2) Pass second row seat belt, if equipped, through slot in quarter trim panel on long wheel base vehicle.
(3) Pass first row seat belt through slot in quarter trim panel.
(4) Connect wire connector into accessory power outlet, if equipped.
(5) Align locating pins on backside of trim panel to mating holes in inner panels.

LEFT QUARTER TRIM PANEL (Continued)

(6) Position quarter trim panel on inner quarter panel.
(7) Install screws attaching rear edge of quarter trim to attaching bracket or inner quarter panel.
(8) Install screws attaching quarter trim to inner quarter panel in bolster area.
(9) Install second row seat belts anchor on long wheel base vehicle. Tighten all seat belt bolts to 39 N·m (28 in. lbs.) torque.
(10) Install first row seat belt anchor.
(11) Install left D-pillar trim panel.
(12) Install C-pillar trim panel.
(13) Install upper left B-pillar trim on three door vehicle.
(14) Install left quarter trim bolster.
(15) Install front door sill plate on three door vehicle.
(16) Install sliding door sill plate on four door vehicle.
(17) Install second row seat, if equipped.
(18) Install first row seat.
(19) Connect the battery negative cable.

REAR HEADER TRIM

REMOVAL

(1) Disengage hidden clips holding trim to rear header (Fig. 10).
(2) Separate rear header trim from vehicle.

INSTALLATION

(1) Place rear header trim in position on vehicle.
(2) Align guide pins on trim to holes in header.
(3) Engage hidden clips to hold trim to rear header.
(4) Engage interlock tabs at D-pillar trim.

REAR HVAC LOUVER

REMOVAL

(1) Using a trim stick (C-4755), pry edge of louver from bezel.
(2) Remove HVAC louver from bezel.
(3) Using a trim stick, pry lower edge of HVAC bezel away from headlining (Fig. 11).
(4) Remove louver from vehicle.

INSTALLATION

(1) Place bezel in position in HVAC duct opening.
(2) Push inward on bezel until clips snap in place. Verify that all four clips have been engaged to the bezel and that the bezel is flush to the headlining
(3) Position HVAC louver to bezel.
(4) Snap both ends of the louver into HVAC bezel.

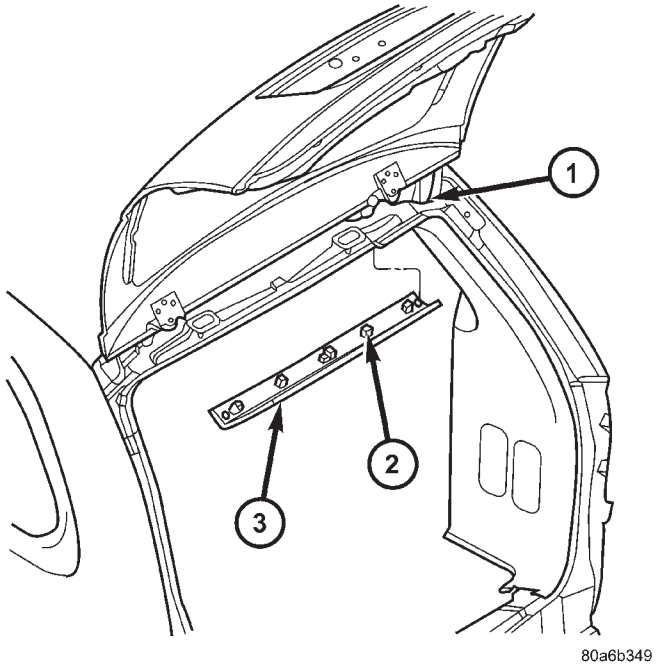

Fig. 10 REAR HEADER TRIM

1 - REAR HEADER
2 - GUIDE PINS
3 - CLIPS

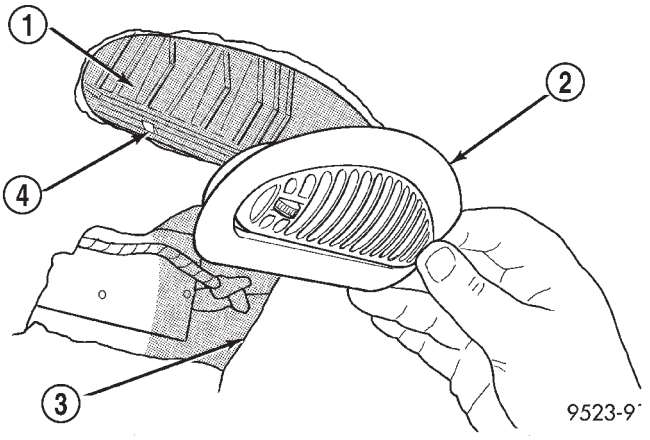

Fig. 11 REAR HVAC LOUVER

1 - HEVAC DUCT
2 - REAR HEVAC LOUVER
3 - HEADLINING
4 - CLIP

REAR VIEW MIRROR

REMOVAL

(1) If equipped, disconnect mirror harness connector (Fig. 12).

(2) Loosen the mirror base set screw (Fig. 13).

(3) Slide the mirror base upward and off the bracket.

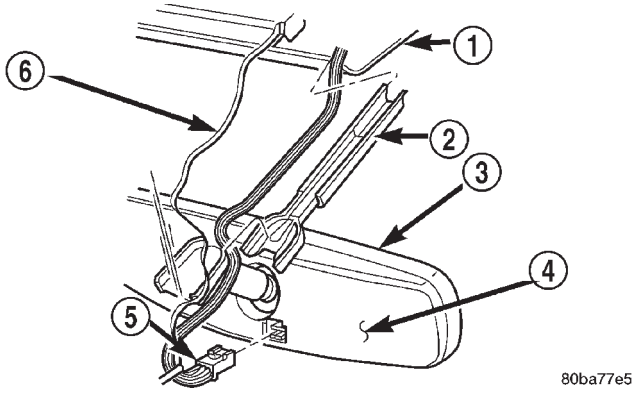

Fig. 12 REAR VIEW MIRROR ASSEMBLY

1 - HEADLINER
2 - WIRE COVER
3 - MIRROR
4 - MIRROR ASSEMBLY
5 - WIRE CONNECTOR
6 - WINDSHIELD

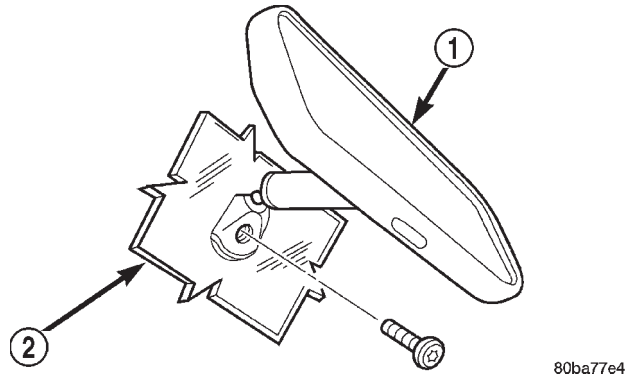

Fig. 13 REAR VIEW MIRROR

1 - MIRROR
2 - WINDSHIELD

INSTALLATION

(1) Position the mirror base at the bracket and slide it downward onto the support bracket.

(2) Tighten the setscrew 1 N·m (15 in. lbs.) torque.

(3) If equipped, connect mirror harness connector.

RIGHT D-PILLAR TRIM PANEL

REMOVAL

(1) Remove rear header trim cover.

(2) Remove liftgate sill plate.

(3) Remove second row seat belt turning loop on long wheel base vehicle.

(4) Remove bolt attaching second row seat belt, anchor to quarter on short wheel base vehicle.

(5) Disengage hidden clips attaching trim to D-pillar.

(6) Remove D-pillar trim panel from D-pillar.

(7) Disconnect speaker wire connector, if equipped.

(8) Pass second row seat belt, if equipped, through slot in trim panel on short wheel base vehicle.

(9) Remove D-pillar trim from vehicle.

INSTALLATION

(1) Position D-pillar trim on vehicle.

(2) Pass second row seat belt, if equipped, through slot in trim panel on short wheel base vehicle.

(3) Connect speaker wire connector to speaker, if equipped.

(4) Align locating pins on backside of trim panel to mating holes in D-pillar.

(5) Engage hidden clips attaching trim to D-pillar.

(6) Install screws attaching trim panel to attaching bracket on short wheel base vehicle.

(7) Install quarter trim bolster on short wheel base vehicle.

(8) Install bolt to attach second row seat belt, if equipped, anchor to quarter on short wheel base vehicle. Tighten all seat belt bolts to 39 N·m (29 ft. lbs.) torque.

(9) Install second row seat belt turning loop on long wheel base vehicle.

(10) Install liftgate sill plate.

(11) Install rear header trim cover.

SLIDING DOOR SILL PLATE

REMOVAL

(1) Disengage hidden clips holding sill plate to sliding door opening sill.

(2) Disengage hooks holding outside edge of sill plate to door sill (Fig. 14).

(3) Remove sill plate from vehicle.

INSTALLATION

(1) Place sill plate in position on vehicle.

(2) Engage hooks to hold outside edge of sill plate to door sill.

(3) Align guide pins to holes in door sill.

(4) Engage hidden clips to hold sill plate to sliding door opening sill.

SLIDING DOOR SILL PLATE (Continued)

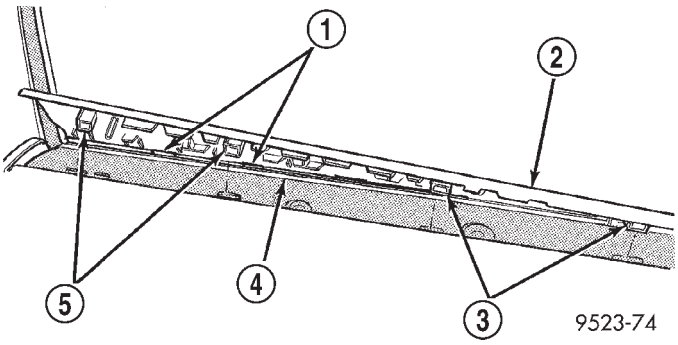

Fig. 14 SLIDING DOOR SILL PLATE

1 - HOOKS
2 - SILL PLATE
3 - CLIPS
4 - SLIDING DOOR SILL
5 - CLIPS

(5) Engage interlock tabs at lower B-pillar and quarter trim panel.

SUN VISOR

REMOVAL

All vehicles with driver and passenger side air bags must have a colored coded five Bullet point air bag warning label applied to the sun visor, verify label availability and ensure the label is installed.

(1) Disengage sun visor from center support.

(2) Remove screws attaching sun visor to roof header (Fig. 15).

(3) Remove sun visor from roof.

(4) If equipped, disconnect illuminated vanity mirror wire connector from body harness.

(5) Remove sun visor from vehicle.

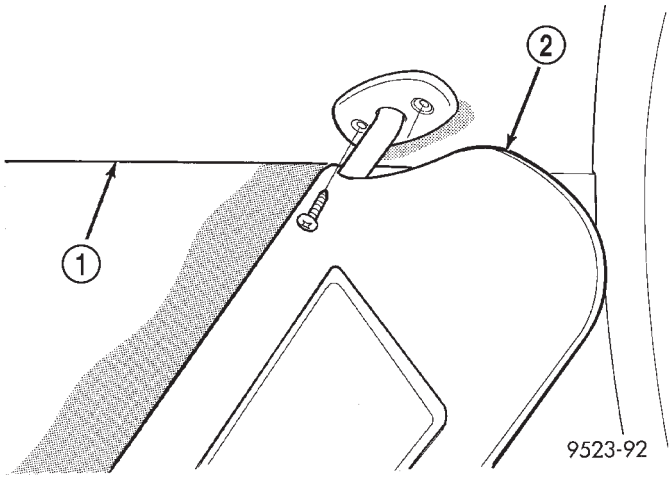

Fig. 15 SUN VISOR

1 - HEADLINING
2 - SUN VISOR

INSTALLATION

All vehicles with driver and passenger side air bags must have a colored coded five Bullet point air bag warning label applied to the sun visor, verify label availability and ensure the label is installed.

(1) Place sun visor in position on vehicle.

(2) Connect illuminated vanity mirror wire connector into body harness.

(3) Place sun visor in position on roof.

(4) Install screws to hold sun visor to roof header (Fig. 15) .

(5) Engage sun visor into center support.

SUN VISOR SUPPORT

REMOVAL

(1) Disengage sun visor from support.

(2) Remove screw holding support to roof header (Fig. 16).

(3) Remove sun visor support from vehicle.

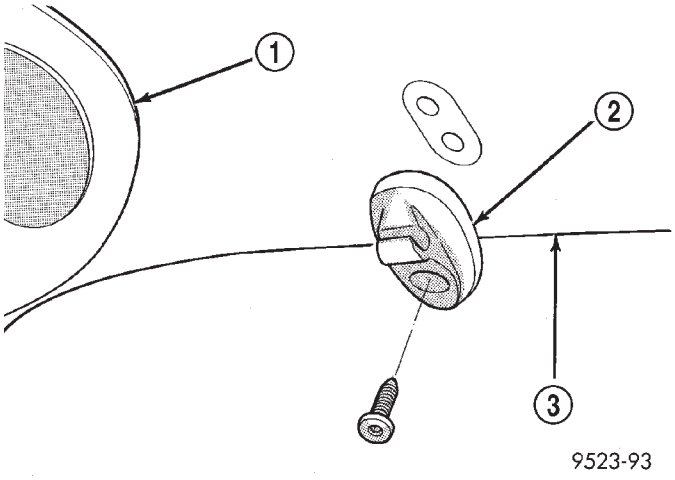

Fig. 16 SUN VISOR SUPPORT

1 - OVERHEAD CONSOLE
2 - SUN VISOR SUPPORT
3 - HEADLINING

INSTALLATION

(1) Place sun visor support in position on vehicle.

(2) Install screw holding support to roof header (Fig. 16) .

(3) Engage sun visor into support.

FLOOR CONSOLE TRAY

REMOVAL

(1) Remove the floor console. Refer to the Owner's Manual for proper procedures.

(2) Remove the four screws and remove the tray.

INSTALLATION

(1) Install the floor console tray and install the screws.

(2) Install the floor console. Refer to the Owner's Manual for proper procedures.

FLOOR CONSOLE TRAY - BRACKET ASSEMBLY

REMOVAL

(1) Remove the floor carpet. (Refer to 23 - BODY/ INTERIOR/CARPETS AND FLOOR MATS - REMOVAL)

(2) Disconnect the electrical connector.

(3) Remove the four screws and remove the bracket assembly.

INSTALLATION

(1) Install the bracket assembly and install the four screws.

(2) Connect the electrical connector.

(3) Install the floor carpet. (Refer to 23 - BODY/ INTERIOR/CARPETS AND FLOOR MATS - INSTALLATION)

BASE COAT/CLEARCOAT FINISH

DESCRIPTION

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clearcoat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Body Code plate. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION). The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The codes listed in the Color Code Chart are used for manufacturing purposes.

PAINTED TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch Up Paints and Clear Top Coat. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION).

WARNING: USE A OSHA APPROVED BREATHING MASK WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

TOUCH UP PROCEDURE

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the defect without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch up paint. Do not overlap touch up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch up paint to dry hard.

(5) On vehicles without clearcoat, the touch up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clearcoat, apply clear top coat to touch up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

FINESSE SANDING/BUFFING & POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

CHILD SEAT MODULE

REMOVAL

(1) Close child restraint seat.
(2) Remove seat back cover.
(3) Remove screws attaching child restraint seat module hinges to seat back frame lower rail (Fig. 1).
(4) Return seat back to upright position.
(5) Disengage push in fasteners attaching upper bolster to child restraint seat module (Fig. 2).
(6) Remove screws attaching top of module to seat back frame upper rail (Fig. 3).
(7) Remove child restraint seat module from seat back (Fig. 4).

CHILD SEAT MODULE (Continued)

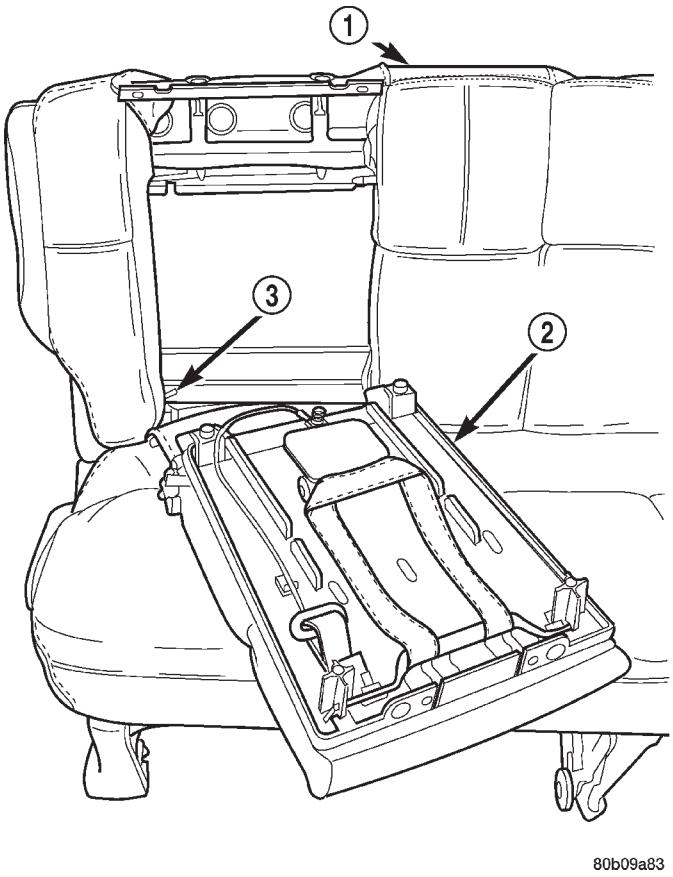

Fig. 4 CHILD RESTRAINT SEAT MODULE

1 - 1ST REAR SEAT BACK
2 - CHILD RESTRAINT SEAT MODULE
3 - SEAT BACK HINGE INTERLOCK LEVER

INSTALLATION

INSTALLATION

(1) Place child restraint seat module in position on seat back (Fig. 4).

(2) Position seat back hinge interlock lever over the top of the outboard child restraint seat hinge (Fig. 5).

(3) Install screws attaching child restraint seat module hinges to seat back frame lower rail (Fig. 1).

(4) Install screws attaching top of module to seat back frame upper rail (Fig. 3). Tighten nuts to 7 N·m (62 in. lbs.) torque.

(5) Install push in fasteners attaching upper bolster to child restraint seat module (Fig. 2).

(6) Return seat back to folded position.

(7) Install seat back cover.

(8) Verify child restraint seat operation.

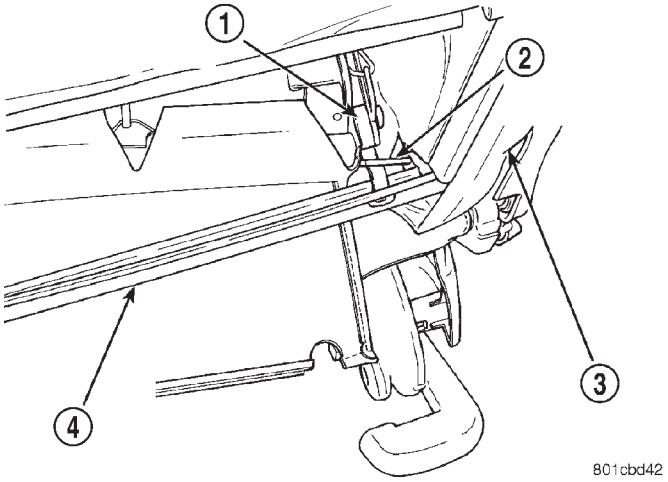

Fig. 5 INTERLOCK LEVER

1 - CHILD RESTRAINT SEAT HINGE
2 - SEAT BACK HINGE INTERLOCK LEVER
3 - 1ST REAR SEAT BACK
4 - SEAT BACK FRAME RAIL

SYNCHRONIZING CABLE ADJUSTMENT

NOTE:
Bench seats equipped with child restraint seats have an interlock feature that will not allow the seat back to fold forward with the child seat open.
If the seat back hinges do not release at the same time the synchronizing cable must be adjusted.

(1) Remove seat from vehicle. Refer to Owner's Manual for proper procedures.

(2) Disengage cable from the recline mechanism by pulling the cable end toward the front of the seat (Fig. 6).

(3) Pull U-shaped locking tab on self-adjusting mehcanism to disengage auto-adjust feature.

(4) Reattach self-adjusting mechanism, pulling against spring load to tighten cable.

(5) Press locking tab onto the adjusting mechanism to lock into place.

QUAD CHILD SEAT

REMOVAL

(1) Remove the seat. Refer to Owner's Manual for proper procedures.
(2) Remove seat back cover (Fig. 7).
(3) Remove fasteners attaching quad child seat to the seat (Fig. 8).
(4) Remove quad child seat from the seat.

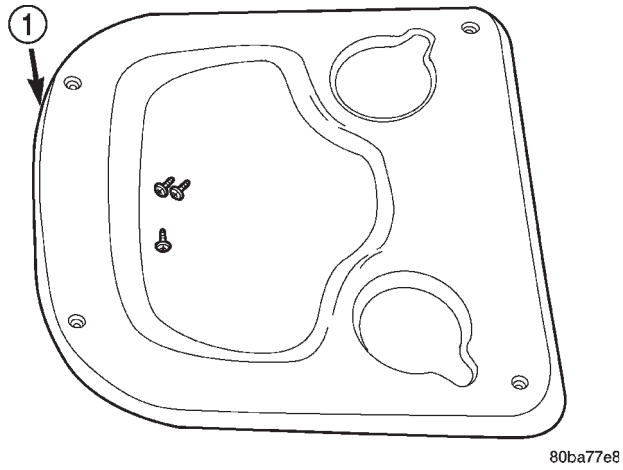

Fig. 7 SEAT BACK COVER

1 - SEAT BACK COVER

INSTALLATION

(1) Place quad child seat in position.
(2) Install fasteners and tighten to 13.5 N·m (10 ft. lbs.)
(3) Install seat back cover.
(4) Install seat in vehicle.

HEADREST

REMOVAL

(1) Lift head restraint to top of travel.
(2) Depress lock button on side of sleeve at top of seat back (Fig. 9).
(3) Pull head restraint from top of seat back.

INSTALLATION

(1) Place head restraint in position.
(2) Depress lock button on side of sleeve at top of seat back.
(3) Push heat restraint down into position.

HEADREST SLEEVE

REMOVAL

(1) Remove head rest.
(2) Disengage closure attaching bottom of trim cover together.

HEADREST SLEEVE (Continued)

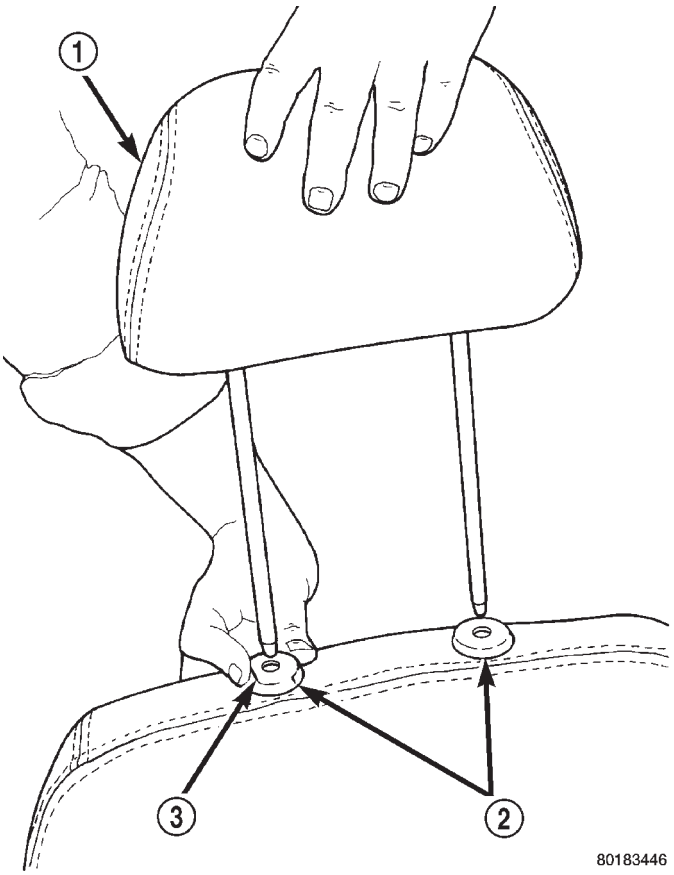

Fig. 9 HEAD RESTRAINT

1 - HEAD RESTRAINT
2 - SLEEVES
3 - LOCK BUTTON

(3) Reach under trim cover through opening at bottom of seat back.

(4) Pinch retainer barbs on end of head restraint sleeve together (Fig. 10).

(5) Pull head restraint sleeve upward and out the top of the seat back frame guide tube (Fig. 11).

INSTALLATION

(1) Insert head restraint sleeve into guide tube at top of seat back.

(2) Push head restraint sleeve downward until retainer clicks into lock position.

(3) Engage closure to hold bottom of trim cover together.

(4) Install head restraint.

RECLINER HANDLE

REMOVAL

(1) Remove screw holding recliner handle to recliner spline shaft (Fig. 12).

(2) Remove recliner handle from spline shaft.

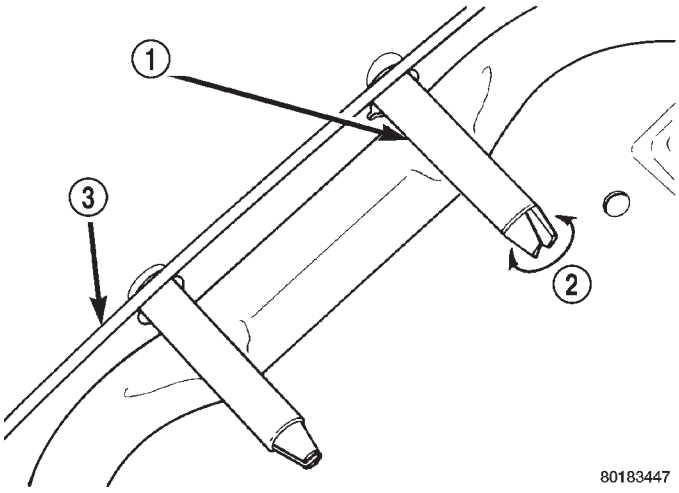

Fig. 10 HEAD RESTRAINT SLEEVE RETAINER

1 - GUIDE TUBE
2 - PINCH RETAINER TO RELEASE
3 - SEAT BACK FRAME

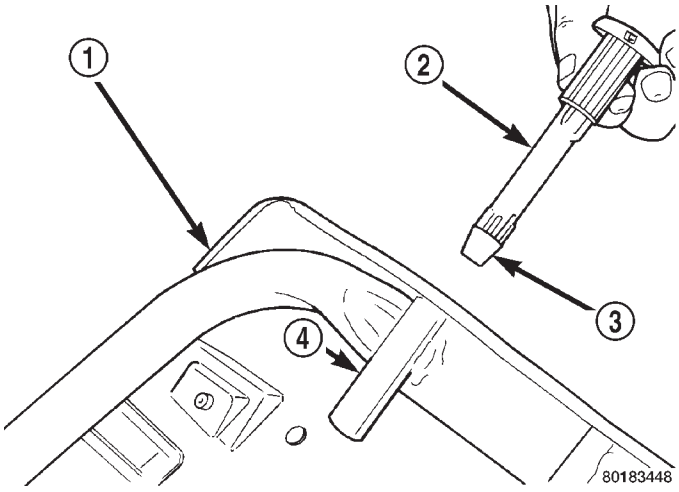

Fig. 11 HEAD RESTRAINT SLEEVE

1 - SEAT BACK FRAME
2 - HEAD RESTRAINT SLEEVE
3 - RETAINER
4 - GUIDE TUBE

INSTALLATION

(1) Place recliner handle in position on spline shaft.

(2) Install screw to hold recliner handle to recliner spline shaft (Fig. 12).

ARMREST

REMOVAL

(1) Using a small flat blade, pry cap from side of armrest (Fig. 13).

(2) Remove bolt attaching armrest to seat back.

ARMREST (Continued)

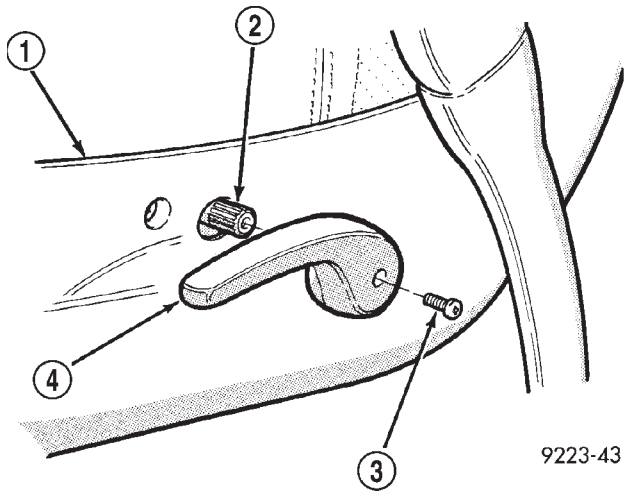

Fig. 12 RECLINER HANDLE - MANUAL

1 - CUSHION SIDE COVER
2 - RECLINER SPLINE
3 - SCREW
4 - RECLINER HANDLE

(3) Remove armrest from seat back.

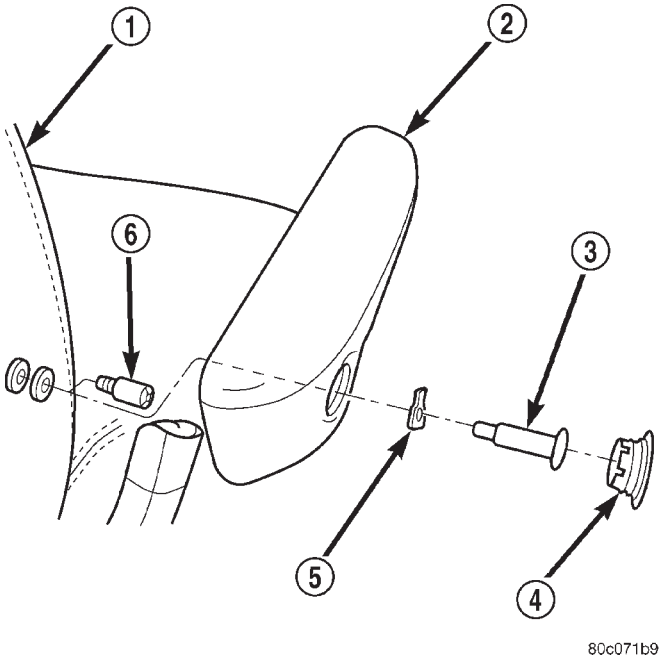

Fig. 13 ARMREST

1 - SEAT BACK
2 - ARMREST
3 - SHOULDER BOLT
4 - CAP
5 - WASHER
6 - STOP SCREW

INSTALLATION

(1) Place armrest in position on seat back.
(2) Install bolt attaching armrest to seat back. Tighten bolt to 29N·m (21 ft. lbs.) torque.
(3) Install side cap into the side of the armrest.

CENTER ARMREST 3 PASSENGER BENCH

REMOVAL

(1) Remove screws attaching the plastic grocery bag retainer. (Refer to 23 - BODY/SEATS/PLASTIC GROCERY BAG RETAINER - REMOVAL)
(2) Remove seat back rear cover.
(3) Remove E-clip from pivot post.
(4) Remove pivot post.
(5) Remove armrest.
(6) Remove pivot bushings.

INSTALLATION

(1) Install pivot bushings.
(2) Place armrest in position.
(3) Install pivot post.
(4) Install E-clip to pivot post.
(5) Install seat back rear cover.
(6) Install screws attaching the plastic grocery bag retainer. (Refer to 23 - BODY/SEATS/PLASTIC GROCERY BAG RETAINER - INSTALLATION)

FRONT SEAT

REMOVAL

(1) From under vehicle, remove nuts attaching front seat risers to the floor.
(2) Remove seat and riser from floor (Fig. 14).
(3) Tip seat rearward and disconnect wire connectors from body harness, if equipped.
(4) Remove seat from vehicle.

INSTALLATION

(1) Place seat into position
(2) Tip seat rearward and connect wire connectors to body harness, if equipped.
(3) Place seat and riser into floor.
(4) From under vehicle, install nuts attaching front seat risers to the floor. Tighten nuts to 60 N·m (44 ft. lbs.) torque.

FRONT SEATBACK

REMOVAL

NOTE: On front seats equipped with side air bags, the seatback is serviced as an assembly.

FRONT SEATBACK (Continued)

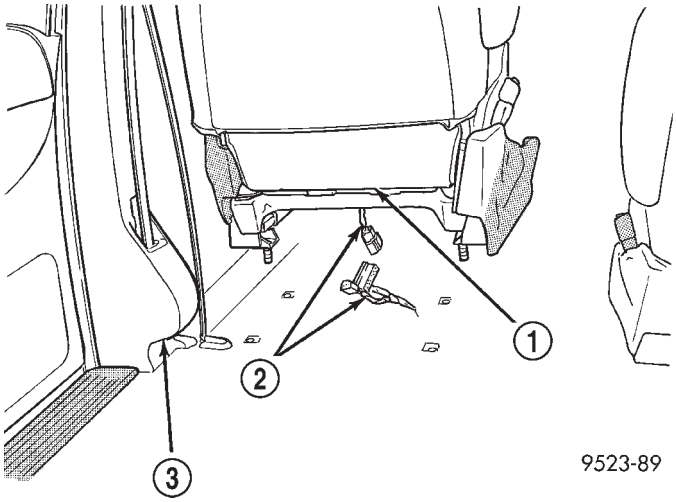

Fig. 14 FRONT SEAT

1 - FRONT SEAT
2 - CONNECTORS
3 - B-PILLAR

(1) Remove head rest sleeves. (Refer to 23 - BODY/SEATS/HEADREST SLEEVE - REMOVAL)
(2) Remove the armrest. (Refer to 23 - BODY/SEATS/ARMREST - REMOVAL)
(3) Remove the seatback recliner lever.
(4) Remove the lumbar adjustment lever.
(5) Remove both seat cushion side covers. (Refer to 23 - BODY/SEATS/FRONT SEAT CUSHION SIDE COVER - REMOVAL)
(6) Remove nut attaching the recliner to the seatback frame (Fig. 15).
(7) Remove both pivot bolts and remove seatback from recliner.

INSTALLATION

(1) Place seat back into position.
(2) Install both pivot bolts attaching seat back frame to seat track. Tighten bolts to 54 N·m (40 ft. lbs.) torque.
(3) Install nut attaching the recliner to the seat back frame. Tighten nut to 12 N·m (105 in. lbs.) torque.
(4) Install both seat cushion side covers. (Refer to 23 - BODY/SEATS/FRONT SEAT CUSHION SIDE COVER - INSTALLATION)
(5) Install the lumbar adjustment lever.
(6) Install the seat back recliner lever.
(7) Install the armrest. (Refer to 23 - BODY/SEATS/ARMREST - INSTALLATION)
(8) Install headrest sleeves. (Refer to 23 - BODY/SEATS/HEADREST SLEEVE - INSTALLATION)

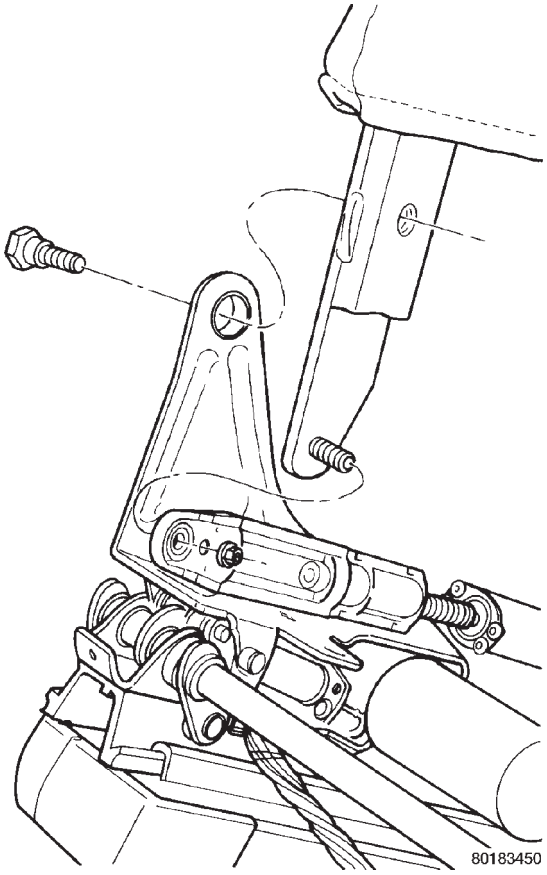

Fig. 15 FRONT SEATBACK

FRONT SEATBACK ASSIST STRAP

REMOVAL

(1) Using a small screw driver, pry screw plugs from ends of assist strap (Fig. 16).
(2) Remove screws attaching assist strap to seatback.
(3) Remove assist strap from vehicle.

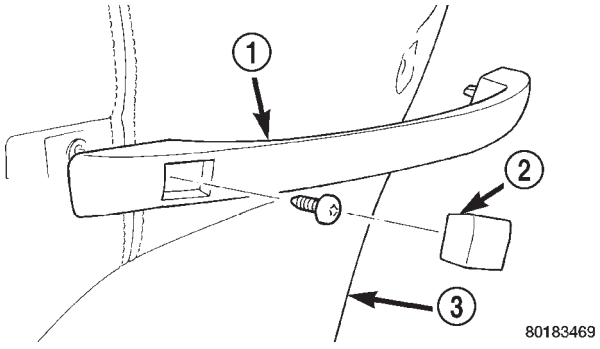

Fig. 16 FRONT SEATBACK ASSIST STRAP

1 - ASSIST STRAP
2 - SCREW PLUG
3 - SEAT BACK

FRONT SEATBACK ASSIST STRAP (Continued)

INSTALLATION

(1) Place assist strap in position on vehicle.
(2) Install screws attaching assist strap to seat back. Tighten screws to 2.5 N·m (22 in. lbs.).
(3) Insert screw plugs into ends of assist strap (Fig. 16).

FRONT SEATBACK PANEL

REMOVAL

(1) Remove the screws (Fig. 17).
(2) Tip the top of the panel away from the seat back and lift off the hooks at the bottom to remove.

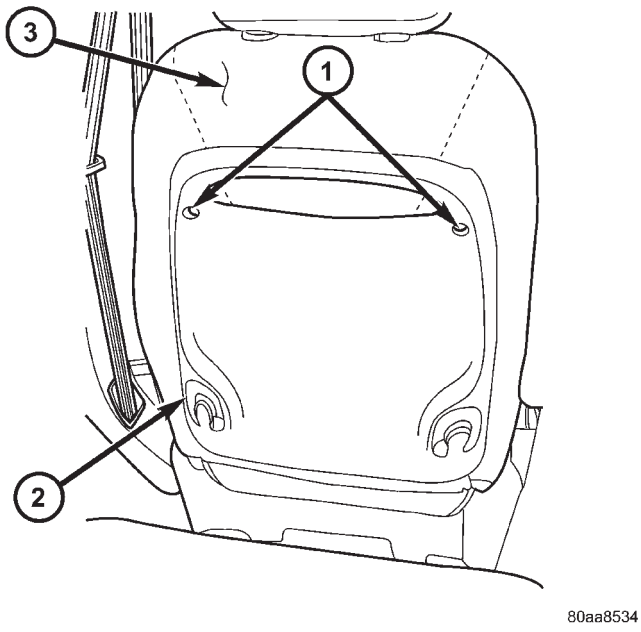

Fig. 17 FRONT SEATBACK PANEL - TYPICAL

1 - SCREWS
2 - SEAT BACK PANEL
3 - SEAT BACK

INSTALLATION

(1) Place seat back cover onto the seat and engage the bottom hooks.
(2) Install the top screws.

FRONT SEATBACK COVER

REMOVAL

NOTE: On vehicles equipped with seat side air bags the seat cover is NOT serviceable. The seat back is serviced as an assembly. (Refer to 23 - BODY/ SEATS/SEAT BACK - REMOVAL)

(1) Remove the seat back. (Refer to 23 - BODY/ SEATS/FRONT SEATBACK - REMOVAL)
(2) Unclip J-straps as necessary.
(3) Remove seat back cover from seat back cushion and frame assembly.

INSTALLATION

NOTE: On vehicles equipped with seat side air bags the seat cover is NOT serviceable. The seat back is serviced as an assembly only. (Refer to 23 - BODY/ SEATS/SEAT BACK - INSTALLATION)

(1) Fit seat cover onto seat back cushion and frame assembly.
(2) Connect the J-straps.
(3) Install the seat back. (Refer to 23 - BODY/ SEATS/FRONT SEATBACK - INSTALLATION)

FRONT/QUAD SEAT CUSHION

REMOVAL

(1) Remove seat cushion side covers, and leave connector connected, if equipped. (Refer to 23 - BODY/SEATS/FRONT SEAT CUSHION SIDE COVER - REMOVAL)
(2) On quad buckets, remove the seat side shield and cup holder. (Refer to 23 - BODY/SEATS/SEAT SIDE SHIELD/QUAD BUCKET SEAT SIDE SHIELD/CUP HOLDER - REMOVAL) and (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT SIDE SHIELD - NO CUP HOLDER - REMOVAL)
(3) Remove seat track front and rear covers if equipped. (Refer to 23 - BODY/SEATS/SEAT TRACK REAR COVER - REMOVAL) and (Refer to 23 - BODY/SEATS/SEAT TRACK FRONT COVER - REMOVAL)

FRONT/QUAD SEAT CUSHION (Continued)

(4) If equipped, open stowage bin to access front pan bolts.
(5) Remove bolts attaching seat cushion pan to seat track.
(6) Disconnect wire connectors, if equipment.
(7) Remove seat cushion from seat.
(8) Disengage J-strap retainers holding seat cover to cushion.
(9) Remove seat cushion pan from cover and pad.

INSTALLATION

(1) Place seat cushion cover in position on seat cushion.
(2) Engage J-strap retainers to hold seat cover to cushion.
(3) Place seat cushion in position on seat.
(4) Connect wire connectors, if equipment.
(5) Install bolts attaching seat cushion to seat track. Tighten bolts to 28.5 N·m (21 ft. lbs.) torque.
(6) If equipped, close stowage bin.
(7) Install seat track front and rear covers, if equipped. (Refer to 23 - BODY/SEATS/SEAT TRACK REAR COVER - INSTALLATION) and (Refer to 23 - BODY/SEATS/SEAT TRACK FRONT COVER - INSTALLATION)
(8) Install the quad seat side shield and cup holder if equipped. (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT SIDE SHIELD/CUP HOLDER - INSTALLATION) and (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT SIDE SHIELD - NO CUP HOLDER - INSTALLATION)
(9) Install seat cushion side covers. (Refer to 23 - BODY/SEATS/FRONT SEAT CUSHION SIDE COVER - INSTALLATION)

FRONT SEAT CUSHION SIDE COVER

REMOVAL

(1) Remove screws and plastic push pin attaching seat cushion side cover to bucket seat (Fig. 18).
(2) Disengage J-strap along rear of seat cushion to access screw.
(3) Remove screw attaching rear of side cover to seat cushion frame.
(4) Remove side cover from seat cushion.
(5) If equipped, disconnect wire connector from power seat switch (Fig. 19).

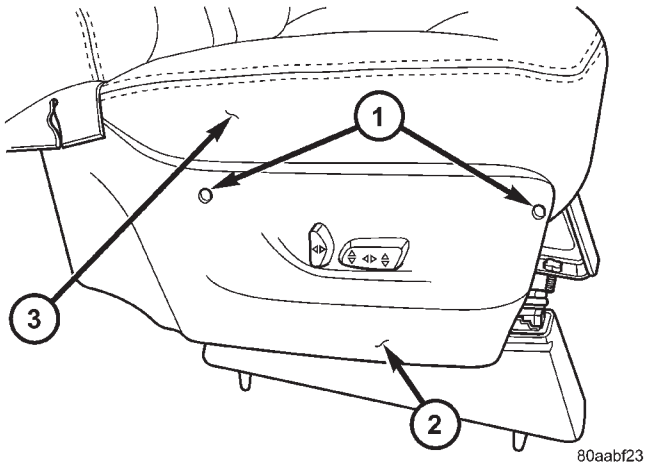

Fig. 18 FRONT SEAT SIDE SHIELD

1 - SCREWS
2 - SIDE SHIELD
3 - SEAT CUSHION

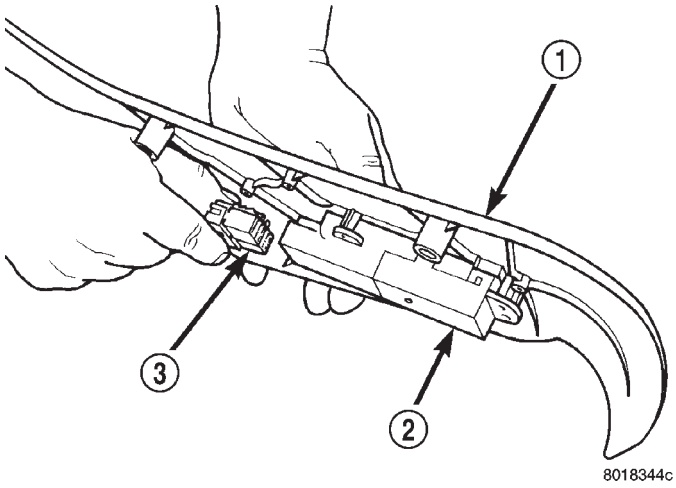

Fig. 19 POWER SEAT SWITCH WIRE CONNECTOR

1 - SEAT CUSHION SIDE COVER
2 - POWER SEAT SWITCH
3 - WIRE CONNECTOR

INSTALLATION

(1) Place side cover in position on seat cushion.
(2) If equipped, connect wire connector into power seat switch.
(3) Install screw attaching rear of side cover to seat cushion frame. Tighten screw to 1 N·m (9 in. lbs.) torque.
(4) Engage J-strap along rear of seat cushion to access screw.
(5) Install screws attaching seat cushion side cover to bucket seat (Fig. 18).

FRONT SEAT RISER - MANUAL TRACK

REMOVAL

(1) Remove seat from vehicle. (Refer to 23 - BODY/SEATS/FRONT SEAT - REMOVAL)

(2) Remove storage bin from riser. (Refer to 23 - BODY/SEATS/UNDER SEAT STORAGE BIN - REMOVAL)

(3) Remove nuts attaching riser to manual seat track (Fig. 20).

(4) Remove riser from seat.

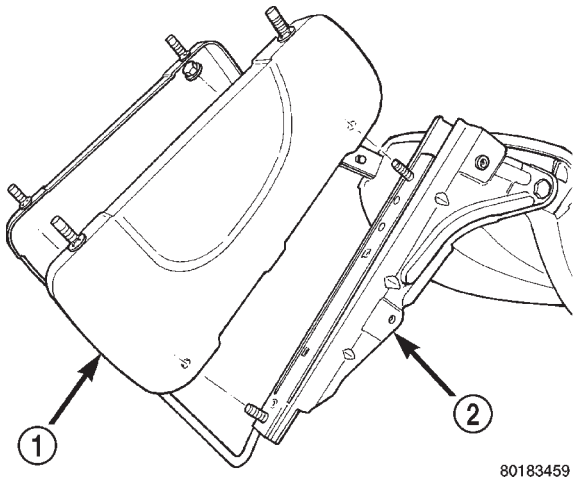

Fig. 20 FRONT SEAT RISER - MANUAL TRACK

1 - RISER
2 - SEAT TRACK

INSTALLATION

(1) Place riser in position on seat.

(2) Install nuts attaching riser to manual seat track (Fig. 20). Tighten fasteners to 81 N·m (60 ft. lbs.) torque.

(3) If equipped, install storage bin into riser. (Refer to 23 - BODY/SEATS/UNDER SEAT STORAGE BIN - INSTALLATION)

(4) Install seat into vehicle. Tighten fasteners to 54 N·m (40 ft. lbs.) torque. (Refer to 23 - BODY/SEATS/FRONT SEAT - INSTALLATION)

FRONT SEAT TRACK POWER ADJUSTER

REMOVAL

The power seat track and motors are serviced as an assembly.

(1) Remove seat from vehicle. (Refer to 23 - BODY/SEATS/FRONT SEAT - REMOVAL)

(2) Remove seat cushion. (Refer to 23 - BODY/SEATS/FRONT/QUAD SEAT CUSHION - REMOVAL)

(3) Remove nut attaching recliner to seat back frame.

(4) Remove bolts attaching seat back frame to seat track.

(5) Remove stud on seat back frame from recliner.

(6) Remove seat back.

(7) If power seat track is being replaced, transfer power recliner, wire harness and trim covers to replacement seat track.

INSTALLATION

The power seat track and motors are serviced as an assembly.

(1) Install wire harness.

(2) Place seat back in position.

(3) Insert stud on seat back frame into recliner.

(4) Install bolts to hold seat back frame to seat track.

(5) Install nut attaching recliner to seat back frame.

(6) Install seat cushion. (Refer to 23 - BODY/SEATS/FRONT/QUAD SEAT CUSHION - INSTALLATION)

(7) Install seat in vehicle. Tighten fasteners to 60 N·m (44 ft. lbs.) torque. (Refer to 23 - BODY/SEATS/FRONT SEAT - INSTALLATION)

FRONT SEAT TRACK MANUAL ADJUSTER

REMOVAL

(1) Remove seat from vehicle. (Refer to 23 - BODY/SEATS/FRONT SEAT - REMOVAL)

(2) Remove seat cushion. (Refer to 23 - BODY/SEATS/FRONT/QUAD SEAT CUSHION - REMOVAL)

(3) Remove riser. (Refer to 23 - BODY/SEATS/FRONT SEAT RISER - MANUAL TRACK - REMOVAL)

FRONT SEAT TRACK MANUAL ADJUSTER (Continued)

(4) Remove bolt attaching seat back frame to seat track (Fig. 21).

(5) Remove seat track from seat adjuster handle (Fig. 22).

(6) Remove seat track from seat.

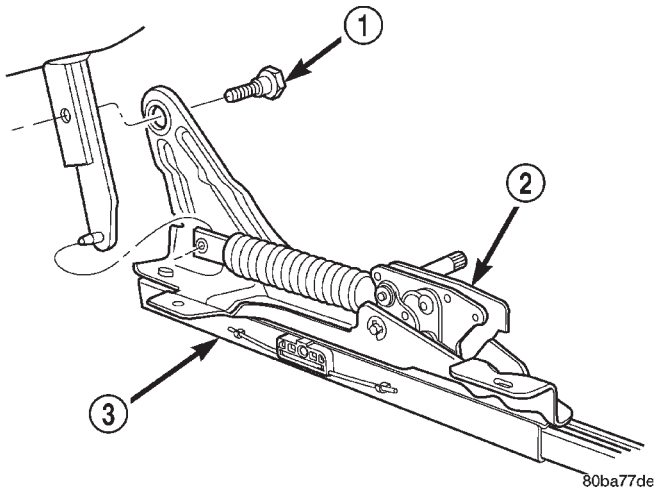

Fig. 21 FRONT SEAT TRACK - MANUAL

1 - SHOULDER BOLT
2 - RECLINER
3 - MANUAL SEAT TRACK

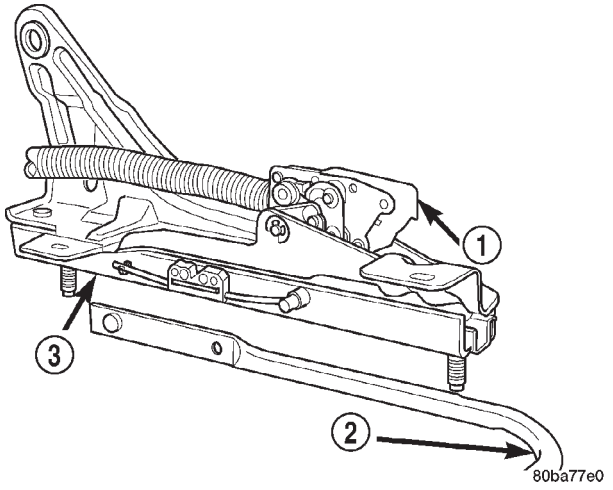

Fig. 22 FRONT SEAT TRACK ADJUSTER HANDLE

1 - RECLINER
2 - SEAT ADJUSTER HANDLE
3 - MANUAL SEAT TRACK

INSTALLATION

(1) Place seat track in position on seat.

(2) Place adjuster handle in position on seat track (Fig. 22).

(3) Insert stud on seat back frame into recliner.

(4) Install bolt attaching seat back frame to seat track (Fig. 21).

(5) Install riser. (Refer to 23 - BODY/SEATS/FRONT SEAT RISER - MANUAL TRACK - INSTALLATION)

(6) Install seat cushion. (Refer to 23 - BODY/SEATS/FRONT/QUAD SEAT CUSHION - INSTALLATION)

(7) Install seat in vehicle. (Refer to 23 - BODY/SEATS/FRONT SEAT - INSTALLATION)

FRONT SEAT TRACK - FRONT COVER

REMOVAL

(1) Remove screws attaching front cover to seat track (Fig. 23).

(2) Remove front cover from vehicle.

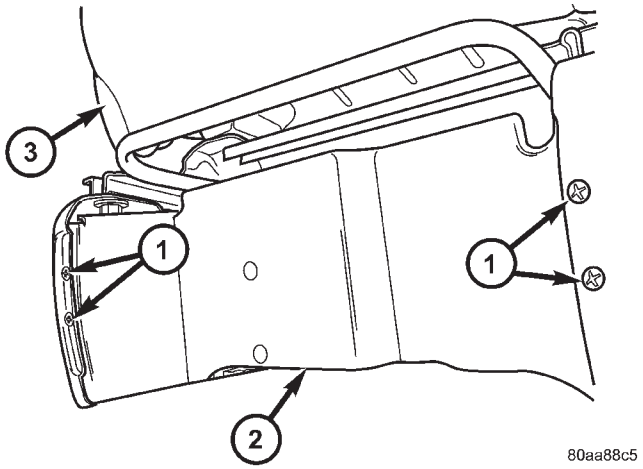

Fig. 23 FRONT SEAT TRACK FRONT COVER - MANUAL DRIVERS SEAT

1 - SCREWS
2 - COVER
3 - SEAT CUSHION

INSTALLATION

(1) Place front cover in position on seat.

(2) Install screws attaching front cover to seat track (Fig. 23). Tighten screws to 4 N·m (35 in. lbs.) torque.

FRONT SEAT TRACK - REAR COVER

REMOVAL

(1) Disengage arrowhead retainer from loop strip attaching rear cover to power seat track crossbar (Fig. 24).

(2) Disengage fasteners attaching rear cover to slots on power seat track.

(3) Remove rear cover from seat.

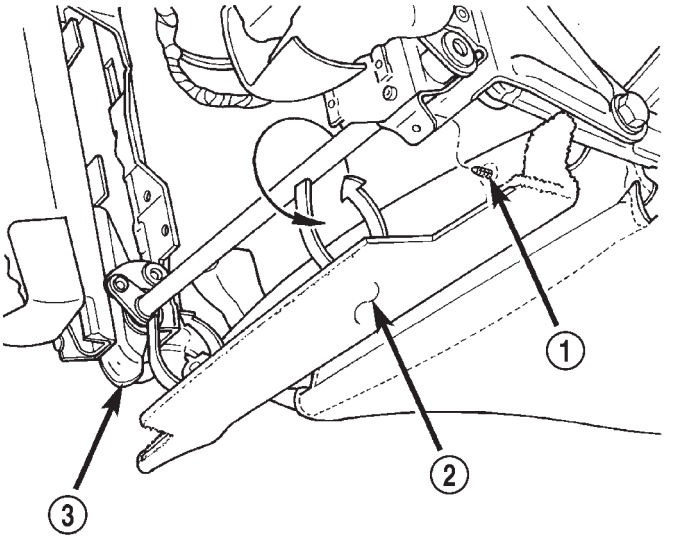

Fig. 24 FRONT POWER SEAT TRACK - REAR COVER

1 - PUSH IN FASTENER
2 - POWER SEAT TRACK REAR COVER
3 - POWER SEAT TRACK

INSTALLATION

(1) Place rear cover in position on seat.

(2) Engage fasteners attaching rear cover to slots on power seat track.

(3) Engage arrowhead retainer into loop strip attaching rear cover to power seat track crossbar (Fig. 24) .

QUAD BUCKET SEAT SIDE SHIELD/CUP HOLDER

REMOVAL

(1) Remove the seat from the vehicle. Refer to Owner's Manual for proper procedures.

(2) Remove the two screws and remove the hinge cover (Fig. 25)

(3) Remove the dump latch handle.

(4) Remove the three screws (Fig. 26).

(5) Depress the tab on the cup holder assembly (Fig. 27).

(6) Using a deep well socket or equivalent, depress the push pin tabs and remove the cup holder assembly (Fig. 28).

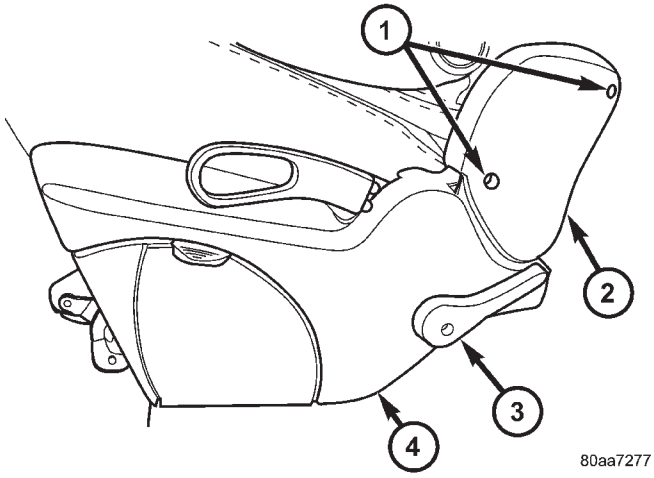

Fig. 25 SEAT SIDE SHIELD/CUP HOLDER

1 - HINGE COVER SCREWS

3 - DUMP LATCH HANDLE
4 - SIDE SHIELD/CUP HOLDER

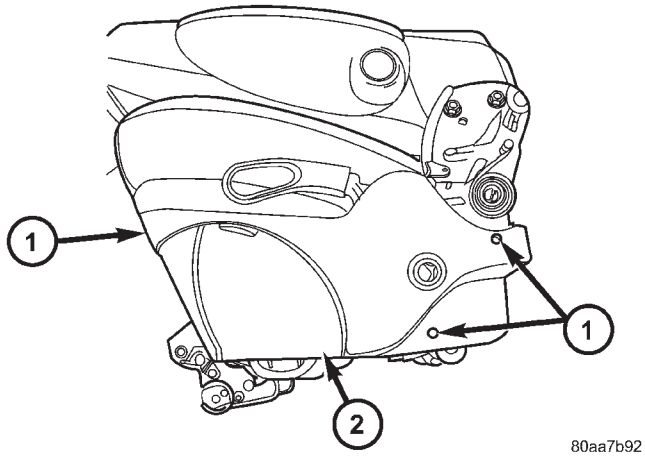

Fig. 26 SEAT SIDE SHIELD/CUP HOLDER SCREWS

1 - SIDE SHIELD/CUP HOLDER SCREWS
2 - SIDE SHIELD/CUP HOLDER

INSTALLATION

(1) Install cup holder onto the pin and lock tab.

(2) Install the three screws.

(3) Install the dump latch handle.

(4) Install the hinge cover and screws.

(5) Install the seat. Refer to Owner's Manual for proper procedures.

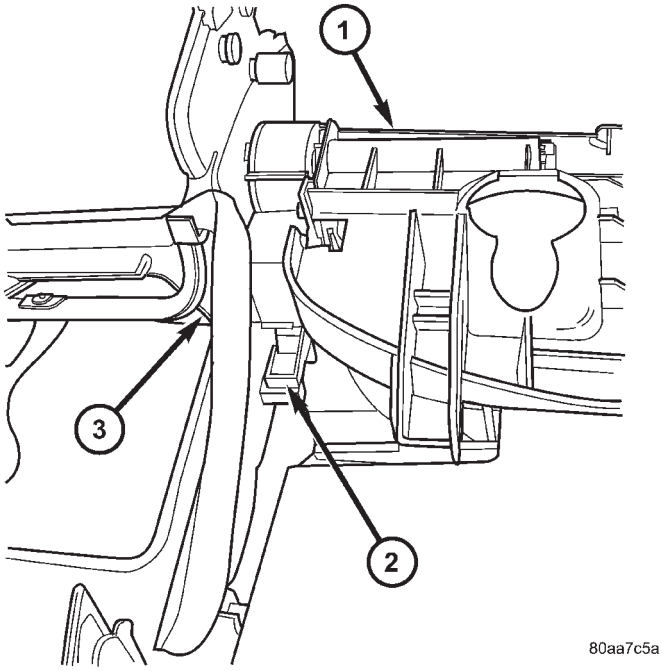

Fig. 27 SIDE SHIELD/CUP HOLDER ATTACHMENT CLIPS

1 - SIDE SHIELD/CUP HOLDER
2 - LOCK TAB
3 - SEAT RISER

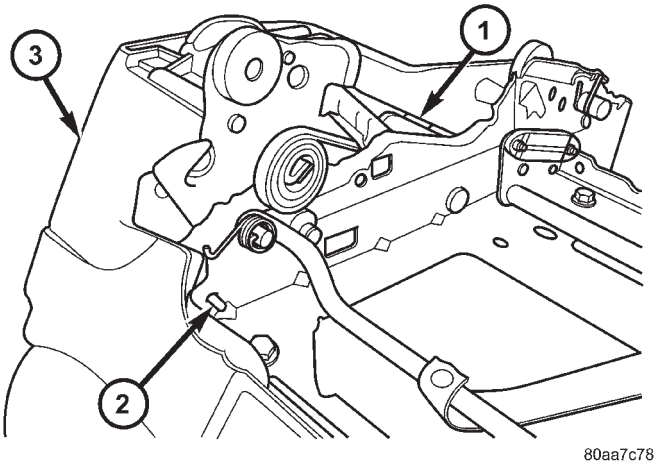

Fig. 28 SIDE SHIELD/CUP HOLDER ATTACHMENT PIN

1 - SEAT RISER
2 - ATTACHMENT PIN
3 - SIDE SHIELD/CUP HOLDER

QUAD BUCKET SEAT SIDE SHIELD - NO CUP HOLDER

REMOVAL

(1) Remove the three screws (Fig. 29).
(2) Remove the side shield.

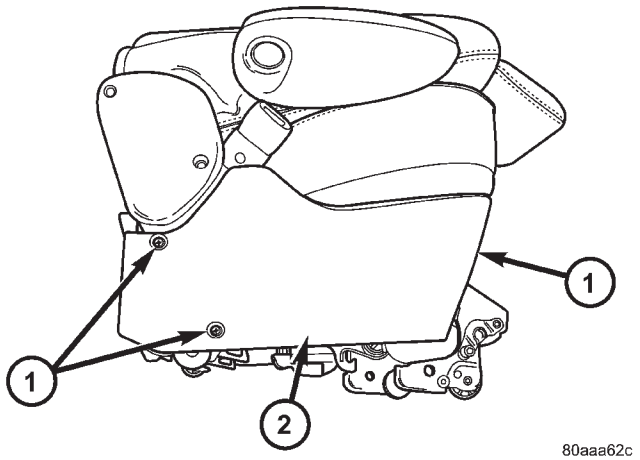

Fig. 29 SEAT SIDE COVER - QUAD BUCKETS

1 - SIDE SHIELD SCREWS
2 - SIDE SHIELD

INSTALLATION

(1) Install the side shield hook into the rectangular hole on the riser.
(2) Install the three screws.

QUAD BUCKET SEAT RISER

REMOVAL

(1) Remove the seat from vehicle. Refer to Owner's Manual for proper procedures.
(2) Remove seat side shield/cupholder. (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT SIDE SHIELD/CUP HOLDER - REMOVAL)
(3) Remove the seat side shield. (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT SIDE SHIELD - NO CUP HOLDER - REMOVAL)
(4) Remove the five bolts, two nuts, strut bushing and remove the riser from the seat (Fig. 30).

INSTALLATION

(1) Install the riser, the strut bushing into the hole, the five bolts, two nuts and tighten all fasteners to 40 N·m (30 ft. lbs.).
(2) Install the seat side shield. (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT SIDE SHIELD - NO CUP HOLDER - INSTALLATION)

QUAD BUCKET SEAT RISER (Continued)

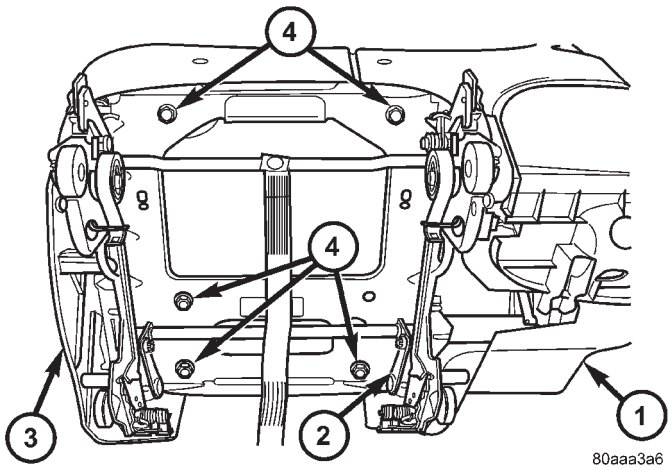

Fig. 30 BUCKET SEAT RISER - QUAD BUCKET

1 - SEAT SIDE SHIELD/CUP HOLDER
2 - SEAT RISER
3 - SEAT SIDE SHIELD
4 - RISER BOLTS

(3) Install the seat side shield/cup holder. (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT SIDE SHIELD/CUP HOLDER - INSTALLATION)

(4) Install the seat. Refer to Owner's Manual for proper procedures.

BUCKET SEAT BACK - QUAD BUCKET

REMOVAL

NOTE: Quad seats equipped with child restraint seats have an interlock feature that will not allow the seat back to fold forward with the child seat open.

(1) Remove the headrests. (Refer to 23 - BODY/SEATS/HEADREST - REMOVAL)

(2) Remove the armrests, if equipped. (Refer to 23 - BODY/SEATS/ARMREST - REMOVAL)

(3) Remove the seatback hinge covers. (Refer to 23 - BODY/SEATS/SEAT BACK HINGE COVERS - QUAD BUCKET, 50/50 SPLIT, BENCH - REMOVAL)

(4) Disconnect the child seat synchronizer cable, if equipped. (Fig. 31)

(5) Remove the seatback frame bolts and remove the seat back. (Fig. 32)

INSTALLATION

(1) Install the seatback.

(2) Install the shoulder bolts attaching the seatback hinge to the seat back frame and tighten to 34 N·m (25 ft. lbs.) torque.

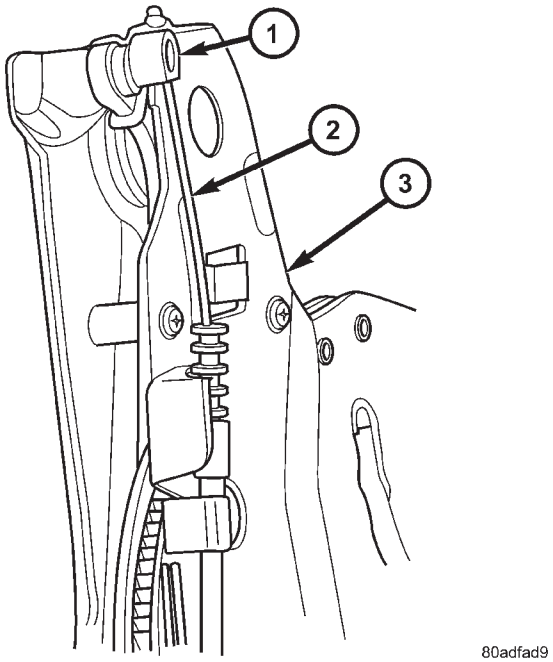

Fig. 31 QUAD SEAT SYNCHRONIZER CABLE

1 - CABLE END CONNECTOR
2 - SYNCHRONIZER CABLE
3 - SEATBACK HINGE

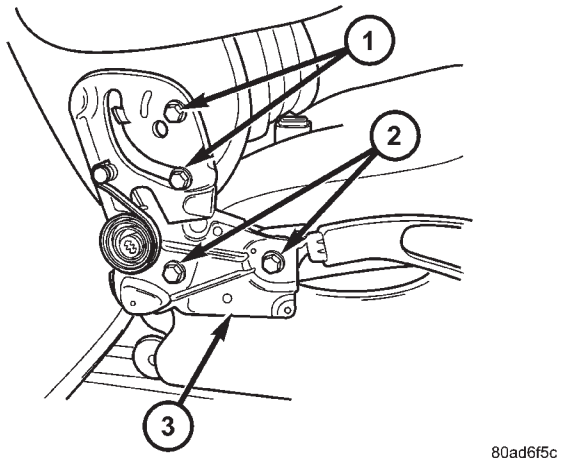

Fig. 32 SEAT BACK HINGE - TYPICAL

1 - SEATBACK FRAME BOLTS
2 - SEAT CUSHION FRAME BOLTS
3 - SEATBACK HINGE

(3) Connect the child seat synchronizer cable, if equipped.

(4) Install the seatback hinge covers. (Refer to 23 - BODY/SEATS/SEAT BACK HINGE COVERS - QUAD BUCKET, 50/50 SPLIT, BENCH - INSTALLATION)

(5) Install the armrests. (Refer to 23 - BODY/SEATS/ARMREST - INSTALLATION)

BUCKET SEAT BACK - QUAD BUCKET (Continued)

(6) Install the headreast. (Refer to 23 - BODY/SEATS/HEADREST - INSTALLATION)
(7) Verify seatback operation.

BENCH SEATBACK PANEL

REMOVAL

(1) On third row seats remove plastic grocery bag retainer. (Refer to 23 - BODY/SEATS/PLASTIC GROCERY BAG RETAINER - REMOVAL)
(2) Using a fork type prying tool (C4829) on three pass seats, disengage push-in fasteners holding seat back cover to seat back frame and remove seat back cover from seat. (Fig. 33).
(3) Using a fork type prying tool (C4829) on two pass seats, disengage push-in fasteners holding the upper corners and lower edge of the seat back panel to seat back frame and remove seat back cover from seat by pulling the lower edge out away from the seatback to disengage the upper two hooks. (Fig. 34).

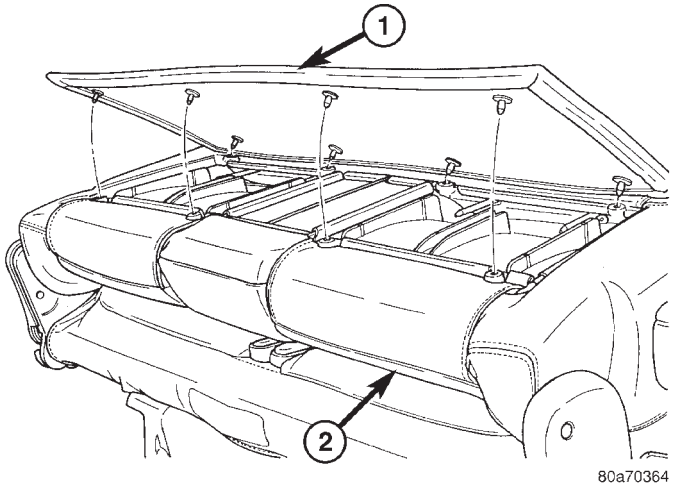

Fig. 33 THREE - PASS BENCH SEATBACK PANEL

1 - SEATBACK REAR PANEL
2 - FIRST REAR CHILD RESTRAINT SEAT

INSTALLATION

(1) On three pass seats place seat back panel in position on seat and install the push-in fasteners (Fig. 33).
(2) On two pass seats engage the two upper hooks of the panel, place the panel into position and install the push-in fasteners (Fig. 34).
(3) On third row bench seats install grocery bag holder. (Refer to 23 - BODY/SEATS/PLASTIC GROCERY BAG RETAINER - INSTALLATION)

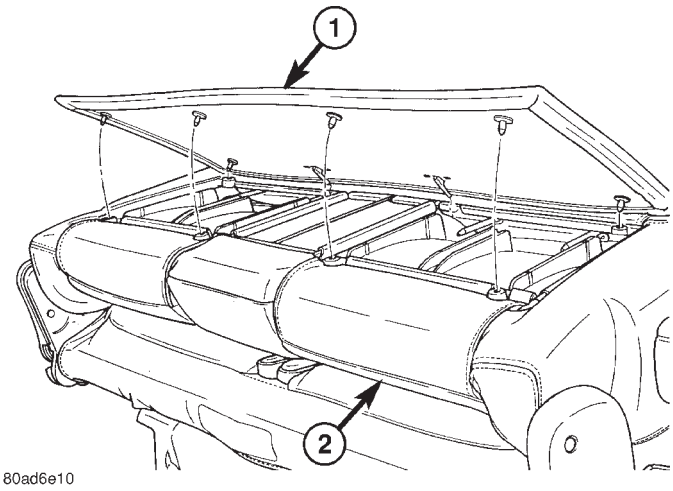

Fig. 34 TWO - PASSENGER BENCH SEATBACK PANEL

1 - SEATBACK REAR PANEL
2 - SEATBACK

SEAT CUSHION COVER - QUAD BUCKET, 50/50 SPLIT, BENCH

REMOVAL

BENCH SEAT & 50/50 SPLIT

(1) Remove seat from vehicle. Refer to Owner's Manual for proper procedures.
(2) Remove seat back. (Refer to 23 - BODY/SEATS/BENCH SEAT BACK - REMOVAL)
(3) Remove seat risers. (Refer to 23 - BODY/SEATS/BENCH SEAT RISER - 50/50 SPLIT - REMOVAL) and (Refer to 23 - BODY/SEATS/BENCH SEAT RISER - FIRST ROW - REMOVAL) and (Refer to 23 - BODY/SEATS/BENCH SEAT RISER - SECOND ROW - REMOVAL)
(4) Disconnect the cushion cover J-straps.
(5) Remove seat cushion cover from seat cushion.

QUAD BUCKET

(1) Remove seat from vehicle. Refer to Owner's Manual for proper procedures.
(2) Remove seat back.(Refer to 23 - BODY/SEATS/BUCKET SEAT BACK - QUAD BUCKET - REMOVAL)
(3) Remove seat risers. (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT RISER - REMOVAL)
(4) Disconnect the cushion cover J-straps.
(5) Remove seat cushion cover from seat cushion.

SEAT CUSHION COVER - QUAD BUCKET, 50/50 SPLIT, BENCH (Continued)

INSTALLATION

BENCH SEAT & 50/50 SPLIT

(1) Position the seat cushion cover on the cushion.
(2) Engage the J-strap retainers.
(3) Steam wrinkles from seat cushion, if necessary.
(4) Install seat risers. (Refer to 23 - BODY/SEATS/BENCH SEAT RISER - 50/50 SPLIT - INSTALLATION) and (Refer to 23 - BODY/SEATS/BENCH SEAT RISER - SECOND ROW - INSTALLATION) and (Refer to 23 - BODY/SEATS/BENCH SEAT RISER - THIRD ROW - INSTALLATION)
(5) Install seat back. (Refer to 23 - BODY/SEATS/BENCH SEAT BACK - INSTALLATION)
(6) Install seat into vehicle.

QUAD BUCKET

(1) Position the seat cushion cover on the cushion.
(2) Engage the J-strap retainers.
(3) Steam wrinkles from seat cushion, if necessary.
(4) Install seat risers. (Refer to 23 - BODY/SEATS/QUAD BUCKET SEAT RISER - INSTALLATION)
(5) Install seat back. (Refer to 23 - BODY/SEATS/BUCKET SEAT BACK - QUAD BUCKET - INSTALLATION)
(6) Install seat into vehicle.

BENCH SEAT RISER - 50/50 SPLIT

REMOVAL

(1) Remove the seat from the vehicle. Refer to the Owners Manual for proper procedures.
(2) Unclip the seat cushion cover j-strap. (Fig. 35).
(3) Remove the six bolts and remove the riser.

INSTALLATION

(1) Place the riser onto the seat install the bolts and tighten to 48 N·m (35 ft. lbs.) torque.
(2) Clip seat cusion cover j-strap onto the riser.
(3) Install the seat into the vehicle. Refer to the Owner's Manual for proper procedure.

BENCH SEAT RISER - SECOND ROW

REMOVAL

(1) Remove seat from vehicle. Refer to Owner's Manual for proper procedures.
(2) Place seat bottom side up on a clean covered work surface.
(3) Remove bolts attaching seat riser to seat cushion frame (Fig. 36).

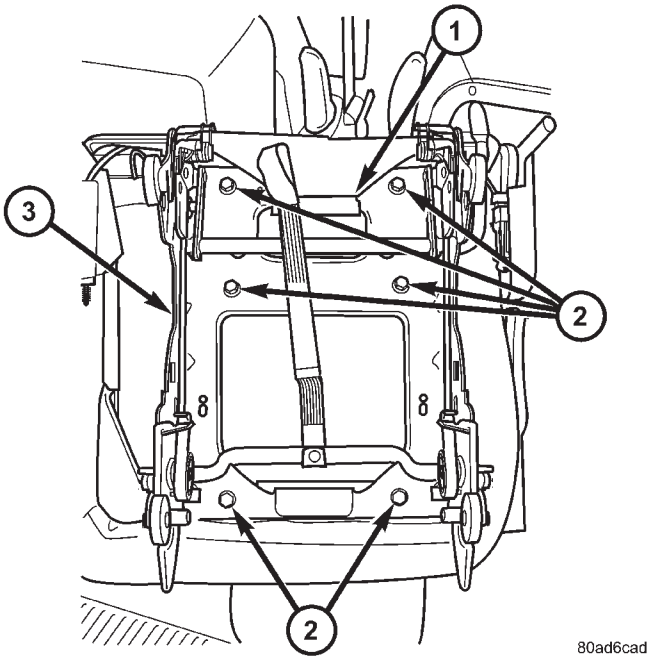

Fig. 35 BENCH SEAT RISER - 50/50 SPLIT

1 - SEAT CUSHION COVER CLIP
2 - SEAT RISER BOLTS
3 - SEAT RISER

(4) Remove riser from seat.

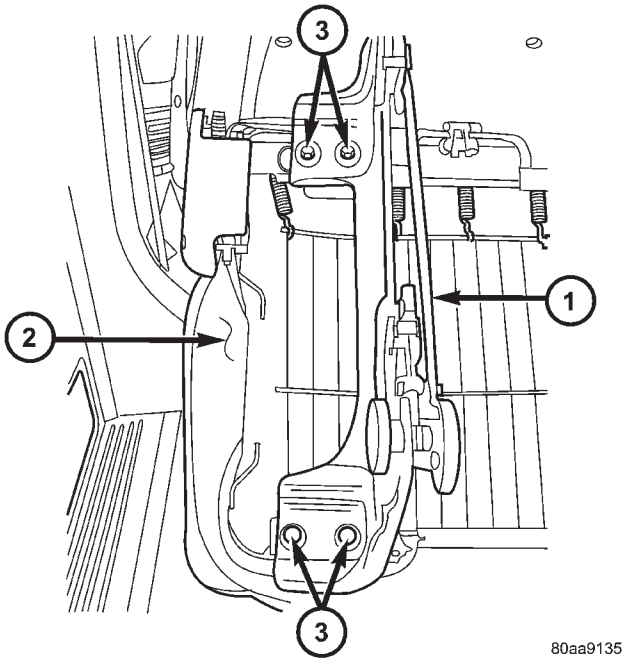

Fig. 36 BENCH SEAT RISER - SECOND ROW

1 - RISER
2 - FIRST ROW BENCH SEAT
3 - RISER BOLTS

BENCH SEAT RISER - SECOND ROW (Continued)

INSTALLATION

(1) Place riser in position on seat.
(2) Install bolts attaching seat riser to seat cushion frame (Fig. 36). Tighten bolts to 48 N·m (35 ft. lbs.) torque.
(3) Install seat into vehicle.

BENCH SEAT RISER - THIRD ROW

REMOVAL

(1) Remove seat track. (Refer to 23 - BODY/SEATS/BENCH SEAT TRACK - REMOVAL)
(2) Remove bolts attaching riser to seat cushion frame and remove the riser. (Fig. 41).

INSTALLATION

(1) Place riser in position on seat.
(2) Install bolts attaching riser to seat cushion frame (Fig. 41). Tighten nuts to 48 N·m (35 ft. lbs.) torque.
(3) Install seat track. (Refer to 23 - BODY/SEATS/BENCH SEAT TRACK - INSTALLATION)

SEAT BACK HINGE COVERS - QUAD BUCKET, 50/50 SPLIT, BENCH

REMOVAL

(1) Remove seat from vehicle. Refer to Owner's Manual for proper procedures.
(2) Remove screws attaching upper hinge cover to seat back hinge (Fig. 37).
(3) Remove upper cover from seat back hinge.
(4) Remove screws attaching lower cover to seat back hinge.
(5) Remove lower cover from hinge.

INSTALLATION

(1) Place upper cover in position on seat back hinge.
(2) Install screws attaching upper hinge cover to seat back hinge. Tighten screws to 2.3 N·m (20 in. lbs.) torque.
(3) Place lower cover in position on hinge.
(4) Install screws attaching lower cover to seat back hinge (Fig. 37). Tighten screws to 2.3 N·m (20 in. lbs.) torque.
(5) Install seat in vehicle.

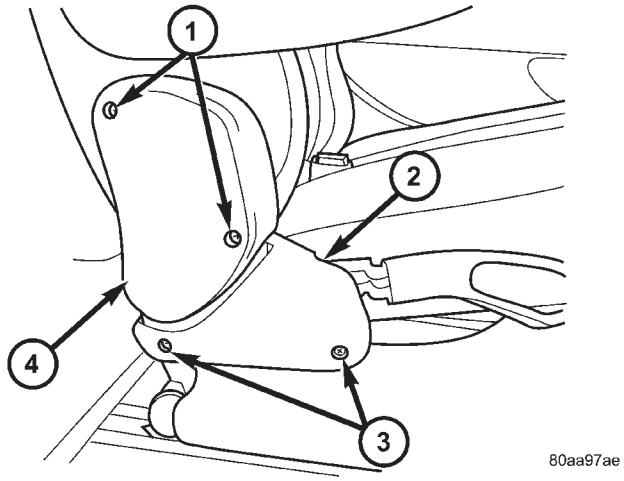

Fig. 37 BENCH SEAT BACK HINGE COVERS - TYPICAL

1 - UPPER COVER SCREWS
2 - LOWER COVER
3 - LOWER COVER SCREWS
4 - UPPER COVER

BENCH SEAT BACK HINGE

REMOVAL

NOTE: Bench seats equipped with child restraint seats have an interlock feature that will not allow the seat back to fold forward with the child seat open.

(1) Remove the bench seat back upper and lower hinge covers. (Refer to 23 - BODY/SEATS/SEAT BACK HINGE COVERS - 50/50 SPLIT, BENCH - REMOVAL)
(2) Remove the seat back. (Refer to 23 - BODY/SEATS/BENCH SEAT BACK - REMOVAL)
(3) Remove bolts attaching seat back hinge to seat cushion frame (Fig. 38).
(4) Remove seat back hinge from seat.
(5) Remove hinge from seat.

INSTALLATION

INSTALLATION

NOTE: Bench seats equipped with child restraint seats have an interlock feature that will not allow the seat back to fold forward with the child seat open.

(1) Place hinge in position on seat.
(2) Engage synchronizing cable end into (clip on left side) hinge latch release arm.

BENCH SEAT BACK HINGE (Continued)

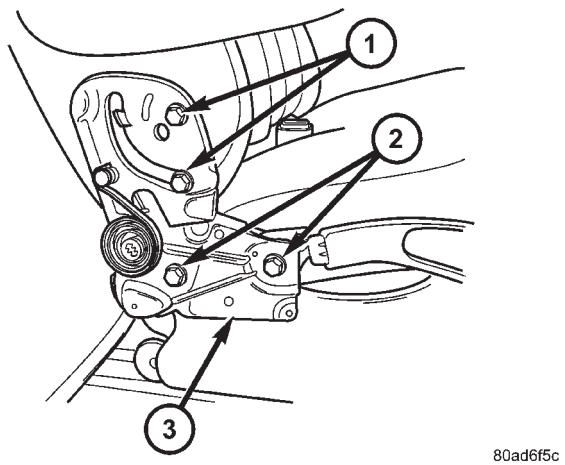

Fig. 38 BENCH SEAT BACK HINGE

1 - SEATBACK FRAME BOLTS
2 - SEAT CUSHION FRAME BOLTS
3 - SEATBACK HINGE

(3) Engage synchronizing cable housing into seat back hinge.

(4) Place seat back hinge in position on seat.

(5) Install bolts attaching seat back hinge to seat cushion frame. Tighten bolts to 48 N·m (35 ft. lbs.) torque.

(6) Install shoulder bolts attaching seat back hinge to seat back frame (Fig. 38). Tighten nuts to 34 N·m (25 ft. lbs.) torque.(Refer to 23 - BODY/SEATS/ BENCH SEAT BACK - INSTALLATION)

(7) Install bench seat back hinge covers. (Refer to 23 - BODY/SEATS/SEAT BACK HINGE COVERS - 50/50 SPLIT, BENCH - INSTALLATION)

(8) Verify seat back hinge operation and adjust synchronizing cable, if equipped. (Refer to 23 - BODY/SEATS/SYNCHRONIZING CABLE ADJUSTMENT)

SYNCHRONIZING CABLE ADJUSTMENT

NOTE:
Bench seats equipped with child restraint seats have an interlock feature that will not allow the seat back to fold forward with the child seat open.
If the seat back hinges do not release at the same time the synchronizing cable must be adjusted.

(1) Remove seat from vehicle. Refer to Owner's Manual for proper procedures.

(2) Disengage cable from the recline mechanism by pulling the cable end toward the front of the seat (Fig. 39).

(3) Pull U-shaped locking tab on self-adjusting mehcanism to disengage auto-adjust feature.

(4) Reattach self-adjusting mechanism, pulling against spring load to tighten cable.

(5) Press locking tab onto the adjusting mechanism to lock into place.

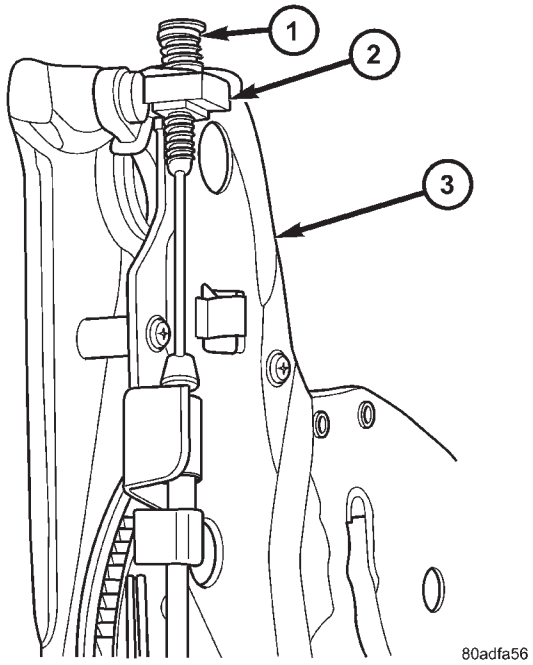

Fig. 39 SYNCHRONIZING CABLE

1 - CABLE END
2 - LOCKING TAB
3 - SETBACK HINGE

BENCH SEAT BACK

REMOVAL

NOTE: Bench seats equipped with child restraint seats have an interlock feature that will not allow the seat back to fold forward with the child seat open.

(1) Remove the headrests. (Refer to 23 - BODY/ SEATS/HEADREST - REMOVAL)

(2) Remove the armrests, if equipped. (Refer to 23 - BODY/SEATS/ARMREST - REMOVAL)

(3) Remove the upper hinge cover. (Refer to 23 - BODY/SEATS/SEAT BACK HINGE COVERS - REMOVAL)

(4) Disengage synchronizing cable housing from seat back hinge, if equipped.

(5) Disengage synchronizing cable end from (clip on left side) hinge latch release arm, if equipped.

(6) Remove shoulder bolts attaching seat back hinge to seat back frame (Fig. 40).

(7) Remove the seat back.

BENCH SEAT BACK (Continued)

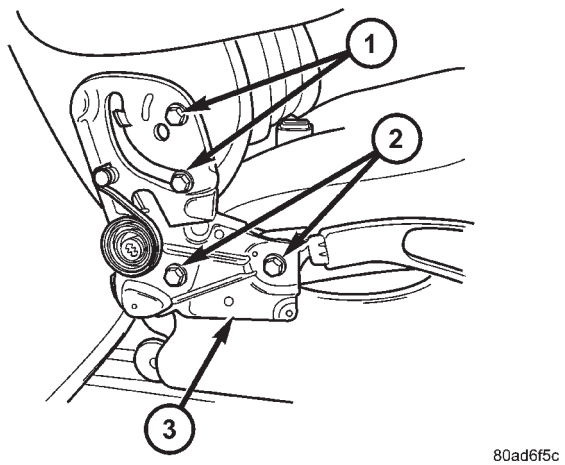

Fig. 40 SEAT BACK HINGE - TYPICAL

1 - SEATBACK FRAME BOLTS
2 - SEAT CUSHION FRAME BOLTS
3 - SEATBACK HINGE

INSTALLATION

NOTE: Bench seats equipped with child restraint seats have an interlock feature that will not allow the seat back to fold forward with the child seat open.

(1) Install the seat back.
(2) Install the shoulder bolts attaching the seat back hinge to the seat back frame and tighten to 34 N·m (25 ft. lbs.) torque.
(3) Connect the synchronizing cable end from (clip on left side) hinge latch release arm, if equipped.
(4) Connect the synchronizing cable housing to the seat back hinge, if equipped.
(5) Install the upper hinge cover. (Refer to 23 - BODY/SEATS/SEAT BACK HINGE - INSTALLATION)
(6) Install the armrests, if equipped. (Refer to 23 - BODY/SEATS/ARMREST - INSTALLATION)
(7) Install the headrest sleeves. (Refer to 23 - BODY/SEATS/HEADREST SLEEVE - INSTALLATION)
(8) Adjust synchronizing cable, if equipped. (Refer to 23 - BODY/SEATS/SYNCHRONIZING CABLE ADJUSTMENT)

BENCH SEAT BACK COVER

REMOVAL

(1) Remove the bench seat back. (Refer to 23 - BODY/SEATS/BENCH SEAT BACK - REMOVAL)
(2) Remove the bench seatback panel. (Refer to 23 - BODY/SEATS/BENCH SEATBACK PANEL - REMOVAL)
(3) Disconnect the cover J-straps.
(4) Remove the seat back cover from the seat back assembly.

INSTALLATION

(1) Install seat back cover onto the seat back frame and cushion assembly.
(2) Connect the J-straps.
(3) Install the bench seatback panel. (Refer to 23 - BODY/SEATS/BENCH SEATBACK PANEL - INSTALLATION)
(4) Install the seat back. (Refer to 23 - BODY/SEATS/BENCH SEAT BACK - INSTALLATION)

BENCH SEAT TRACK

REMOVAL

(1) Remove second row seat from vehicle. Refer to Owner's Manual for proper procedure.
(2) Place seat on clean covered work surface.
(3) Disengage seat track adjuster link wire from track being removed.
(4) Remove nuts attaching track to seat riser (Fig. 41).
(5) Remove track from seat riser.

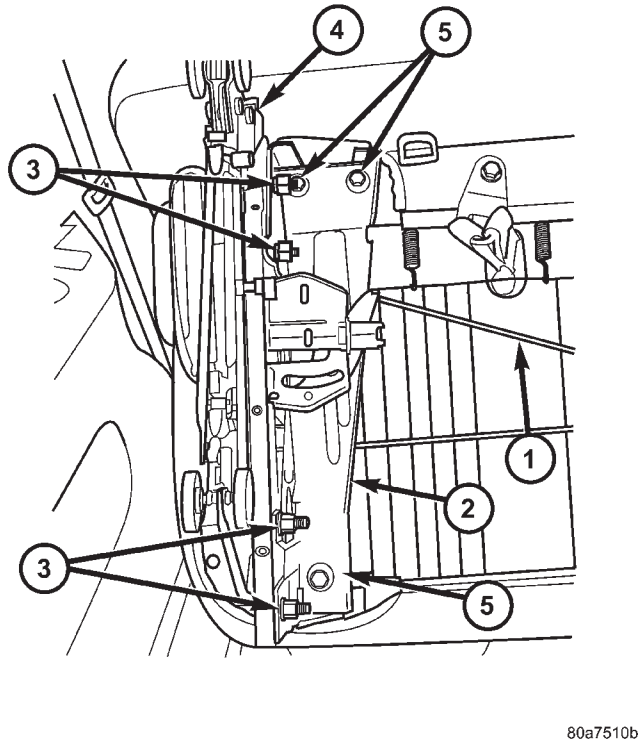

Fig. 41 BENCH SEAT TRACK

1 - SEAT TRACK ADJUSTER LINK
2 - RISER
3 - SEAT TRACK NUTS
4 - SEAT TRACK
5 - RISER BOLTS

BENCH SEAT TRACK (Continued)

INSTALLATION

(1) Place track in position on seat riser.
(2) Install nuts attaching track to seat riser. (Fig. 41). Tighten nuts to 48 N·m (35 ft. lbs.) torque.
(3) Engage seat track adjuster link wire onto track being installed.
(4) Install second row seat into vehicle.

PLASTIC GROCERY BAG RETAINER

REMOVAL

3-PASS BENCH SEAT

(1) Remove five screws attaching the plastic grocery bag retainer to the steel slats on the back frame (Fig. 42).
(2) Remove retainer.

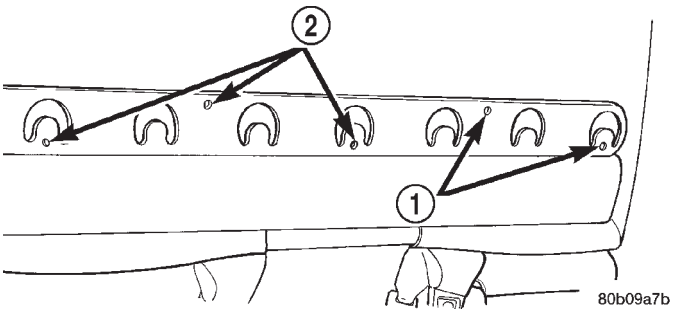

Fig. 42 PLASTIC GROCERY BAG RETAINER

1 - SCREWS
2 - SCREWS

50/50 SPLIT BENCH SEAT

(1) Remove the screws. (Fig. 43)
(2) Pull top of retainer away from the seatback and lift off of the two bottom attachment hooks.

INSTALLATION

3-PASS BENCH SEAT

(1) Place retainer in position.
(2) Install the five attaching screws and tighten 2 N·m (17 in. lbs.) torque.

50/50 SPLIT BENCH SEAT

(1) Engage bottom hooks of the retainer and place into position.
(2) Install the attaching screws and tighten 2 N·m (17 in. lbs.) torque.

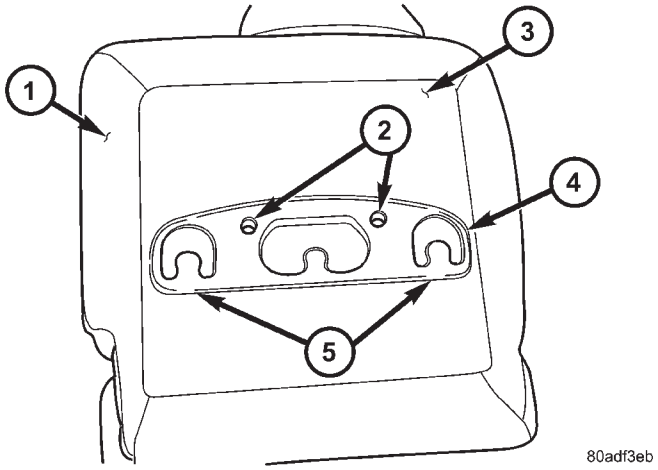

Fig. 43 PLASTIC GROCERY BAG RETAINER - 50/50 SPLIT

1 - SEATBACK
2 - SCREWS
3 - SEATBACK PANEL
4 - GROCERY BAG RETAINER
5 - ATTACHMENT HOOKS

UNDER SEAT STORAGE BIN

REMOVAL

(1) Release under seat storage bin latch and open bin.
(2) Depress lock tabs at the rear/top edge of the storage bin (Fig. 44).
(3) Pull storage bin from bucket seat riser.

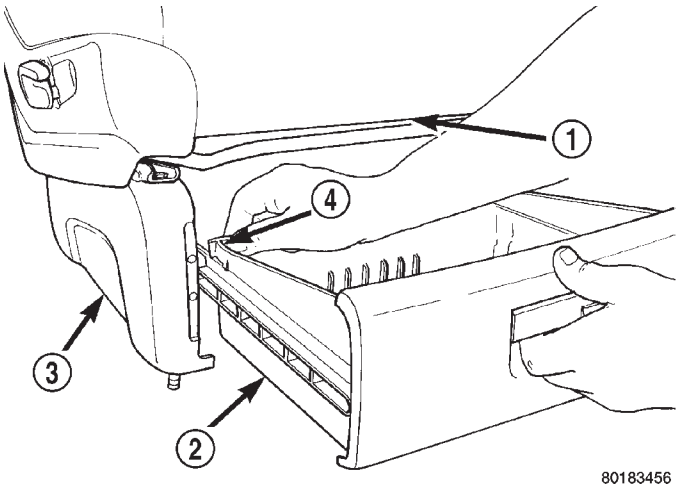

Fig. 44 STORAGE BIN

1 - PASS. SIDE BUCKET SEAT
2 - UNDER SEAT STORAGE BIN
3 - RISER
4 - LOCK TAB

UNDER SEAT STORAGE BIN (Continued)

INSTALLATION

(1) Engage storage bin tracks into guides on each side of seat riser.

(2) Push storage bin inward until lock tabs snap past retaining ridge on tracks

(3) Verify storage bin latch operation.

UNDER SEAT STORAGE BIN GUIDE

REMOVAL

(1) Remove under seat storage bin. (Refer to 23 - BODY/SEATS/UNDER SEAT STORAGE BIN - REMOVAL)

(2) Remove screws attaching storage bin track guide to seat riser (Fig. 45).

(3) Remove track guide from vehicle.

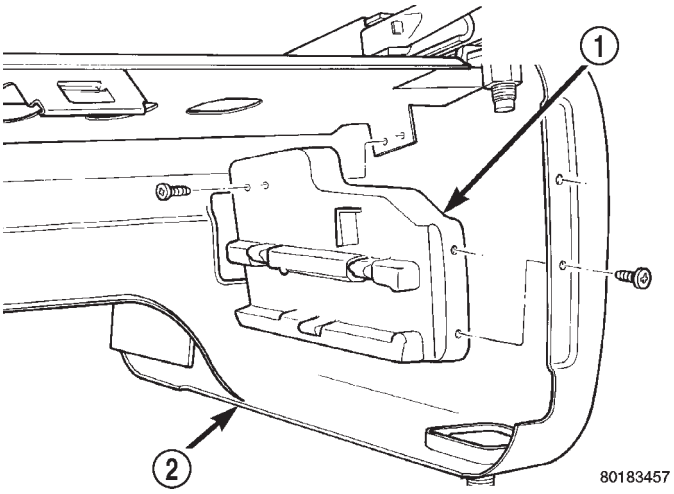

Fig. 45 UNDER SEAT STORAGE BIN GUIDE

1 - STORAGE BIN TRACK GUIDE
2 - RISER

INSTALLATION

(1) Place track guide in position on seat riser.

(2) Install screws attaching storage bin track guide to seat riser (Fig. 45). Tighten screws to 81 N·m (32 in lbs.) torque.

(3) Install under seat storage bin. (Refer to 23 - BODY/SEATS/UNDER SEAT STORAGE BIN - INSTALLATION)

UNDER SEAT STORAGE BIN LOCK/LATCH

REMOVAL

(1) Open under seat storage bin.

(2) Remove screws holding under seat storage bin lock/latch to storage bin (Fig. 46).

(3) Remove lock/latch from bin.

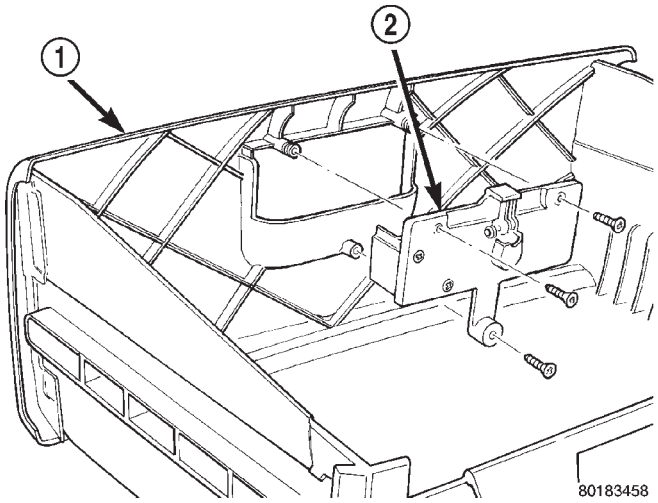

Fig. 46 UNDER SEAT STORAGE BIN LOCK/LATCH

1 - UNDER SEAT STORAGE BIN
2 - LOCK/LATCH

INSTALLATION

(1) Place lock/latch in position on storage bin.

(2) Install screws to hold lock/latch to storage bin (Fig. 46) .

(3) Verify under seat storage bin latch operation.

LUMBAR SUPPORT

REMOVAL

(1) Remove screw attaching lumbar handle to seat back (Fig. 47).
(2) Remove seat back assembly from cushion.
(3) Detrim the seat back assembly.
(4) Remove frame and replace.

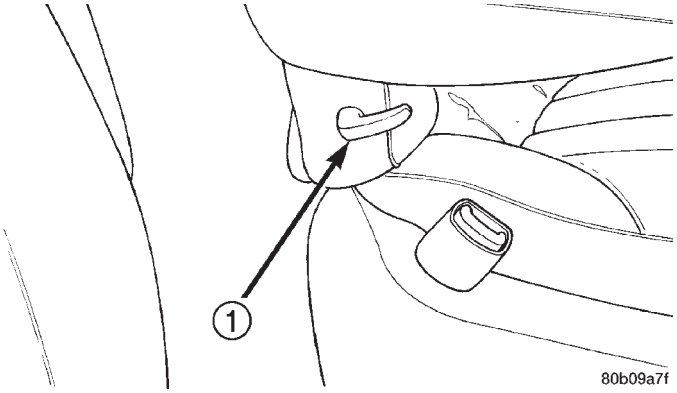

Fig. 47 LUMBAR HANDLE

1 - LUMBAR HANDLE

INSTALLATION

(1) Trim the seat back frame.
(2) Install seat back assembly to cushion.
(3) Install attaching screw to lumbar handle. The handle is to be installed, between two and three O'clock position. Tighten screw to 1 N·m (11 ft. lbs.) torque.
(4) Test lumbar operation.

WINDSHIELD

DESCRIPTION

The windshield is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.
URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, PVC (VINYL) PRIMER AND PINCH WELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.
DAIMLERCHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURES WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.
BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.
VAPORS THAT ARE EMITTED FROM THE URETHANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.
SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.
ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

REMOVAL

WINDSHIELD REMOVAL – EXTERIOR METHOD

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

(1) Remove inside rear view mirror.
(2) Remove windshield wiper arms.
(3) Remove cowl cover.

WINDSHIELD (Continued)

(4) Remove A-pillar trim panels.

(5) Disconnect wire connectors to windshield defroster grid.

(6) Place protective covers over instrument panel and hood.

(7) Remove windshield molding. Using pliers, pull outward on molding at the bottom of A-pillars.

(8) Using a sharp cold knife, cut urethane adhesive holding the windshield to the A-pillars, roof header and cowl pinch weld fences (Fig. 1). A power cutting device can be used if available.

(9) Remove windshield from vehicle.

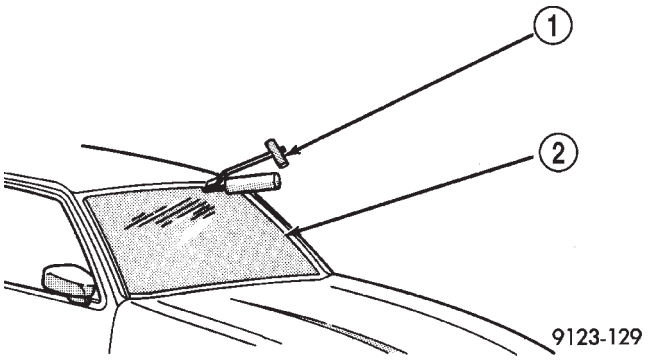

Fig. 1 CUT URETHANE AROUND WINDSHIELD

1 - COLD KNIFE
2 - WINDSHIELD

WINDSHIELD REMOVAL – INTERIOR METHOD

(1) Remove inside rear view mirror.

(2) Remove instrument panel top cover. Refer to Group 8E, Instrument Panel and Systems.

(3) Remove A-pillar trim covers.

(4) Disconnect wire connectors to windshield defroster grid.

(5) Place protective covers over instrument panel and hood.

(6) Using a reciprocating or oscillating power knife, cut urethane adhesive holding the windshield to the A-pillars, roof header and cowl pinch weld fences. Refer to instructions provided with the equipment being used.

(7) Remove windshield from vehicle.

INSTALLATION

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

CAUTION: Open the left front door glass before installing windshield to avoid pressurizing the passenger compartment. If a door is slammed before urethane bonding is cured, water leaks can result. Allow the urethane at least 24 hours to cure before returning the vehicle to use.

To avoid stressing the replacement windshield, the urethane bonding material on the windshield fence should be smooth and consistent to the shape of the replacement windshield . The support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

(1) Place replacement windshield into windshield opening and position glass in the center of the opening against the compression spacers.

(2) Verify the glass lays evenly against the pinch weld fence at the sides, top and bottom of the replacement windshield. If not, the pinch weld fence must be formed to the shape of the new glass.

(3) Remove replacement windshield from windshield opening.

(4) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 2).

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(5) Clean inside of windshield with ammonia based glass cleaner and lint-free cloth.

(6) Install molding to perimeter of windshield.

(7) Apply Glass Prep adhesion promoter 25 mm (1 in.) wide around perimeter of windshield and wipe with clean/dry lint-free cloth until no streaks are visible.

(8) Apply Glass Primer 25 mm (1 in.) wide around perimeter of windshield. Allow at least three minutes drying time.

(9) Using a razor knife, remove as much original urethane as possible. Do not damage paint on windshield fence.

(10) Apply pinch weld primer 19 mm (0.75 in.) wide around the windshield fence. Allow at least three minutes drying time.

(11) If a low viscosity urethane adhesive is used, install compression spacers on the fence around the windshield opening (Fig. 3).

(12) Apply a 10 mm (0.4 in.) bead of urethane on center line of windshield fence.

(13) With the aid of a helper, position the windshield over the windshield opening.

(14) Slowly lower windshield glass to windshield opening fence. Guide the molding into proper position as necessary. Push windshield inward until molding is flush to roof line and A-pillars (Fig. 3).

WINDSHIELD (Continued)

(15) Clean access urethane from exterior with Mopar® Super Kleen or equivalent.

(16) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold molding in place until urethane cures.

(17) Engage wire connectors to windshield defroster grid.

(18) Install A-pillar trim panels.

(19) Install cowl cover and wipers.

(20) Install inside rear view mirror.

(21) After urethane has cured, remove tape strips and water test windshield to verify repair.

SLIDING DOOR GLASS

REMOVAL

The temperature of the vehicle should be at least 21° C (70° F) before removing the stationary quarter/ sliding door glass. Butyl sealer becomes more pliable at high temperatures.

(1) Remove interior trim as necessary to gain access attaching locations on back of glass.

(2) Remove nuts holding stationary glass to fence.

(3) Using razor knife, cut butyl sealer holding glass to fence from between the mounting studs (Fig. 4).

(4) Push glass from opening.

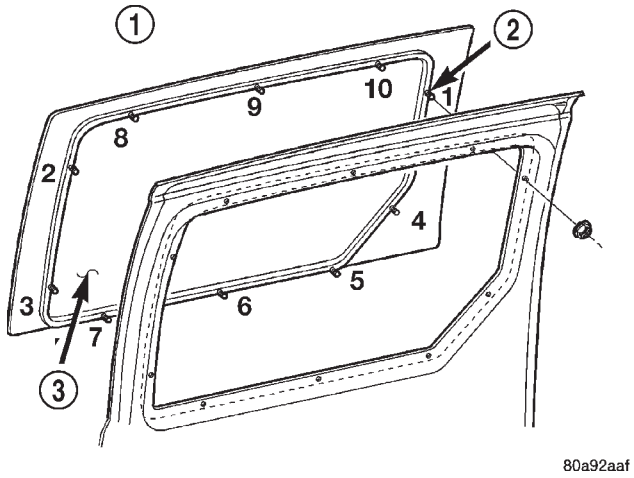

Fig. 4 SLIDING DOOR STATIONARY GLASS

1 - NUMBERS INDICATE THE TIGHTENING SEQUENCE
2 - 6 mm BEAD OF BUTYL TAPE
3 - BODY SIDE/SLIDING DOOR GLASS

INSTALLATION

The temperature of the vehicle should be at least 21° C (70° F) before removing the stationary quarter/ sliding door glass. Butyl sealer becomes more pliable at high temperatures.

The stationary glass fence should be cleaned of all old butyl sealer.

(1) Apply a 6 mm (0.25 in.) butyl tape around perimeter of glass assembly encapsulation track. Ensure that the butyl tape is wrapped around the mounting studs.

(2) Place the glass into the opening and insert mounting studs through holes in fence.

(3) Install nuts to hold stationary glass to fence.

CAUTION: Tighten nuts to 3.4 N·m (30 in. lbs.) torque in the sequence indicated. Do not over torque, or glass breakage may result (Fig. 4).

(4) Install interior trim. (Refer to 23 - BODY/ DOORS - SLIDING/TRIM PANEL - INSTALLATION)

(5) Verify alignment and flushness.

QUARTER WINDOW

REMOVAL

(1) Remove C-pillar trim.
(2) Open quarter glass to vent position.
(3) Disengage quarter window retainer from vent motor arm.
(4) Remove nuts attaching quarter glass to C-pillar (Fig. 5).
(5) Use magnetic socket to prevent dropping into the pillar.
(6) Remove quarter glass from vehicle.

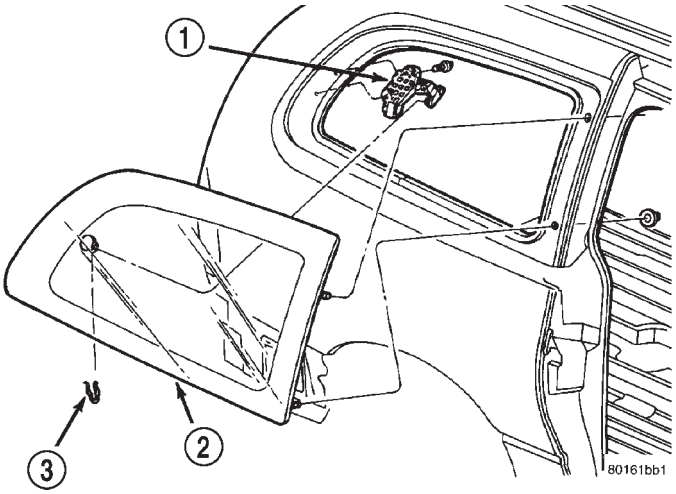

Fig. 5 QUARTER GLASS

1 - VENT CONTROL
2 - QUARTER GLASS
3 - CLIP

INSTALLATION

(1) Place quarter glass in position on vehicle.
(2) Install nuts attaching quarter glass to C-pillar.
(3) Engage quarter window retainer to vent motor arm.
(4) Install screw attaching quarter window retainer to vent motor arm.
(5) Close quarter glass.
(6) Install C-pillar trim.

REAR DOOR GLASS

REMOVAL

Refer to the Safety Precautions in this section for description of tools and adhesive systems that are recommended for use in this procedure.

REAR WINDOW REMOVAL – EXTERIOR METHOD

(1) Remove rear window wiper arm, if equipped.
(2) Remove screws attaching moldings to liftgate at the sides of the rear window (Fig. 6).
(3) Using pliers, pull outward on molding at the top and bottom of liftgate.
(4) Using a sharp cold knife, cut urethane adhesive attaching the rear window to the liftgate. A power cutting device can be used if available (Fig. 1).
(5) Remove rear window from vehicle.

REAR WINDOW REMOVAL – INTERIOR METHOD

(1) Remove rear window wiper arm, if equipped.
(2) Remove screws attaching moldings to liftgate at the sides of the rear window (Fig. 6).
(3) Remove liftgate inside lamps and trim covers.
(4) Remove center high mounted stop lamp.
(5) Using a reciprocating or oscillating power knife, cut urethane adhesive holding the rear window to the liftgate. Refer to instructions provided with the equipment being used.
(6) Remove rear window from vehicle.

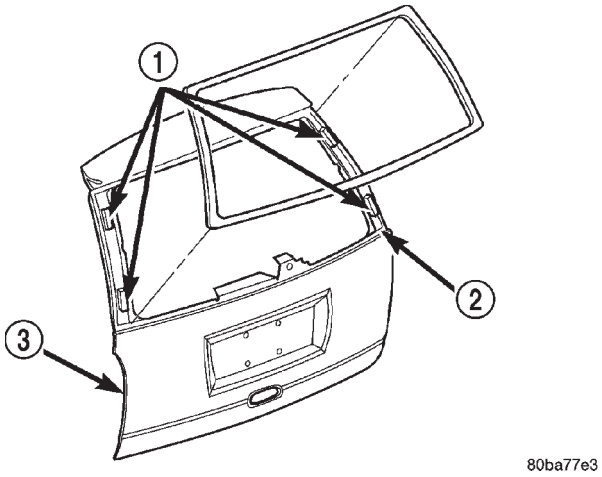

Fig. 6 REAR WINDOW SIDE MOLDINGS

1 - COMPRESSION SPACERS
2 - REAR WINDOW WITH MOLDING
3 - LIFT GATE

INSTALLATION

Refer to the Safety Precautions in this section for description of tools and adhesive systems that are recommended for use in this procedure.

CAUTION: Open the left front door glass before installing rear window to avoid pressurizing the passenger compartment. If a door is slammed before urethane bonding is cured, water leaks can result.
Allow the urethane at least 24 hours to cure before returning the vehicle to use.
To avoid stressing the replacement rear window, the urethane bonding material on the rear window fence should be smooth and consistent to the shape of the replacement glass.

REAR DOOR GLASS (Continued)

(1) Place replacement glass into rear window opening.

(2) Verify the glass lays evenly against the pinch weld fence at the sides, top and bottom of the replacement rear window. If not, the fence must be formed to the shape of the new glass.

(3) Using a grease pencil, mark the glass and liftgate in several locations to aid installation.

(4) Remove replacement glass from liftgate opening.

(5) Position the rear window inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 2).

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN REAR WINDOW BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(6) Clean inside of rear window with ammonia based glass cleaner and lint-free cloth.

(7) Apply molding to top and bottom of rear window.

(8) Apply Glass Prep adhesion promoter 25 mm (1 in.) wide around perimeter of rear window and wipe with clean/dry lint-free cloth until no streaks are visible.

(9) Apply Glass Primer 25 mm (1 in.) wide around perimeter of rear window. Allow at least three minutes drying time.

(10) Apply Pinch weld Primer 19 mm (0.75 in.) wide around the rear window fence. Allow at least three minutes drying time.

(11) If a low viscosity urethane adhesive is used, install compression spacers on the fence around the rear window opening (Fig. 7).

(12) Apply a 10 mm (0.4 in.) bead of urethane along center line of rear window fence.

(13) With the aid of a helper, position the rear window over the rear window opening and align the reference marks.

(14) Slowly lower the glass to rear window opening fence. Guide the molding into proper position as necessary. Push glass inward until molding is flush to liftgate surface (Fig. 7).

(15) Clean excess urethane from exterior with Mopar® Super Kleen, or equivalent.

(16) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold molding in place until urethane cures.

(17) Install rear window side moldings and wiper arm (Fig. 6).

(18) Install interior trim.

(19) After urethane has cured, remove tape strips and water test rear window to verify repair.

FRONT DOOR GLASS RUN WEATHERSTRIP

REMOVAL

(1) Remove door frame closeout moldings.
(2) Pull weatherstrip from glass run channel at rear of door frame, working from the bottom to the top.
(3) Disengage clip attaching weatherstrip to door frame.
(4) Pull weatherstrip from lip along top of door frame (Fig. 1).
(5) Remove door trim panel.
(6) Remove door speaker, if equipped.
(7) Remove watershed as necessary to gain access to screw attaching front lower corner of glass run weatherstrip to inner door panel.
(8) Remove screw attaching glass run weatherstrip to inner door panel.
(9) Remove inner belt weatherstrip.
(10) Pull weatherstrip from front glass run channel.
(11) Remove glass run weatherstrip from vehicle.

INSTALLATION

(1) Position glass run weatherstrip on vehicle (Fig. 1).
(2) Push weatherstrip into front glass run channel.
(3) Install screw attaching glass run weatherstrip to inner door panel.
(4) Install inner belt weatherstrip.
(5) Install watershed.
(6) Push weatherstrip groove onto lip along top of door frame.
(7) Engage clip into slot in door frame.
(8) Push weatherstrip into channel at rear of door frame, working from the top to bottom.
(9) Install door frame closeout moldings.
(10) Install door speaker, if equipped.
(11) Install door trim panel.

FRONT DOOR GLASS RUN WEATHERSTRIP (Continued)

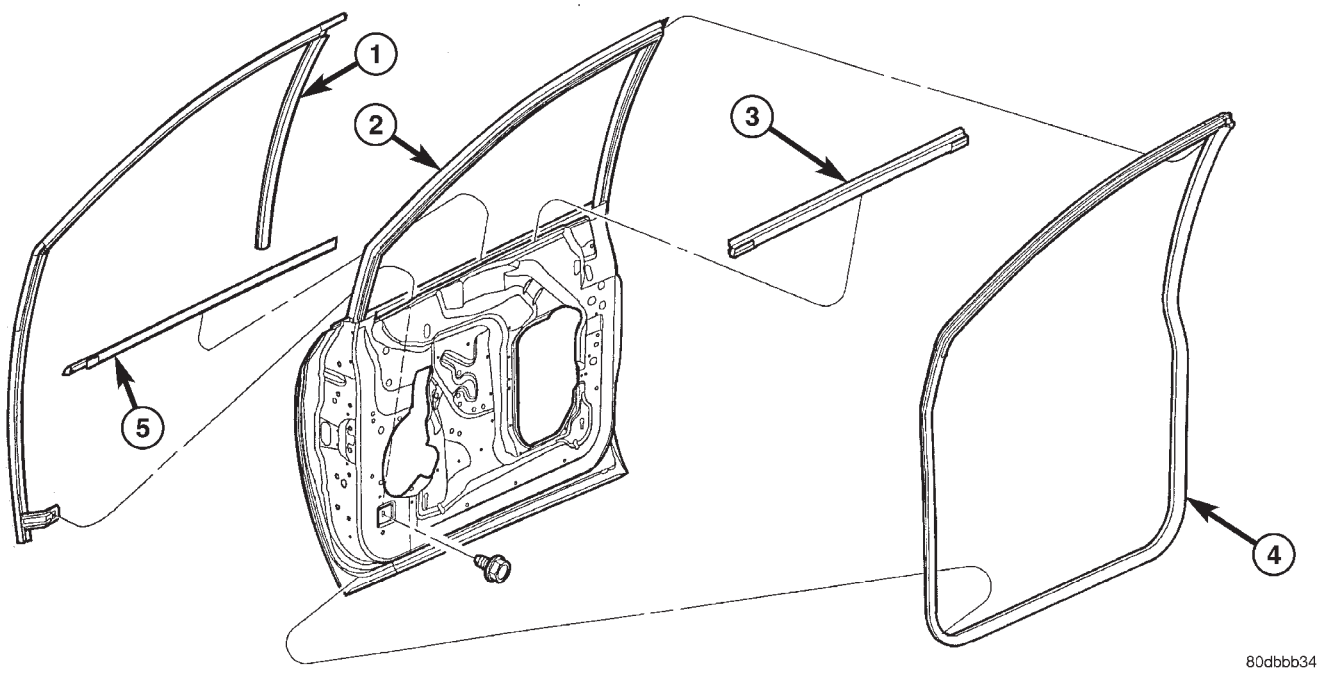

Fig. 1 FRONT DOOR WEATHERSTRIP

1 - DOOR GLASS RUN WEATHERSTRIP
2 - FRONT INNER DOOR
3 - DOOR BELT OUTER WEATHERSTRIP
4 - DOOR MOUNTED WEATHERSTRIP
5 - DOOR OUTER BELT WEATHERSTRIP

FRONT DOOR OUTER BELT MOLDING

REMOVAL

(1) Remove the side view mirror. (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - REMOVAL)
(2) Remove door trim panel.
(3) Roll door glass down.
(4) Using a hook tool, disengage interlocking lip at the base of the inward edge of the belt molding (Fig. 1).
(5) Remove belt molding from door.

INSTALLATION

(1) Place belt molding in position on door (Fig. 1).
(2) Engage interlocking lip at the base of the inward edge of the belt molding on door panel.
(3) Install door trim panel.

FRONT DOOR WEATHERSTRIP

REMOVAL

(1) Open front door.
(2) Using fork tool (C-4829), remove push pin fasteners attaching front door weatherstrip to end frames and bottom of door (Fig. 2).
(3) Pull weatherstrip from retaining channel around window frame.
(4) Remove weatherstrip from vehicle.

INSTALLATION

(1) Position weatherstrip on door.
(2) Install push pin fasteners attaching front door weatherstrip to end frames and bottom of door (Fig. 2).
(3) Install weatherstrip into retaining channel around window frame.
(4) Close front door.

FRONT DOOR WEATHERSTRIP (Continued)

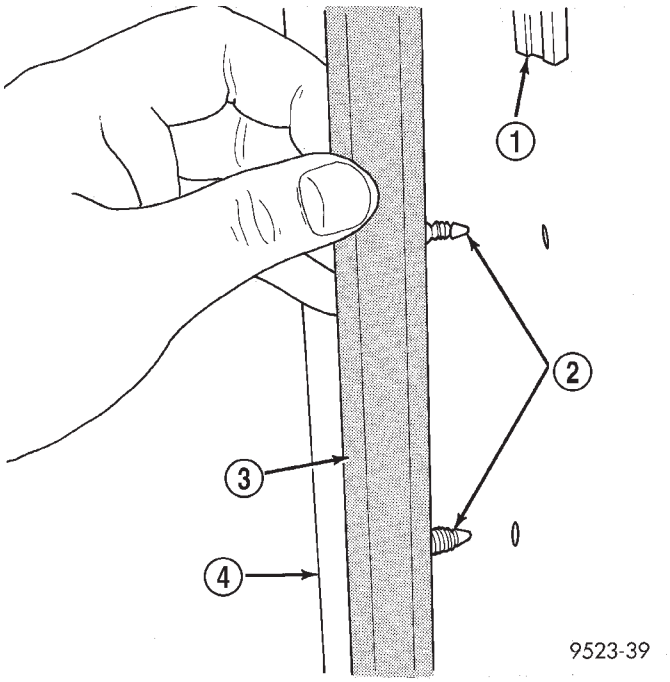

Fig. 2 Front Door Weatherstrip

1 - RETAINING CHANNEL
2 - PUSH-IN FASTENER
3 - WEATHERSTRIP
4 - FRONT DOOR

SLIDING DOOR WEATHERSTRIP

REMOVAL

(1) Open sliding door.
(2) Remove door opening sill plate.
(3) Loosen B-pillar trim covers.
(4) Loosen quarter panel trim panels.
(5) From splice at the bottom center of door opening, pull weatherstrip from pinch flange around door opening.

INSTALLATION

(1) Place splice at the bottom center of door opening, pushing weatherstrip onto pinch flange around door opening.
(2) Tighten quarter panel trim panels.
(3) Tighten B-pillar trim covers.
(4) Install door opening sill plate.
(5) Close sliding and check alignment.

FRONT DOOR INNER BELT MOLDING

REMOVAL

(1) Remove door trim panel.
(2) Peel upper corner seals away form inner belt molding to clear removal path.
(3) Pull inner belt molding upward to disengage retaining channel in bottom of molding from door panel flange (Fig. 1).
(4) Remove inner belt molding from vehicle.

INSTALLATION

(1) Place inner belt molding in position on door (Fig. 1).
(2) Push inner belt molding downward to engage retaining channel onto door panel flange.
(3) Install upper corner seals in proper location.
(4) Install door trim panel.

HEATING & AIR CONDITIONING

DESCRIPTION

DESCRIPTION - SINGLE ZONE

A single zone heating and air conditioning system allows one temperature setting for the entire vehicle. The full range of temperatures that the system can produce are available by rotating the temperature control located in control panel.

The control panel and integral computer is mounted in the instrument panel.

DESCRIPTION - DUAL ZONE

A manual Dual Zone Heating and Air Conditioning system allows completely independent side-to-side tempeture control of the discharge air.

The Dual Zone Heating and Air Conditioning system includes a dust and odor air filter. The filter element is the same size as the air conditioning evaporator to ensure ample capacity. A door at the base of the heating and air conditioning housing below the glove box provides easy access to the filter element.

The control panel and integral computer is located in the instrument panel.

The instrument panel mounted control and integral computer contains:

- a power button which allows the system to be completely turned off. Contains an LED that illuminates to show when the function is operational.
- rear window defogger on/off switch. Contains an LED that illuminates to show when the function is operational.
- slide controls for completely independent side-to-side temperature control of the discharged air. The full range of temperature that the system can produce in any mode is available on either side of the vehicle by independently positioning the slide controls on the instrument panel.
- air recirculation on/off switch. The Recirculate button contains an LED that illuminates to show when the function is in operation.
- air conditioning on/off switch. The Snowflake button contains an LED that illuminates to shown when the function is in operation.
- rotary knob for fan speed selection.
- a rotary knob for mode control.

DESCRIPTION - MANUAL THREE ZONE

The fully adjustable Three-Zone front and rear heating and air conditioning system allows intermediate seat passengers the ability to regulate air temperature as well as fan speed. All controls are identified by ISO graphic symbols.

The Three Zone Heating and Air Conditioning system includes a dust and odor air filter. The filter element is the same size as the air conditioning evaporator to ensure ample capacity. A door at the base of the heating and air conditioning housing below the glove box provides easy access to the filter element.

HEATING & AIR CONDITIONING (Continued)

FRONT CONTROL PANEL

The front control panel and integral computer is mounted in the instrument panel.

The instrument panel mounted control and integral computer contains:

- a power button which allows the system to be completely turned off.
- rear window defogger on/off switch.
- slide controls for completely independent side-to-side temperature control of the discharge air. The full range of temperature that the system can produce in any mode is available on either side of the vehicle by independently positioning the slide controls on the instrument panel.
- air recirculation button. The Recirculate button contains an LED that illuminates to show when the function is in operation.
- an air conditioning button that allows the compressor to be turned on/off. The Snowflake button contains an LED that illuminates to shown when the function is in operation.
- rotary knobs for front and rear fan speed selection.
- a rotary knob for mode control.

REAR CONTROL PANEL

A rear control panel centrally mounted on the headliner has a rotary adjustment for temperature and fan speed control of the rear unit by intermediate seat passengers when the front control rear knob is set to the rear position.

DESCRIPTION - THREE ZONE AUTOMATIC TEMPERATURE CONTROL

The Three-Zone Automatic Temperature Control (ATC) allows occupants to select a comfort temperature, which is the perceived temperature level not the actual passenger compartment air temperature.

The Three Zone Automatic Temperature Control system includes a dust and odor air filter. The filter element is the same size as the air conditioning evaporator to ensure ample capacity. A door at the base of the heater and air conditioning housing below the glove box provides easy access to the filter element.

The ATC computer utilizes integrated circuitry and information carried on the Programmable Communications Interface (PCI) data bus network to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the ATC computer allow it to control electronic functions and features of the ATC system. The inputs to the ATC computer are:

- **Vehicle Speed/Engine RPM** – The ATC computer monitors engine RPM, vehicle speed and Manifold Absolute Pressure information from the PCM.
- **Coolant Temperature** – ATC computer monitors Coolant temperature received from the PCM and converts it to degrees Fahrenheit.
- **Ambient Temperature** – ATC computer monitors Ambient temperature from the Compass Mini Trip Computer (CMTC) and converts it to degrees Fahrenheit.
- **Engine Miscellaneous Sensor Status** – ATC computer monitors A/C disable information from the PCM.
- **Refrigerant Pressure** – ATC computer monitors Barometric Pressure, Intake Air Temperature, High Side Pressure and Methanol Content as broadcast by the PCM.
- **Door Ajar Status** – The ATC computer monitors Driver Front Door, Passenger Front Door, Left Rear Door, Right Rear Door and Liftgate ajar information, as identified by the Body Control Module (BCM), to determine if all in-car temperatures should be maintained.
- **Dimming** – The ATC computer monitors dimming status from the BCM to determine the required level of brightness and will dim accordingly.
- **Vehicle Odometer** – The ATC computer monitors the vehicle odometer information from the BCM to prevent flashing the VF tube icons if the manual motor calibration or manual cool down tests have failed. Flashing of the display icons will cease when the vehicle odometer is greater than 3 miles.
- **English Metric** – The ATC computer monitors the English/Metric information broadcast by the CMTC. The set temp displays for both the front and rear control heads will be set accordingly.
- **Vehicle Identification Number** – The ATC computer monitors the last eight characters of the VIN broadcast by the PCM and compares it to the information stored in EEPROM. If it is different, the new number will be stored over the old one and a motor calibration shall be initiated.
- **A/C System Information** – The ATC computer will send a message for Evaporator Temperature too Low, Fan Blower Relay status, Evaporator Sensor Failure, Rear Window Defogger Relay and A/C Select.

FRONT CONTROL PANEL

The front control panel and integral computer is mounted in the instrument panel.

The instrument panel mounted control and integral computer contains:

- A power button which allows the system to be completely turned off. The display is blank when the system is off.
- Three rocker switches that select comfort temperatures from 15° to 30° C (59° to 85° F), which are shown in the vacuum-fluorescent digital control display. If the set temp is 59 and the down button is

pressed, the set temp value will become 55 but the display will show LO. If the set temp is 85 and the up button is pressed, the set temp value will become 90 but the display will show HIGH. Temperatures can be displayed in either metric or Fahrenheit, which is controlled from the overhead console.

- A rocker switch that selects a cool-down rate. LO-AUTO or HI-AUTO are displayed when the system is in automatic operation.
- A defroster button which turns on the defroster independently during full automatic control. A defroster symbol illuminates in the display when the button is pressed.
- Air recirculation button. A Recirculation symbol appears in the display when the button is pressed, or when the system exceeds 80 percent circulated air under automatic control due to high air conditioning demand.
- Rear window defogger on/off switch. A graphic symbol shows when the defroster is on.
- An air conditioning button that allows the compressor to be turned off. A Snowflake symbol is illuminated when air conditioning is on, whether under manual or automatic control.
- Rotary knob for front fan speed selection can override the automatic controls. LEDs surrounding the knob show the current setting.
- Rotary knob for control of the Rear system.
- A rotary knob for mode control can override the automatic controls. LEDs surrounding the knob show the current setting.
- Computer logic remembers the settings of the controls when the ignition is turned off and retains those settings after a restart. If the system is off when the ignition is turned off it will be off when the engine is restarted, etc.
- Computer logic provides variable air recirculation under high temperature and humidity conditions. Because recirculation is generally accompanied by increased fan noise, the proportion of recirculated to outside air gradually approaches full recirculation over a broad temperature range.
- A graphic symbol of the windshield that illuminates when the windshield wiper deicer is active.

REAR CONTROL PANEL

A rear control panel centrally mounted on the headliner includes a vacuum-flourescent digital display, a rocker control for temperature and rotary controls for adjustment of mode and fan speed control of the rear unit by intermediate seat passengers.

OPERATION

OPERATION - DUAL ZONE

- The mode control knob enables continously variable proportioning of air flow between modes but has detents adjacent to each icon.
- The blower control provides five separate speeds.
- When the fan is off, the HVAC computer closes the recirculation door to prevent outside air from entering the passenger compartment.
- Interior air may be recirculated to speed up heating or cooling in all modes except defrost and mix by pressing the Recirculate button on the control panel.
- To reduce humidity for rapid defogging the A/C compressor runs automatically in modes from “mix’ to full defrost when outside temperatures are above freezing.
- Air conditioning is available in any mode by pressing the snowflake, A/C on/off, button.

OPERATION - MANUAL THREE ZONE

FRONT CONTROL PANEL

- Primary control of the rear compartment unit is on the instrument panel. This control allows the driver to set the rear compartment fan speed, to turn the rear unit off, or to give control to the intermediate seat occupants by switching to the REAR position. When the rear unit is controlled from the instrument panel, rear air temperature is based on the driver-side temperature control position, and the mode (floor or overhead air) is based on the front control’s mode position.
- The mode control knob enables continously variable proportioning of air flow between modes but has detents adjacent to each icon.
- The blower control provides five separate speeds and Off. When the fan is off, the HVAC computer closes the recirculation door to prevent outside air from entering the passenger compartment.
- Interior air may be recirculated to speed up heating or cooling in all modes exccept defrost and mix by pressing the Recirculate button on the control panel.
- To reduce humidity for rapid defogging the A/C compressor runs automatically in modes from “mix’ to full defrost when outside temperatures are above freezing.
- Air conditioning is available in any mode by pressing the snowflake, A/C on/off, button.

HEATING & AIR CONDITIONING (Continued)

REAR CONTROL PANEL

With the rear control active, temperature selection dictates indirectly the mode (floor or overhead air) of the rear unit: a low temperature setting directs flow to the overhead outlets and a high temperature setting to the floor.

OPERATION - THREE ZONE ATC

Comfort temperature or perceived temperature is affected by air flow, sun impinging on exposed skin, etc. The air temperature may be higher or lower than the comfort temperature. Three infrared sensors, two in the instrument panel center stack, and one in the overhead-mounted rear control panel, independently measure the temperature of the driver, front passenger, and rear compartment occupants to determine their comfort level relative to the selected comfort temperature. The HVAC computer in the control module adjusts the air flow rate and temperature to maintain the customer-perceived comfort temperature. The air temperature in the passenger compartment at any time may be slightly higher or lower than the comfort temperature. For instance, on sunny summer days the air flow will probably be cooler than the comfort temperature; on cold or cloudy days and at night it will probably be slightly warmer. Infrared Three-Zone Temperature Control provides side-to-side and front-to-rear variation in comfort temperature settings. The Infrared Three-Zone Automatic Temperature Control fan provides a continuously variable air flow rate to meet occupant comfort requirements.

FRONT CONTROL PANEL

- **AUTO HI/LO** – This system features two sets of automatic control logic that allow either a rapid cool-down rate or a somewhat slower cool-down rate with less fan noise. HI-AUTO controls the system to reach its assigned temperature quickly with a higher fan speed. LO-AUTO controls the system to reach its assigned temperature somewhat slower with less fan noise. Both modes will automatically engage auto recirculation.
- **DE-FROST** – The front de-frost function is active when the rear window defogger function is active or when the defog/defrost mode is selected.
- **RECIRC** – The RECIRC button will close the air inlet door. If the system is in auto recirc (indicator being displayed automatically), pressing the manual recirc button will disable the auto recirc function until one of the auto keys are pressed or the ignition is cycled. If Auto HI/LO is pressed while manual recirc is active, manual recirc will be deactivated.
- **REAR WINDOW DEFOGGER** – Pushing the button sends a PCI bus message to the Intelligent Power Module which controls the Rear Window Defogger and side view mirror (if equipped) circuitry. The defogger function will be active for 10 minutes and can be turned off by a switch press. The defogger will function while the control is in the OFF mode.
- **FAN/MODE** – The Fan and Mode knobs have 17 manual selectable positions. Manually changing either of the rotary knobs for mode or fan speed settings makes control of that function alone manual for as long as the ignition is on. If only one is changed manually, the other remains under automatic control. Pressing the HI-AUTO/LO-AUTO rocker switch restores full automatic control.
- **REAR CONTROL** – When the Rear System control knob is moved to the OFF position, there will be a delay of approximately 1 second before the system actually turns off. This delay is to prevent an undesired blower dropout if the knob is moved through OFF to the other selections.
- **BLOWER DELAY TIMER** – The word DELAY is displayed at start-up to signify that the system is waiting so that cold air will not be blowing. This tells the operator that it is unnecessary to turn the system off, raise the temperature setting or turn the fan speed setting down to prevent cold air from blowing. A countdown in minutes and seconds until the engine is warm enough to begin delivering heat to the passengers alternates with the DELAY message at 25 second intervals. This countdown is based on actual measurement of the rate of engine coolant temperature change. During the delay time, Defrost mode is selected and the fan operates at a low speed to keep the windshield fog free.

REAR CONTROL PANEL

Primary control of the rear compartment unit is in the instrument panel center stack. The rear unit control knob there allows the driver to turn the rear unit off, allow control by the intermediate seat occupants by switching to the REAR position, or provide fully automatic control based on the temperature setting shown on the front control display.

- **REAR CONTROL** – Selecting automatic control of the rear unit at the instrument panel, illuminates a Locked Padlock in the rear control panel display. Selecting REAR activates the rear control panel and the Padlock then appears unlocked.
- **FAN KNOB** – The rear fan control has Off and AUTO positions and a range of manual speed settings that override the AUTO setting.
- **MODE KNOB** – The mode control allows intermediate seat occupants to manually override the automatic mode and select any balance of air flow between overhead and floor outlets from full overhead to full floor.
- **SET TEMP** – The rear set temp control will operate identical to the front controls. If the front

control rear set temp button is pressed simultaneously with the rear control head, then the front control head press events shall have priority, i.e. if the front user presses Rear Set Temp down and the rear user presses Set Temp up, then the rear set temp will decrease.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - A/C COOL DOWN TEST

The heater-A/C control module can perform an A/C cool down test, which is a test performed during the manufacturing process to confirm that the air conditioning system is performing satisfactorily. This test can also provide a quick confirmation of air conditioning system performance to the service technician. If the test is completed satisfactorily, no further service is required. If the test is failed, proceed to the A/C Performance Test to confirm the a/c system is operating properly, or use a DRBIII® scan tool to diagnose the A/C system control and distribution systems. Refer to the appropriate diagnostic information.

MANUAL TEMPERATURE CONTROL

The front blower speed and rear blower speed (if equipped with rear HVAC) must be set to High and the evaporator temperature sensor must be greater than 55° F or the test will fail immediately. The test is activated by depressing the A/C and PWR buttons simultaneously and holding them depressed for no less than five seconds. The PWR and A/C LEDs will blink on and off until the test is complete. If the LEDs stop blinking before two minutes, then the cool down test has been completed successfully. If the two minutes expire without the expansion valve temperature reaching 20° F less than the outside air temperature, then the cool down test has been failed and further A/C system diagnosis is required. If the test is failed, the LEDs will continue to blink until the vehicle has been driven for greater than (8 miles).

AUTOMATIC TEMPERATURE CONTROL

The ambient air temperature in the room where the vehicle will be tested must be a minimum of 21° C (70°F) for this test. The test is activated by depressing the A/C and PWR buttons simultaneously and holding them depressed for no less than four seconds. The snowflake icon and the DELAY text in the ATC display will blink on and off alternately until the test is complete. If the snowflake icon and the DELAY text stop blinking before two minutes, then the cool down test has been completed successfully. If the two minutes expire without the evaporator temperature reaching 20° F less than the evaporator initial temperature, then the cool down test has been failed and further A/C system diagnosis is required. If the test is failed, the snowflake icon and the DELAY text will continue to blink across ignition cycles until the vehicle has been driven for greater than (8 miles).

DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST

An air conditioning performance test is the best way to determine whether the system is performing up to standard. This test also provides valuable clues as to the possible cause of trouble with the air conditioning system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70°F) for this test.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Connect a tachometer to monitor the engine speed.

(2) Remove the caps from the refrigerant system service ports and attach a manifold gauge set to monitor the refrigerant system pressures.

(3) Set the heater-air conditioner controls so that the compressor is engaged, the air within the vehicle is being recirculated, the output air is directed through the panel outlets, the temperature control is in the full cool position, and the blower motor is operating at its highest speed.

(4) Start the engine and allow the engine to operate for about five minutes or until it reaches normal operating temperature. Then hold the engine speed at 1000 rpm with the compressor clutch engaged. If the compressor clutch does not engage, proceed with diagnosis of the compressor clutch coil. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/COMPRESSOR CLUTCH COIL - DIAGNOSIS AND TESTING).

(5) Close all the vehicle windows and doors.

(6) Insert a thermometer in the left center panel outlet and operate the engine for five minutes.

HEATING & AIR CONDITIONING (Continued)

(7) With the compressor clutch engaged, record the left center panel outlet discharge air temperature, the discharge pressure (high side service port), and the suction pressure (low side service port). The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

(8) Compare the discharge air temperature reading to the Performance Temperature and Pressure chart. If the temperature reading is high, check the refrigerant system for leaks and proper refrigerant charge level. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM CHARGE LEVEL).

Performance Temperature and Pressure					
Ambient Temperature	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)
Left Center Panel Outlet Discharge Air Temperature	1 to 8° C (34 to 46° F)	3 to 9° C (37 to 49° F)	4 to 10°C (39 to 50° F)	6 to 11°C (43 to 52° F)	7 to 18° C (45 to 65° F)
Discharge Pressure (High Side Service Port)	1034 to 1724 kPa (150 to 250 psi)	1517 to 2275 kPa (220 to 330 psi)	1999 to 2620 kPa (290 to 380 psi)	2068 to 2965 kPa (300 to 430 psi)	2275 to 3421 kPa (330 to 450 psi)

DIAGNOSIS AND TESTING - HEATER PERFORMANCE TEST

PRE-DIAGNOSTIC PREPARATIONS

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING FRONT - WARNING - HEATER PLUMBING).

Check the coolant level, drive belt tension, radiator air flow, and cooling fan operation. Start the engine and allow it to warm up to normal temperature.

MAXIMUM HEATER OUTPUT: TEST AND ACTION

Engine coolant is provided to the heater system by two 16 mm (5/8 inch inside diameter) heater hoses. With the engine idling at normal running temperature, set the heater-A/C controls as follows. Temperature control to full Heat, Mode control to Floor, Blower control to the highest speed setting. Using a test thermometer, check the air temperature coming from the center floor outlets and compare this reading to the Temperature Reference table.

TEMPERATURE REFERENCE			
AMBIENT TEMPERATURE		MINIMUM FLOOR OUTLET TEMPERATURE	
CELSIUS	FAHRENHEIT	CELSIUS	FAHRENHEIT
15.5°	60°	62.2°	144°
21.1°	70°	63.8°	147°
26.6°	80°	65.5°	150°
32.2°	90°	67.2°	153°

If the floor outlet air temperature is insufficient, check that the cooling system is operating to specifications. (Refer to 7 - COOLING/ENGINE - DIAGNOSIS AND TESTING). Both heater hoses should be HOT to the touch (the coolant return hose should be slightly cooler than the supply hose). If the coolant return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in heater system.

POSSIBLE LOCATIONS OR CAUSE OF OBSTRUCTED COOLANT FLOW

- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at cooling system connections.
- Plugged heater core.
- Air locked heater core.
- Restrictor in backwards.

If coolant flow is verified and the heater floor outlet temperature is insufficient, a mechanical problem may exist.

POSSIBLE LOCATION OR CAUSE OF INSUFFICIENT HEAT

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Blend-air door not functioning properly.

TEMPERATURE CONTROL

If heater floor outlet temperature cannot be adjusted with the heater-A/C control temperature control lever, one of the following could require service:

- Blend-air door binding.
- Faulty blend-air door motor.
- Improper engine coolant temperature.
- Faulty heater-A/C control.

SPECIFICATIONS - HEATER-A/C SYSTEM

ITEM	DESCRIPTION	NOTES
Vehicle	RS - Caravan, Town & Country, Voyager	
System	R134a with expansion valve(s)	
Compressor	Nippondenso - 10S20	ND-8 PAG Oil
Freeze–up Control	evaporator temperature sensor	expansion valve mounted - input to heater-A/C control module
Low PSI Control		liquid line mounted - input to Powertrain Control Module (PCM) - PCM opens compressor clutch relay < 29.4 psi
High PSI Control	pressure transducer	liquid line mounted - input to PCM - PCM opens compressor clutch relay > 450 psi
	pressure relief valve	compressor mounted - opens > 495 psi
Control Head	single zone, dual zone, and three zone Manual Temperature Control (MTC) - or three zone Automatic Temperature Control (ATC)	PCI data bus messaging - ATC uses three infrared temperature sensors - two front/one rear
Mode Door	electric actuator	Control head driven
Blend Air Door	electric actuator	
Fresh/Recirc Door	electric actuator	
Blower Motor	control head switch	resistor and relay with MTC, power module and relay with ATC
Cooling Fans	pulse width modulated variable speed	PCM control through solid state fan relay
Clutch		
Clutch Control	PCM	PCM control through compressor clutch relay
Clutch Coil Draw	2.2 amps @ 12V	± 0.5amps@ 70° F
Compressor Clutch Air Gap	0.020″ - 0.035″

A/C HEATER CONTROL

STANDARD PROCEDURE - HEATER-A/C CONTROL CALIBRATION

The heater-A/C control module must be recalibrated each time an actuator motor or the control module is replaced. If the vehicle is so equipped, the calibration procedure also includes rear HVAC positions for each actuator motor.

(1) Turn the ignition switch to the On position.

(2) Simultaneously depress and hold the Power and Recirculation buttons on the heater-A/C control for at least five seconds. The manual heater-A/C control power Light Emitting Diode (LED) and Recirculation LED, or the Automatic Temperature Control (ATC) heater-A/C control Delay and Recirculation graphics will begin to flash when the calibration procedure has begun.

A/C HEATER CONTROL (Continued)

(3) The calibration procedure should take less than two minutes to complete for the manual heater-A/C control, and less than twenty seconds for the ATC heater-A/C control. When the LEDs or graphics stop flashing, the calibration procedure is complete.

(4) If the LEDs or graphics continue to flash beyond the normal three minute (manual) or twenty second (ATC) calibration time, it indicates that the heater-A/C control has detected a failure and a Diagnostic Trouble Code (DTC) has been set. Use a DRBIII® scan tool to perform further diagnosis. Refer to the appropriate diagnostic information. The LEDs or graphics will continue to flash even after the ignition switch is cycled Off and On, until a successful calibration is completed or until the vehicle has been driven about 13 kilometers (8 miles).

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the center bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(3) Place the instrument panel center bezel unit face down on a suitable work surface. Take the proper precautions to protect the center bezel from cosmetic damage.

(4) If the vehicle is equipped with the optional Automatic Temperature Control (ATC) system, disconnect the infrared sensor jumper harness connector from the receptacle on the back of the heater-A/C control (Fig. 1).

(5) Remove the six screws that secure the heater-A/C control to the back of the instrument panel center bezel.

(6) Remove the heater-A/C control from the instrument panel center bezel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the heater-A/C control onto the back of instrument panel center bezel.

(2) Install and tighten the six screws that secure the heater-A/C control to the back of the instrument panel center bezel. Tighten the screws to 2 N·m (17 in. lbs.).

(3) If the vehicle is equipped with the optional ATC system, reconnect the infrared sensor jumper harness connector to the receptacle on the back of the heater-A/C control.

(4) Reinstall the center bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

(5) Reconnect the battery negative cable.

A/C PRESSURE TRANSDUCER

DESCRIPTION - A/C PRESSURE TRANSDUCER

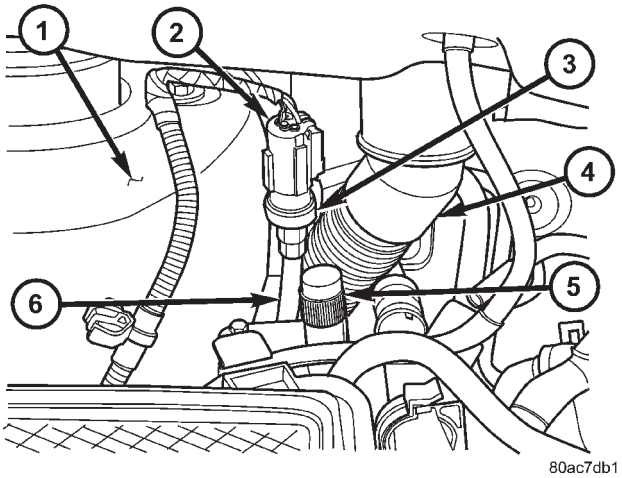

Fig. 2 A/C Pressure Transducer

1 - RIGHT FRONT STRUT TOWER
2 - CONNECTOR
3 - A/C PRESSURE TRANSDUCER
4 - RIGHT WIPER MODULE DRAIN TUBE
5 - HIGH SIDE SERVICE PORT
6 - LIQUID LINE

The A/C pressure transducer (Fig. 2) is a switch that is installed on a fitting located on the refrigerant liquid line between the filter-drier and the expansion valve in the right rear corner of the engine compartment. An internally threaded hex fitting on the transducer connects it to the externally threaded Schrader-type fitting on the liquid line. A rubber O-ring seals the connection between the transducer and the liquid line fitting. Three terminals within a molded plastic connector receptacle on the top of the transducer connect it to the vehicle electrical system through a take out and connector of the headlamp and dash wire harness.

The A/C pressure transducer cannot be adjusted or repaired and, if faulty or damaged, it musty be replaced.

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the liquid line. The transducer will change its internal resistance in response to the pressures it monitors. The Powertrain Control Module (PCM) provides a five volt reference signal and a sensor ground to the transducer, then monitors the output voltage of the transducer on a sensor return circuit to determine refrigerant pressure. The PCM is programmed to respond to this and other sensor inputs by controlling the operation of the air conditioning compressor clutch and the radiator cooling fan to help optimize air conditioning system performance and to protect the system components from damage. The A/C pressure transducer input to the PCM will also prevent the air conditioning compressor clutch from engaging when ambient temperatures are below about 10° C (50° F) due to the pressure/temperature relationship of the refrigerant. The Schrader-type valve in the liquid line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the system. The A/C pressure transducer is diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - A/C PRESSURE TRANSDUCER

The A/C pressure transducer is tested using a DRBIII® scan tool. Refer to the appropriate diagnostic information. Before testing the A/C pressure transducer, be certain that the transducer wire harness connection is clean of corrosion and properly connected. For the air conditioning system to operate, an A/C pressure transducer voltage reading between 0.451 and 4.519 volts is required. Voltages outside this range indicate a low or high refrigerant system pressure condition to the Powertrain Control Module (PCM). The PCM is programmed to respond to a low or high refrigerant system pressure by suppressing operation of the compressor. Refer to the A/C Pressure Transducer Voltage table for the possible condition indicated by the transducer voltage readings.

A/C PRESSURE TRANSDUCER VOLTAGE	
VOLTAGE	POSSIBLE INDICATION
0.0	1. NO SENSOR SUPPLY VOLTAGE FROM PCM. 2. SHORTED SENSOR CIRCUIT. 3. FAULTY TRANSDUCER.
0.150 TO 0.450	1. AMBIENT TEMPERATURE BELOW 10° C (50° F). 2. LOW REFRIGERANT SYSTEM PRESSURE.
0.451 TO 4.519	1. NORMAL REFRIGERANT SYSTEM PRESSURE.
4.520 TO 4.850	1. HIGH REFRIGERANT SYSTEM PRESSURE.
5.0	1. OPEN SENSOR CIRCUIT. 2. FAULTY TRANSDUCER.

A/C PRESSURE TRANSDUCER (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the headlamp and dash wire harness connector for the A/C pressure transducer from the transducer connector receptacle (Fig. 3).

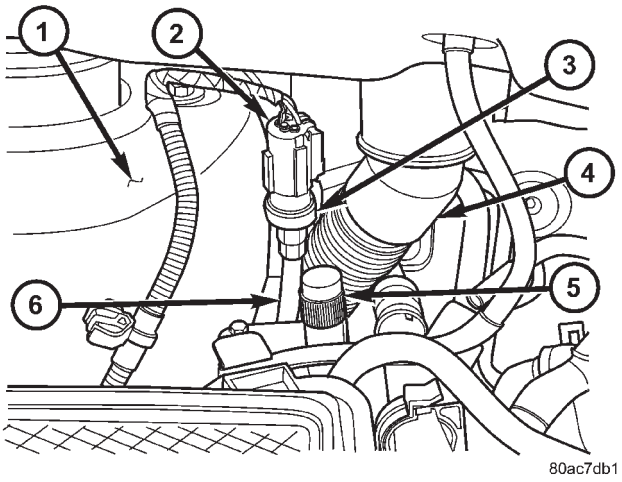

Fig. 3 A/C Pressure Transducer

1 - RIGHT FRONT STRUT TOWER
2 - CONNECTOR
3 - A/C PRESSURE TRANSDUCER
4 - RIGHT WIPER MODULE DRAIN TUBE
5 - HIGH SIDE SERVICE PORT
6 - LIQUID LINE

(3) Using an open end wrench, unscrew the A/C pressure transducer from the fitting on the liquid line between the filter-drier and the expansion valve.

(4) Remove the seal from the A/C pressure transducer fitting and discard.

INSTALLATION

(1) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the A/C pressure transducer fitting.

(2) Using an open end wrench, install and tighten the A/C pressure transducer onto the fitting on the liquid line between the filter-drier and the expansion valve.

(3) Reconnect the headlamp and dash wire harness connector for the A/C pressure transducer to the transducer connector receptacle.

(4) Reconnect the battery negative cable.

BLEND DOOR ACTUATOR

DESCRIPTION

The blend door actuators are reversible, 12-volt Direct Current (DC), servo motors. Models with the single zone heater and air conditioner system have a single blend air door, which is controlled by a single blend door actuator. Models with the optional dual zone front heater and air conditioner system have dual blend air doors, which are controlled by two blend door actuators. The single zone blend door actuator is located on the driver side end of the heater-A/C housing unit, close to the dash panel. In the dual zone system, the same blend door actuator used for the single zone system becomes the passenger blend door actuator, and is mechanically connected to only the passenger side blend air door. In the dual zone system, a second separate blend door actuator is also located on the driver side end of the heater-A/C housing unit close to the instrument panel, and is mechanically connected to only the driver side blend air door.

The blend door actuators are interchangeable with each other, as well as with the actuators for the mode door and the recirculation air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Two integral mounting tabs allow the actuator to be secured with two screws to the heater-A/C unit housing. Each actuator also has an identical output shaft with splines that connects it to the linkage that drives the proper blend air door. The blend door actuators do not require mechanical indexing to the blend door linkage, as they are electronically calibrated by the heater-A/C control module. The blend door actuators cannot be adjusted or repaired and, if damaged or faulty, they must be replaced.

OPERATION

Each blend door actuator is connected to the heater-A/C control module through the vehicle electrical system by a dedicated two-wire take out and connector of the HVAC wire harness. The blend door actuator can move the blend air door in two directions. When the heater-A/C control module pulls the voltage on one side of the motor connection high and the other connection low, the blend air door will move in one direction. When the module reverses the polarity of the voltage to the motor, the blend air door moves in the opposite direction. When the module makes the voltage to both connections high or both connections low, the blend air door stops and will not move. These same motor connections also provide a feedback signal to the heater-A/C control module. This feedback signal allows the module to monitor the operation and relative positions of the blend door actuator and the blend air door. The heater-A/C control module learns the blend air door stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the blend door actuator circuits. The blend door actuator can be diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

BLEND DOOR ACTUATOR (Continued)

REMOVAL

The single zone heating and air conditioning system is equipped with a single blend door actuator. The dual zone system has two blend door actuators, one for the driver side blend air door and one for the passenger side blend air door. The same service procedures can be used for each of these actuators.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the silencer from beneath the driver side end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).

(3) Remove the three screws that secure the heater core shield to the left end of the HVAC distribution housing (Fig. 4).

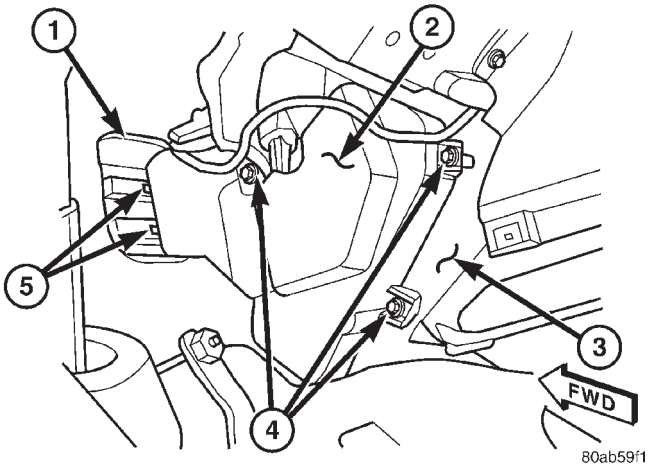

Fig. 4 Heater Core Shield

1 - HEATER/ AIR CONDITIONER HOUSING
2 - HEATER CORE SHIELD
3 - DISTRIBUTION HOUSING
4 - SCREWS (3)
5 - LOCATION TABS (2)

(4) Pull the heater core shield rearward far enough to disengage the two location tabs that position the front of the shield to the receptacles in the two lower finger formations of the heater/ air conditioner housing near the dash panel.

(5) Remove the heater core shield from the distribution housing.

(6) Disconnect the HVAC wire harness connector for the blend door actuator from the actuator connector receptacle (Fig. 5).

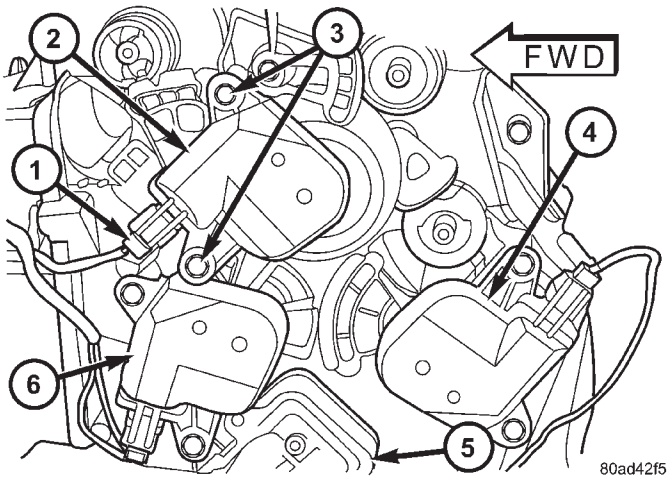

Fig. 5 Blend Door Actuator

1 - CONNECTOR
2 - MODE DOOR ACTUATOR
3 - SCREW (2)
4 - DRIVER BLEND DOOR ACTUATOR (DUAL-ZONE ONLY)
5 - HEATER CORE
6 - BLEND DOOR ACTUATOR (SINGLE ZONE) OR PASSENGER BLEND DOOR ACTUATOR (DUAL-ZONE)

(7) Remove the two screws that secure the blend door actuator to the distribution housing.

(8) Remove the blend door actuator from the distribution housing.

INSTALLATION

(1) Position the blend door actuator onto the heater/air conditioner housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the blend air door linkage.

(2) Install and tighten the two screws that secure the blend door actuator to the distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Reconnect the HVAC wire harness connector for the blend door actuator to the actuator connector receptacle.

(4) Position the heater core shield onto the distribution housing. Be certain that the two location tabs on the front of the shield are engaged in the receptacles in the two lower finger formations of the evaporator housing near the dash panel.

BLEND DOOR ACTUATOR (Continued)

(5) Install and tighten the three screws that secure the heater core shield to the left end of the heater/air conditioner housing. Tighten the screws to 2 N·m (17 in. lbs.).

(6) Reinstall the silencer under the driver side end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).

(7) Reconnect the battery negative cable.

(8) Perform the heater-A/C control calibration procedure. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/A/C-HEATER CONTROL - STANDARD PROCEDURE - HEATER-A/C CONTROL CALIBRATION).

BLOWER MOTOR RELAY

DESCRIPTION

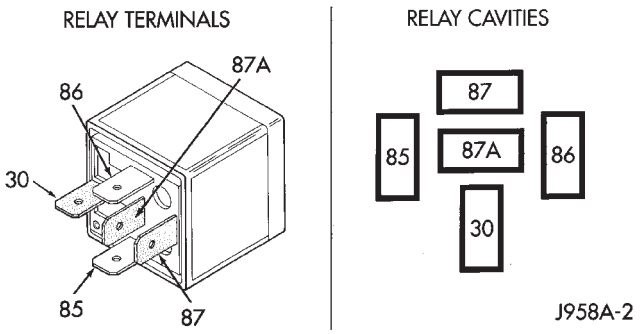

Fig. 6 Blower Motor Relay

NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

The blower motor relay (Fig. 6) is a International Standards Organization (ISO) mini-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The ISO mini-relay terminal functions are the same as a conventional ISO relay. However, the ISO mini-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay. The blower motor relay is located in the Intelligent Power Module (IPM), which is in the engine compartment near the battery. See the fuse and relay layout map molded into the inner surface of the IPM cover for blower motor relay identification and location.

The black, molded plastic case is the most visible component of the blower motor relay. Five male spade-type terminals extend from the bottom of the base to connect the relay to the vehicle electrical system, and the ISO designation for each terminal is molded into the base adjacent to each terminal.

OPERATION

The blower motor relay is an electromechanical switch that uses a low current input from the Front Control Module (FCM) to control the high current output to the blower motor resistor (manual heater-A/C control) or blower power module (ATC control). The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. The resistor or diode is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The blower motor relay terminals are connected to the vehicle electrical system through a receptacle in the Intelligent Power Module (IPM). The inputs and outputs of the blower motor relay include:

- The common feed terminal (30) receives a battery current input from the battery through a B(+) circuit at all times.
- The coil ground terminal (85) receives a ground input through the front/rear blower motor relay control circuit only when the FCM electronically pulls the control circuit to ground.
- The coil battery terminal (86) receives a battery current input from the battery through a B(+) circuit at all times.
- The normally open terminal (87) provides a battery current output to the blower motor resistor (manual heater-A/C control) or blower power module (automatic heater-A/C control) through a fuse in the IPM on the fused front blower motor relay output circuit only when the blower motor relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the blower motor relay coil is de-energized.

BLOWER MOTOR RELAY (Continued)

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

DIAGNOSIS AND TESTING - BLOWER MOTOR RELAY

The front blower motor relay (Fig. 7) is located in the Intelligent Power Module (IPM), which is in the engine compartment near the battery. See the fuse and relay layout map molded into the inner surface of the IPM cover for front blower motor relay identification and location. Remove the relay from the IPM to perform the following tests:

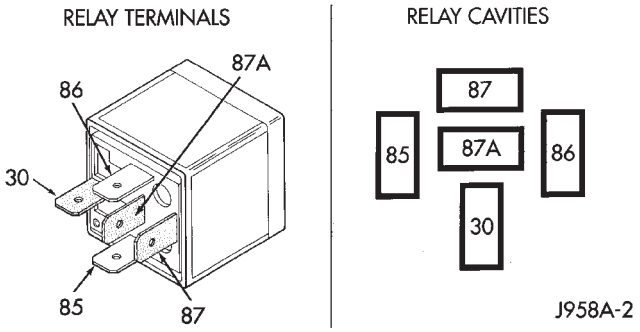

Fig. 7 Blower Motor Relay - Terminal Legend

NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, use a DRBIII® scan tool to perform further diagnosis of the relay circuits. Refer to the appropriate diagnostic information. If not OK, replace the faulty relay.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and remove the cover from the Intelligent Power Module (IPM) (Fig. 8).

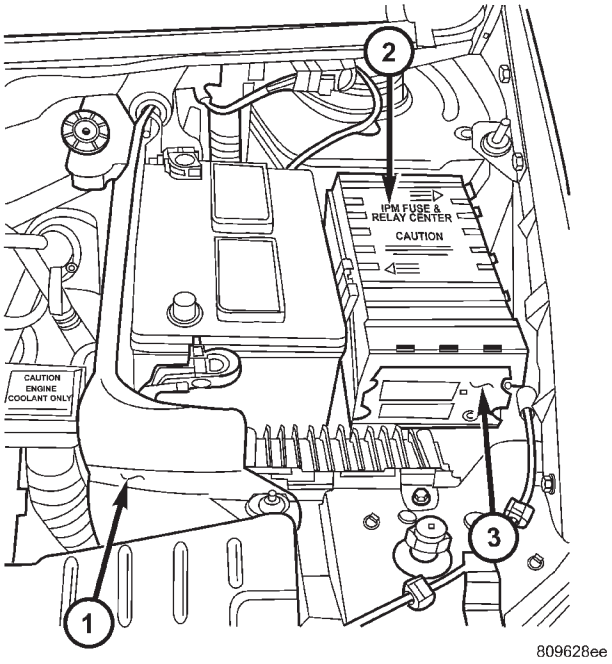

Fig. 8 Intelligent Power Module

1 - BATTERY THERMAL GUARD
2 - INTELLIGENT POWER MODULE
3 - FRONT CONTROL MODULE

(3) See the fuse and relay layout map molded into the inner surface of the IPM cover for front blower motor relay identification and location.

(4) Remove the front blower motor relay from the IPM by pulling the relay straight up.

INSTALLATION

(1) See the fuse and relay layout map molded into the inner surface of the Intelligent Power Module (IPM) cover for front blower motor relay identification and location.

(2) Position the front blower motor relay to the proper receptacle in the IPM.

(3) Align the front blower motor relay terminals with the terminal cavities in the IPM relay receptacle.

(4) Push down firmly on the front blower motor relay until the terminals are fully seated in the terminal cavities in the IPM receptacle.

(5) Install and latch the cover onto the IPM.

(6) Reconnect the battery negative cable.

BLOWER MOTOR RESISTOR

DESCRIPTION

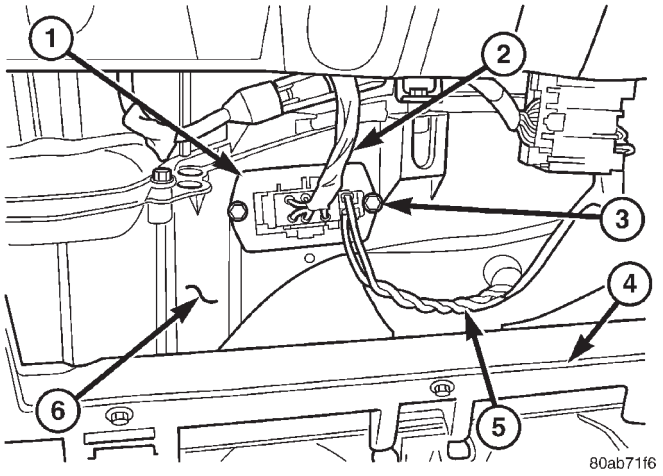

Fig. 9 Blower Motor Resistor

1 - BLOWER MOTOR RESISTOR
2 - INSTRUMENT PANEL WIRE HARNESS
3 - SCREW (2)
4 - GLOVE BOX OPENING LOWER REINFORCEMENT
5 - BLOWER MOTOR PIGTAIL WIRE
6 - EVAPORATOR HOUSING

A blower motor resistor is used on this model when it is equipped with the manual heater-A/C control (Fig. 9). Models equipped with the optional Automatic Temperature Control (ATC) use a blower power module, instead of the blower motor resistor. The blower motor resistor is installed in a mounting hole in the heater/AC housing, directly behind the glove box opening of the instrument panel. The resistor consists of a molded plastic mounting plate with two integral connector receptacles. Concealed behind the mounting plate within the heater/AC housing are four coiled resistor wires contained within a protective stamped steel cage. The resistor mounting plate is secured with two screws to the heater/AC housing and is accessed for service by rolling down the glove box from the instrument panel.

The blower motor resistor wires will get hot when in use. Do not touch the resistor wires or the protective cage if the blower motor has been running. The blower motor resistor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. A second connector receptacle receives the pigtail wire connector from the blower motor. The blower motor resistor has multiple resistor wires, each of which will reduce the current flow through the blower motor to change the blower motor speed. The blower motor switch in the manual heater-A/C control directs the ground path for the blower motor through the correct resistor wire to obtain the selected speed. With the blower motor switch in the lowest speed position, the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor wires are bypassed and the blower motor receives a direct path to ground through the blower motor switch. The blower motor resistor may be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - BLOWER MOTOR RESISTOR

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the instrument panel wire harness connector for the blower motor resistor and the blower motor pigtail wire connector from the resistor connector receptacles.

(3) Check for continuity between each of the blower motor switch input terminals of the blower motor resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the instrument panel wire harness circuits between the blower motor switch and the blower motor resistor or the blower motor pigtail wires as required. If not OK, replace the faulty blower motor resistor.

BLOWER MOTOR RESISTOR (Continued)

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: THE BLOWER MOTOR RESISTOR MAY GET VERY HOT DURING NORMAL OPERATION. IF THE BLOWER MOTOR WAS TURNED ON, WAIT FIVE MINUTES TO ALLOW THE BLOWER MOTOR RESISTOR TO COOL BEFORE PERFORMING DIAGNOSIS OR SERVICE. FAILURE TO TAKE THIS PRECAUTION CAN RESULT IN PERSONAL INJURY.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

(1) Disconnect and isolate the battery negative cable.
(2) Open the glove box.
(3) Flex both sides of the glove box bin inward near the top far enough for the rubber glove box stop bumpers to clear the sides of the glove box opening, then roll the glove box downward.
(4) Reach through the glove box opening to access and disconnect the instrument panel wire harness connector for the blower motor resistor from the resistor connector receptacle (Fig. 10).
(5) Reach through the glove box opening to access and disconnect the blower motor pigtail wire connector from the resistor connector receptacle.
(6) Remove the two screws that secure the blower motor resistor to the evaporator housing.
(7) Remove the blower motor resistor from the evaporator housing.

INSTALLATION

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

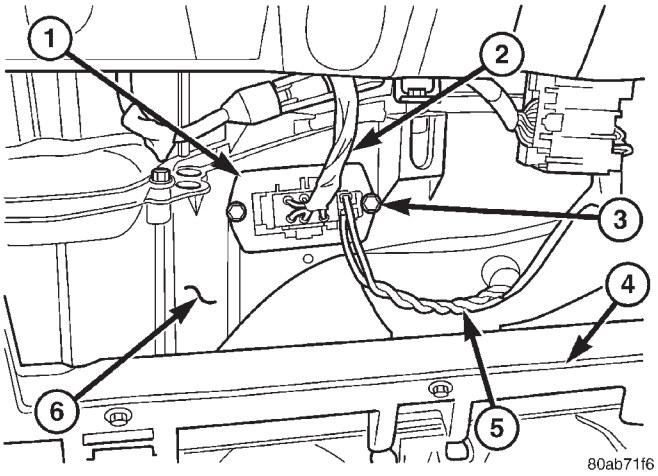

Fig. 10 Blower Motor Resistor

1 - BLOWER MOTOR RESISTOR
2 - INSTRUMENT PANEL WIRE HARNESS
3 - SCREW (2)
4 - GLOVE BOX OPENING LOWER REINFORCEMENT
5 - BLOWER MOTOR PIGTAIL WIRE
6 - EVAPORATOR HOUSING

(1) Position the blower motor resistor into the evaporator housing.
(2) Install and tighten the two screws that secure the blower motor resistor to the evaporator housing. Tighten the screws to 2 N·m (17 in. lbs.).
(3) Reconnect the blower motor pigtail wire connector to the blower motor resistor connector receptacle.
(4) Reconnect the instrument panel wire harness connector for the blower motor resistor to the resistor connector receptacle.
(5) Flex both sides of the glove box bin inward near the top far enough for the rubber glove box stop bumpers to clear the sides of the glove box opening, then roll the glove box upward.
(6) Close and latch the glove box.
(7) Reconnect the battery negative cable.

COMPRESSOR CLUTCH

DESCRIPTION

The compressor clutch assembly consists of a stationary electromagnetic coil with a zener diode, a hub bearing and pulley assembly, and a clutch plate (Fig. 11). The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is keyed or splined to the compressor shaft, and secured with a bolt.

COMPRESSOR CLUTCH (Continued)

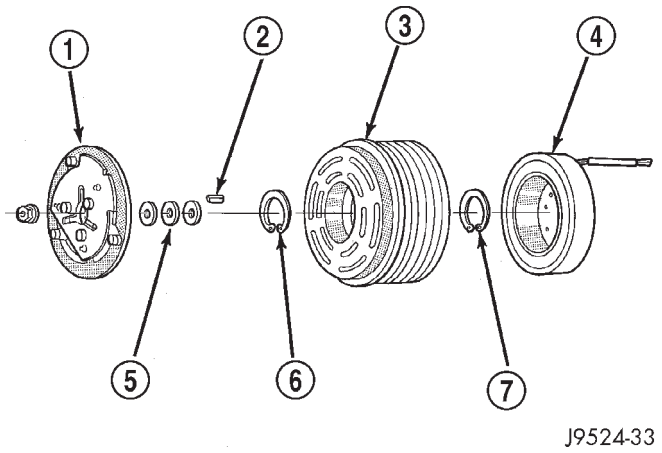

Fig. 11 Compressor Clutch - Typical

1 - CLUTCH PLATE
2 - SHAFT KEY (SOME MODELS)
3 - PULLEY AND BEARING
4 - CLUTCH COIL
5 - CLUTCH SHIMS
6 - SNAP RING
7 - SNAP RING

The compressor clutch plate and pulley unit, or the clutch coil are available for separate service replacement. The clutch coil zener diode is integral to the clutch coil pigtail wire and connector and, if faulty or damaged, the clutch electromagnetic coil unit must be replaced.

OPERATION

The compressor clutch components provide the means to engage and disengage the compressor from the engine serpentine accessory drive belt. When the clutch coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley.

A zener diode is connected in parallel with the clutch electromagnetic coil. This diode controls the dissipation of voltage induced into the coil windings by the collapsing of the electromagnetic fields that occurs when the compressor clutch is disengaged. The zener diode dissipates this induced voltage by regulating a current path to ground. This arrangement serves to protect other circuits and components from potentially damaging voltage spikes in the vehicle electrical system that might occur if the voltage induced in the clutch coil windings could not be dissipated.

The compressor clutch engagement is controlled by several components: the heater-A/C controls in the passenger compartment, the A/C pressure transducer on the liquid line, the evaporator temperature sensor on the expansion valve, the Powertrain Control Module (PCM) in the engine compartment, and the compressor clutch relay in the Intelligent Power Module (IPM). The PCM may delay compressor clutch engagement for up to thirty seconds. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION - PCM OPERATION).

STANDARD PROCEDURE

STANDARD PROCEDURE - COMPRESSOR CLUTCH AIR GAP

If a new clutch plate and/or clutch pulley are being used, the air gap between the clutch plate and clutch pulley must be checked using the following procedure:

(1) Using feeler gauges, measure the air gap between the clutch plate and the clutch pulley friction surfaces.

(2) If the air gap is not between 0.5 and 0.9 mm (0.020 and 0.035 in.), add or subtract shims until the desired air gap is obtained.

NOTE: The shims may compress after tightening the compressor shaft bolt. Check the air gap in four or more places on the clutch plate to verify that the air gap is still correct. Spin the clutch pulley before making the final air gap check.

STANDARD PROCEDURE - COMPRESSOR CLUTCH BREAK-IN

After a new compressor clutch has been installed, check that the compressor clutch coil is performing to specifications. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/COMPRESSOR CLUTCH COIL - DIAGNOSIS AND TESTING). If the clutch coil is performing to specifications, perform the compressor clutch break-in procedure. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

(1) Set the heater-A/C controls to the A/C mode, with the blower switch in the highest speed position.

(2) Start the engine and hold the engine speed at 1500 to 2000 rpm.

(3) Cycle the compressor clutch On and Off about twenty times (five seconds On, then five seconds Off).

REMOVAL

The refrigerant system can remain fully charged during compressor clutch, pulley, or coil replacement. Although the compressor assembly must be removed from its mounting, the compressor clutch can be service with the compressor in the vehicle.

COMPRESSOR CLUTCH (Continued)

(1) Disconnect and isolate the battery negative cable.

(2) Raise and support the vehicle.

(3) Remove the serpentine drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - 2.4L - REMOVAL) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - 3.3/3.8L - REMOVAL).

(4) Disconnect the engine wire harness connector for the compressor clutch coil from the clutch coil pigtail wire connector on the top of the compressor.

(5) On models with the 3.3L and 3.8L engines, disengage the retainer on the engine wire harness compressor clutch coil take out from the bracket on the top of the compressor.

(6) On models with the 2.4L engine, remove all of the compressor mounting screws except the upper left (rear of the compressor) screw, which should only be loosened. Allow the front (pulley end) of the compressor to tilt downward far enough to access the clutch for removal, then tighten the loosened upper left compressor mounting screw.

(7) On models with the 3.3L and 3.8L engines, remove the three screws and one nut that secure the compressor to the engine. Disengage the mounting ear at the front of the compressor from the stud on the engine, allow the front (pulley end) of the compressor to tilt downward far enough to access the clutch for removal, then reinstall and tighten the upper left compressor mounting screw.

(8) Remove the compressor shaft bolt (Fig. 12). If necessary, a band-type oil filter wrench or a strap wrench can be placed around the clutch plate to aid in bolt removal.

(9) Tap the clutch plate lightly with a plastic hammer and remove the clutch plate and shim(s) from the compressor shaft (Fig. 13). **Be certain not to lose the shim or shims.**

CAUTION: Do not pry between the clutch plate unit and the pulley to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

(10) Using snap ring pliers (Special Tool C-4574 or equivalent), remove the external snap ring that secures the pulley to the front cover of the compressor, then slide the pulley off of the compressor (Fig. 14).

(11) Remove the screw that secures the clutch coil pigtail wire connector bracket and ground clip to the top of the compressor housing.

(12) Using snap ring pliers (Special Tool C-4574 or equivalent), remove the external snap ring that secures the clutch coil to the front cover of the compressor housing, then slide the clutch coil off of the compressor (Fig. 15).

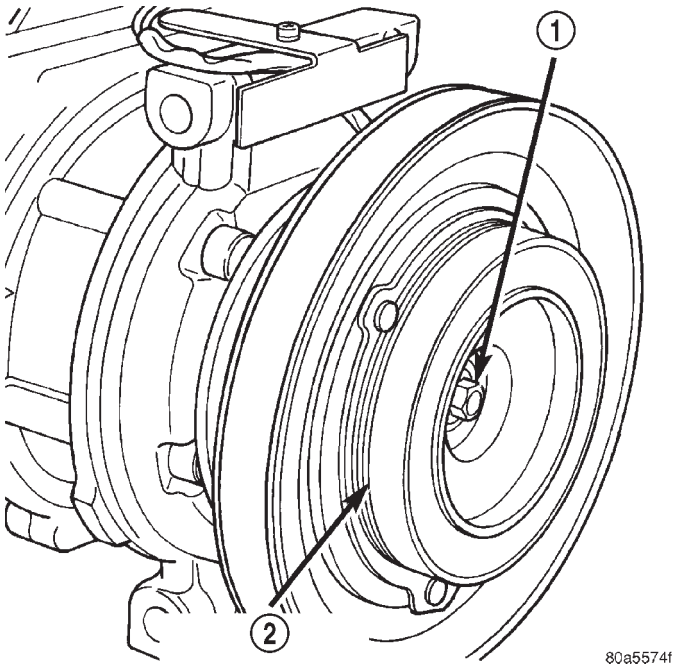

Fig. 12 Compressor Shaft Bolt and Clutch Plate

1 - COMPRESSOR SHAFT BOLT
2 - COMPRESSOR CLUTCH PLATE

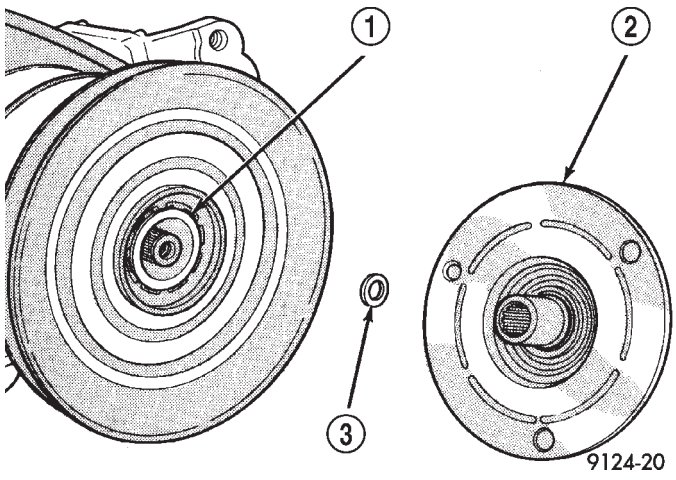

Fig. 13 Clutch Plate and Shim(s)

1 - COMPRESSOR SHAFT
2 - CLUTCH PLATE
3 - CLUTCH PLATE SHIM

INSPECTION - COMPRESSOR CLUTCH/COIL

Compressor clutch components should always be inspected closely before they are reinstalled. The clutch plate and clutch pulley are mated at the factory using a burnishing operation. No attempt should be made to separately replace the compressor clutch pulley or clutch plate. The clutch coil may be serviced separately.

COMPRESSOR CLUTCH (Continued)

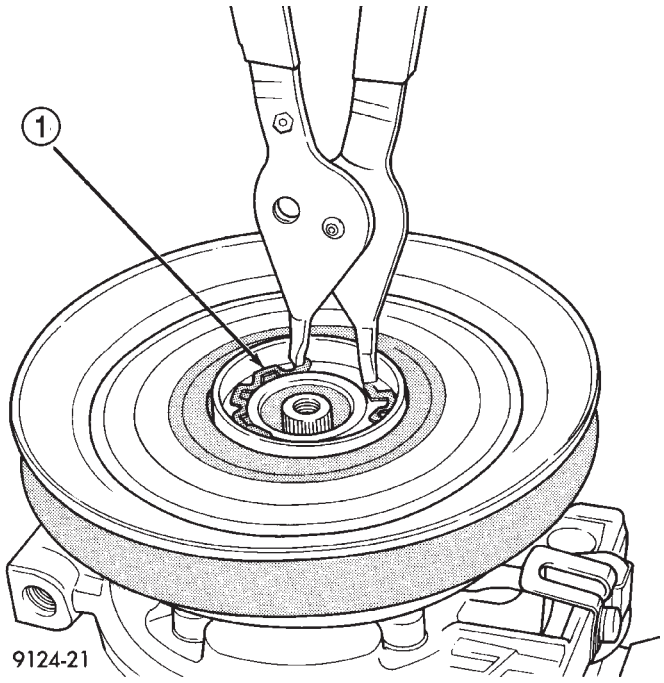

Fig. 14 Remove Clutch Pulley Snap Ring

1 - SNAP RING

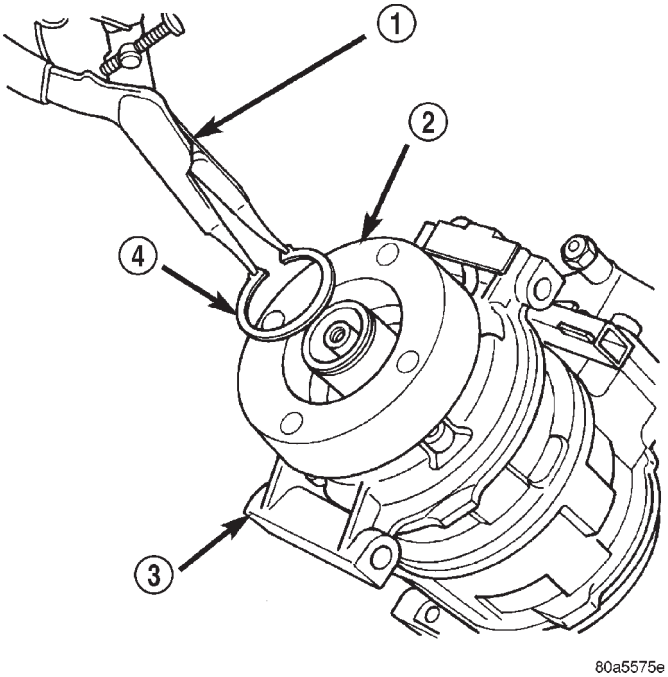

Fig. 15 Remove Clutch Coil Snap Ring

1 - SNAP RING PLIERS
2 - CLUTCH COIL
3 - COMPRESSOR
4 - SNAP RING

(1) Examine the friction surfaces of the clutch pulley and the clutch plate for wear. The clutch pulley and clutch plate should be replaced if there is excessive wear or scoring.

(2) Examine the friction surfaces of the clutch pulley and the clutch plate for oil contamination. If the friction surfaces are oily, the clutch pulley and clutch plate should be replaced. Also inspect the shaft and nose area of the compressor for oil. Remove the felt packing from around the compressor shaft in the compressor front cover. If the felt is saturated with oil, the compressor front shaft seal is leaking and the compressor will also have to be replaced.

(3) Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the clutch pulley and clutch plate if the bearing is faulty.

INSTALLATION

The refrigerant system can remain fully charged during compressor clutch, pulley, or coil replacement. Although the compressor assembly must be removed from its mounting, the compressor clutch can be service with the compressor in the vehicle.

(1) Align the dowel pin on the back of the clutch coil with the hole in the compressor front cover, and position the clutch coil onto the compressor. Be certain that the clutch coil pigtail wires are properly oriented and routed so that they are not pinched between the compressor front cover and the clutch coil.

NOTE: A new snap ring must be used to secure the clutch coil to the compressor. The bevel side of the snap ring must face outward.

(2) Using snap ring pliers (Special Tool C-4574 or equivalent), install the external snap ring that secures the clutch coil to the front cover of the compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or the left of the clutch coil dowel pin location on the compressor. Be certain that the snap ring is fully and properly seated in the groove.

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the compressor front cover.

(3) Install and tighten the screw that secures the clutch coil pigtail wire connector bracket and ground clip to the top of the compressor housing.

(4) Install the pulley onto the front cover of the compressor. If necessary, tap the pulley gently with a block of wood placed on the pulley friction surface (Fig. 16).

CAUTION: Do not mar the friction surfaces of the pulley.

COMPRESSOR CLUTCH (Continued)

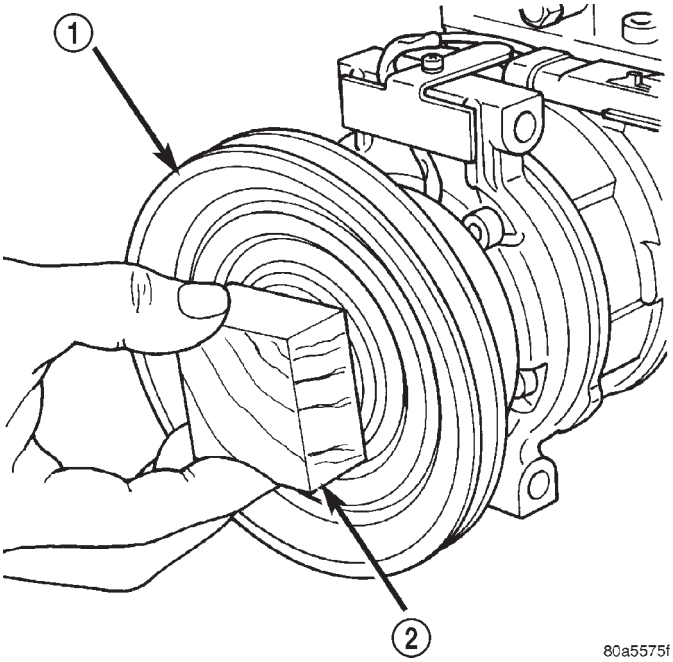

Fig. 16 Install Clutch Pulley

1 - PULLEY ASSEMBLY
2 - WOOD BLOCK

NOTE: A new snap ring must be used to secure the clutch pulley to the compressor. The bevel side of the snap ring must face outward.

(5) Using snap ring pliers (Special Tool C-4574 or equivalent), install the external snap ring (bevel side facing outward) that secures the clutch pulley to the front cover of the compressor. Be certain that the snap ring is fully and properly seated in the groove.

(6) If the original clutch plate and clutch pulley are to be reused, reinstall the original shim(s) on the compressor shaft against the shoulder. If a new clutch plate and/or clutch pulley are being used, install a trial stack of shims 1.0 mm (0.040 in.) thick on the compressor shaft against the shoulder.

(7) Install the clutch plate onto the compressor shaft.

(8) Install and tighten the compressor shaft nut. If necessary, a band-type oil filter wrench or a strap wrench can be placed around the clutch plate to aid in bolt tightening. Tighten the bolt to 17.5 N·m (155 in. lbs.).

(9) If a new clutch plate and/or clutch pulley are being installed, the air gap between the clutch plate and clutch pulley must be checked. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/COMPRESSOR CLUTCH - STANDARD PROCEDURE - COMPRESSOR CLUTCH AIR GAP).

(10) On models with the 2.4L engine only, loosely install the four screws that secure the compressor to the mounting bracket on the engine. Tighten the screws to 28 N·m (21 ft. lbs.).

(11) On models with the 3.3L and 3.8L engines only, loosely install the three screws and one nut that secure the compressor to the engine. Tighten each of the fasteners using the following sequence to 54 N·m (40 ft. lbs.).

- The upper screw at the rear of the compressor.
- The lower screw at the rear of the compressor.
- The lower screw at the front of the compressor.
- The upper nut at the front of the compressor.

(12) On models with the 3.3L and 3.8L engines only, engage the retainer on the engine wire harness compressor clutch coil take out with the bracket on the top of the compressor.

(13) Reconnect the engine wire harness connector for the compressor clutch coil to the coil pigtail wire connector on the top of the compressor.

(14) Reinstall the serpentine accessory drive belt onto the front of the engine. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - 2.4L - INSTALLATION) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - 3.3L/3.8L - INSTALLATION).

(15) Lower the vehicle.

(16) Reconnect the battery negative cable.

(17) If a new clutch plate and/or clutch pulley are being installed, the new clutch components must be burnished. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/COMPRESSOR CLUTCH - STANDARD PROCEDURE - COMPRESSOR CLUTCH BREAK-IN).

COMPRESSOR CLUTCH COIL

DIAGNOSIS AND TESTING - COMPRESSOR CLUTCH COIL

The air conditioning compressor clutch coil electrical circuit is controlled by the Powertrain Control Module (PCM) through the compressor clutch relay, which is located in the Intelligent Power Module (IPM) in the engine compartment near the battery. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

(1) If the compressor clutch will not engage, verify the refrigerant charge level. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - DIAGNOSIS AND TESTING - REFRIGERANT CHARGE LEVEL). If the refrigerant charge level is OK, go to Step 2. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COMPRESSOR CLUTCH COIL (Continued)

(2) If the a/c compressor clutch still will not engage, disconnect the headlamp and dash wire harness connector for the A/C pressure transducer and check for battery current at the connector with the engine running and the heater-A/C control set to the A/C mode. If OK, go to TESTS . If not OK, use a DRBIII® scan tool to perform further diagnosis. Refer to the appropriate diagnostic information.

TESTS

(1) Verify the battery state of charge. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - DIAGNOSIS AND TESTING).

(2) Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch coil feed terminal. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.

(3) With the heater-A/C control in the A/C mode and the blower at low speed, start the engine and allow it to run at a normal idle speed.

(4) The compressor clutch should engage immediately, and the clutch coil voltage should be within two volts of the battery voltage. If the coil voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop. If the compressor clutch does not engage, use a DRBIII® scan tool to perform further diagnosis. Refer to the appropriate diagnostic information.

(5) With the ambient temperature at 21° C (70° F), the compressor clutch coil is acceptable if the current draw is 2.0 to 3.7 amperes at 11.5 to 12.5 volts at the clutch coil. If the voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the voltage reads below 12.5 volts.

(a) If the compressor clutch coil current reading is zero, the coil is open and must be replaced.

(b) If the compressor clutch coil current reading is four amperes or more, the coil is shorted and must be replaced.

COMPRESSOR CLUTCH RELAY

DESCRIPTION

The compressor clutch relay (Fig. 17) is a International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay. The compressor clutch relay is located in the Intelligent Power Module (IPM), which is in the engine compartment near the battery. See the fuse and relay layout map molded into the inner surface of the IPM cover for compressor clutch relay identification and location.

The black, molded plastic case is the most visible component of the compressor clutch relay. Five male spade-type terminals extend from the bottom of the base to connect the relay to the vehicle electrical system, and the ISO designation for each terminal is molded into the base adjacent to each terminal.

OPERATION

The compressor clutch relay is an electromechanical switch that uses a low current input from the Powertrain Control Module (PCM) to control the high current output to the compressor clutch electromagnetic coil. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. The resistor or diode is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The compressor clutch relay terminals are connected to the vehicle electrical system through a receptacle in the Intelligent Power Module (IPM). The inputs and outputs of the compressor clutch relay include:

- The common feed terminal (30) receives a battery current input from a fuse in the IPM through a fused B(+) circuit at all times.
- The coil ground terminal (85) receives a ground input from the PCM through the compressor clutch relay control circuit only when the PCM electronically pulls the control circuit to ground.
- The coil battery terminal (86) receives a battery current input from the PCM through a fused ignition switch output (run-start) circuit only when the ignition switch is in the On or Start positions.
- The normally open terminal (87) provides a battery current output to the compressor clutch coil through the compressor clutch relay output circuit only when the compressor clutch relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides

COMPRESSOR CLUTCH RELAY (Continued)

a battery current output only when the compressor clutch relay coil is de-energized.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

DIAGNOSIS AND TESTING - COMPRESSOR CLUTCH RELAY

The compressor clutch relay (Fig. 17) is located in the Intelligent Power Module (IPM), which is in the engine compartment near the battery. See the fuse and relay layout map molded into the inner surface of the IPM cover for compressor clutch relay identification and location. Remove the relay from the IPM to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, use a DRBIII® scan tool to perform further diagnosis of the relay circuits. Refer to the appropriate diagnostic information. If not OK, replace the faulty relay.

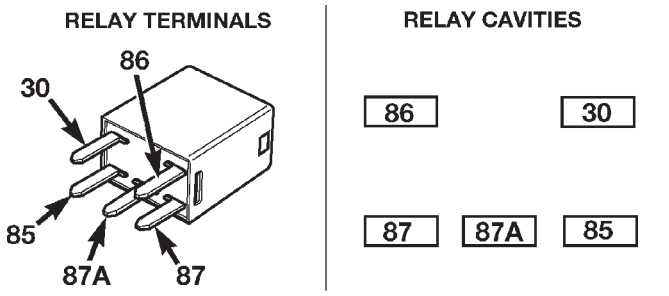

Fig. 17 Compressor Clutch Relay

TERMINAL LEGEND	
NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and remove the cover from the Intelligent Power Module (IPM).

(3) See the fuse and relay layout map molded into the inner surface of the IPM cover for compressor clutch relay identification and location.

(4) Remove the compressor clutch relay from the IPM by pulling it straight up.

INSTALLATION

(1) See the fuse and relay layout map molded into the inner surface of the Intelligent Power Module (IPM) cover for compressor clutch relay identification and location.

(2) Position the compressor clutch relay to the proper receptacle in the IPM.

(3) Align the compressor clutch relay terminals with the terminal cavities in the IPM relay receptacle.

(4) Push down firmly on the compressor clutch relay until the terminals are fully seated in the terminal cavities in the IPM receptacle.

(5) Install and latch the cover onto the IPM.

(6) Reconnect the battery negative cable.

EVAPORATOR TEMPERATURE SENSOR

DESCRIPTION

The evaporator temperature sensor is a switch that is installed on the top of the expansion valve in the right rear corner of the engine compartment (Fig. 18). The sensor has a small probe that is inserted in a small well in the body of the expansion valve that is filled with a special silicone-based thermal grease. A small molded plastic push-in retainer secures the sensor to a threaded hole in the top surface of the expansion valve. Two terminals within a molded plastic connector receptacle on the sensor connect it to the vehicle electrical system through a take out and connector of the HVAC wire harness.

EVAPORATOR TEMPERATURE SENSOR (Continued)

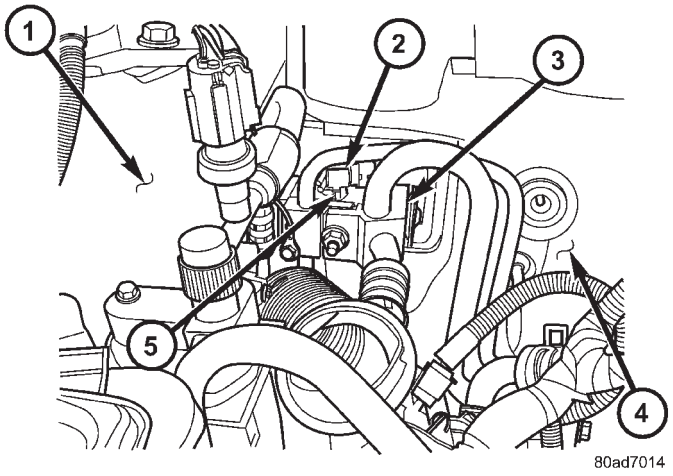

Fig. 18 Evaporator Temperature Sensor

1 - RIGHT FRONT STRUT TOWER
2 - EVAPORATOR TEMPERATURE SENSOR
3 - EXPANSION VALVE
4 - DASH PANEL
5 - RETAINER

The evaporator temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The evaporator temperature sensor monitors the temperature of the evaporator through its connection to the top of the expansion valve. The sensor will change its internal resistance in response to the temperatures it monitors. The heater-A/C control module is connected to the sensor through a sensor ground circuit and a sensor signal circuit. As the evaporator temperature increases, the resistance of the sensor decreases and the voltage monitored by the module decreases. The module uses this monitored voltage reading to an indication of the evaporator temperature. The heater-A/C control module is programmed to respond to this input by sending electronic messages to the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus, and the PCM then cycles the air conditioning compressor clutch as necessary to optimize air conditioning system performance and to protect the system from evaporator freezing. The external location of the sensor and the use of a screw allows the sensor to be removed or installed from the expansion valve without disturbing the refrigerant in the system. The evaporator temperature sensor is diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the air cleaner housing from the right side of the engine compartment.

(3) Remove the windshield wiper assembly from the vehicle(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(4) Remove the temperature sensor attaching screw from the expansion valve.

(5) Pull the evaporator temperature sensor away from the expansion valve far enough to access the red release ring on the wiring connector. Push the red ring toward the connector to release lock and remove the HVAC wire harness connector from the temperature sensor.

(6) Remove the evaporator temperature sensor from the engine compartment. Please note that any grease removed with the old temperature sensor must be replaced, failure to do so could result in poor a/c performance.

INSTALLATION

(1) Position the evaporator temperature sensor into the right rear corner of the engine compartment. Please make sure any grease removed with the old sensor has been replaced before the new sensor is installed, failure to do so could lead to poor a/c performance.

(2) Reconnect the HVAC wire harness connector for the evaporator temperature sensor to the sensor connector receptacle.

(3) Position the evaporator temperature sensor onto the top of the expansion valve with the sensor probe inserted into the well in the expansion valve.

(4) Install the temperature sensor retaining screw and tighten.

(5) Install the window wiper assembly to the vehicle(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(6) Reinstall the air cleaner housing into the right side of the engine compartment.

(7) Reconnect the battery negative cable.

(8) Run the HVAC Cool Down test to verify system is operating properly(Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING).

INFRARED TEMPERATURE SENSOR

DESCRIPTION

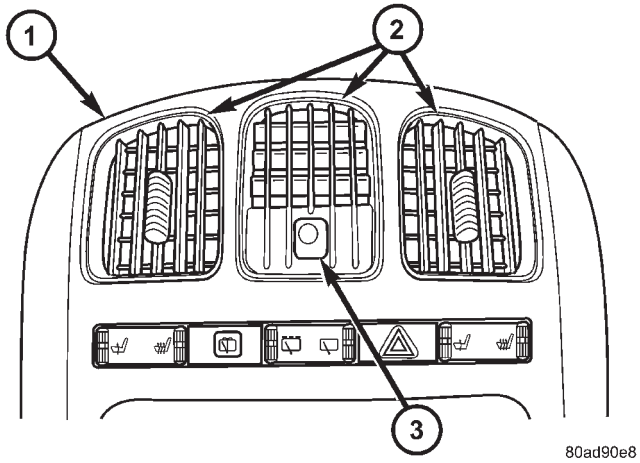

Fig. 19 Infrared Temperature Sensor

1 - INSTRUMENT PANEL CENTER BEZEL
2 - CENTER BEZEL OUTLETS
3 - INFRARED TEMPERATURE SENSOR

The infrared temperature sensor consists of two infrared transducers that are concealed behind a clear lens located near the bottom of the center panel outlet near the top of the instrument panel center bezel (Fig. 19). These sensors are used only on models equipped with the optional Automatic Temperature Control (ATC) heating and air conditioning system. A molded plastic connector receptacle on the bottom of the panel outlet unit is concealed behind the center bezel. A short, dedicated jumper wire harness routed behind the center bezel connects the sensors directly to the ATC heater-A/C control module near the bottom of the center bezel. The infrared temperature sensor is integral to the center bezel panel outlet unit. The infrared sensors cannot be adjusted or repaired and, if faulty or damaged, the center bezel panel outlet unit must be replaced.

OPERATION

The dual infrared temperature sensors provide independent measurement inputs to the Automatic Temperature Control (ATC) heater-A/C control module that indicates the surface temperature of the driver seat and front seat passenger seat occupants. By using a surface temperature measurement, rather than an air temperature measurement, the ATC system is able to adjust itself to the comfort level as perceived by the occupant. This allows the system to detect and compensate for other ambient conditions affecting comfort levels, such as solar heat gain or evaporative heat loss. The ATC system logic responds to the infrared sensor inputs by calculating and adjusting the air flow temperature and air flow rate needed to properly obtain and maintain the individually selected comfort level temperatures of both the driver and passenger seat occupants. The ATC heater-A/C control module continually monitors the infrared sensor circuits, and will store a Diagnostic Trouble Code (DTC) for any problem it detects. This DTC information can be retrieved and the infrared temperature sensor diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

MODE DOOR ACTUATOR

DESCRIPTION

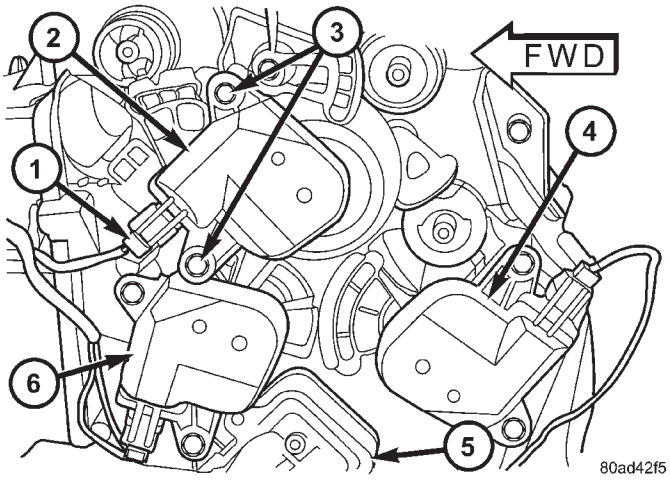

Fig. 20 Mode Door Actuator

1 - CONNECTOR
2 - MODE DOOR ACTUATOR
3 - SCREW (2)
4 - DRIVER BLEND DOOR ACTUATOR (DUAL-ZONE ONLY)
5 - HEATER CORE
6 - BLEND DOOR ACTUATOR (SINGLE ZONE) OR PASSENGER BLEND DOOR ACTUATOR (DUAL-ZONE)

The mode door actuator is a reversible, 12-volt Direct Current (DC), servo motor (Fig. 20). The single mode door actuator is located on the driver side end of the heater-A/C housing unit, close to the top of the distribution housing. The mode door actuator is mechanically connected to the mode door. The mode door actuator is interchangeable with the actuators for the blend air door(s) and the recirculation air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Two integral mounting tabs allow the actuator to be secured with two screws to the heater-A/C unit housing. Each actuator also has an identical output shaft with splines that connects

MODE DOOR ACTUATOR (Continued)

it to the linkage that drives the mode door. The mode door actuator does not require mechanical indexing to the mode door linkage, as it is electronically calibrated by the heater-A/C control module. The mode door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

OPERATION

The mode door actuator is connected to the heater-A/C control module through the vehicle electrical system by a dedicated two-wire take out and connector of the HVAC wire harness. The mode door actuator can move the mode door in two directions. When the heater-A/C control module pulls the voltage on one side of the motor connection high and the other connection low, the mode door will move in one direction. When the module reverses the polarity of the voltage to the motor, the mode door moves in the opposite direction. When the module makes the voltage to both connections high or both connections low, the mode door stops and will not move. These same motor connections also provide a feedback signal to the heater-A/C control module. This feedback signal allows the module to monitor the operation and relative position of the mode door actuator and the mode door. The heater-A/C control module learns the mode door stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the mode door actuator circuits. The mode door actuator can be diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the silencer from beneath the driver side end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).

(3) Disconnect the HVAC wire harness connector for the mode door actuator from the actuator connector receptacle (Fig. 21).

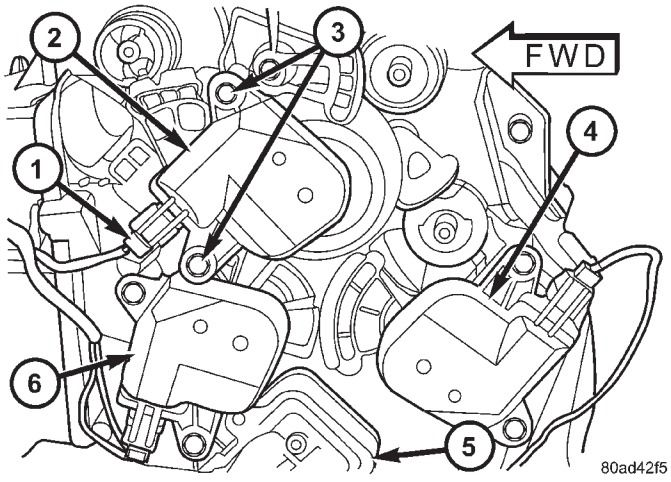

Fig. 21 Mode Door Actuator

1 - CONNECTOR
2 - MODE DOOR ACTUATOR
3 - SCREW (2)
4 - DRIVER BLEND DOOR ACTUATOR (DUAL-ZONE ONLY)
5 - HEATER CORE
6 - BLEND DOOR ACTUATOR (SINGLE ZONE) OR PASSENGER BLEND DOOR ACTUATOR (DUAL-ZONE)

(4) Remove the two screws that secure the mode door actuator to the distribution housing.

(5) Remove the mode door actuator from the distribution housing.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the mode door actuator onto the heater/AC housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the mode door linkage.

MODE DOOR ACTUATOR (Continued)

(2) Install and tighten the two screws that secure the mode door actuator to the distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Reconnect the HVAC wire harness connector for the mode door actuator to the actuator connector receptacle.

(4) Reinstall the silencer under the driver side end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).

(5) Reconnect the battery negative cable.

(6) Perform the heater-A/C control calibration procedure. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/A/C-HEATER CONTROL - STANDARD PROCEDURE - HEATER-A/C CONTROL CALIBRATION).

POWER MODULE

DESCRIPTION

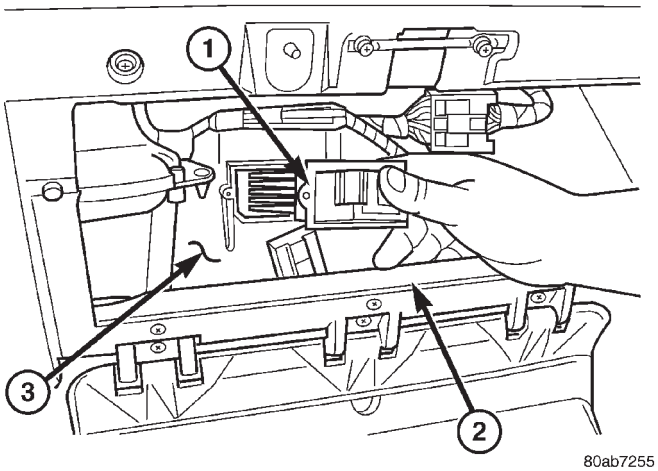

Fig. 22 Power Module

1 - POWER MODULE
2 - LOWER GLOVE BOX OPENING REINFORCEMENT
3 - EVAPORATOR HOUSING

A blower power module is used on this model when it is equipped with the optional Automatic Temperature Control (ATC) (Fig. 22). Models equipped with the standard manual heater-A/C control use a blower motor resistor, instead of the blower power module. The blower power module is installed in a mounting hole in the evaporator housing, directly behind the glove box opening of the instrument panel. The module consists of a molded plastic mounting plate with two integral connector receptacles. Concealed behind the mounting plate within the evaporator housing is the power module electronic circuitry and a large finned, heat sink. The module mounting plate is secured with two screws to the evaporator housing and is accessed for service by rolling down the glove box from the instrument panel.

The power module heat sink will get hot when in use. Do not touch the heat sink if the blower motor has been running. The blower power module cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The blower power module is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. A second connector receptacle receives the pigtail wire connector from the blower motor. The blower power module allows the microprocessor-based Automatic Temperature Control (ATC) heater-A/C control module to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a Pulse Width Modulated (PWM) circuit strategy. The PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which adjusts the voltage output received from the blower motor relay to change or maintain the desired blower speed. The blower power module is diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Open the glove box.

(3) Flex both sides of the glove box bin inward near the top far enough for the rubber glove box stop bumpers to clear the sides of the glove box opening, then roll the glove box downward.

(4) Reach through the glove box opening to access and disconnect the instrument panel wire harness

POWER MODULE (Continued)

connector for the power module from the module connector receptacle.

(5) Reach through the glove box opening to access and disconnect the blower motor pigtail wire connector from the power module connector receptacle.

(6) Remove the two screws that secure the power module to the evaporator housing.

(7) Remove the power module from the evaporator housing.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the power module into the evaporator housing.

(2) Install and tighten the two screws that secure the power module to the evaporator housing. Tighten the screws to 2 N·m (18 in. lbs.).

(3) Reconnect the blower motor pigtail wire connector to the power module connector receptacle.

(4) Reconnect the instrument panel wire harness connector for the power module to the module connector receptacle.

(5) Flex both sides of the glove box bin inward near the top far enough for the rubber glove box stop bumpers to clear the sides of the glove box opening, then roll the glove box upward.

(6) Close and latch the glove box.

(7) Reconnect the battery negative cable.

RECIRCULATION DOOR ACTUATOR

DESCRIPTION

The recirculation door actuator is a reversible, 12-volt Direct Current (DC), servo motor (Fig. 23). The single recirculation door actuator is located on the passenger side end of the heater-A/C housing unit, on the bottom of the lower intake air housing. The recirculation door actuator is mechanically connected to the recirculation air door. The recirculation door actuator is interchangeable with the actuators for the blend air door(s) and the mode door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Two integral mounting tabs allow the actuator to be secured with two screws to the lower intake air housing. Each actuator also has an identical output shaft with splines that connects it to the linkage that drives the recirculation air door. The recirculation door actuator does not require mechanical indexing to the recirculation air door, as it is electronically calibrated by the heater-A/C control module. The recirculation door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

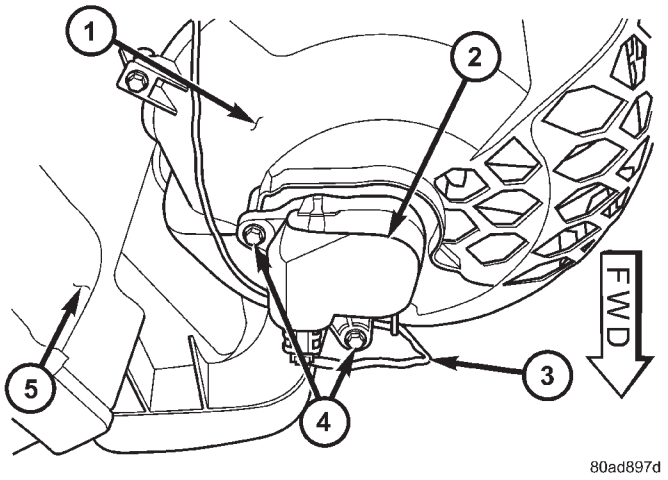

Fig. 23 Recirculation Door Actuator

1 - LOWER INTAKE AIR HOUSING
2 - RECIRCULATION DOOR ACTUATOR
3 - HVAC WIRE HARNESS
4 - SCREW (2)
5 - LOWER EVAPORATOR HOUSING

OPERATION

The recirculation door actuator is connected to the heater-A/C control module through the vehicle electrical system by a dedicated two-wire take out and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation door in two directions. When the heater-A/C control module pulls the voltage on one side of the motor connection high and the other connection low, the recirculation air door will move in one direction. When the module reverses the polarity of the voltage to the motor, the recirculation air door moves in the opposite direction. When the module makes the voltage to both connections high or both connections low, the recirculation air door stops and will not move. These same motor connections also provide a feedback signal to the heater-A/C control module. This feedback signal

RECIRCULATION DOOR ACTUATOR (Continued)

allows the module to monitor the operation and relative position of the recirculation door actuator and the recirculation air door. The heater-A/C control module learns the recirculation air door stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the recirculation door actuator circuits. The recirculation door actuator can be diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Pull the carpet on the passenger side front floor away from the dash panel far enough to access the recirculation door actuator.

(3) Disconnect the HVAC wire harness connector for the recirculation door actuator from the actuator connector receptacle (Fig. 24).

(4) Remove the two screws that secure the recirculation door actuator to the lower intake air housing.

(5) Remove the recirculation door actuator from the lower intake air housing.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

A/C-HEATER CONTROL

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick or another suitable wide flat bladed tool, gently pry the top edge of the rear heater-A/C control bezel away from the headliner far enough to release the two snap clip retainers (Fig. 1).

(3) Pull the rear heater-A/C control and bezel unit rearward far enough to access the headliner wire harness connector on the back of the control.

(4) Disconnect the headliner wire harness connector for the rear heater-A/C control from the control connector receptacle.

(5) Remove the rear heater-A/C control from the headliner.

(6) Remove the three screws that secure the rear heater-A/C control to the bezel (Fig. 2).

(7) Remove the rear heater-A/C control from the bezel.

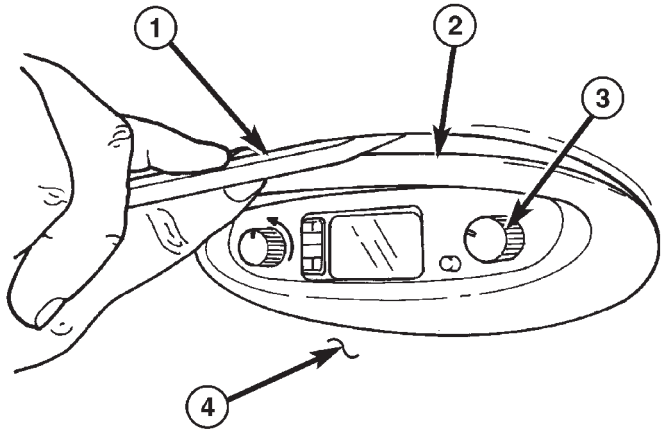

Fig. 1 Heater-A/C Control

1 - TRIM STICK
2 - BEZEL
3 - HEATER-A/C CONTROL
4 - HEADLINER

INSTALLATION

(1) Position the rear heater-A/C control onto the bezel.

(2) Install and tighten the three screws that secure the rear heater-A/C control to the bezel. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Position the rear heater-A/C control and bezel unit to the headliner.

(4) Reconnect the headliner wire harness connector for the rear heater-A/C control to the control connector receptacle.

(5) Insert the locator tabs on the back of the rear heater-A/C control and bezel unit over the forward edge of the headliner opening for the control.

(6) Slide the rear heater-A/C control and bezel unit forward far enough to align the snap clips on the

A/C-HEATER CONTROL (Continued)

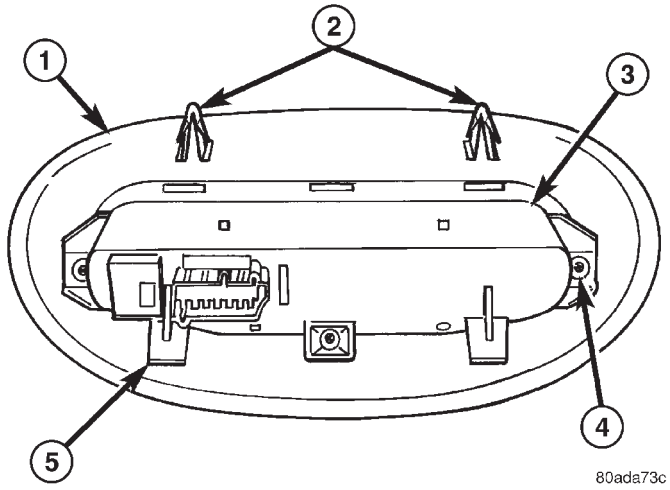

Fig. 2 Heater-A/C Control Bezel

1 - BEZEL
2 - SNAP CLIP (2)
3 - HEATER-A/C CONTROL
4 - SCREW (3)
5 - LOCATOR TAB (2)

bezel with the snap clip receptacles on the retainer above the headliner.

(7) Using hand pressure, press the top edge of the rear heater-A/C control bezel upward until the two snap clips are fully seated in their receptacles.

(8) Reconnect the battery negative cable.

(9) Using the DRB-III® reset the Rear Temperature Selector calibration values.

(10) Verify that the Actuator Calibration of the Front Control has passed. If an Actuator Calibration has not passed correct any errors before proceeding further.

(11) Rotate the Rear Temperature Selector counter clockwise to the Cold Position, allow the Selector to remain in the Cold Position for 5 seconds.

(12) Rotate the Rear Temperature Selector Clockwise to the Hot Position, allow the Selector to remain in the Cold Position for 5 seconds.

(13) calibration is now complete.

BLEND DOOR ACTUATOR

DESCRIPTION

The blend door actuator is a reversible, 12-volt Direct Current (DC), servo motor (Fig. 3). The single blend door actuator is located on the outboard side of the rear heater-A/C unit housing, below the mode door actuator. The blend door actuator is mechanically connected to the blend air door. The blend door actuator is interchangeable with the actuator for the mode door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Two integral mounting tabs allow the actuator to be secured with two screws to the rear heater-A/C unit housing. Each actuator also has an identical output shaft with splines that connects it to the pivot or linkage of the proper door. The blend door actuator does not require mechanical indexing to the blend air door pivot, as it is electronically calibrated by the front heater-A/C control module. The blend door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

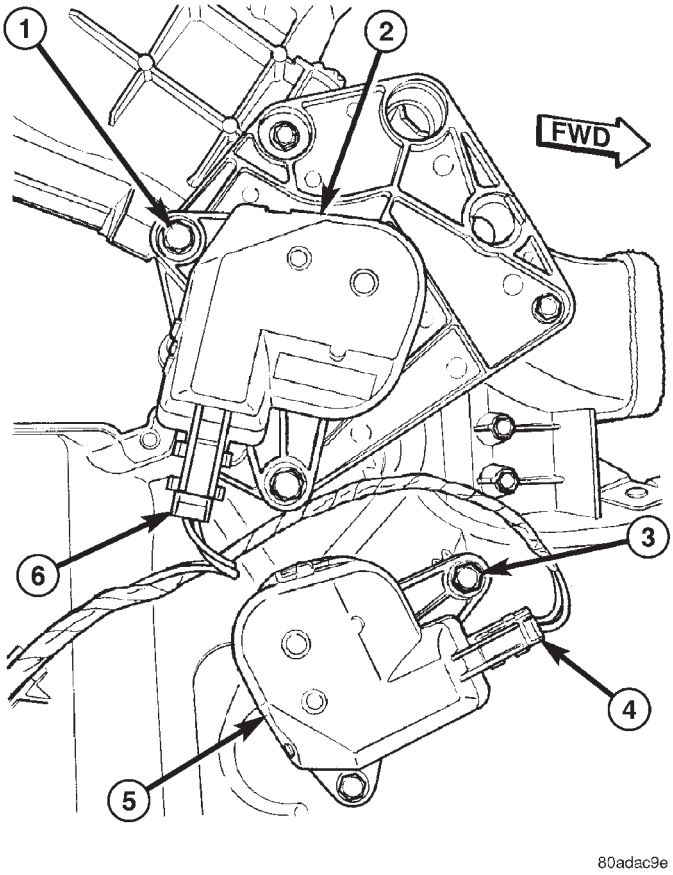

Fig. 3 Blend Door Actuator

1 - SCREW (2)
2 - MODE DOOR ACTUATOR
3 - SCREW (2)
4 - CONNECTOR
5 - BLEND DOOR ACTUATOR
6 - CONNECTOR

OPERATION

The blend door actuator is connected to the front heater-A/C control module through the vehicle electrical system by a dedicated two-wire take out and connector of the rear HVAC wire harness. The blend door actuator can move the blend air door in two directions. When the front heater-A/C control module pulls the voltage on one side of the motor connection

BLEND DOOR ACTUATOR (Continued)

high and the other connection low, the blend air door will move in one direction. When the module reverses the polarity of the voltage to the motor, the blend air door moves in the opposite direction. When the module makes the voltage to both connections high or both connections low, the blend air door stops and will not move. These same motor connections also provide a feedback signal to the front heater-A/C control module. This feedback signal allows the module to monitor the operation and relative positions of the blend door actuator and the blend air door. The front heater-A/C control module learns the blend air door stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the blend door actuator circuits. A DTC can be retrieved and the blend door actuator can be diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the right quarter trim panel and right D-pillar trim panel from the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(3) Remove the two screws that secure the top of the quarter trim panel attaching bracket to the quarter inner panel.

(4) Remove the screw that secures the back of the rear heater-A/C unit housing to the right D-pillar.

(5) Remove the screw that secures the front of the rear heater-A/C unit housing to the right quarter inner panel.

(6) Carefully pull the top of the rear heater-A/C unit housing away from the right quarter inner panel far enough to reach between the rear heater-A/C unit housing and the quarter inner panel to access the blend door actuator (Fig. 4).

(7) Remove the two screws that secure the blend door actuator to the rear heater-A/C unit housing.

(8) Pull the blend door actuator away from the rear heater-A/C unit housing far enough to disengage the actuator output shaft from the blend air door pivot.

(9) Raise the blend door actuator far enough to access and disconnect the rear HVAC wire harness connector for the actuator from the actuator connector receptacle.

(10) Remove the blend door actuator from between the rear heater-A/C unit housing and the quarter inner panel.

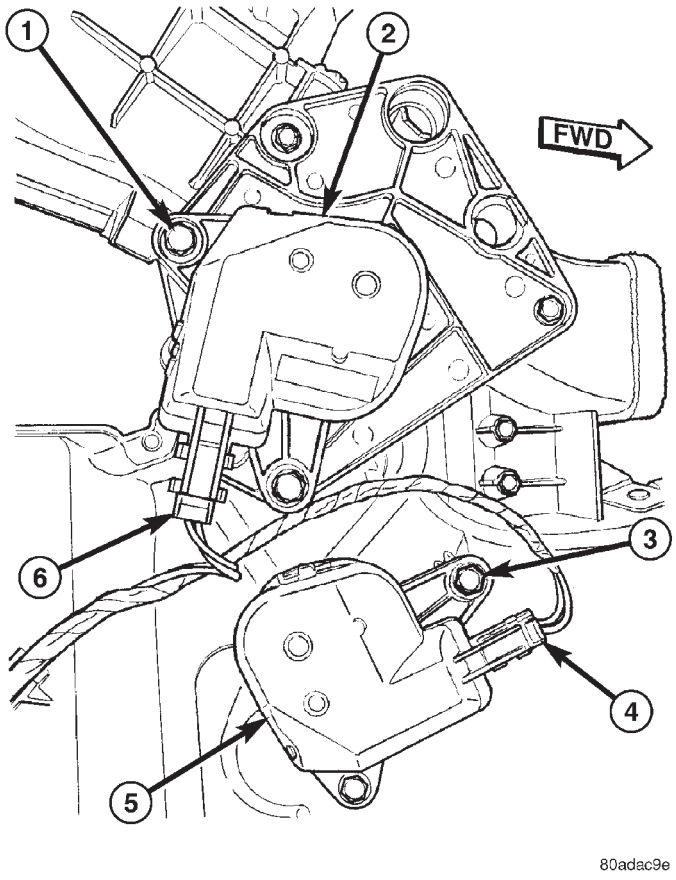

Fig. 4 Mode Door Actuator

1 - SCREW (2)
2 - MODE DOOR ACTUATOR
3 - SCREW (2)
4 - CONNECTOR
5 - BLEND DOOR ACTUATOR
6 - CONNECTOR

INSTALLATION

(1) Position the blend door actuator between the rear heater-A/C unit housing and the quarter inner panel.

(2) Reconnect the rear HVAC wire harness connector for the blend door actuator to the actuator connector receptacle.

(3) Position the blend door actuator onto the rear heater-A/C unit housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the blend air door pivot.

(4) Install and tighten the two screws that secure the blend door actuator to the rear heater-A/C unit housing. Tighten the screws to 2 N·m (18 in. lbs.).

(5) Push the top of the rear heater-A/C unit housing back into position against the right quarter inner panel.

(6) Install and tighten the screw that secures the front of the rear heater-A/C unit housing to the right

BLEND DOOR ACTUATOR (Continued)

quarter inner panel. Tighten the screw to 11 N·m (97 in. lbs.).

(7) Install and tighten the screw that secures the back of the rear heater-A/C unit housing to the right D-pillar. Tighten the screw to 11 N·m (97 in. lbs.).

(8) Install and tighten the two screws that secure the top of the quarter trim panel attaching bracket to the quarter inner panel. Tighten the screws to 1.7 N·m (15 in. lbs.).

(9) Reinstall the right quarter trim panel and right D-pillar trim panel onto the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

(10) Reconnect the battery negative cable.

(11) Perform the heater-A/C control calibration procedure. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/A/C-HEATER CONTROL - STANDARD PROCEDURE - HEATER-A/C CONTROL CALIBRATION).

BLOWER MOTOR RELAY

DESCRIPTION

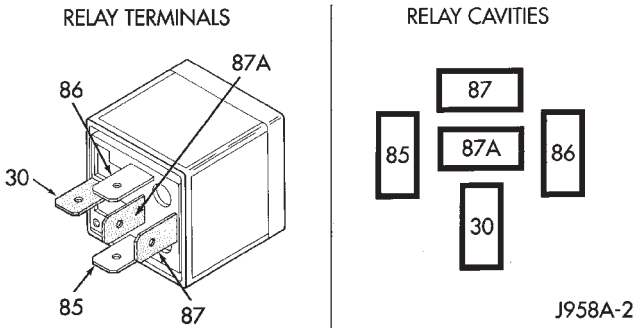

Fig. 5 Blower Motor Relay

TERMINAL LEGEND	
NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

The blower motor relay (Fig. 5) is a International Standards Organization (ISO) mini-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The ISO mini-relay terminal functions are the same as a conventional ISO relay. However, the ISO mini-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay. The blower motor relay is located in the Intelligent Power Module (IPM), which is in the engine compartment near the battery. See the fuse and relay layout map molded into the inner surface of the IPM cover for compressor clutch relay identification and location.

The black, molded plastic case is the most visible component of the blower motor relay. Five male spade-type terminals extend from the bottom of the base to connect the relay to the vehicle electrical system, and the ISO designation for each terminal is molded into the base adjacent to each terminal. The ISO terminal designations are as follows:

- **30 (Common Feed)** - This terminal is connected to the movable contact point of the relay.
- **85 (Coil Ground)** - This terminal is connected to the ground feed side of the relay control coil.
- **86 (Coil Battery)** - This terminal is connected to the battery feed side of the relay control coil.
- **87 (Normally Open)** - This terminal is connected to the normally open fixed contact point of the relay.
- **87A (Normally Closed)** - This terminal is connected to the normally closed fixed contact point of the relay.

The factory-installed blower motor relay cannot be adjusted or repaired. If the relay is damaged or faulty, it must be replaced.

OPERATION

The blower motor relay is an electromechanical switch that uses a low current input from the Front Control Module (FCM) to control the high current output to the blower motor resistor (manual heater-A/C control) or blower power module (automatic heater-A/C control). The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. The resistor or diode is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

BLOWER MOTOR RELAY (Continued)

The blower motor relay terminals are connected to the vehicle electrical system through a receptacle in the Intelligent Power Module (IPM). The inputs and outputs of the compressor clutch relay include:

- The common feed terminal (30) receives a battery current input from the battery through a B(+) circuit at all times.
- The coil ground terminal (85) receives a ground input through the front/rear blower motor relay control circuit only when the FCM electronically pulls the control circuit to ground.
- The coil battery terminal (86) receives a battery current input from the battery through a B(+) circuit at all times.
- The normally open terminal (87) provides a battery current output to the blower motor resistor (manual heater-A/C control) or blower power module (automatic heater-A/C control) through a fuse in the IPM on the fused rear blower motor relay output circuit only when the blower motor relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the blower motor relay coil is de-energized.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

DIAGNOSIS AND TESTING - BLOWER MOTOR RELAY

The rear blower motor relay (Fig. 6) is located in the Intelligent Power Module (IPM), which is in the engine compartment near the battery. See the fuse and relay layout map molded into the inner surface of the IPM cover for rear blower motor relay identification and location. Remove the relay from the IPM to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, use a DRBIII® scan tool to perform further diagnosis of the relay circuits. Refer to the appropriate diagnostic information. If not OK, replace the faulty relay.

BLOWER MOTOR RELAY (Continued)

(3) See the fuse and relay layout map molded into the inner surface of the IPM cover for rear blower motor relay identification and location.

(4) Remove the rear blower motor relay from the IPM.

INSTALLATION

(1) See the fuse and relay layout map molded into the inner surface of the Intelligent Power Module (IPM) cover for rear blower motor relay identification and location.

(2) Position the rear blower motor relay to the proper receptacle in the IPM.

(3) Align the rear blower motor relay terminals with the terminal cavities in the IPM relay receptacle.

(4) Push down firmly on the rear blower motor relay until the terminals are fully seated in the terminal cavities in the IPM receptacle.

(5) Install and latch the cover onto the IPM.

(6) Reconnect the battery negative cable.

BLOWER MOTOR RESISTOR

DESCRIPTION

A blower motor resistor is used on this model when it is equipped with the manual heater-A/C control (Fig. 8). Models equipped with the optional Automatic Temperature Control (ATC) use a blower power module, instead of the blower motor resistor. The blower motor resistor is installed in a mounting hole on the back of the rear heater-A/C unit housing, directly above the expansion valve. The resistor consists of a molded plastic mounting plate with an integral connector receptacle. Concealed behind the mounting plate within the rear heater-A/C unit housing are two coiled resistor wires contained within a protective stamped steel cage. The resistor mounting plate is secured with two screws to the rear heater-A/C unit housing and is accessed for service by removing the right quarter and D-pillar trim panels.

The blower motor resistor wires will get hot when in use. Do not touch the resistor wires or the protective cage if the blower motor has been running. The blower motor resistor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated take out and connector of the rear HVAC wire harness. The blower motor resistor has two resistor wires, each of which will reduce the current flow through the blower motor to change the blower motor speed. The blower motor switch in the manual heater-A/C control directs the ground path for the blower motor through the correct resistor wire to obtain the selected speed. With the blower motor switch in the lowest speed position, the ground path for the motor is applied through both resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor wires are bypassed and the blower motor receives a direct path to ground through the blower motor switch. The blower motor resistor may be diagnosed using conventional diagnostic tools and methods.

BLOWER MOTOR RESISTOR (Continued)

DIAGNOSIS AND TESTING - BLOWER MOTOR RESISTOR

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the rear HVAC wire harness connector for the blower motor resistor from the resistor connector receptacle.

(3) Check for continuity between each of the blower motor switch input terminals of the blower motor resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or the blower motor pigtail wires as required. If not OK, replace the faulty blower motor resistor.

REMOVAL

WARNING: THE BLOWER MOTOR RESISTOR MAY GET VERY HOT DURING NORMAL OPERATION. IF THE BLOWER MOTOR WAS TURNED ON, WAIT FIVE MINUTES TO ALLOW THE BLOWER MOTOR RESISTOR TO COOL BEFORE PERFORMING DIAGNOSIS OR SERVICE. FAILURE TO TAKE THIS PRECAUTION CAN RESULT IN PERSONAL INJURY.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the right quarter trim panel and right D-pillar trim panel from the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(3) Disconnect the rear HVAC wire harness connector for the blower motor resistor from the resistor connector receptacle (Fig. 9).

(4) Remove the two screws that secure the blower motor resistor to the rear heater-A/C unit housing.

(5) Remove the blower motor resistor from the rear heater-A/C unit housing.

2 - D-PILLAR
3 - BLOWER PIGTAIL WIRE
4 - CONNECTOR
5 - EXPANSION VALVE
6 - SCREW (2)
7 - BLOWER MOTOR RESISTOR

INSTALLATION

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

(1) Position the blower motor resistor into the rear heater-A/C unit housing.

(2) Install and tighten the two screws that secure the blower motor resistor to the rear heater-A/C unit housing. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Reconnect the rear HVAC wire harness connector for the blower motor resistor to the resistor connector receptacle.

(4) Reinstall the right quarter trim panel and right D-pillar trim panel onto the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

(5) Reconnect the battery negative cable.

INFRARED TEMPERATURE SENSOR

DESCRIPTION

The rear infrared temperature sensor consists of an infrared transducer that is concealed behind the lens of the rear heater-A/C control in the headliner. This sensor is used only on models equipped with the optional Automatic Temperature Control (ATC) heating and air conditioning system. The rear infrared temperature sensor is integral to the rear heater-A/C control. The infrared sensor cannot be adjusted or repaired and, if faulty or damaged, the rear heater-A/C control unit must be replaced.

OPERATION

The rear infrared temperature sensor provides an independent measurement input to the Automatic Temperature Control (ATC) heater-A/C control module that indicates the surface temperature of the rear seat occupants. By using a surface temperature measurement, rather than an air temperature measurement, the ATC system is able to adjust itself to the comfort level as perceived by the occupant. This allows the system to detect and compensate for other ambient conditions affecting comfort levels, such as solar heat gain or evaporative heat loss. The ATC system logic responds to the infrared sensor input by calculating and adjusting the air flow temperature and air flow rate needed to properly obtain and maintain the selected comfort level temperatures for the rear seat occupants. The ATC heater-A/C control module continually monitors the infrared sensor circuit, and will store a Diagnostic Trouble Code (DTC) for any problem it detects. This DTC information can be retrieved and the infrared temperature sensor diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

MODE DOOR ACTUATOR

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the right quarter trim panel and right D-pillar trim panel from the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(3) Remove the two screws that secure the top of the quarter trim panel attaching bracket to the quarter inner panel.

(4) Remove the screw that secures the back of the rear heater-A/C unit housing to the right D-pillar.

(5) Remove the screw that secures the front of the rear heater-A/C unit housing to the right quarter inner panel.

(6) Carefully pull the top of the rear heater-A/C unit housing away from the right quarter inner panel far enough to reach between the rear heater-A/C unit housing and the quarter inner panel to access the mode door actuator (Fig. 10).

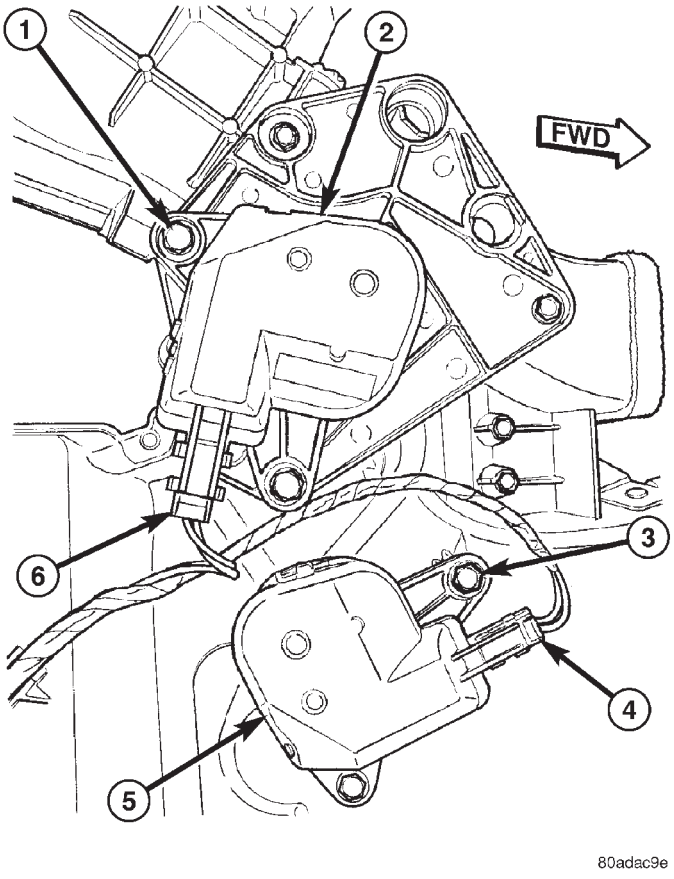

Fig. 10 Blend Door Actuator

1 - SCREW (2)
2 - MODE DOOR ACTUATOR
3 - SCREW (2)
4 - CONNECTOR
5 - BLEND DOOR ACTUATOR
6 - CONNECTOR

(7) Remove the two screws that secure the mode door actuator to the rear heater-A/C unit housing.

(8) Pull the mode door actuator away from the rear heater-A/C unit housing far enough to disengage the actuator output shaft from the mode door linkage.

(9) Raise the mode door actuator far enough to access and disconnect the rear HVAC wire harness connector for the actuator from the actuator connector receptacle.

MODE DOOR ACTUATOR (Continued)

(10) Remove the mode door actuator from between the rear heater-A/C unit housing and the quarter inner panel.

INSTALLATION

(1) Position the mode door actuator between the rear heater-A/C unit housing and the quarter inner panel.

(2) Reconnect the rear HVAC wire harness connector for the mode door actuator to the actuator connector receptacle.

(3) Position the mode door actuator onto the rear heater-A/C unit housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the mode door linkage.

(4) Install and tighten the two screws that secure the mode door actuator to the rear heater-A/C unit housing. Tighten the screws to 2 N·m (18 in. lbs.).

(5) Push the top of the rear heater-A/C unit housing back into position against the right quarter inner panel.

(6) Install and tighten the screw that secures the front of the rear heater-A/C unit housing to the right quarter inner panel. Tighten the screw to 11 N·m (97 in. lbs.).

(7) Install and tighten the screw that secures the back of the rear heater-A/C unit housing to the right D-pillar. Tighten the screw to 11 N·m (97 in. lbs.).

(8) Install and tighten the two screws that secure the top of the quarter trim panel attaching bracket to the quarter inner panel. Tighten the screws to 1.7 N·m (15 in. lbs.).

(9) Reinstall the right quarter trim panel and right D-pillar trim panel onto the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

(10) Reconnect the battery negative cable.

(11) Perform the heater-A/C control calibration procedure. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/A/C-HEATER CONTROL - STANDARD PROCEDURE - HEATER-A/C CONTROL CALIBRATION).

POWER MODULE

DESCRIPTION

A blower power module is used on this model when it is equipped with the optional Automatic Temperature Control (ATC) (Fig. 11). Models equipped with the standard manual heater-A/C control use a blower motor resistor, instead of the blower power module. The blower power module is installed in a mounting hole in the back of the rear heater-A/C unit housing, directly above the expansion valve. The module consists of a molded plastic mounting plate with two integral connector receptacles. Concealed behind the mounting plate within the evaporator housing is the power module electronic circuitry and a large finned, heat sink. The module mounting plate is secured with two screws to the rear heater-A/C unit housing and is accessed for service by removing the right quarter and D-pillar trim panels.

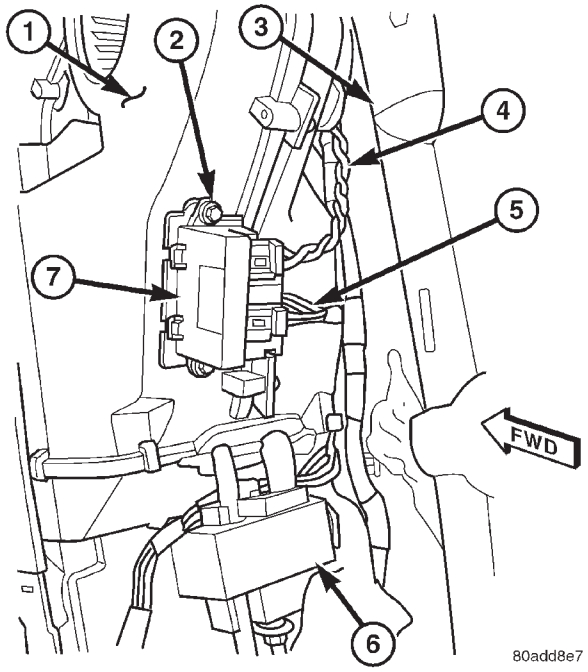

Fig. 11 Power Module

1 - REAR HEATER-A/C UNIT HOUSING
2 - SCREW (2)
3 - D-PILLAR
4 - BLOWER PIGTAIL WIRE
5 - REAR HVAC WIRE HARNESS
6 - EXPANSION VALVE
7 - BLOWER POWER MODULE

The power module heat sink will get hot when in use. Do not touch the heat sink if the blower motor has been running. The blower power module cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The blower power module is connected to the vehicle electrical system through a dedicated take out and connector of the rear HVAC wire harness. A second connector receptacle receives the pigtail wire connector from the blower motor. The blower power module allows the microprocessor-based Automatic Temperature Control (ATC) heater-A/C control module to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a Pulse Width Modulated (PWM) circuit strategy. The PWM

POWER MODULE (Continued)

voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which adjusts the voltage output received from the blower motor relay to change or maintain the desired blower speed. The blower power module is diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the right quarter trim panel and right D-pillar trim panel from the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(3) Disconnect the rear HVAC wire harness connector for the blower power module from the resistor connector receptacle (Fig. 12).

(4) Disconnect the blower motor pigtail wire connector from the blower power module connector receptacle.

(5) Remove the two screws that secure the blower power module to the rear heater-A/C unit housing.

(6) Remove the blower power module from the rear heater-A/C unit housing.

INSTALLATION

(1) Position the blower power module into the rear heater-A/C unit housing.

(2) Install and tighten the two screws that secure the blower power module to the rear heater-A/C unit housing. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Reconnect the blower motor pigtail wire to the blower power module connector receptacle.

(4) Reconnect the rear HVAC wire harness connector for the blower power module to the module connector receptacle.

AIR FILTER

DESCRIPTION

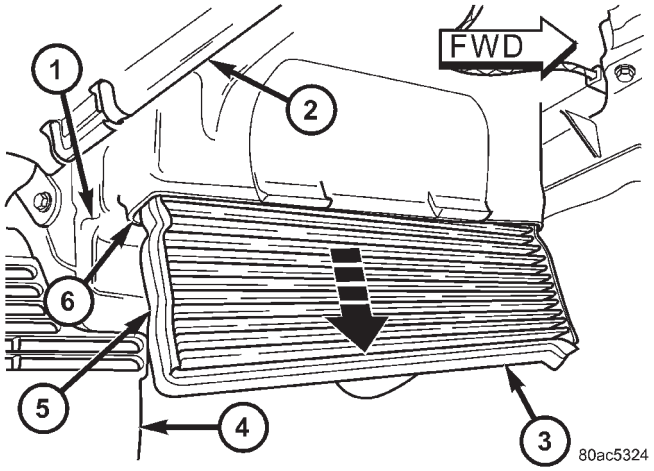

Fig. 1 Air Filter

1 - LOWER EVAPORATOR HOUSING
2 - LOWER EDGE OF INSTRUMENT PANEL
3 - AIR FILTER
4 - INSTRUMENT PANEL CENTER FLOOR BRACKET COVER
5 - FOAM SEAL
6 - AIR FILTER OPENING

A dust and odor air filter is standard equipment on models equipped with the dual zone or three zone temperature control systems (Fig. 1). The filter element is the same size as the front air conditioner evaporator to ensure ample filtering capacity. A removable door on the bottom of the front heater-A/C unit housing below the glove box provides easy access to the filter element for replacement. Filter replacement is recommended at 24,000 kilometer (15,000 mile) intervals.

REMOVAL

(1) Locate the air filter door on the bottom of the lower evaporator housing just outboard of the passenger side of the instrument panel center stack (Fig. 2).

(2) Slide the air filter door latch toward the rear of the vehicle until it engages the opened stop on the door.

(3) Pull the air filter door straight downward to disengage it from the air filter opening of the lower evaporator housing.

(4) Use your fingers to reach through the air filter opening of the lower evaporator housing far enough to grasp the air filter.

(5) Pull the air filter straight down and out of the evaporator housing (Fig. 2).

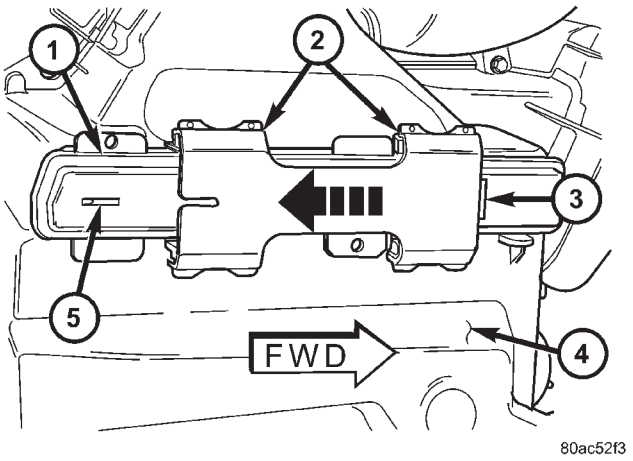

Fig. 2 Air Filter Door

1 - AIR FILTER DOOR
2 - LATCH
3 - CLOSED STOP
4 - LOWER EVAPORATOR HOUSING
5 - OPENED STOP

INSTALLATION

(1) Note the “Airflow” directional arrow imprinted on the foam seal around the frame of the air filter. This arrow should always be oriented towards the center of the vehicle.

(2) With the air filter “Airflow” arrow properly oriented, carefully slide the filter fully upward into the evaporator housing through the air filter opening.

(3) With the latch still positioned against its opened stop, reinstall the air filter door onto the lower evaporator housing air filter opening.

(4) Slide the air filter door latch toward the front of the vehicle until it hits the closed stop on the door.

AIR OUTLETS

DESCRIPTION

Based upon the system mode selected, conditioned air can exit the front heater-A/C unit housing through one or a combination of the four main housing outlets: defrost, demist, panel, or floor. Once the conditioned air exits the unit housing, it is directed through molded plastic ducts to the various outlets in the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlet** - A single, centrally mounted outlet delivers air for defrosting the large windshield. Because outlet vanes are not needed to direct flow, a simple, integral grid is molded into the center of the instrument panel top cover to prevent objects from falling into the duct. If the defroster outlet is faulty

AIR OUTLETS (Continued)

or damaged, the instrument panel top cover must be replaced.

- **Demister Outlets** - There are two side window demisters that aid in defogging and defrosting the front door windows. One demister outlet is located at each outboard end of the instrument panel top pad, near the belt line at the A-pillars. The demister outlets can be removed from the top pad individually for service replacement.
- **Instrument Panel Outlets** - There are five panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle, and three located near the top of the instrument panel center bezel. On models with manual temperature control, all five of these outlets are fully adjustable. On models with Automatic Temperature Control (ATC), the center outlet in the center bezel has fixed vanes because it also houses the remote infrared temperature sensors for the front seat positions. The outboard outlets can be removed individually for service replacement. The center bezel outlets are serviced as a gang of three outlets and, on models with ATC, also includes the infrared sensors.
- **Front Door Rear Outlets** - A fully adjustable outlet located at the rear of each front door trim panel supplies only cooled air to the intermediate seat passengers. Air is supplied to these outlets from the instrument panel through ducts in the doors that use molded seals at the instrument panel to prevent air leakage. The door ducts are integral to the front door trim panels. These outlets also incorporate a red reflector to improve the safety and visibility of an opened front door to traffic approaching the vehicle from the rear at night. These outlets can be removed from the door trim panels for service replacement.
- **Front Floor Outlets** - There are two front floor outlets, one located above each side of the floor panel center tunnel below the instrument panel. These outlets are integral to the front heater-A/C unit distribution housing.
- **Rear Floor Outlets** - Wide rear floor outlets located under each front seat have integral, fixed directional dividers to distribute heated air across the floor for intermediate seat passengers. These outlets are integral to the floor distribution ducts routed under the front floor carpet from an outlet nozzle on the bottom of the front heater-A/C unit distribution housing.

REMOVAL

REMOVAL - CENTER BEZEL OUTLETS

The three outlets located near the top of the instrument panel center bezel are serviced only as a set of all three outlets. If the vehicle is equipped with the optional Automatic Temperature Control (ATC) system, the center outlet of the three has fixed vanes and also houses the remote front infrared temperature sensors.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the center bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(3) Place the center bezel face down on a suitable work surface. Be certain to take the proper precautions to protect the face of the center bezel from cosmetic damage.

(4) If the vehicle is equipped with the optional ATC system, disconnect the ATC remote infrared temperature sensor jumper harness from the sensor connector receptacle located on the bottom of the center outlet housing (Fig. 3).

(5) Remove the three screws that secure the bottom of the outlet housing to the center bezel.

(6) Roll the bottom of the outlet housing upwards towards the top of the center bezel far enough to disengage the retainer features on the top of the outlet housing from their receptacles at the top of the center bezel.

(7) Remove the center bezel outlets and housing from the center bezel as a unit.

REMOVAL - DEMISTER OUTLET

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry the outer perimeter of the demister outlet away from the instrument panel top pad until the snap features on the outlet are released (Fig. 4).

(2) Remove the demister outlet from the demister duct opening in the instrument panel top pad.

REMOVAL - FRONT DOOR REAR OUTLET

(1) Disconnect and isolate the battery negative cable.

3 - TRIM STICK

(2) Remove the trim panel from the front door inner panel. (Refer to 23 - BODY/DOOR - FRONT/ TRIM PANEL - REMOVAL).

(3) Using a trim stick or another suitable wide flat-bladed tool, depress the four latch features (two top and two bottom) that secure the outlet to the inside of the trim panel rear outlet opening and push the outlet unit out through the opening (Fig. 5).

(4) Remove the front door rear outlet through the outside of the front door trim panel outlet opening.

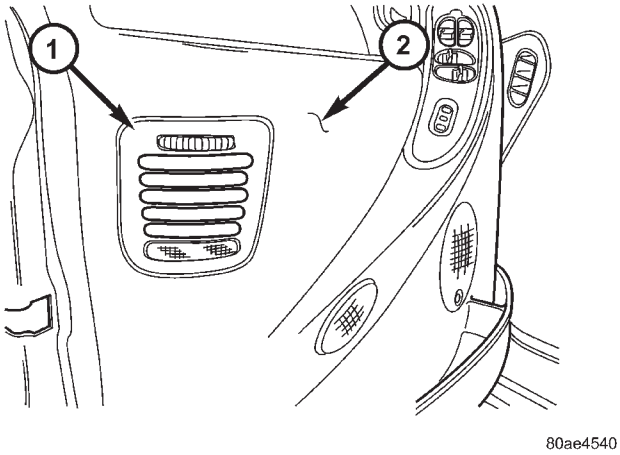

Fig. 5 Front Door Rear Outlet

1 - FRONT DOOR REAR OUTLET
2 - FRONT DOOR TRIM PANEL

REMOVAL - INSTRUMENT PANEL OUTLET

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry the outer perimeter of the instrument panel outlet away from the instrument panel top pad until the snap features on the outlet are released (Fig. 6).

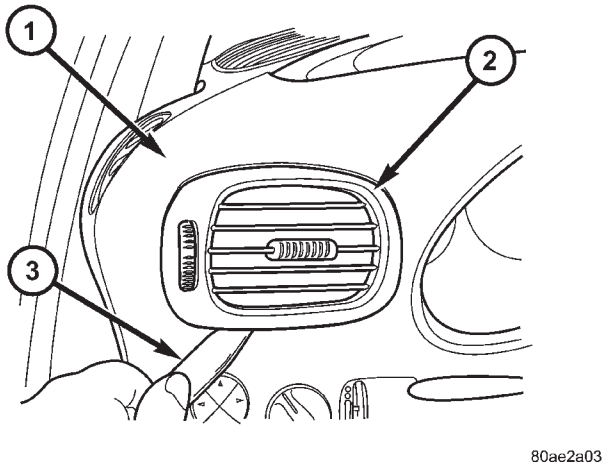

Fig. 6 Instrument Panel Outlet

1 - INSTRUMENT PANEL TOP PAD
2 - INSTRUMENT PANEL OUTLET
3 - TRIM STICK

(2) Remove the instrument panel outlet from the panel duct opening in the instrument panel top pad.

AIR OUTLETS (Continued)

INSTALLATION

INSTALLATION - CENTER BEZEL OUTLETS

(1) Position the center bezel outlets and housing onto the center bezel as a unit.

(2) Engage the retainer features on the top of the outlet housing with their receptacles at the top of the center bezel, then roll the bottom of the outlet housing downwards towards the center bezel.

(3) Install and tighten the three screws that secure the bottom of the outlet housing to the center bezel. Tighten the screws to 2 N·m (17 in. lbs.).

(4) If the vehicle is equipped with the optional ATC system, reconnect the ATC remote infrared temperature sensor jumper harness to the sensor connector receptacle located on the bottom of the center outlet housing.

(5) Reinstall the center bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

(6) Reconnect the battery negative cable.

INSTALLATION - DEMISTER OUTLET

(1) Position the demister outlet over the demister duct opening in the instrument panel top pad.

(2) Using hand pressure, press the demister outlet firmly and evenly into the instrument panel top pad opening until the snap features on the outlet are fully engaged.

INSTALLATION - FRONT DOOR REAR OUTLET

(1) Position the front door rear outlet through the outside of the front door trim panel outlet opening.

(2) While keeping the outlet aligned with the door duct opening behind the trim panel, use hand pressure to press the outlet firmly and evenly through the outside of the front door trim panel outlet opening until the four latch features (two top and two bottom) that secure the outlet to the inside of the opening are fully engaged.

(3) Reinstall the trim panel onto the front door inner panel. (Refer to 23 - BODY/DOOR - FRONT/ TRIM PANEL - INSTALLATION).

(4) Reconnect the battery negative cable.

INSTALLATION - INSTRUMENT PANEL OUTLET

(1) Position the instrument panel outlet into the panel duct opening in the instrument panel top pad.

(2) Using hand pressure, press the instrument panel outlet firmly and evenly into the instrument panel top pad opening until the snap features on the outlet are fully engaged.

BLOWER MOTOR

DESCRIPTION

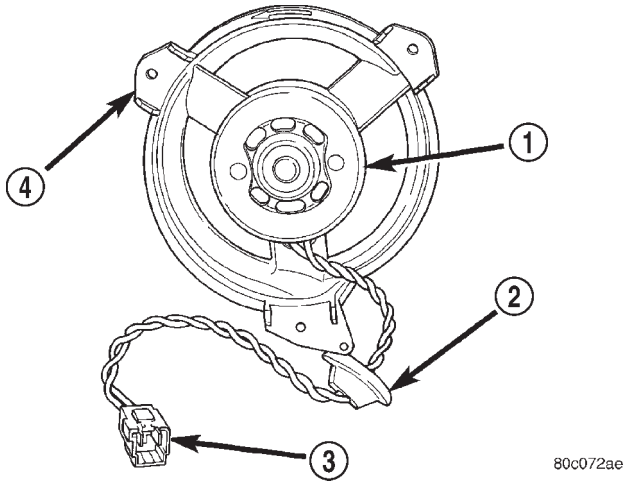

Fig. 7 Blower Motor

1 - BLOWER MOTOR
2 - RUBBER GROMMET
3 - BLOWER MOTOR CONNECTOR
4 - MOUNTING TABS

The blower motor is a 12-volt, Direct Current (DC) motor with a squirrel cage-type blower wheel that is secured to the blower motor shaft (Fig. 7). The blower motor and wheel are located near the passenger side end of the heater-A/C unit within the two halves of the intake air housing in the passenger compartment below the instrument panel. The blower motor and blower motor wheel are a factory balanced unit and cannot be adjusted or repaired. If faulty or damaged, the blower motor and blower wheel must be replaced as a unit.

OPERATION

The blower motor will operate whenever the ignition switch is in the On position and the heater-A/C control power is turned on. The blower motor can only be turned off by turning off the power at the heater-A/C control. The blower motor receives battery current whenever the front blower motor relay is energized. The front blower motor relay output circuit is protected by a fuse in the Intelligent Power Module (IPM) located in the engine compartment near the battery. In the Manual system, the blower motor speed is controlled by regulating the path to ground through the blower control switch and the blower motor resistor. In the ATC system, the blower motor speed is controlled by an electronic blower power module, which uses a pulse width modulated input from the ATC module and feedback from the blower motor to regulate the blower motor ground

path it provides. The blower motor and wheel are used to control the velocity of air moving through the heater-A/C unit housing. The blower motor controls the velocity of the air flowing through the heater-A/C housing by spinning the blower wheel within the housing at the selected speed or, in the ATC system, at the selected or programmed speed.

DIAGNOSIS AND TESTING - BLOWER MOTOR

BLOWER MOTOR INOPERATIVE

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fuse (Fuse 10 - 40 ampere) in the Intelligent Power Module (IPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Be certain that the heater-A/C control power is turned on. Check for battery voltage at the fuse (Fuse 10 - 40 ampere) in the IPM. If OK, go to Step 3. If not OK, proceed to diagnosis of the front blower motor relay. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/BLOWER MOTOR RELAY - DIAGNOSIS AND TESTING).

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the front HVAC wire harness connector for the front blower motor resistor (Manual Temperature Control) or the front blower power module (Automatic Temperature Control) from the resistor or module connector receptacle. Reconnect the battery negative cable. Turn the ignition switch to the On position. Be certain that the heater-A/C control power is turned on. Check for battery voltage at the fused front blower motor relay output circuit cavity of the front HVAC wire harness connector for the front blower motor resistor (MTC) or the front blower power module (ATC). If OK, go to Step 4. If not OK, repair the open fused front blower motor relay output circuit to the IPM as required.

(4) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the front blower motor pigtail wire connector from the connector receptacle of the front blower motor resistor (MTC) or the front blower power module (ATC). Use jumper wires to connect a battery and ground feeds to the blower motor pigtail wire connector. The blower motor should operate. If OK with MTC, proceed to diagnosis of the front blower motor resistor. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/BLOWER MOTOR RESISTOR - DIAGNOSIS AND TESTING). If OK with ATC, use a DRBIII scan tool to diagnose the front blower power module. Refer to the appropriate diagnostic information. If not OK with MTC or ATC, replace the faulty front blower motor.

BLOWER MOTOR NOISE OR VIBRATION

Refer to the Blower Motor Noise/Vibration Diagnosis chart (Fig. 8).

REMOVAL

The blower motor and blower wheel are serviced only as a balanced unit. If either component is faulty or damaged, the entire unit must be replaced.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNING - HEATER PLUMBING).

(1) Disconnect the blower motor pigtail harness connector from the connector receptacle of either the blower motor resistor or power module, depending how vehicle is equipped (Fig. 9).

(2) Remove the lower right trim panel and roll back the carpet.

(3) Remove the two screws that secure the recirculation door actuator and disengage the wire harness from the routing clips molded into the bottom of the lower air intake housing.

(4) Remove the one screw (from the top) that secures the lower air intake housing to the upper air intake housing.

(5) Remove the four screws (from the bottom) that secures the lower air intake housing to the lower half of the evaporator housing and the upper air intake housing.

(6) Push the rubber grommet on the blower motor pigtail wires through the hole in the lower intake air housing (Fig. 10).

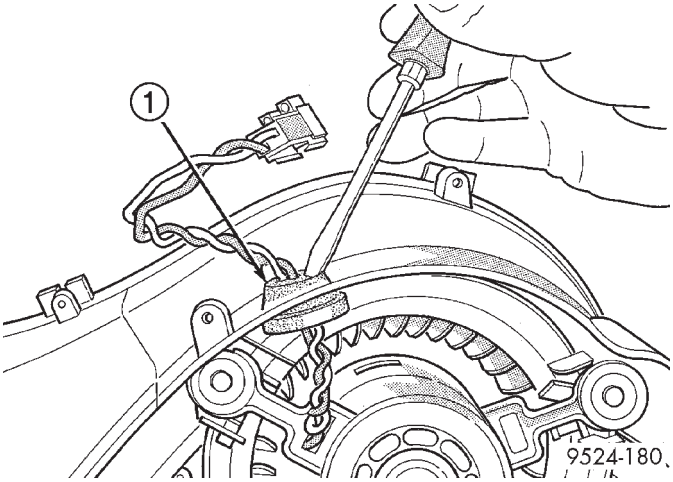

Fig. 10 Rubber Grommet - Typical

1 - BLOWER MOTOR PIGTAIL WIRE GROMMET

(7) Feed the blower motor pigtail wires and electrical connector through the grommet hole in the lower intake air housing.

(8) Relocate the recirculation air door as necessary to access and remove the three screws that secure the blower motor to the blower housing in the lower half of the evaporator housing (Fig. 11).

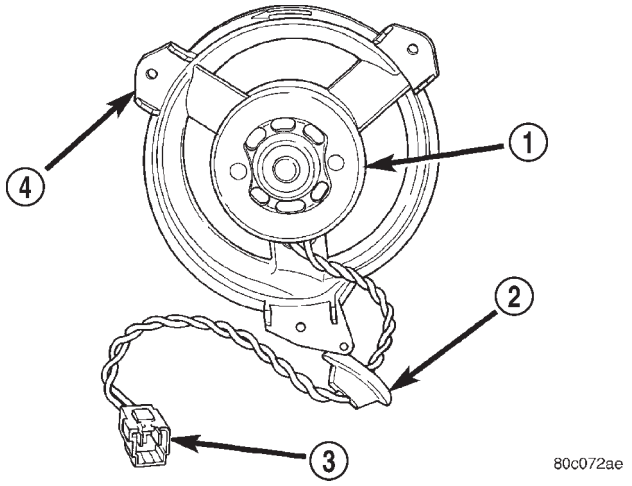

Fig. 11 Blower Motor Mounting Tabs

1 - BLOWER MOTOR
2 - RUBBER GROMMET
3 - BLOWER MOTOR CONNECTOR
4 - MOUNTING TABS

(9) Gently flex the recirculation air door far enough to remove the blower motor and blower wheel from the blower housing in the lower half of the evaporator housing.

INSTALLATION

The blower motor and blower wheel are serviced only as a balanced unit. If either component is faulty or damaged, the entire unit must be replaced.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - HEATER PLUMBING).

(1) Gently flex the recirculation air door far enough to position the blower motor and blower wheel into the blower housing in the lower half of the evaporator housing.

(2) Install and tighten the four screws that secure the blower motor to the blower housing in the lower half of the evaporator housing. Tighten the screws to 2 N·m (18 in. lbs.).

(3) Feed the blower motor pigtail wires and electrical connector through the grommet hole in the lower intake air housing and seat the rubber grommet.

BLOWER MOTOR (Continued)

(4) Position the upper pivot of the recirculation door into the opening at the top of the air inlet housing an dhold in place while the lower air inlet housing is placed in position.

(5) Install and tighten the three screws (from the bottom) that secure the lower air intake housing to the lower half of the evaporator housing. Tighten the screws to 2 N·m (18 in. lbs.).

(6) Install and tighten the one screw that secures the upper intake air housing to the lower intake air housing. Tighten the screws to 2 N·m (18 in. lbs.).

(7) Install the recirculation actuator making certain that the splines are aligned and secure the actuator with two screws and torque the to 2 N·m (18 in. lbs.). Route the wiring into the molded inn routing clips.

(8) Position the carpet into location and install the lower right trim panel.

(9) Connect the blower motor pigtail wire harness electrical connector back into either the power module or resistor receptacle.

(10) Run the Heater-A/C Calibration procedure(Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - STANDARD PROCEDURE).

(11) Run the HVAC Control Cooldown test(Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING).

DEFROSTER DUCT

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Place the instrument panel face down on a suitable work surface. Be certain to take the proper precautions to protect the face of the instrument panel from cosmetic damage.

(4) Remove the fasteners that secure the defroster duct to the instrument panel armature.

(5) Remove the defroster duct from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the defroster duct to the instrument panel.

(2) Install the fasteners that secure the defroster duct to the instrument panel armature.

(3) Reinstall the instrument panel in the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(4) Reconnect the battery negative cable.

DEMISTER DUCTS

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

DEMISTER DUCTS (Continued)

(2) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Place the instrument panel face down on a suitable work surface. Be certain to take the proper precautions to protect the face of the instrument panel from cosmetic damage.

(4) Remove the fasteners that secure the demister ducts to the instrument panel armature.

(5) Disengage the demister ducts from the demister outlets.

(6) Remove the demister ducts from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the demister ducts to the instrument panel.

(2) Engage the demister ducts to the demister outlets.

(3) Install the fasteners that secure the demister ducts to the instrument panel armature.

(4) Reinstall the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Reconnect the battery negative cable.

FLOOR DISTRIBUTION DUCTS

REMOVAL

(1) Roll back the carpet on the front floor from under the instrument panel toward the rear of the vehicle. (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - REMOVAL).

(2) Lift the center floor distribution duct upward far enough to disengage its locator hole from the weld stud on the front floor panel (Fig. 12).

(3) Pull the floor distribution duct assembly rearward far enough to disengage the center floor distribution duct from the outlet on the bottom of the heater-A/C housing unit.

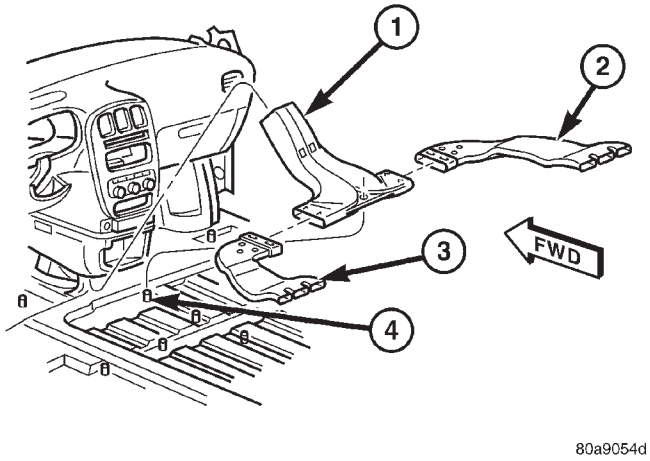

Fig. 12 Floor Distribution Ducts

1 - CENTER FLOOR DISTRIBUTION DUCT
2 - RIGHT FLOOR DISTRIBUTION DUCT
3 - LEFT FLOOR DISTRIBUTION DUCT
4 - WELD STUD

(4) Disassemble the right and/or left floor distribution ducts from the center floor distribution duct as required.

INSTALLATION

(1) Assemble the right and/or left floor distribution ducts onto the center floor distribution duct as required.

(2) Slide the floor distribution duct assembly under the instrument panel center stack far enough to engage the center floor distribution duct with the outlet on the bottom of the heater-A/C housing unit.

(3) Align the locator hole on the center floor distribution duct with the weld stud on the front floor panel.

(4) Using hand pressure, push the locator hole of the center floor distribution duct down over the weld stud on the front floor panel.

(5) Reinstall the carpet onto the front floor panel and under the instrument panel. (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - INSTALLATION).

HVAC HOUSING

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - HEATER PLUMBING).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Drain the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).

(3) Disconnect and isolate the battery negative cable.

(4) Disconnect the liquid line and suction line from the expansion valve. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LIQUID LINE - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/SUCTION LINE - REMOVAL).

(5) Disconnect the heater hoses from the heater core tubes. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/HEATER HOSE - REMOVAL).

(6) Remove the four nuts that secure the heater-A/C unit housing studs to the engine compartment side of the dash panel (Fig. 13).

(7) Remove the instrument panel from the passenger compartment. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

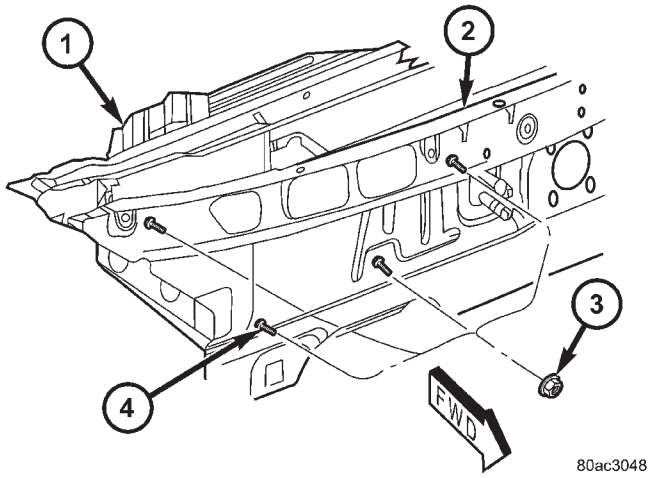

Fig. 13 Heater-A/C Unit Housing Studs

1 - HEATER-A/C UNIT HOUSING
2 - DASH PANEL
3 - NUT (4)
4 - STUD (4)

(8) Remove the floor distribution duct from the heater-A/C unit housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/ FLOOR DISTRIBUTION DUCTS - REMOVAL).

(9) Remove the one screw that secures the heater-A/C unit housing bracket to the passenger compartment side of the dash panel (Fig. 14).

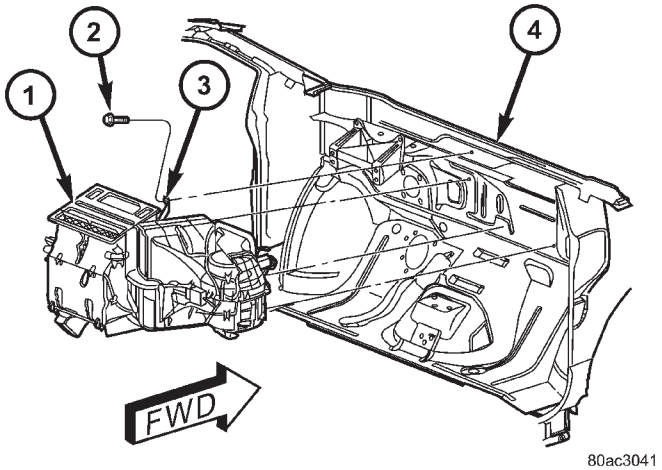

Fig. 14 Heater-A/C Unit Housing

1 - HEATER-A/C UNIT HOUSING
2 - SCREW
3 - BRACKET
4 - DASH PANEL

HVAC HOUSING (Continued)

(10) Pull the heater-A/C unit housing rearward far enough for the mounting studs to clear the dash panel and remove the unit from the passenger compartment.

INSTALLATION

(1) Position the heater-A/C unit housing against the dash panel in the passenger compartment with the four mounting studs located in their proper mounting holes in the dash panel.

(2) Install and tighten the one screw that secures the heater-A/C unit housing bracket to the passenger compartment side of the dash panel. Tighten the screw to 3 N·m (26 in. lbs.).

(3) Install and tighten the four nuts that secure the heater-A/C unit housing studs to the engine compartment side of the dash panel. Tighten the nuts to 7 N·m (62 in. lbs.).

(4) Reinstall the floor distribution duct onto the heater-A/C unit housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/FLOOR DISTRIBUTION DUCTS - INSTALLATION).

(5) Reinstall the instrument panel into the passenger compartment. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(6) Reconnect the heater hoses to the heater core tubes. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/HEATER HOSE - INSTALLATION).

(7) Reconnect the suction line and liquid line to the expansion valve. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/SUCTION LINE - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LIQUID LINE - INSTALLATION).

(8) Reconnect the battery negative cable.

(9) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

(10) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(11) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

PANEL DUCTS

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Place the instrument panel face down on a suitable work surface. Be certain to take the proper precautions to protect the face of the instrument panel from cosmetic damage.

(4) Remove the fasteners that secure the panel ducts to the instrument panel armature.

(5) Disengage the panel ducts from the panel outlets.

(6) Remove the panel ducts from the instrument panel.

INSTALLATION

(1) Position the panel ducts to the instrument panel.

(2) Engage the panel ducts to the panel outlets.

(3) Install the fasteners that secure the panel ducts to the instrument panel armature.

(4) Reinstall the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Reconnect the battery negative cable.

AIR OUTLETS

DESCRIPTION

Based upon the system mode selected, conditioned air can exit the rear heater-A/C unit housing through one or a combination of the two main housing outlets: air conditioner, or heater. Once the conditioned air exits the unit housing, it is directed through molded plastic ducts to the various outlets in the vehicle interior. These outlets and their locations are as follows:

- **Floor Outlets** - Three floor outlets with fixed vanes are located in the right quarter trim panel, near the floor. These outlets distribute air from the rear heater distribution duct to the intermediate and rear seat occupants. The floor outlets are integral to the right quarter trim panel and, if faulty or damaged, the quarter trim panel must be replaced.
- **Overhead Outlets** - Four (two right side and two left side) fully adjustable outlets along the roof rails distribute air from the rear A/C distribution duct and the headliner ducts to the intermediate and rear seat occupants. The headliner ducts are integral to the headliner panel. Each overhead outlet is housed in a headliner bezel. The two forward headliner bezels also feature a courtesy lamp, a fold-away coat hook, and a fold-away assist handle. The overhead outlets can be removed from the headliner bezels individually for service replacement.

REMOVAL

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry the thumb wheel end of the overhead outlet away from the pivot pin in the headliner bezel until one end of the outlet is released (Fig. 1).

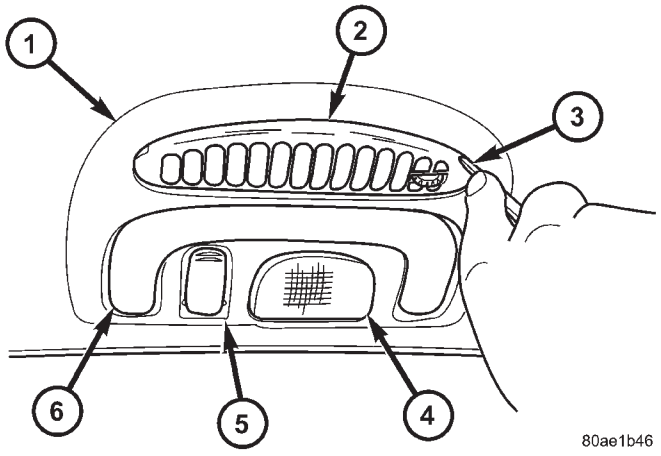

Fig. 1 Overhead Outlet

1 - HEADLINER BEZEL
2 - OVERHEAD OUTLET
3 - TRIM STICK
4 - COURTESY LAMP
5 - COAT HOOK
6 - ASSIST HANDLE

(2) Pull the opposite end of the overhead outlet away from its pivot pin in the headliner bezel until that end of the outlet is released.

(3) Remove the overhead outlet from the opening in the headliner bezel.

INSTALLATION

(1) Position the overhead outlet into the opening in the headliner bezel.

(2) Slide the non-thumb wheel end of the outlet onto the pivot pin in the headliner bezel. Using hand pressure, push the thumb wheel end outboard onto the pivot pin until it fully seats.

A/C DISTRIBUTION DUCT

REMOVAL

(1) Remove the trim from the right quarter inner panel and the right D pillar. (Refer to 23 - BODY/INTERIOR/RIGHT QUARTER TRIM PANEL - REMOVAL).

(2) Slide the rear air conditioning distribution duct upwards far enough to disengage it from the outlet at the top of the rear heater-A/C unit housing (Fig. 2).

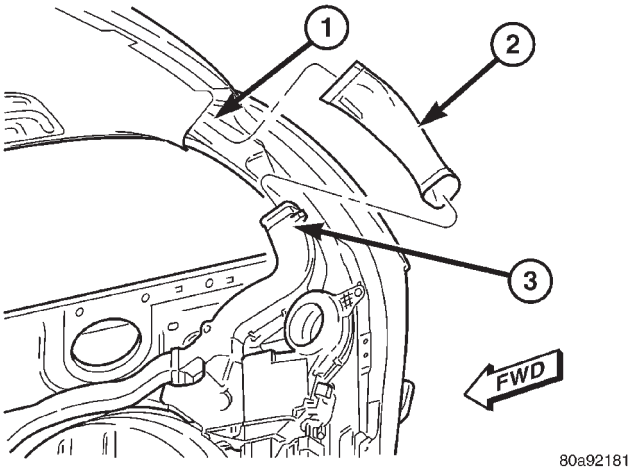

Fig. 2 Rear A/C Distribution Duct

1 - HEADLINER DUCT
2 - REAR A/C DISTRIBUTION DUCT
3 - REAR HEATER-A/C UNIT OUTLET

(3) While pulling the lower end of the auxiliary air conditioning distribution duct away from the rear heater-A/C unit outlet, disengage the upper end of the distribution duct from the headliner duct.

(4) Remove the auxiliary air conditioning distribution duct from the vehicle.

INSTALLATION

(1) Align the upper end of the rear air conditioning distribution duct to the headliner duct.

(2) Slide the upper end of the rear air conditioning distribution duct onto the headliner duct far enough to align the lower end of the duct with the outlet at the top of the rear heater-A/C unit housing.

(3) Slide the rear air conditioning distribution duct downwards far enough to engage it onto the outlet at the top of the rear heater-A/C unit housing.

(4) Reinstall the trim onto the right quarter inner panel and the right D pillar. (Refer to 23 - BODY/INTERIOR/RIGHT QUARTER TRIM PANEL - INSTALLATION).

BLOWER MOTOR

DESCRIPTION

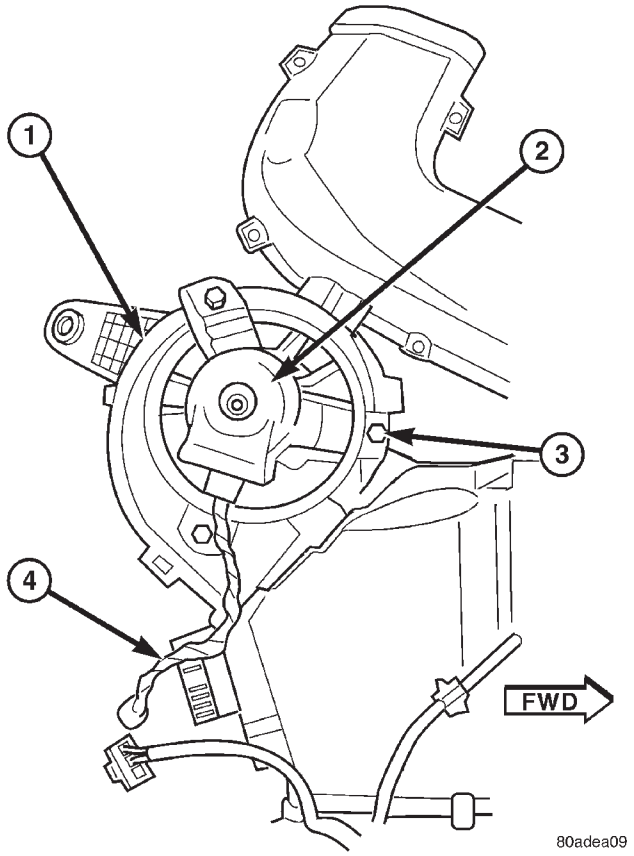

Fig. 3 Blower Motor

1 - REAR HEATER-A/C UNIT HOUSING
2 - BLOWER MOTOR
3 - SCREW (3)
4 - BLOWER PIGTAIL WIRE

The blower motor is a 12-volt, Direct Current (DC) motor with a squirrel cage-type blower wheel that is secured to the blower motor shaft (Fig. 3). The blower motor and wheel are located in a housing near the top of the rear heater-A/C unit in the passenger compartment behind the right rear wheel house. The rear heater-A/C unit housing must be removed from the vehicle to access the blower motor and blower wheel for service. The blower motor and blower motor wheel are a factory balanced unit and cannot be adjusted or repaired. If faulty or damaged, the blower motor and blower wheel must be replaced as a unit.

OPERATION

The rear blower motor will operate whenever the ignition switch is in the On position, the heater-A/C control power is turned on, and the rear heater-A/C

system control switch on the front heater-A/C control is not in the Off position. The blower motor can only be turned off by turning off the rear system at the front heater-A/C control. The blower motor receives battery current whenever the rear blower motor relay is energized. The rear blower motor relay output circuit is protected by a fuse in the Intelligent Power Module (IPM) located in the engine compartment near the battery. In the MTC system, the blower motor speed is controlled by regulating the path to ground through the blower control switch and the blower motor resistor. In the ATC system, the blower motor speed is controlled by an electronic blower power module, which uses a pulse width modulated input from the ATC module and feedback from the blower motor to regulate the blower motor ground path it provides. The blower motor and wheel are used to control the velocity of air moving through the rear heater-A/C unit housing. The blower motor controls the velocity of the air flowing through the rear heater-A/C housing by spinning the blower wheel within the housing at the selected speed or, in the ATC system, at the selected or programmed speed.

DIAGNOSIS AND TESTING - BLOWER MOTOR

BLOWER MOTOR INOPERATIVE

(1) Check the fuse (Fuse 12 - 25 ampere) in the Intelligent Power Module (IPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Be certain that the rear heater-A/C control power is turned on. Check for battery voltage at the fuse (Fuse 12 - 25 ampere) in the IPM. If OK, go to Step 3. If not OK, proceed to diagnosis of the rear blower motor relay. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - REAR/BLOWER MOTOR RELAY - DIAGNOSIS AND TESTING).

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the rear HVAC wire harness connector for the rear blower motor resistor (Manual Temperature Control) or the rear blower power module (Automatic Temperature Control) from the resistor or module connector receptacle. Reconnect the battery negative cable. Turn the ignition switch to the On position. Be certain that the rear heater-A/C control power is turned on. Check for battery voltage at the fused rear blower motor relay output circuit cavity of the rear HVAC wire harness connector for the rear blower motor resistor (MTC) or the rear blower power module (ATC). If OK, go to Step 4. If not OK, repair the open fused front blower motor relay output circuit to the IPM as required.

(4) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the rear blower motor pigtail wire connector from the take out and connector of the rear HVAC wire harness (MTC) or the connector receptacle of the rear blower power module (ATC). Use jumper wires to connect a battery and ground feeds to the blower motor pigtail wire connector. The blower motor should operate. If OK with MTC, proceed to diagnosis of the rear blower motor resistor. (Refer to 24 - HEATING & AIR CONDITIONING/ CONTROLS - REAR/BLOWER MOTOR RESISTOR - DIAGNOSIS AND TESTING). If OK with ATC, use a DRBIII scan tool to diagnose the rear blower power module. Refer to the appropriate diagnostic information. If not OK with MTC or ATC, replace the faulty rear blower motor.

BLOWER MOTOR NOISE OR VIBRATION

Refer to the Blower Motor Noise/Vibration Diagnosis chart (Fig. 4).

REMOVAL

The rear blower motor and blower wheel are serviced only as a balanced unit. If either component is faulty or damaged, the entire unit must be replaced.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - HEATER PLUMBING).

(1) Remove the rear heater-A/C unit housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER-A/C HOUSING - REMOVAL).

(2) Disconnect the rear blower motor pigtail wire connector. With manual temperature control, the blower pigtail wire is connected to a take out and connector of the rear HVAC wire harness. With automatic temperature control, the blower pigtail wire is connected to a receptacle on the blower power module.

(3) Remove the three screws that secure the blower motor to the outboard side of the rear heater-A/C unit housing (Fig. 5).

(4) Remove the blower motor and blower wheel from the rear heater-A/C unit housing.

BLOWER MOTOR (Continued)

BLOWER MOTOR (Continued)

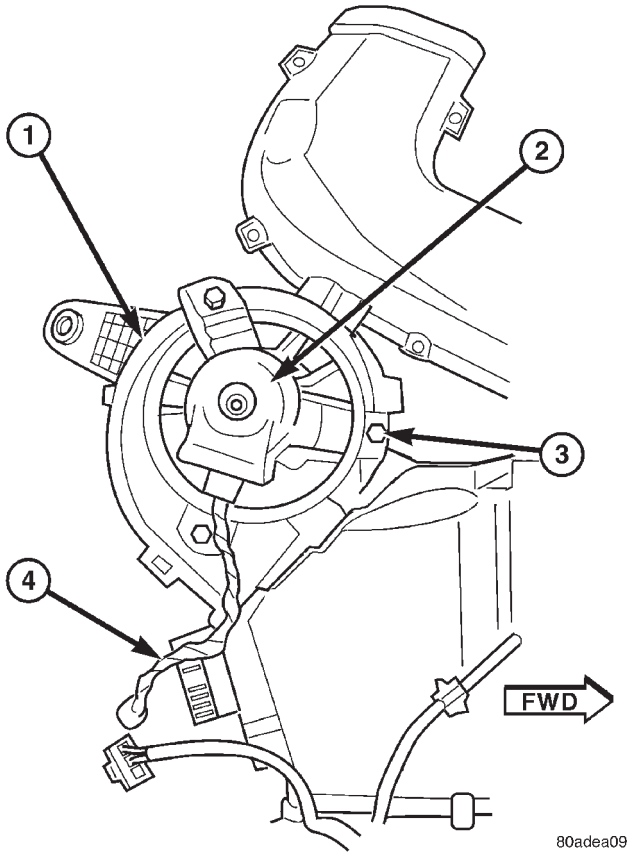

Fig. 5 Blower Motor

1 - REAR HEATER-A/C UNIT HOUSING
2 - BLOWER MOTOR
3 - SCREW (3)
4 - BLOWER PIGTAIL WIRE

INSTALLATION

(1) Position the blower motor and blower wheel onto the outboard side of the rear heater-A/C unit housing.

(2) Install and tighten the three screws that secure the blower motor to the rear heater-A/C unit housing. Tighten the screws to 2 N·m (18 in. lbs.).

(3) Reconnect the rear blower motor pigtail wire connector. With manual temperature control, the blower pigtail wire is connected to a take out and connector of the rear HVAC wire harness. With automatic temperature control, the blower pigtail wire is connected to a receptacle on the blower power module.

(4) Reinstall the rear heater-A/C unit housing into the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER-A/C HOUSING - INSTALLATION).

REAR HEATER-A/C HOUSING

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - HEATER PLUMBING).

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Drain the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).

(3) Disconnect and isolate the battery negative cable.

(4) Raise and support the vehicle.

(5) Disconnect the underbody refrigerant line sealing plate from the rear heater-A/C unit evaporator extension line sealing plate that extends through the rear floor panel behind the right rear wheel housing (Fig. 6).

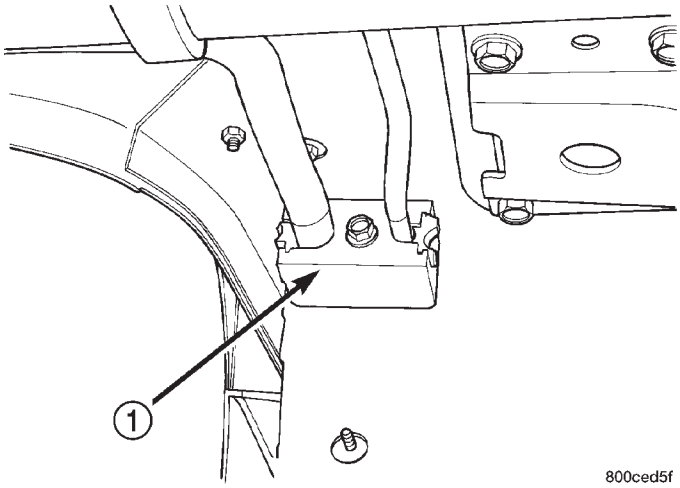

Fig. 6 Refrigerant Lines

1 - UNDERBODY REFRIGERANT LINE SEALING PLATE

(6) Remove the seals from the liquid line and suction line fittings and discard.

(7) Install plugs in, or tape over the opened liquid line and suction line fittings and both ports in the evaporator extension line sealing plate.

REAR HEATER-A/C HOUSING (Continued)

(8) Remove the three nuts that secure the rear heater-A/C unit mounting studs to the rear floor panel behind the right rear wheel housing (Fig. 7).

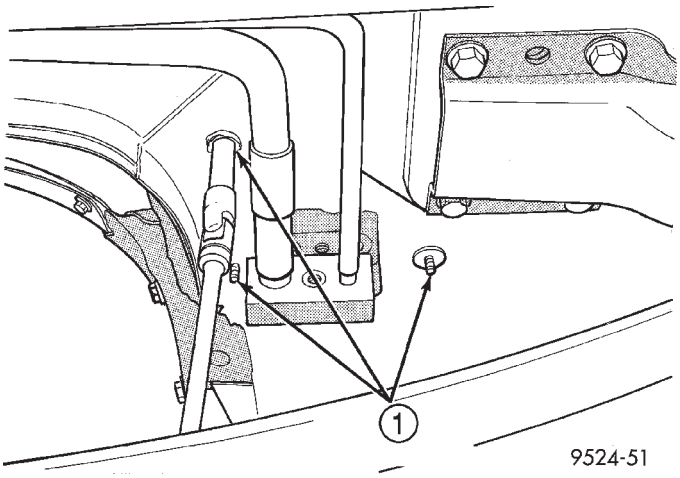

Fig. 7 Rear Heater-A/C Unit Mounting Studs

1 - REAR HEATER-A/C UNIT MOUNTING STUDS

(9) Lower the vehicle.

(10) Remove the right quarter trim panel and right D-pillar trim panel from the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(11) Remove the rear A/C distribution duct from the rear heater-A/C unit and the rear roof duct. (Refer to 24 - HEATING & AIR CONDITIONING/ DISTRIBUTION - REAR/AUXILIARY A/C DISTRIBUTION DUCT - REMOVAL).

(12) Disconnect the body wire harness connector for the rear heater-A/C unit housing from the rear HVAC wire harness connector located near the expansion valve at the back of the unit.

(13) Remove the two screws that secure the top of the quarter trim panel attaching bracket to the quarter inner panel.

(14) Remove the two screws that secure the bottom of the quarter trim panel attaching bracket to the rear heater-A/C unit housing.

(15) Remove the rear heater distribution duct from the right quarter inner panel. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER DISTRIBUTION DUCT - REMOVAL).

(16) Take the proper precautions to protect the carpeting below the rear heater core from spilled engine coolant and have absorbent toweling readily available to clean up any spills.

(17) Disconnect the heater hoses at the rear heater core. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/HEATER HOSE - REMOVAL).

(18) Install plugs in, or tape over the opened heater core fittings and both heater hoses.

(19) Use absorbent toweling to mop up any engine coolant spills from the preceding operation.

(20) Remove the screw that secures the back of the rear heater-A/C unit housing to the right D-pillar (Fig. 8).

(21) Remove the screw that secures the front of the rear heater-A/C unit housing to the right quarter inner panel.

(22) Lift the rear heater-A/C unit housing up far enough for the lower mounting studs and the evaporator extension lines to clear the mounting holes in the rear floor panel.

(23) Remove the rear heater-A/C unit housing from the vehicle.

(24) Use absorbent toweling to mop up any engine coolant spills from the preceding operation.

INSTALLATION

NOTE: If the rear heater core or the rear heater-A/C housing have been removed from the vehicle for service, the rear heater core may be pre-filled with the proper engine coolant mixture prior to reconnecting the heater hoses to the heater core hose fittings. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - REAR/HEATER CORE - STANDARD PROCEDURE - HEATER CORE FILLING).

(1) Position the rear heater-A/C unit housing into the vehicle with the evaporator extension line sealing plate inserted into the rectangular hole in the rear floor panel behind the right rear wheel house.

(2) Align the rear heater-A/C unit housing lower mounting studs with the mounting holes in the rear floor panel and lower the unit to the floor.

(3) Install and tighten the screw that secures the front of the rear heater-A/C unit housing to the right quarter inner panel. Tighten the screw to 11 N·m (97 in. lbs.).

(4) Install and tighten the screw that secures the back of the rear heater-A/C unit housing to the right D-pillar. Tighten the screw to 11 N·m (97 in. lbs.).

(5) Remove the plugs or tape from both heater core fittings and both heater hoses.

(6) Reconnect the heater hoses to the rear heater core. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/HEATER HOSE - INSTALLATION).

(7) Reinstall the rear heater distribution duct onto the right quarter inner panel. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER DISTRIBUTION DUCT - INSTALLATION).

REAR HEATER-A/C HOUSING (Continued)

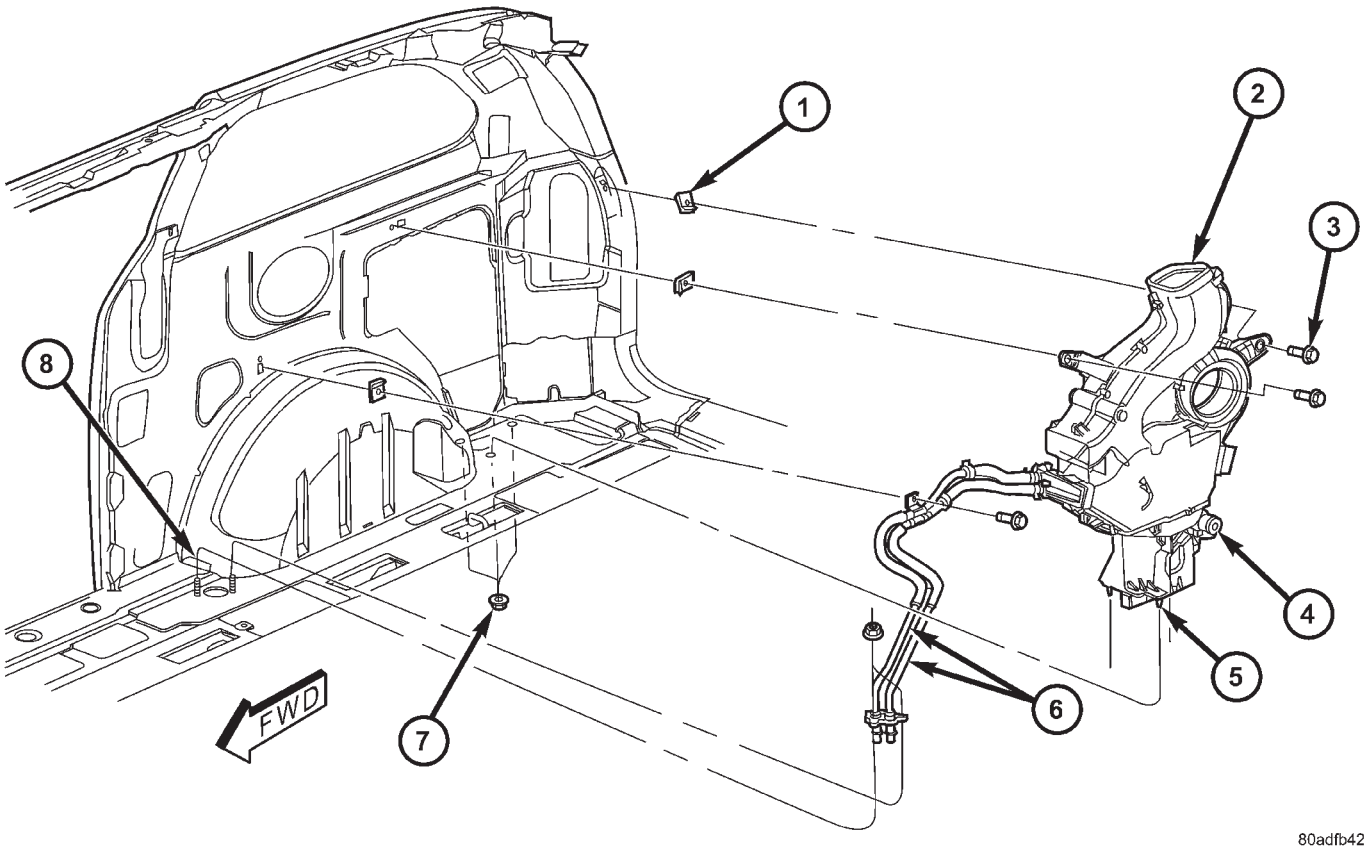

Fig. 8 Rear Heater-A/C Housing

1 - U-NUT (3)	5 - STUD (3)
2 - REAR HEATER-A/C HOUSING	6 - HEATER LINES
3 - SCREW (3)	7 - NUT (5)
4 - EXPANSION VALVE	8 - STUD (2)

(8) Install and tighten the two screws that secure the bottom of the quarter trim panel attaching bracket to the rear heater-A/C unit housing. Tighten the screws to 1.7 N·m (15 in. lbs.).

(9) Install and tighten the two screws that secure the top of the quarter trim panel attaching bracket to the quarter inner panel.

(10) Reconnect the body wire harness connector for the rear heater-A/C unit housing to the rear HVAC wire harness connector located near the expansion valve at the back of the unit.

(11) Reinstall the auxiliary A/C distribution duct onto the rear heater-A/C unit and the rear roof duct. (Refer to 24 - HEATING & AIR CONDITIONING/ DISTRIBUTION - REAR/AUXILIARY A/C DISTRIBUTION DUCT - INSTALLATION).

(12) Reinstall the right quarter trim panel and right D-pillar trim panel onto the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

(13) Raise and support the vehicle.

(14) Install and tighten the three nuts that secure the rear heater-A/C unit mounting studs to the rear floor panel behind the right rear wheel housing. Tighten the nuts to 9 N·m (80 in. lbs.).

(15) Remove the tape or plugs from the underbody liquid line and suction line fittings and both ports in the rear heater-A/C unit evaporator extension line sealing plate that extends through the rear floor panel behind the right rear wheel housing.

(16) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the liquid line and suction line fittings.

(17) Reconnect the underbody refrigerant line sealing plate to the evaporator extension line sealing plate.

(18) Install and tighten the screw that secures the underbody refrigerant line sealing plate to the evaporator extension line sealing plate. Tighten the screw to 23 N·m (17 ft. lbs.).

(19) Lower the vehicle.

(20) Reconnect the battery negative cable.

REAR HEATER-A/C HOUSING (Continued)

(21) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

(22) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(23) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

(24) Run the HVAC Cooldown test to verify proper operation(Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING).

REAR HEATER DISTRIBUTION DUCT

REMOVAL

(1) Remove the trim from the right quarter inner panel. (Refer to 23 - BODY/INTERIOR/RIGHT QUARTER TRIM PANEL - REMOVAL).

(2) Remove the two screws that secure the rear heater distribution duct to the right quarter inner panel (Fig. 9).

(3) Slide the rear heater distribution duct forward far enough to disengage it from the outlet on the front of the rear heater-air conditioner unit housing.

(4) Remove the rear heater distribution duct from the vehicle.

INSTALLATION

(1) Align the inlet end of rear heater distribution duct with the outlet on the front of the rear heater-air conditioner unit housing.

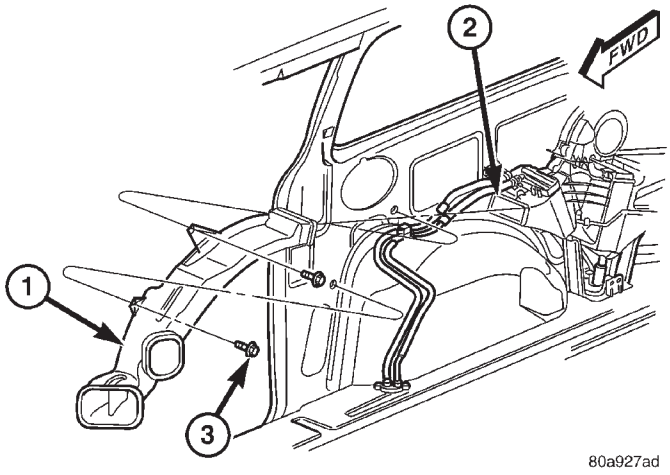

Fig. 9 Rear Heater Distribution Duct

1 - REAR HEATER DISTRIBUTION DUCT
2 - REAR HEATER-A/C UNIT OUTLET
3 - SCREW (2)

(2) Slide the rear heater distribution duct rearward far enough to fully engage the inlet end of the duct with the outlet on the front of the rear heater-air conditioner unit housing.

(3) Install and tighten the two screws that secure the rear heater distribution duct to the right quarter inner panel. Tighten the screws to 1.6 N·m (14 in. lbs.).

(4) Reinstall the trim onto the right quarter inner panel. (Refer to 23 - BODY/INTERIOR/RIGHT QUARTER TRIM PANEL - INSTALLATION).

WARNING

WARNING

WARNING: DO NOT OPERATE DCHA IN AN ENCLOSED AREA SUCH AS A GARAGE THAT DOES NOT HAVE EXHAUST VENTILATION FACILITIES. ALWAYS VENT THE DCHA'S EXHAUST WHEN OPERATING THE DCHA. FAILURE TO FOLLOW THESE INSTRUCTION MAY RESULT IN PERSONAL INJURY OR DEATH.
ALLOW THE DCHA ASSEMBLY TO COOL BEFORE PERFORMING A COMPONENT INSPECTION/REPAIR/REPLACEMENT. FAILURE TO FOLLOW THESE INSTRUCTIONS MY RESULT IN PERSONAL INJURY. VERIFY THAT ALL DCHA FUEL LINES ARE SECURELY FASTENED TO THEIR RESPECTIVE COMPONENTS BEFORE THIS PROCEDURE.

WARNING

WARNING:: THE ENGINE COOLING SYSTEM IS DESIGNED TO DEVELOP INTERNAL PRESSURES OF 97 TO 123 KILOPASCALS (14 TO 18 POUNDS PER SQUARE INCH). DO NOT REMOVE OR LOOSEN THE COOLANT PRESSURE CAP, CYLINDER BLOCK DRAIN PLUGS, RADIATOR DRAIN, RADIATOR HOSES, HEATER HOSES, OR HOSE CLAMPS WHILE THE SYSTEM IS HOT AND UNDER PRESSURE. FAILURE TO OBSERVE THIS WARNING CAN RESULT IN SERIOUS BURNS FROM THE HEATED ENGINE COOLANT. ALLOW THE VEHICLE TO COOL FOR A MINIMUM OF 15 MINUTES BEFORE OPENING THE COOLING SYSTEM FOR SERVICE.

WARNING: THE ENGINE COOLING SYSTEM CONTAINS ANTIFREEZE. ANTIFREEZE IS AN ETHYLENE GLYCOL BASED COOLANT AND IS HARMFUL IF SWALLOWED OR IF THE VAPORS ARE INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF VAPORS ARE INHALED, MOVE TO AN AREA FOR FRESH AIR. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN.

WARNING: DISPOSE OF ETHYLENE GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR A LOCAL GOVERNMENT AGENCY FOR THE LOCATION OF AN APPROVED ETHYLENE GLYCOL COLLECTION AND/OR RECYCLING CENTER IN YOUR AREA.

WARNING - A/C PLUMBING

WARNING:: THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.

WARNING: AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.

WARNING: DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.

WARNING: IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION.

WARNING: THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.

WARNING: THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

PLUMBING - FRONT (Continued)

CAUTION - A/C PLUMBING

CAUTION:: Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.

CAUTION: R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.

CAUTION: Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result. All parts, tools, and equipment must be designed for R-134a refrigerant.

CAUTION: Do not discharge refrigerant into the atmosphere. Use an R-134a refrigerant recovery/recycling device that meets SAE Standard J2210.

CAUTION: The refrigerant must be recovered completely from the system before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. If any pressure is noticed as a fitting is loosened, tighten the fitting and recover the refrigerant from the system again.

CAUTION: The refrigerant system must always be evacuated before charging.

CAUTION: Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.

CAUTION: Do not open the refrigerant system or remove the sealing caps from a replacement component until it is to be installed. This will prevent contamination in the system.

CAUTION: Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

CAUTION: When it is necessary to open the refrigerant system, have everything needed to service the system ready. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug to prevent the entrance of dirt and moisture. The refrigerant system should not be left open to the atmosphere any longer than necessary.

CAUTION: Before connecting an open refrigerant fitting, always install a new seal or gasket. All fittings with O-rings need to be coated with refrigerant oil before installation. Use only O-rings that are the correct size and approved for use with R-134a refrigerant. Failure to do so may result in a leak. Coat the fitting and seal with clean refrigerant oil before connecting. Unified plumbing connections with gaskets cannot be serviced with O-rings. The gaskets are not reusable and new gaskets do not require lubrication before installing.

CAUTION: When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. Sharp bends will reduce the flow of refrigerant.

CAUTION: Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line. The flexible hose lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold. Inspect all flexible refrigerant system hose lines at least once a year to make sure they are in good condition and properly routed.

CAUTION: High pressures are produced in the refrigerant system when it is operating. Extreme care must be exercised to make sure that all refrigerant system connections are pressure tight.

CAUTION: Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.

CAUTION: When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

PLUMBING - FRONT (Continued)

CAUTION: All tools, including the refrigerant recycling equipment, the manifold gauge set, and test hoses should be kept clean and dry. Keep the work area clean. Contamination of the refrigerant system through careless work habits must be avoided. The refrigerant system will remain chemically stable as long as pure, moisture-free R-134a refrigerant and refrigerant oil is used. Dirt, moisture, or air can upset this chemical stability. Operational troubles or serious damage can occur if foreign material is introduced to the refrigerant system.

COMPRESSOR

DESCRIPTION

The compressor used on this vehicle can be one of two models, depending upon the air conditioning system in the vehicle. All vehicles use the Nippondenso 10S20 compressor. This compressor use an aluminum swash plate, teflon coated pistons and aluminum sleeveless cylinder walls. This compressor includes an integral high pressure relief valve. The compressor is secured low in the right front corner of the engine compartment to a mounting bracket on the cylinder block (2.4L engine), or directly to the cylinder block (3.3L and 3.8L engines) is integral to the compressor. This compressor cannot be repaired. If faulty or damaged, the entire compressor must be replaced. The compressor clutch, pulley, and clutch coil are available for service replacement.

OPERATION

The compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant. The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor. The compressor pumps high-pressure refrigerant vapor to the condenser through the compressor discharge port. The mechanical high pressure relief valve is designed to vent refrigerant from the system to protect against damage to the compressor or other system components, caused by condenser air flow restrictions or an overcharge of refrigerant. The valve only vents enough refrigerant to reduce the system pressure, then re-seats itself. The valve opens at a discharge pressure of 3445 to 4135 kPA (500 to 600 psi) or above, and closes when a minimum discharge pressure of 2756 kPa (400 psi) is reached.

DIAGNOSIS AND TESTING - COMPRESSOR NOISE DIAGNOSIS

Excessive noise while the air conditioning compressor is operating can be caused by loose compressor mounts, a loose compressor clutch, or high operating pressures in the refrigerant system. Verify compressor drive belt condition, proper compressor mounting, correct refrigerant charge level, and compressor head pressure before compressor repair is performed.

With the close tolerances within the compressor, it is possible to experience a temporary lockup. The longer the compressor is inactive, the more likely the condition is to occur. This condition is the result of normal refrigerant migration within the refrigerant system caused by ambient temperature changes. The refrigerant migration may wash the refrigerant oil out of the compressor.

NOTE: Prior to a vehicle being removed from service or stored for more than two weeks, the compressor should be operated to ensure adequate refrigerant oil distribution throughout the system components. Turn on the air conditioner for a minimum of five minutes with outside air and the highest blower speed selected.

BELT NOISE

If the compressor drive belt slips at initial start-up, it does not necessarily mean the compressor has failed. The following procedure can be used to identify a compressor drive belt noise problem.

- Start the vehicle and run at idle.
- Turn the air conditioner On and listen for belt squeal.
- If belt squeal is heard, turn the air conditioner Off immediately.

If the belt squeal stops when the air conditioner is turned Off, perform the following repair procedures.

(1) Using an appropriate sized oil filter wrench or a strap wrench, grasp the outer diameter of the compressor clutch hub. While facing the compressor, rotate the hub clockwise, then counterclockwise. If the hub rotates, proceed to the next step. If the hub will not rotate, the compressor is internally damaged, and must be replaced.

(2) Turn the hub clockwise five complete revolutions and remove the tool.

(3) Start the vehicle and run at idle.

(4) Turn the air conditioner On. Observe the compressor and the system for normal operation, noting cooling performance and noise levels. Operate for five minutes before turning the air conditioner Off. If acceptable cooling performance is observed during compressor operation, the compressor does not need to be replaced.

COMPRESSOR (Continued)

(5) Inspect the drive belt for wear, damage, and proper tension. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING).

REMOVAL

REMOVAL - COMPRESSOR

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Disconnect and isolate the battery negative cable.

(3) Remove the nut that secures the suction line fitting to the top of the compressor.

(4) Disconnect the suction line fitting from the compressor suction port.

(5) Remove the seal from the suction line fitting and discard.

(6) Install plugs in, or tape over the opened suction line fitting and the compressor suction port.

(7) Remove the nut that secures the discharge line fitting to the top of the compressor.

(8) Disconnect the discharge line fitting from the compressor discharge port.

(9) Remove the seal from the discharge line fitting and discard.

(10) Install plugs in, or tape over the opened discharge line fitting and the compressor discharge port.

(11) Raise and support the vehicle.

(12) Remove the serpentine accessory drive belt from the front of the engine. (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - 2.4L - REMOVAL) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - 3.3L/3.8L - REMOVAL).

(13) Disconnect the engine wire harness connector for the compressor clutch coil from the coil pigtail wire connector on the top of the compressor (Fig. 1) or (Fig. 2).

(14) On models with the 3.3L and 3.8L engines, disengage the retainer on the engine wire harness compressor clutch coil take out from the bracket on the top of the compressor.

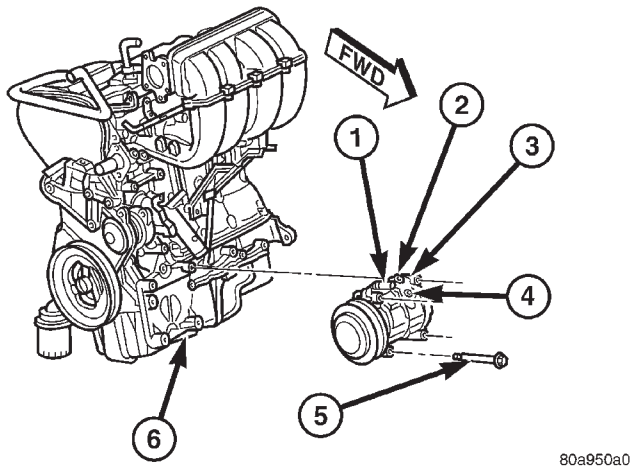

Fig. 1 Compressor - 2.4L Engine

5 - SUCTION PORT
6 - COMPRESSOR
7 - SCREW
8 - NUT

(15) On models with the 2.4L engine, remove the four screws that secure the compressor to the mounting bracket on the engine.

(16) On models with the 3.3L and 3.8L engines, remove the three screws and one nut that secure the compressor to the engine.

COMPRESSOR (Continued)

(17) Remove the compressor from the engine compartment.

NOTE: If a replacement compressor is being installed, be certain to drain and measure the refrigerant oil contained in the removed compressor. This will determine how much oil the replacement compressor must contain before it is installed. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

REMOVAL - COMPRESSOR MOUNTING BRACKET - 2.4L ENGINE

(1) Remove the compressor from the mounting bracket. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR - REMOVAL).

(2) Remove the four screws that secure the compressor mounting bracket to the engine (Fig. 3).

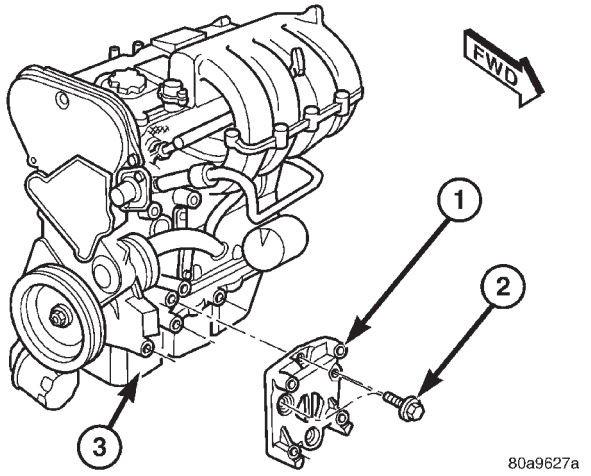

Fig. 3 Compressor Mounting Bracket - 2.4L Engine

1 - MOUNTING BRACKET
2 - SCREWS (4)
3 - ENGINE

(3) Remove the compressor mounting bracket from the engine.

INSTALLATION

INSTALLATION - COMPRESSOR

NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Position the compressor into the engine compartment.

(2) On models with the 2.4L engine, loosely install the four screws that secure the compressor to the mounting bracket on the engine. Tighten the screws to 28 N·m (21 ft. lbs.).

(3) On models with the 3.3L and 3.8L engines, loosely install the three screws and one nut that secure the compressor to the engine. Tighten each of the fasteners using the following sequence to 54 N·m (40 ft. lbs.).

- The upper screw at the rear of the compressor.
- The lower screw at the rear of the compressor.
- The lower screw at the front of the compressor.
- The upper nut at the front of the compressor.

(4) On models with the 3.3L and 3.8L engines only, engage the retainer on the engine wire harness compressor clutch coil take out with the bracket on the top of the compressor.

(5) Reconnect the engine wire harness connector for the compressor clutch coil to the coil pigtail wire connector on the top of the compressor.

(6) Reinstall the serpentine accessory drive belt onto the front of the engine. (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - 2.4L - INSTALLATION) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - 3.3L/3.8L - INSTALLATION).

(7) Lower the vehicle.

(8) Remove the tape or plugs from the compressor discharge port and the discharge line fitting.

(9) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting.

(10) Reconnect the discharge line fitting to the compressor discharge port.

(11) Install and tighten the nut that secures the discharge line fitting to the compressor. Tighten the nut to 23 N·m (17 ft. lbs.).

(12) Remove the tape or plugs from the compressor suction port and the suction line fitting.

(13) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the suction line fitting.

(14) Reconnect the suction line fitting to the compressor suction port.

(15) Install and tighten the nut that secures the suction line fitting to the compressor. Tighten the nut to 23 N·m (17 ft. lbs.).

(16) Reconnect the battery negative cable.

(17) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(18) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

COMPRESSOR (Continued)

FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

INSTALLATION - COMPRESSOR MOUNTING BRACKET - 2.4L ENGINE

(1) Position the compressor mounting bracket onto the engine.

(2) Install and tighten the four screws that secure the compressor mounting bracket to the engine. Tighten the screws to 54 N·m (40 ft. lbs.).

(3) Reinstall the compressor onto the mounting bracket. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR - INSTALLATION).

CONDENSER

DESCRIPTION

The condenser is integral to a cooling module which includes the radiator, the electric cooling fan, the fan shroud, air seals and an automatic transmission oil cooler. The cooling module is located in the air flow in the front of the engine compartment behind the radiator grille. The condenser cannot be repaired or adjusted and, if faulty or damaged, it must be replaced. The condenser may be removed from the cooling module for service without removing the cooling module from the vehicle.

OPERATION

The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins. When the refrigerant gas gives up its heat, it condenses. When the refrigerant leaves the condenser, it has become a high-pressure liquid refrigerant. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air conditioning system. Therefore, it is important that there are no objects placed in front of the radiator grille openings in the front of the vehicle or foreign material on the condenser fins that might obstruct air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or condenser service.

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTION - A/C PLUMBING).

NOTE: Before removing the condenser, note the location of each of the radiator and condenser air seals. These air seals are used to direct air through the condenser and radiator. The air seals must be reinstalled in their proper locations in order for the air conditioning and engine cooling systems to perform as designed.

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Remove the two large screws that secure the front fascia and the outboard ends of the radiator sight shield to the radiator closure panel crossmember (Fig. 4).

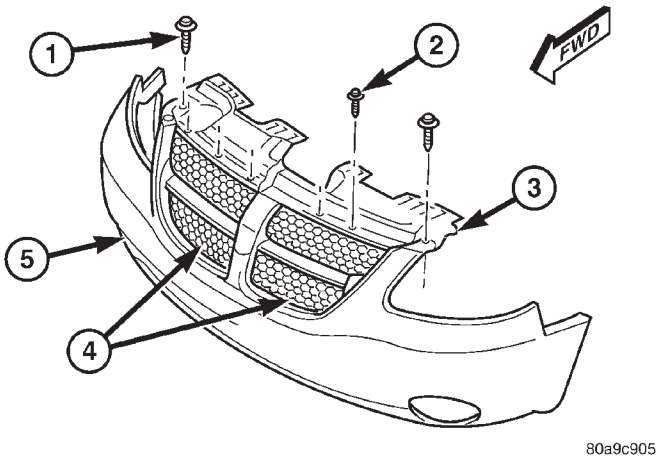

Fig. 4 Radiator Sight Shield

1 - LARGE SCREWS (2)
2 - SMALL SCREWS (5)
3 - RADIATOR SIGHT SHIELD
4 - GRILLE INSERTS
5 - FRONT FASCIA

(3) Remove the five small screws that secure the front fascia grille inserts to the radiator sight shield.

(4) Remove the radiator sight shield from the radiator closure panel crossmember.

(5) Remove the two screws that secure the hood latch unit to the front of the radiator closure panel crossmember and move the latch out of the way over the top of the crossmember. Mark the location of latch for reinstallation.

(6) Disconnect the hoses from the transmission oil cooler fittings on the left side of the cooling module. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER LINES - REMOVAL).

(7) Remove the nut that secures the discharge line fitting to the condenser on the right side of the cooling module.

CONDENSER (Continued)

(8) Disconnect the discharge line fitting from the condenser inlet port.

(9) Remove the seal from the discharge line fitting and discard.

(10) Install plugs in, or tape over the opened discharge line fitting and the condenser inlet port.

(11) Remove the nut that secures the liquid line fitting to the condenser on the right side of the cooling module.

(12) Disconnect the liquid line fitting from the condenser outlet port.

(13) Remove the seal from the liquid line fitting and discard.

(14) Install plugs in, or tape over the opened liquid line fitting and the condenser outlet port.

(15) Remove the screw that secures the top of the mounting bracket on each side of the condenser to the cooling module (Fig. 5).

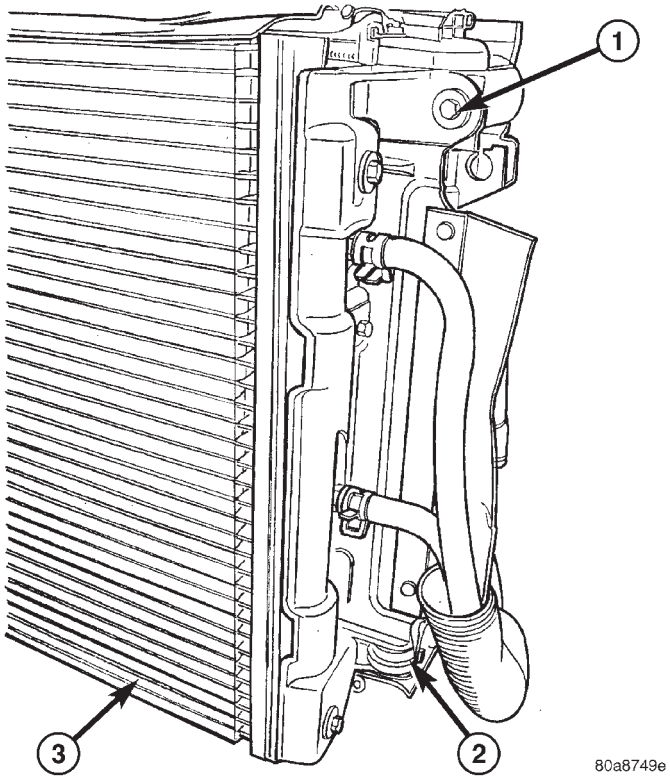

Fig. 5 Condenser Mounting

1 - SCREW (2)
2 - LOWER MOUNT ISOLATOR (2)
3 - CONDENSER

(16) Lift the condenser, transmission oil cooler, and mounting brackets as a unit far enough to disengage the locating pin that secures the mounting brackets in the lower mount rubber isolators on each side of the cooling module.

(17) Remove the condenser, transmission oil cooler, and mounting brackets from the vehicle as a unit.

(18) Remove the two screws that secure each mounting bracket to the sides of the condenser.

(19) Remove the one screw that secures the left mounting bracket to the side of the transmission oil cooler.

(20) Remove the left mounting bracket from the side of the condenser and transmission oil cooler.

(21) Remove the condenser from the right mounting bracket and transmission oil cooler unit.

INSTALLATION

NOTE: If the condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

NOTE: Be certain that each of the radiator and condenser air seals are reinstalled in their proper locations. These air seals are required in order for the air conditioning and engine cooling systems to perform as designed.

(1) Position the condenser to the right mounting bracket and transmission oil cooler unit.

(2) Position the left mounting bracket onto the side of the condenser and transmission oil cooler.

(3) Install and tighten the one screw that secures the left mounting bracket to the side of the transmission oil cooler. Tighten the screw to 5 N·m (45 in. lbs.).

(4) Install and tighten the two screws that secure each mounting bracket to the sides of the condenser. Tighten the screws to 5 N·m (45 in. lbs.).

(5) Position the condenser, transmission oil cooler, and mounting brackets into the vehicle as a unit. Be certain that the locating pins that secure the mounting brackets are engaged in the lower mount rubber isolators on each side of the cooling module.

NOTE: Verify that the condensor isolators are all installed and positioned correctly.

(6) Install and tighten the two screws that secure the top of the mounting bracket on each side of the condenser to the cooling module. Tighten the screws to 5 N·m (45 in. lbs.).

(7) Remove the tape or plugs from the condenser outlet port and the liquid line fitting.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting.

(9) Reconnect the liquid line fitting to the condenser outlet port on the right side of the cooling module.

CONDENSER (Continued)

(10) Install and tighten the nut that secures the liquid line fitting to the condenser. Tighten the nut to 23 N·m (17 ft. lbs.).

(11) Remove the tape or plugs from the condenser inlet port and the discharge line fitting.

(12) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting.

(13) Reconnect the discharge line fitting to the condenser inlet port on the right side of the cooling module.

(14) Install and tighten the nut that secures the discharge line fitting to the condenser. Tighten the nut to 23 N·m (17 ft. lbs.).

(15) Reconnect the hoses to the transmission oil cooler fittings on the left side of the cooling module. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER LINES - INSTALLATION).

(16) Reposition the hood latch unit to the front of the radiator closure panel crossmember.

(17) Install and tighten the two screws that secure the hood latch unit to the front of the radiator closure panel crossmember. Check and adjust the hood latch as needed. Tighten the screws to 14 N·m (123 in. lbs.).

(18) Position the radiator sight shield onto the radiator closure panel crossmember.

(19) Install and tighten the five small screws that secure the front fascia grille inserts to the radiator sight shield. Tighten the screws to 2 N·m (18 in. lbs.).

(20) Install and tighten the two large screws that secure the front fascia and the outboard ends of the radiator sight shield to the radiator closure panel crossmember. Tighten the screws to 6 N·m (53 in. lbs.).

(21) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(22) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

DISCHARGE LINE

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Remove the two large screws that secure the front fascia and the outboard ends of the radiator sight shield to the radiator closure panel crossmember (Fig. 6).

INSTALLATION

(1) Position the discharge line into the engine compartment.

(2) Remove the tape or plugs from the compressor discharge port and the discharge line fitting.

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting.

(4) Reconnect the discharge line fitting to the compressor discharge port on the top of the compressor.

(5) Install and tighten the nut that secures the discharge line fitting to the compressor. Tighten the nut to 23 N·m (17 ft. lbs.).

(6) Remove the tape or plugs from the condenser inlet port and the discharge line fitting.

(7) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting.

(8) Reconnect the discharge line fitting to the condenser inlet port on the right side of the cooling module.

(9) Install and tighten the nut that secures the discharge line fitting to the condenser. Tighten the nut to 23 N·m (17 ft. lbs.).

(10) Position the radiator sight shield onto the radiator closure panel crossmember.

(11) Install and tighten the five small screws that secure the front fascia grille inserts to the radiator sight shield. Tighten the screws to 2 N·m (18 in. lbs.).

(12) Install and tighten the two large screws that secure the front fascia and the outboard ends of the radiator sight shield to the radiator closure panel crossmember. Tighten the screws to 6 N·m (53 in. lbs.).

(13) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(14) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

EVAPORATOR

DESCRIPTION

The evaporator is located in the heater-A/C unit housing, behind the instrument panel. The evaporator is positioned in the heater-A/C housing so that all air that enters the housing must pass over the fins of the evaporator before it is distributed through the system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator tubes. The heater-A/C unit housing must be removed from the vehicle to access the evaporator for service. The evaporator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

Refrigerant enters the evaporator from the expansion valve as a low-temperature, low-pressure liquid/vapor mixture. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins,

EVAPORATOR (Continued)

and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the evaporator.

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - HEATER PLUMBING).

(1) Remove the HVAC unit housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HVAC HOUSING - REMOVAL).

(2) Remove the heater core tubes from the heater core. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/HEATER CORE - REMOVAL - HEATER CORE TUBES).

(3) Remove and discard the foam seal from the HVAC housing seal flange around the fresh air inlet opening and the expansion valve/evaporator tube opening on the dash panel side of the unit.

(4) Remove the expansion valve from the evaporator inlet and outlet tube fittings. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/EXPANSION VALVE - REMOVAL).

(5) Disconnect the HVAC wire harness connector for the blower motor from the motor connector receptacle on the bottom of the outboard end of the evaporator housing.

(6) Disengage the HVAC wire harness from the routing clips molded into the outside of the HVAC housing components.

(7) Remove the three screws from the dash panel side of the unit that secure the top of the distribution housing to the inboard end of the evaporator housing (Fig. 9).

(8) Pull the top of the distribution housing away from the evaporator housing far enough to disengage the two hook formations on the bottom of the distribution housing from the two receptacles on the evaporator housing (Fig. 10).

(9) Remove the two screws that secure the upper intake air housing to the lower intake air housing.

(10) Remove the three screws that secure the upper intake air housing to the top of the outboard end of the evaporator housing. Be certain not to miss the screw located just inside the inboard side of the fresh air intake opening.

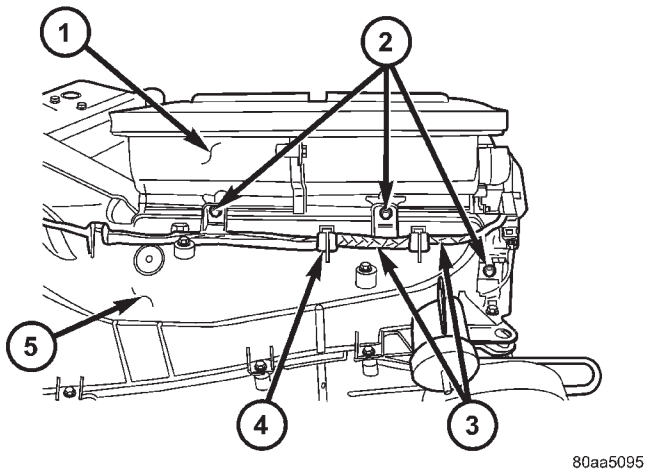

Fig. 9 HVAC Housing

5 - EVAPORATOR HOUSING

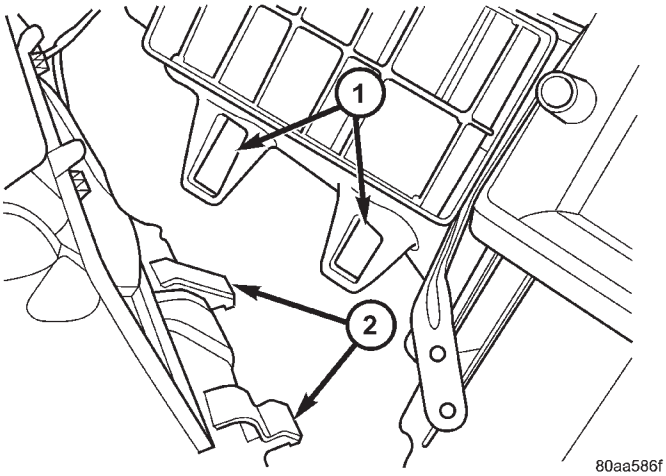

Fig. 10 Distribution Housing Hooks

1 - RECEPTACLES ON EVAPORATOR HOUSING
2 - HOOKS ON DISTRIBUTION HOUSING

(11) Remove the upper intake air housing from the top of the evaporator housing to expose the recirculation air door and the blower wheel housing (Fig. 11).

(12) Remove the two screws that secure the upper half of the recirculation air door to the lower half of the door.

(13) Remove the upper half of the recirculation air door from the lower half of the door (Fig. 12).

(14) Remove the twelve screws around the perimeter of the evaporator housing that secure the upper housing half to the lower half.

EVAPORATOR (Continued)

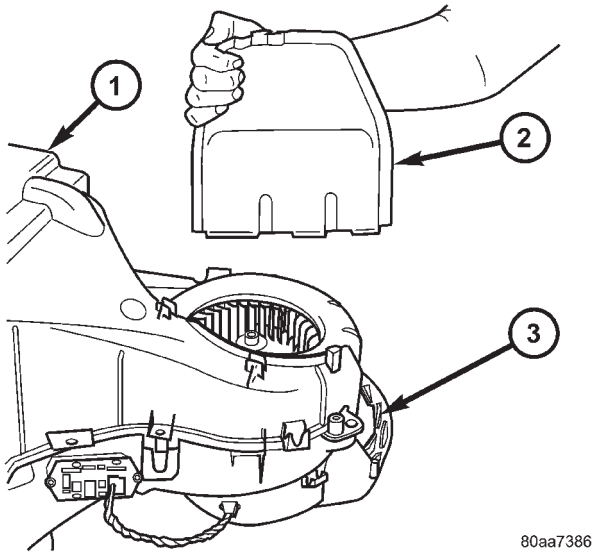

Fig. 12 Recirculation Air Door

1 - EVAPORATOR HOUSING
2 - UPPER RECIRCULATION AIR DOOR
3 - LOWER INTAKE AIR HOUSING

(15) Carefully separate and remove the upper half of the evaporator housing from the lower half. Be certain not to lose the rubber grommet for the HVAC wire harness evaporator temperature sensor take out. This grommet is located on the inboard side of the flange around the expansion valve/evaporator tube opening on the dash panel side of the unit, where it is captured in a notched area between the upper and lower housing halves (Fig. 13).

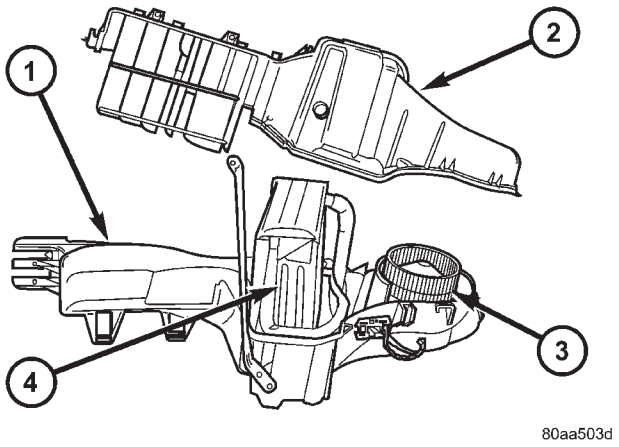

Fig. 13 Evaporator Housing

1 - LOWER EVAPORATOR HOUSING
2 - UPPER EVAPORATOR HOUSING
3 - BLOWER WHEEL
4 - EVAPORATOR

(16) Carefully lift the evaporator and its foam wrap out of the lower half of the evaporator housing as a unit. Be certain not to lose the clam shell type rubber seal that is fitted to the evaporator inlet and outlet tubes where they exit the evaporator housing.

INSTALLATION

NOTE: If the evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Carefully lower the evaporator and its foam wrap into the lower half of the evaporator housing as a unit. Be certain that the clam shell type rubber seal is fitted to the evaporator inlet and outlet tubes where they exit the evaporator housing.

(2) Position the upper half of the evaporator housing onto the lower half. Be certain that the rubber grommet and the HVAC wire harness take out for the evaporator temperature sensor are captured in the notched area between the upper and lower housing halves.

(3) Install and tighten the twelve screws around the perimeter of the evaporator housing that secure the upper housing half to the lower half. Tighten the screws to 2 N·m (18 in. lbs.).

(4) Position the upper half of the recirculation air door onto the lower half of the door.

(5) Install and tighten the two screws that secure the upper half of the recirculation air door to the

EVAPORATOR (Continued)

lower half of the door. Tighten the screws to 2 N·m (18 in. lbs.).

(6) Position the upper intake air housing onto the top of the evaporator housing over the recirculation air door and the blower wheel housing. Be certain that the upper pivot of the recirculation air door is captured in the pivot receptacle of the upper intake air housing.

(7) Install and tighten the three screws that secure the upper intake air housing to the top of the outboard end of the evaporator housing. Be certain not to miss the screw located just inside the inboard side of the fresh air intake opening. Tighten the screws to 2 N·m (18 in. lbs.).

(8) Install and tighten the two screws that secure the upper intake air housing to the lower intake air housing. Tighten the screws to 2 N·m (18 in. lbs.).

(9) Engage the two hook formations on the bottom of the distribution housing in the two receptacles on the evaporator housing.

(10) Roll the top of the distribution housing up into position against the evaporator housing.

(11) Install and tighten the three screws from the dash panel side of the unit that secure the top of the distribution housing to the inboard end of the evaporator housing. Tighten the screws to 2 N·m (18 in. lbs.).

(12) Engage the HVAC wire harness in the routing clips molded into the outside of the HVAC housing components.

(13) Reconnect the HVAC wire harness connector for the blower motor with the motor connector receptacle on the bottom of the outboard end of the evaporator housing.

(14) Reinstall the expansion valve onto the evaporator inlet and outlet tube fittings. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/EXPANSION VALVE - INSTALLATION).

(15) Install a new foam seal onto the HVAC housing seal flange around the fresh air inlet opening and the expansion valve/evaporator tube opening on the dash panel side of the unit.

(16) Reinstall the heater core tubes into the heater core. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/HEATER CORE - INSTALLATION - HEATER CORE TUBES).

(17) Reinstall the HVAC unit housing into the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HVAC HOUSING - INSTALLATION).

(18) Run the HVAC Control Actuator Calibration procedure(Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING)(Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING).

EXPANSION VALVE

DESCRIPTION

The front “H” valve-type thermal expansion valve (TXV) is located at the dash panel between the liquid and suction lines, and the evaporator coil. The assembly consists of an H-valve body and a thermal sensor. High-pressure, low temperature liquid refrigerant from the liquid line passes through the expansion valve orifice, converting it into a low-pressure, low-temperature mixture of liquid and gas before it enters the evaporator coil. The expansion valve is a factory calibrated unit and cannot be adjusted or repaired. If faulty or damaged, the expansion valve must be replaced.

OPERATION

A mechanical sensor in the expansion valve control head monitors the temperature and pressure of the refrigerant leaving the evaporator coil through the suction line, and adjusts the orifice size at the liquid line to let the proper amount of refrigerant into the evaporator coil to meet the vehicle cooling requirements. Controlling the refrigerant flow through the evaporator ensures that none of the refrigerant leaving the evaporator is still in a liquid state, which could damage the compressor. The thermo sensor measures refrigerant suction gas temperature which is monitored by the a/c control assembly.

DIAGNOSIS AND TESTING - EXPANSION VALVE

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

NOTE: The expansion valve should only be tested following testing of the compressor.

NOTE: Liquid CO is required to test the expansion valve. This material is available from most welding supply facilities. Liquid CO is also available from companies which service and sell fire extinguishers.

When testing the expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

(1) Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.

EXPANSION VALVE (Continued)

(2) Close all doors, windows and vents to the passenger compartment.

(3) Set the heater-air conditioner controls so that the compressor is operating, the temperature control is in the highest temperature position, the mode door is directing the output to the floor outlets, and the blower is operating at the highest speed setting.

(4) Start the engine and allow it to idle at 1000 rpm. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the evaporator.

(5) If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 965 to 1655 kPa (140 to 240 psi). The suction (low pressure) gauge should read 140 kPa to 207 kPa (20 psi to 30 psi). If OK, go to Step 6. If not OK, replace the faulty expansion valve.

WARNING:
PROTECT THE SKIN AND EYES FROM EXPOSURE TO LIQUID CO. PERSONAL INJURY CAN RESULT.

(6) If the suction (low pressure) gauge reads within the specified range, freeze the expansion valve control head for 30 seconds using liquid CO or another suitable super-cold material.**Do not spray R-134a or R-12 refrigerant on the expansion valve control head for this test.** The suction (low pressure) gauge reading should drop by 10 psi. If OK, go to Step 7 If not OK, replace the faulty expansion valve.

(7) Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 140 kPa to 240 kPa (20 psi to 30 psi). If not OK, replace the faulty expansion valve.

(8) When expansion valve testing is complete, test the overall air conditioner performance. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST). Remove all test equipment before returning the vehicle to service.

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Disconnect and isolate the battery negative cable.

(3) Remove the air cleaner housing from the right side of the engine compartment.

(4) Disconnect the drain tube from the wiper module drain on the right side of the engine compartment.

(5) Disconnect the headlamp and dash wire harness connector for the A/C pressure transducer from the transducer on the front liquid line rear section (Fig. 14).

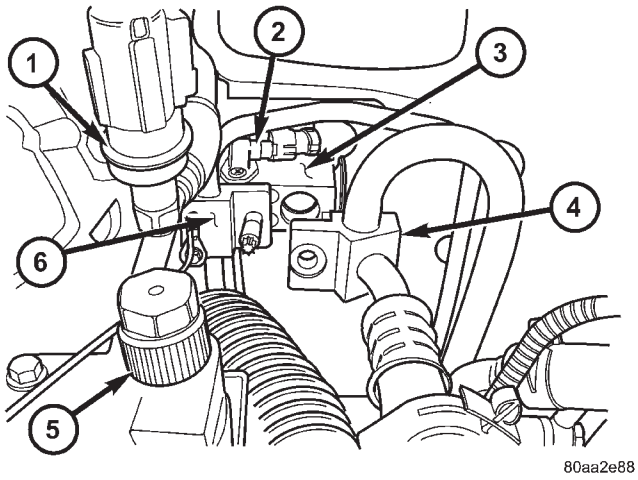

Fig. 14 Expansion Valve

1 - A/C PRESSURE TRANSDUCER
2 - EVAPORATOR TEMPERATURE SENSOR
3 - EXPANSION VALVE
4 - SUCTION LINE
5 - HIGH SIDE SERVICE PORT
6 - FRONT LIQUID LINE REAR SECTION

(6) Remove the screw that secures the front liquid line rear section fitting to the top of the filter-drier.

(7) Disconnect the liquid line fitting from the filter-drier outlet port.

(8) Remove the seal from the liquid line fitting and discard.

(9) Install plugs in, or tape over the opened liquid line fitting and the filter-drier outlet port.

(10) Remove the nut that secures the suction line and liquid line fittings to the stud on the expansion valve.

(11) Disconnect the suction line and liquid line fittings from the expansion valve and move the lines out of the way.

(12) Remove the seals from the suction line and liquid line fittings and discard.

(13) Install plugs in, or tape over the opened suction line and liquid line fittings and both expansion valve ports.

EXPANSION VALVE (Continued)

(14) Remove the two screws that secure the expansion valve to the evaporator tube tapping plate.

(15) Disconnect the HVAC wire harness connector for the evaporator temperature sensor from the sensor on the top of the expansion valve.

(16) Remove the expansion valve from the evaporator inlet and outlet tube fittings.

(17) Remove the seals from the evaporator inlet and outlet tube fittings and discard.

(18) Install plugs in, or tape over the opened evaporator inlet and outlet tube fittings and both expansion valve ports.

INSTALLATION

(1) Remove the tape or plugs from the evaporator inlet and outlet tube fittings and both ports on the back of the expansion valve.

(2) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator inlet and outlet tube fittings.

(3) Position the expansion valve onto the evaporator inlet and outlet tube fittings.

(4) Install and tighten the two screws that secure the expansion valve to the evaporator tube tapping plate plate. Tighten the screws to 11 N·m (97 in. lbs.).

(5) Reconnect the HVAC wire harness connector for the evaporator temperature sensor to the sensor connector receptacle on the top of the expansion valve.

(6) Remove the tape or plugs from the front liquid line rear section and suction line fittings for the expansion valve and both ports on the front of the expansion valve.

(7) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the front liquid line rear section and suction line fittings for the expansion valve.

(8) Reconnect the liquid line and suction line fittings to the expansion valve.

(9) Install and tighten the nut that secures the suction line and liquid line fittings to the stud on the expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).

(10) Remove the tape or plugs from the liquid line rear section fitting for the filter-drier and the filter-drier outlet port.

(11) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting.

(12) Reconnect the liquid line fitting to the filter-drier outlet port on the top of the filter-drier.

(13) Install and tighten the screw that secures the liquid line fitting to the filter-drier. Tighten the screw to 2 N·m (18 in. lbs.).

(14) Reconnect the headlamp and dash wire harness connector for the A/C pressure transducer to the transducer on the front liquid line rear section.

(15) Reconnect the drain tube to the wiper module drain on the right side of the engine compartment.

(16) Reinstall the air cleaner housing into the right side of the engine compartment.

(17) Reconnect the battery negative cable.

(18) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(19) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

HEATER CORE

DESCRIPTION

The heater core is located in the distribution housing of the heater-A/C unit, under the instrument panel. It is a heat exchanger made of rows of tubes and fins. One end of the core is fitted with a molded plastic tank that includes integral heater core inlet and outlet ports. The removable heater core tubes are held in place these ports by a sealing plate secured with a screw to the heater core tank. This removable heater core tube arrangement allows the heater core to be serviced without removing the heater-A/C unit housing from the vehicle. The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

Engine coolant is circulated through heater hoses to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend air door allows control of the heater output air temperature by controlling how much of the air flowing through the heater-A/C unit housing is directed through the heater core.

HEATER CORE (Continued)

REMOVAL

REMOVAL- HEATER CORE EXTENSION TUBES

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING FRONT - WARNING - HEATER PLUMBING).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Drain the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).

(2) Disconnect and isolate the battery negative cable.

(3) Disconnect the heater hoses from the heater hose tubes. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/HEATER HOSE - REMOVAL).

(4) Remove the silencer from beneath the driver side end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).

(5) Remove the three screws that secure the heater core shield to the left end of the HVAC distribution housing (Fig. 15).

(6) Pull the heater core shield rearward far enough to disengage the two location tabs that position the front of the shield to the receptacles in the two lower finger formations of the evaporator housing near the dash panel.

(7) Remove the heater core shield from the distribution housing.

(8) Take the proper precautions to protect the carpeting below the heater core from spilled engine coolant and have absorbent toweling readily available to clean up any spills.

(9) Remove the screw that secures the heater core tube sealing plate to the heater core supply and return ports (Fig. 16).

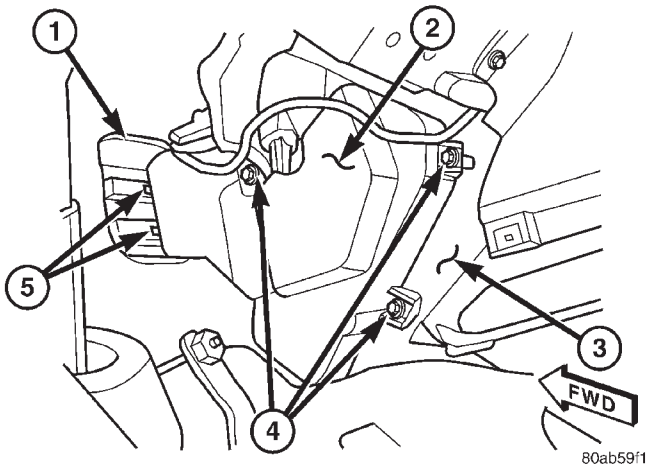

Fig. 15 Heater Core Shield

6 - SEALING PLATE

(10) Push both heater core tubes simultaneously toward the dash panel far enough to disengage their fittings from the heater core supply and return ports.

(11) Install plugs in, or tape over the opened heater core tube fittings and both heater core ports.

(12) Use absorbent toweling to mop up any engine coolant spills from the preceding operation.

(13) Pull both heater core tubes simultaneously slightly away from the distribution housing and rear-

HEATER CORE (Continued)

ward far enough to disengage the engine compartment ends of the tubes from the dash panel seal.

(14) Remove the heater core tubes and sealing plate as a unit from beneath the instrument panel.

(15) Use absorbent toweling to clean up any engine coolant spills from the preceding operation.

REMOVAL - HEATER CORE

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING FRONT - WARNING - HEATER PLUMBING).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Drain the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).

(2) Disconnect and isolate the battery negative cable.

(3) Remove the silencer boot fasteners located around the base of the lower steering shaft from the dash panel so that it may be pushed aside.

(4) Remove the brake lamp switch from its mounting bracket. (Refer to 8 - ELECTRICAL/LAMPS/ LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL).

(5) Disconnect the power brake booster input rod (push rod) from the pin on the brake pedal arm. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/POWER BRAKE BOOSTER - REMOVAL).

(6) Remove the three screws that secure the heater core shield to the left end of the HVAC distribution housing (Fig. 17).

(7) Pull the heater core shield rearward far enough to disengage the two location tabs that position the front of the shield to the receptacles in the two lower finger formations of the evaporator housing near the dash panel.

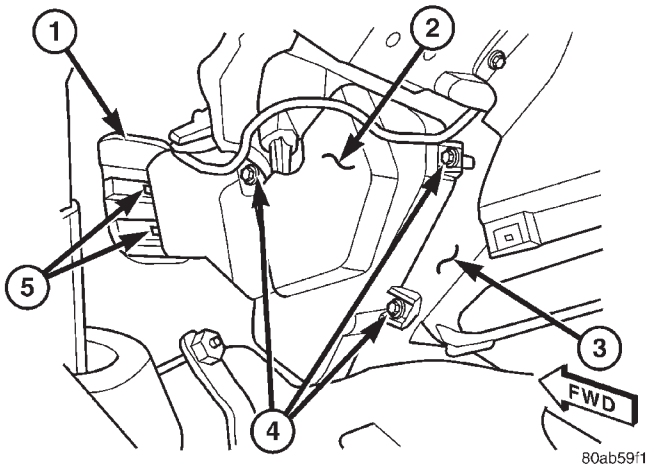

Fig. 17 Heater Core Shield

1 - HEATER/ AIR CONDITIONER HOUSING

HEATER CORE (Continued)

(11) Push both heater core tubes simultaneously toward the dash panel far enough to disengage their fittings from the heater core supply and return ports.

(12) Install plugs in, or tape over the opened heater core tube fittings and both heater core ports.

(13) Use absorbent toweling to mop up any engine coolant spills from the preceding operation.

(14) Remove the two screws that secure the heater core mounting plate to the distribution housing.

(15) While pulling the accelerator pedal upward (Fig. 19) and pushing the brake pedal downward (Fig. 20) far enough for clearance, pull the heater core out of the distribution housing.

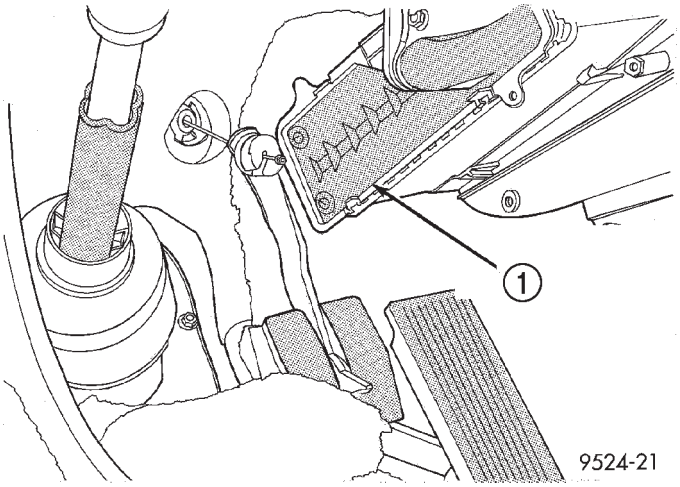

Fig. 19 Accelerator Pedal

1 - SLIDE HEATER CORE PAST ACCELERATOR PEDAL

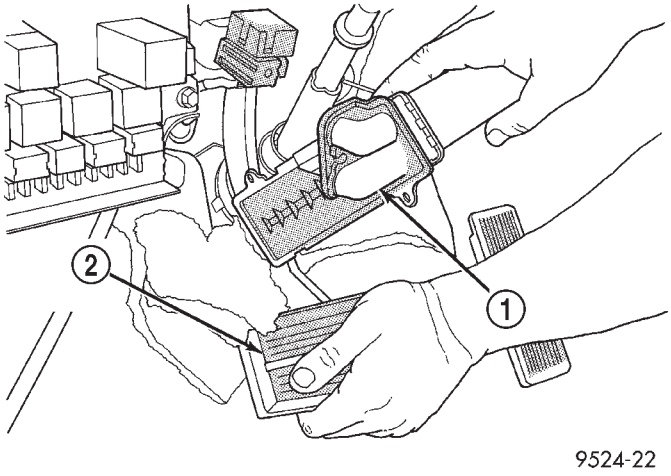

Fig. 20 Brake Pedal

1 - SLIDE HEATER CORE PAST BRAKE PEDAL
2 - DEPRESS BRAKE PEDAL

(16) Use absorbent toweling to mop up any engine coolant spills from the preceding operation. Also, if the heater core was leaking, use absorbent toweling and reach into the heater core opening to mop up any residual engine coolant within the distribution housing.

INSTALLATION

INSTALLATION- HEATER CORE EXTENSION TUBES

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING FRONT - WARNING - HEATER PLUMBING).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the plugs or tape from both heater core tube fittings and both heater core ports.

(2) Position the heater core tubes and sealing plate as a unit beneath the instrument panel.

(3) Align the engine compartment ends of both heater core tubes with the openings in the dash panel seal and push them simultaneously forward through the seal far enough to engage the heater core ends of the tubes with the heater core supply and return ports.

(4) Position both heater core tubes and the sealing plate simultaneously to the heater core supply and return ports.

(5) The heater core tubes each have a slot that must be indexed to a location tab within each of the heater core ports. Adjust the position of the tubes as required so that the sealing plate fits flush against the heater core supply and return ports, which indicates that the tubes are properly indexed.

HEATER CORE (Continued)

(6) Install and tighten the screw that secures the heater core tube sealing plate to the heater core supply and return ports. Tighten the screw to 3 N·m (27 in. lbs.).

(7) Position the heater core shield onto the distribution housing. Be certain that the two location tabs on the front of the shield are engaged in the receptacles in the two lower finger formations of the evaporator housing near the dash panel.

(8) Install and tighten the three screws that secure the heater core shield to the left end of the HVAC distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).

(9) Reinstall the silencer under the driver side end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).

(10) Reconnect the heater hoses to the heater hose tubes. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/HEATER HOSE - INSTALLATION).

(11) Reconnect the battery negative cable.

(12) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

INSTALLATION - HEATER CORE

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING FRONT - WARNING - HEATER PLUMBING).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) While pushing the brake pedal downward and pulling the accelerator pedal upward far enough for clearance, slide the heater core into the distribution housing.

(2) Install and tighten the two screws that secure the heater core mounting plate to the distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Remove the plugs or tape from the heater core tube fittings and both heater core ports.

(4) Position both heater core tubes and the sealing plate simultaneously to the heater core supply and return ports.

(5) The heater core tubes each have a slot that must be indexed to a location tab within each of the heater core ports. Adjust the position of the tubes as required so that the sealing plate fits flush against the heater core supply and return ports, which indicates that the tubes are properly indexed.

(6) Install and tighten the screw that secures the heater core tube sealing plate to the heater core supply and return ports. Tighten the screw to 3 N·m (27 in. lbs.).

(7) Position the heater core shield onto the distribution housing. Be certain that the two location tabs on the front of the shield are engaged in the receptacles in the two lower finger formations of the evaporator housing near the dash panel.

(8) Install and tighten the three screws that secure the heater core shield to the left end of the HVAC distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).

(9) Reconnect the power brake booster input rod (push rod) to the pin on the brake pedal arm(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/POWER BRAKE BOOSTER - INSTALLATION).

(10) Reinstall the brake lamp switch into its mounting bracket(Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION).

(11) Reinstall the silencer boot around the base of the lower steering shaft on the dash panel.

(12) Reconnect the battery negative cable.

(13) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

(14) Operate system for two thermostat cycles to assure elimination of air in the system.

HEATER HOSE

REMOVAL

There are several heater core plumbing configurations used on this model, depending upon the engine size and other optional equipment. One plumbing configuration is used for all 2.4L engines (Fig. 21), while the 3.3L and 3.8L engines have unique heater return plumbing on the engine for models with or without an optional engine oil cooler (Fig. 24) or (Fig. 25). There are also unique plumbing configurations at the heater core for models with or without the optional rear heater and air conditioner (Fig. 22) or (Fig. 23). All models use a combination of formed steel tubing and rubber hoses. In most cases, the rubber hose is secured to the steel tubing with a spring tension clamp.

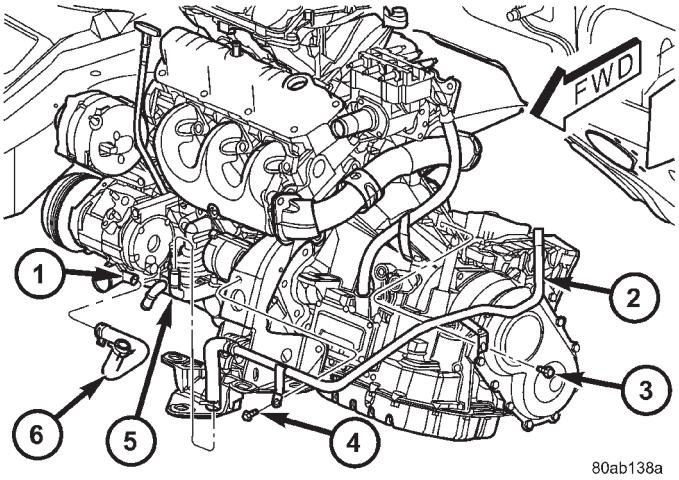

Fig. 25 Heater Return - 3.3/3.8L Engine w/Oil Cooler

1 - ENGINE INLET NIPPLE
2 - HEATER RETURN TUBE & HOSE
3 - SCREW
4 - SCREW
5 - OIL COOLER
6 - HEATER RETURN HOSE

CAUTION:
When removing the heater hose from the heater core or supply and return tube nipples, DO NOT apply excessive pressure. Excessive pressure may damage or deform the nipples and/or the heater core causing an engine coolant leak.

(3) After the clamp has been moved, grasp the end of the hose firmly and carefully twist the hose back and forth while pulling it away from the barbed end of the nipple. Repeat this procedure at the opposite end of the hose being removed. If this procedure is not successful in removing the hose from the nipple, carefully make a parallel cut through the hose where it is engaged on the nipple and peel the hose off of the nipple. This method of removal will require heater hose replacement.

INSTALLATION

There are several heater core plumbing configurations used on this model, depending upon the engine size and other optional equipment. One plumbing configuration is used for all 2.4L engines, while the 3.3L and 3.8L engines have unique heater return plumbing on the engine for models with or without an optional engine oil cooler. There are also unique plumbing configurations at the heater core for models with or without the optional rear heater and air conditioner. All models use a combination of formed steel tubing and rubber hoses. In most cases, the rubber hose is secured to the steel tubing with a spring tension clamp.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING FRONT - WARNING - HEATER PLUMBING).

(1) Using spring tension clamp pliers, compress and slide the clamps that secure each end of the heater hose toward the center of the hose being installed. Release the clamp when it is near the center of the hose.

(2) Grasp one end of the heater hose being installed firmly and carefully twist the hose back and forth while pushing it over from the barbed end of the nipple. Repeat this procedure at the opposite end of the hose being installed.

(3) Using spring tension clamp pliers, compress and slide the clamps that secure each end of the heater hose over the tube or nipple. Release the clamp when it is over the tube or nipple.

(4) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

HEATER HOSES - DIESEL SUPPLEMENTAL HEATER - BUX

REMOVAL

(1) Elevate vehicle on a lift taking note of the exhaust tube flexible section.
(2) Drain cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
(3) Lower heater unit from vehicle(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - REMOVAL).

NOTE: Complete removal of cabin heater from vehicle is not required, lowering unit allows easier access to coolant line clamps.

(4) Remove clamps from both flexible coolant line ends.
(5) Remove both lines from vehicle.

NOTE: If either line is damaged it is recommended that both flexible lines be replaced.

INSTALLATION

(1) Install both flexible coolant lines to the heater unit and install clamps.
(2) Install flexible coolant lines to the coolant pipes and install clamps.
(3) Install heater unit into vehicle(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - INSTALLATION).
(4) Lower vehicle.
(5) Refill cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
(6) Verify operation of heater unit.

HEATER PIPES - DIESEL SUPPLEMENTAL HEATER - BUX

REMOVAL

CAUTION: Allow cooling system to cool completely before removing radiator cap or draining cooling system. Injury could result is system is opened while system coolant is hot and under pressure.

NOTE: Steel heater lines from engine compartment to heater unit are part of an assembly that includes the air intake pipe. If the heater lines or air intake pipe require removal or replacement the entire assembly must be removed or replaced.

(1) Open hood.
(2) Drain the cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
(3) Remove clamps from both the EGR cooler and the lower heater port. Separate hoses from the mating plumbing port. (Fig. 26).
(4) Remove retaining nut from heater line under hood bracket.
(5) Elevate vehicle on a lift.

NOTE: When supporting vehicle care should be taken not to damage the heater exhaust tube.

(6) Remove clamps from heater lines to the rubber connection nearest the tubes. Separate the hoses from the tube assembly leaving the rubber hose attached to the supplemental heater.
(7) Remove heater unit intake pipe from heater-(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/INLET HOSE - REMOVAL) (Fig. 27).
(8) Remove heater pipe assembly retaining screws and remove assembly from vehicle.

HEATER PIPES - DIESEL SUPPLEMENTAL HEATER - BUX (Continued)

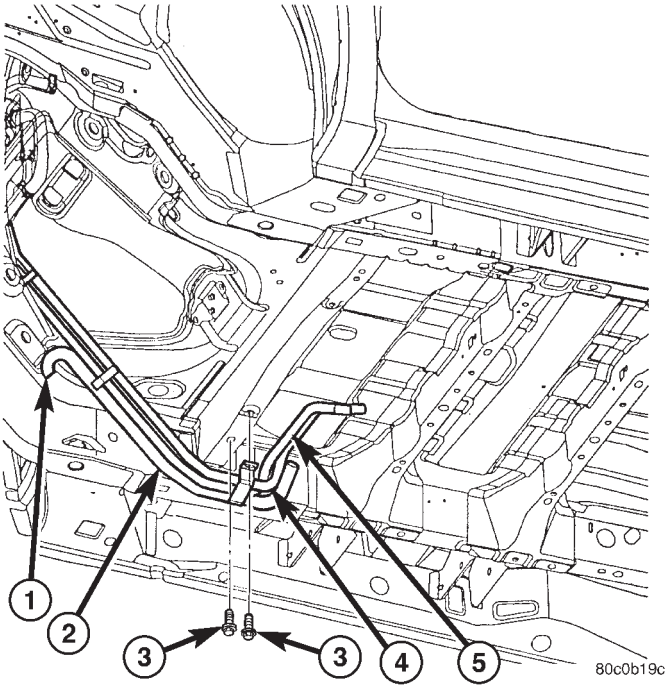

Fig. 27 AIR INTAKE AND HEATER PIPE ASSEMBLY

1 - INTAKE TUBE AIR INTAKE
2 - INTAKE PIPE
3 - RETAINING SCREWS
4 - INTAKE HEATER LINE
5 - RETURN HEATER LINE

INSTALLATION

(1) With vehicle on a lift position the heater pipe assembly and install the retaining screws.

(2) Install the heater unit intake pipe to the heater unit(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/INLET HOSE - INSTALLATION).

(3) Connect heater hoses to the heater unit and tighten the clamps.

(4) Install heater unit intake pipe to heater unit (Refer to 24 - HEATING & AIR CONDITIONING/ CABIN HEATER/INLET HOSE - INSTALLATION).

(5) Lower vehicle on lift.

(6) Install retaining nut to heater line under hood bracket and tighten.

(7) Connect heater lines to heater hoses at heater core and EGR port. Position spring clamps onto the installed hoses.

(8) Refill cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).

(9) Close hood.

LIQUID LINE

REMOVAL

The front air conditioner liquid line is serviced in two sections. The front section connects between the condenser and the filter/drier and includes the high side service port on the fitting for the filter/drier. The rear section connects between the filter/drier and the expansion valve and includes the fitting for the A/C pressure transducer. On models equipped with the optional rear air conditioner, the rear section of the front air conditioner liquid line also includes a liquid line hose and tube extension that connects the front liquid line to the liquid line for the rear air conditioner.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

FRONT SECTION

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Disconnect and isolate the battery negative cable.

(3) Remove the air cleaner housing from the right side of the engine compartment.

(4) Remove the two large screws that secure the front fascia and the outboard ends of the radiator sight shield to the radiator closure panel crossmember (Fig. 28).

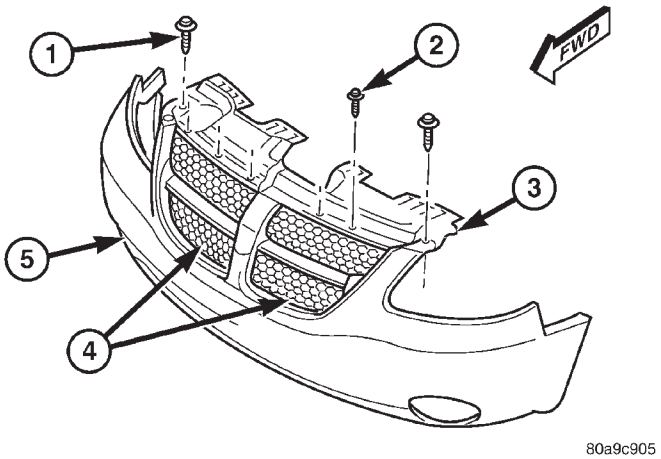

Fig. 28 Radiator Sight Shield

1 - LARGE SCREWS (2)
2 - SMALL SCREWS (5)

4 - NUT

(8) Disconnect the liquid line fitting from the condenser outlet port.

(9) Remove the seal from the liquid line fitting and discard.

(10) Install plugs in, or tape over the opened liquid line fitting and the condenser outlet port.

(11) Disengage the retainer that secures the liquid line routing clip to the top of the right frame rail ahead of the front strut tower in the engine compartment (Fig. 30).

(12) Remove the screw that secures the liquid line front section fitting to the top of the filter-drier.

(13) Disconnect the liquid line fitting from the filter-drier inlet port.

(14) Remove the seal from the liquid line fitting and discard.

(15) Install plugs in, or tape over the opened liquid line fitting and the filter-drier inlet port.

(16) Remove the front section of the front liquid line from the engine compartment.

REAR SECTION

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Disconnect and isolate the battery negative cable.

(3) Remove the air cleaner housing from the right side of the engine compartment.

(4) Disconnect the drain tube from the wiper module drain on the right side of the engine compartment.

(5) Remove the A/C pressure transducer from the fitting on the front liquid line rear section. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/A/C PRESSURE TRANSDUCER - REMOVAL).

(6) Remove the nut that secures the A/C ground strap to the weld stud on the top of the right front strut tower (Fig. 30).

(7) Remove the A/C ground strap eyelet terminal connector from the weld stud.

(8) Remove the screw that secures the liquid line rear section fitting to the top of the filter-drier.

(9) Disconnect the liquid line fitting from the filter-drier outlet port.

LIQUID LINE (Continued)

(10) Remove the seal from the liquid line fitting and discard.

(11) Install plugs in, or tape over the opened liquid line fitting and the filter-drier outlet port.

(12) Remove the nut that secures the suction line and liquid line fittings to the expansion valve.

(13) Disconnect the suction line and liquid line fittings from the expansion valve.

(14) Remove the seals from the suction line and liquid line fittings and discard.

(15) Install plugs in, or tape over the opened suction line and liquid line fittings and both expansion valve ports.

(16) If the vehicle is equipped with the optional rear air conditioner, go to Step 17. If the vehicle does not have the optional rear air conditioner, go to Step 23.

(17) Raise and support the vehicle.

(18) Cut the tie strap located just forward of the connections between the underbody plumbing and the engine compartment plumbing for the rear heater and air conditioner (Fig. 31).

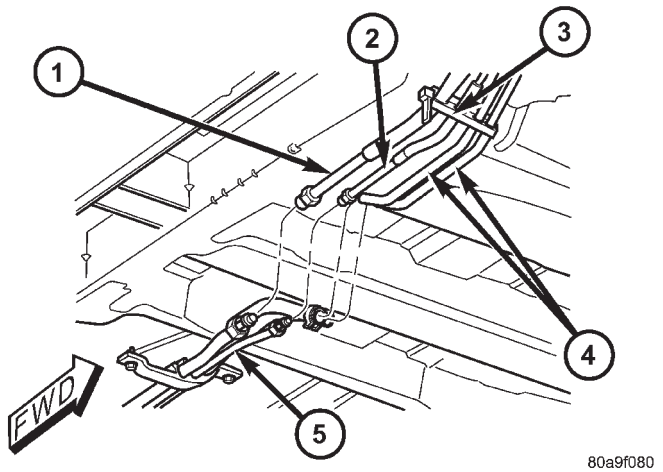

Fig. 31 Underbody Connections

1 - SUCTION LINE EXTENSION
2 - LIQUID LINE EXTENSION
3 - TIE STRAP
4- HEATER LINE EXTENSIONS
5 - UNDERBODY LINES

(19) Disconnect the front liquid line extension fitting from the underbody liquid line fitting for the rear air conditioner.

(20) Remove the seal from the underbody liquid line fitting and discard.

(21) Install plugs in, or tape over the opened liquid line fittings.

(22) Lower the vehicle.

(23) Remove the front liquid line rear section from the engine compartment.

INSTALLATION

The front air conditioner liquid line is serviced in two sections. The front section connects between the condenser and the filter/drier and includes the high side service port on the fitting for the filter/drier. The rear section connects between the filter/drier and the expansion valve and includes the fitting for the A/C pressure transducer. On models equipped with the optional rear air conditioner, the rear section of the front air conditioner liquid line also includes a liquid line hose and tube extension that connects the front liquid line to the liquid line for the rear air conditioner.

FRONT SECTION

(1) Position the front section of the front liquid line into the engine compartment.

(2) Remove the tape or plugs from the liquid line front section fitting for the filter-drier and the filter-drier inlet port.

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting.

(4) Reconnect the liquid line fitting to the filter-drier inlet port on the top of the filter-drier.

(5) Install and tighten the screw that secures the liquid line fitting to the filter-drier. Tighten the screw to 2 N·m (16 in. lbs.).

(6) Engage the retainer that secures the liquid line routing clip to the top of the right frame rail ahead of the front strut tower in the engine compartment.

(7) Remove the tape or plugs from the condenser outlet port and the liquid line fitting.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting.

(9) Reconnect the liquid line fitting to the condenser outlet port on the right side of the cooling module.

(10) Install and tighten the nut that secures the liquid line fitting to the condenser. Tighten the nut to 23 N·m (17 ft. lbs.).

(11) Position the radiator sight shield onto the radiator closure panel crossmember.

(12) Install and tighten the five small screws that secure the front fascia grille inserts to the radiator sight shield. Tighten the screws to 2 N·m (16 in. lbs.).

(13) Install and tighten the two large screws that secure the front fascia and the outboard ends of the radiator sight shield to the radiator closure panel crossmember. Tighten the screws to 6 N·m (53 in. lbs.).

(14) Reinstall the air cleaner housing into the right side of the engine compartment.

(15) Reconnect the battery negative cable.

(16) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

LIQUID LINE (Continued)

FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(17) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REAR SECTION

(1) Position the rear section of the front liquid line into the engine compartment.

(2) Remove the tape or plugs from the suction line and liquid line fittings and both expansion valve ports.

(3) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the suction line and liquid line fittings.

(4) Reconnect the liquid line and suction line fittings to the expansion valve.

(5) Install and tighten the nut that secures the suction line and liquid line fittings to the expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).

(6) Remove the tape or plugs from the liquid line rear section fitting for the filter-drier and the filter-drier outlet port.

(7) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting.

(8) Reconnect the liquid line fitting to the filter-drier outlet port on the top of the filter-drier.

(9) Install and tighten the screw that secures the liquid line fitting to the filter-drier. Tighten the screw to 2 N·m (16 in. lbs.).

(10) Reinstall the A/C ground strap eyelet terminal connector onto the weld stud on the top of the right front strut tower.

(11) Install and tighten the nut that secures the A/C ground strap to the weld stud. Tighten the nut to 12 N·m (106 in. lbs.).

(12) Reinstall the A/C pressure transducer onto the fitting on the front liquid line rear section. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/A/C PRESSURE TRANSDUCER - INSTALLATION).

(13) Reconnect the drain tube to the wiper module drain on the right side of the engine compartment.

(14) Reinstall the air cleaner housing into the right side of the engine compartment.

(15) Reconnect the battery negative cable.

(16) If the vehicle is equipped with the optional rear air conditioner, go to Step 17. If the vehicle does not have the optional rear air conditioner, go to Step 23.

(17) Raise and support the vehicle.

(18) Remove the tape or plugs from the liquid line rear section extension fitting and the underbody liquid line fitting.

(19) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the underbody liquid line fitting.

(20) Reconnect the liquid line rear section extension fitting to the underbody liquid line fitting. Tighten the fittings to 23 N·m (17 ft. lbs.).

(21) Install a new tie strap just forward of the connections between the underbody plumbing and the engine compartment plumbing for the rear heater and air conditioner.

(22) Lower the vehicle.

(23) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(24) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

RECEIVER/DRIER

DESCRIPTION

The filter-drier is mounted in a bracket secured to the right front strut tower in the engine compartment. The filter-drier is connected between the front and rear sections of the liquid line between the condenser outlet and the evaporator inlet. The filter-drier cannot be repaired. If the filter-drier is faulty or damaged, or if the refrigerant system has been contaminated or left open to the atmosphere for an indeterminable period, it must be replaced.

OPERATION

The filter-drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the expansion valve. A desiccant bag is mounted inside the filter-drier canister to absorb any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand air conditioner operation, the filter-drier acts as a reservoir to store surplus refrigerant. Refrigerant enters the filter-drier as a high-pressure, low temperature liquid.

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTION - A/C PLUMBING).

RECEIVER/DRIER (Continued)

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Remove the air cleaner housing from the right side of the engine compartment.

(3) Remove the screw that secures the liquid line front section fitting to the top of the filter-drier (Fig. 32).

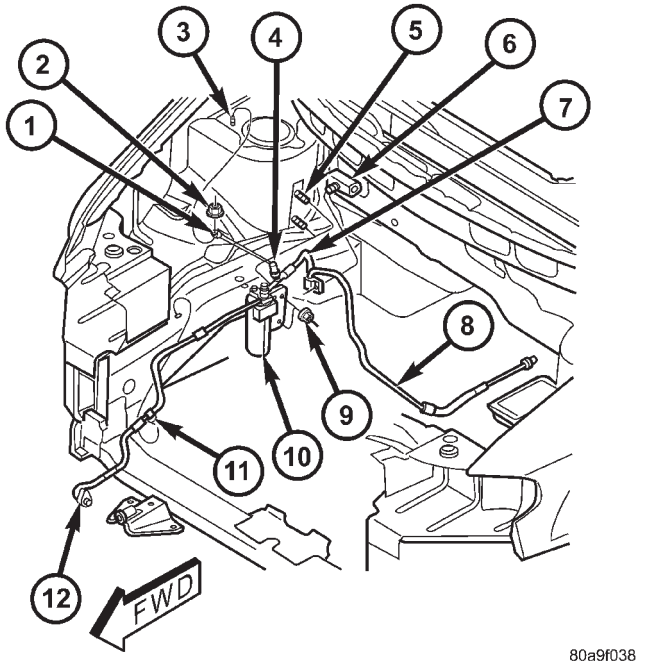

Fig. 32 Front Liquid Lines

(4) Disconnect the liquid line fitting from the filter-drier inlet port.

(5) Remove the seal from the liquid line fitting and discard.

(6) Install plugs in, or tape over the opened liquid line fitting and the filter-drier inlet port.

(7) Remove the screw that secures the liquid line rear section fitting to the top of the filter-drier.

(8) Disconnect the liquid line fitting from the filter-drier outlet port.

(9) Remove the seal from the liquid line fitting and discard.

(10) Install plugs in, or tape over the opened liquid line fitting and the filter-drier outlet port.

(11) Remove the two nuts that secure the filter-drier mounting bracket to the weld studs on the side of the right front strut tower.

(12) Remove the filter-drier and mounting bracket unit from the studs.

INSTALLATION

NOTE: If the filter-drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Position the filter-drier and mounting bracket unit onto the weld studs on the side of the right front strut tower.

(2) Install and tighten the two nuts that secure the filter-drier mounting bracket to the studs. Tighten the nuts to 10 N·m (89 in. lbs.).

(3) Remove the tape or plugs from the liquid line rear section fitting for the filter-drier and the filter-drier outlet port.

(4) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting.

(5) Reconnect the liquid line fitting to the filter-drier outlet port on the top of the filter-drier.

(6) Install and tighten the screw that secures the liquid line fitting to the filter-drier. Tighten the screw to 2 N·m (18 in. lbs.).

(7) Remove the tape or plugs from the liquid line front section fitting for the filter-drier and the filter-drier inlet port.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting.

(9) Reconnect the liquid line fitting to the filter-drier inlet port on the top of the filter-drier.

(10) Install and tighten the screw that secures the liquid line fitting to the filter-drier. Tighten the screw to 2 N·m (18 in. lbs.).

(11) Reinstall the air cleaner housing into the right side of the engine compartment.

(12) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(13) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas. Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system. R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM CHARGE LEVEL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

NOTE: The proper amount of R-134a refrigerant for the refrigerant system in this model is:

- **Single or Dual Zone (Front Unit Only) - 0.96 kilograms (2.13 pounds or 34 ounces)**
- **Three Zone (Front and Rear Units) - 1.31 kilograms (2.88 pounds or 46 ounces)**

The procedure that follows should be used to determine whether the refrigerant system contains the proper refrigerant charge. Symptoms of an improper refrigerant charge (low) include: poor air conditioner performance, fog emitted from the air conditioner outlets, a hissing sound from the expansion valve/ evaporator area. There are two different methods with which the refrigerant charge level may be tested:

- Using a DRBIII® scan tool, a thermocouple and the Charge Determination Chart (Fig. 33). Refer to the appropriate diagnostic information.
- Using a manifold gauge set, a thermocouple and the Charge Determination Chart (Fig. 33).

A temperature probe is required to measure liquid line temperature. The clamp-on, Type K thermocouple temperature probe used in this procedure is available through the DaimlerChrysler Professional Service Equipment (PSE) program. This probe (PSE #66-324-0014 or #80PK-1A) is compatible with temperature-measuring instruments that accept Type K thermocouples, and have a miniature connector input. Other temperature probes are available through aftermarket sources; however, all references in this procedure will reflect the use of the probe made available through the PSE program.

In order to use the temperature probe, a digital thermometer will also be required. If a digital thermometer is not available, an adapter is available through the PSE program that will convert any standard digital multimeter into a digital thermometer. This adapter is designed to accept any standard Type K thermocouple. If a digital multimeter is not available, this tool is also available through the PSE program.

NOTE: When connecting the service equipment couplings to the refrigerant system service ports, be certain that the valve of each coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Remove the caps from the refrigerant system service ports and attach a manifold gauge set or a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 to the refrigerant system.

(2) Attach a clamp-on thermocouple to the liquid line. The thermocouple must be placed as close to the A/C pressure transducer as possible to accurately observe liquid line temperature.

(3) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run at idle under the following conditions for five minutes.

(a) Front windows are open.

(b) Transaxle in Park.

REFRIGERANT (Continued)

(c) Front heater-A/C controls set to outside air, full cool, panel mode, blower high, and compressor engaged.

(d) If the vehicle is so equipped, the rear heater-A/C controls must be set to full cool and blower high.

(4) Raise the liquid line (discharge) pressure to about 1793 kPa (260 psi) by placing a piece of cardboard over part of the front side of the condenser. To place the cardboard properly, remove the upper radiator sight shield from the front fascia. Cover only enough of the condenser to raise and maintain the liquid line pressure at the specified level.

(5) Observe the liquid line (discharge) pressure and liquid line temperature. Using the Charge Determination Chart (Fig. 33), determine whether the refrigerant system is operating within the Proper Charge Range.

(a) If the refrigerant system is operating in the Undercharged area of the chart, add 0.057 kilogram (0.125 pound or 2 ounces) of refrigerant to the system.

(b) If the refrigerant system is operating in the Overcharged area of the chart, reclaim 0.057 kilogram (0.125 pound or 2 ounces) of refrigerant from the system.

(6) Recheck the system charge level following each refrigerant adjustment. Continue this process until the system readings are in the Proper Charge Range area on the Charge Determination Chart.

DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

If the air conditioning system is not cooling properly, determine if the refrigerant system is fully-charged. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM CHARGE LEVEL).

If the refrigerant system is low or empty; a leak at a refrigerant line, connector fitting, component, or component seal is likely. While an oily residue on or near refrigerant system lines, connector fittings, components, or component seals can indicate the general

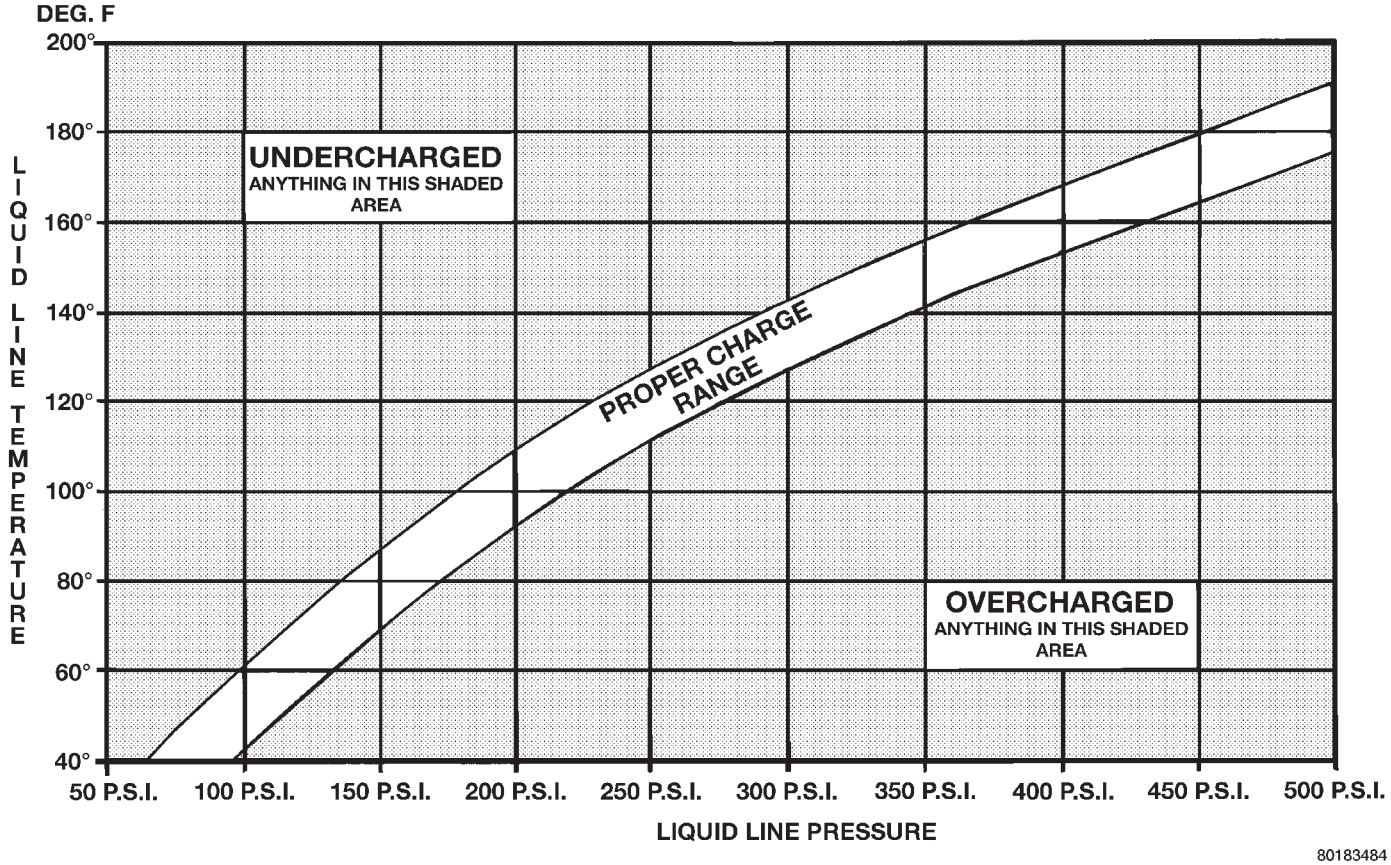

Fig. 33 Charge Determination Chart, Ambient Test Condition 85°F

REFRIGERANT (Continued)

location of a possible refrigerant leak, the exact leak location should be confirmed with an electronic leak detector prior to component repair or replacement. An electronic leak detector designed for R-134a refrigerant is recommended for locating and confirming refrigerant system leaks. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

To detect a leak in the refrigerant system, perform one of the following procedures as indicated by the results of the refrigerant system charge level test.

SYSTEM EMPTY

(1) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(2) Connect and dispense 0.283 kilograms (0.625 pounds or 10 ounces) of R-134a refrigerant into the evacuated refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

(3) Proceed to the SYSTEM LOW procedures.

SYSTEM LOW

(1) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(2) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run at idle under the following conditions for five minutes, then turning the engine off.

(a) Front windows are open.

(b) Rear air conditioner Off (if equipped).

(c) Transaxle in Park.

(d) Front heater-A/C controls set to outside air, panel mode, blower high, and compressor engaged.

(3) Wait five to seven minutes and, with the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(4) To inspect an evaporator for leaks, insert the electronic leak detector probe into a floor outlet or the recirculation air intake.

DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM CHARGE LEVEL 2.5L DIESEL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTION - A/C PLUMBING).

NOTE: The proper amount of R-134a refrigerant for the refrigerant system in this model is:

- **Single or Dual Zone (Front Unit Only - 2.5L Diesel) – 0.91 kilograms (2.00 pounds or 32 ounces)**
- **Single or Dual Zone (Front Unit Only) - 0.96 kilograms (2.13 pounds or 34 ounces)**
- **Three Zone (Front and Rear Units) - 1.31 kilograms (2.88 pounds or 46 ounces)**

The procedure that follows should be used to determine whether the refrigerant system contains the proper refrigerant charge. Symptoms of an improper refrigerant charge (low) include: poor air conditioner performance, fog emitted from the air conditioner outlets, a hissing sound from the expansion valve/evaporator area. There are two different methods with which the refrigerant charge level may be tested:

- Using a DRBIII® scan tool, a thermocouple and the Charge Determination Chart (Fig. 34). Refer to the appropriate diagnostic information.
- Using a manifold gauge set, a thermocouple and the Charge Determination Chart (Fig. 34).

A temperature probe is required to measure liquid line temperature. The clamp-on, Type K thermocouple temperature probe used in this procedure is available through the DaimlerChrysler Professional Service Equipment (PSE) program. This probe (PSE #66-324-0014 or #80PK-1A) is compatible with temperature-measuring instruments that accept Type K thermocouples, and have a miniature connector input. Other temperature probes are available through aftermarket sources; however, all references in this procedure will reflect the use of the probe made available through the PSE program.

In order to use the temperature probe, a digital thermometer will also be required. If a digital thermometer is not available, an adapter is available through the PSE program that will convert any standard digital multimeter into a digital thermometer. This adapter is designed to accept any standard Type K thermocouple. If a digital multimeter is not available, this tool is also available through the PSE program.

NOTE: When connecting the service equipment couplings to the refrigerant system service ports, be certain that the valve of each coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Remove the caps from the refrigerant system service ports and attach a manifold gauge set or a R-134a refrigerant recovery/recycling/charging sta-

REFRIGERANT (Continued)

tion that meets SAE Standard J2210 to the refrigerant system.

(2) Attach a clamp-on thermocouple to the liquid line. The thermocouple must be placed as close to the A/C pressure transducer as possible to accurately observe liquid line temperature.

(3) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run at idle under the following conditions for five minutes.

(a) Front windows are open.

(b) Transaxle in Park.

(c) Front heater-A/C controls set to outside air, full cool, panel mode, blower high, and compressor engaged.

(d) If the vehicle is so equipped, the rear heater-A/C controls must be set to full cool and blower high.

(4) Raise the liquid line (discharge) pressure to about 1793 kPa (260 psi) by placing a piece of cardboard over part of the front side of the condenser. To place the cardboard properly, remove the upper radiator sight shield from the front fascia. Cover only enough of the condenser to raise and maintain the liquid line pressure at the specified level.

(5) Observe the liquid line (discharge) pressure and liquid line temperature. Using the Charge Determination Chart (Fig. 34), determine whether the refrigerant system is operating within the Proper Charge Range.

(a) If the refrigerant system is operating in the Undercharged area of the chart, add 0.057 kilogram (0.125 pound or 2 ounces) of refrigerant to the system.

(b) If the refrigerant system is operating in the Overcharged area of the chart, reclaim 0.057 kilogram (0.125 pound or 2 ounces) of refrigerant from the system.

(6) Recheck the system charge level following each refrigerant adjustment. Continue this process until the system readings are in the Proper Charge Range area on the Charge Determination Chart (Fig. 34).

STANDARD PROCEDURE

STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT

RECOVERY/RECYCLING STATION

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used (Fig. 35). Contact PSE or an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. See the operating instructions

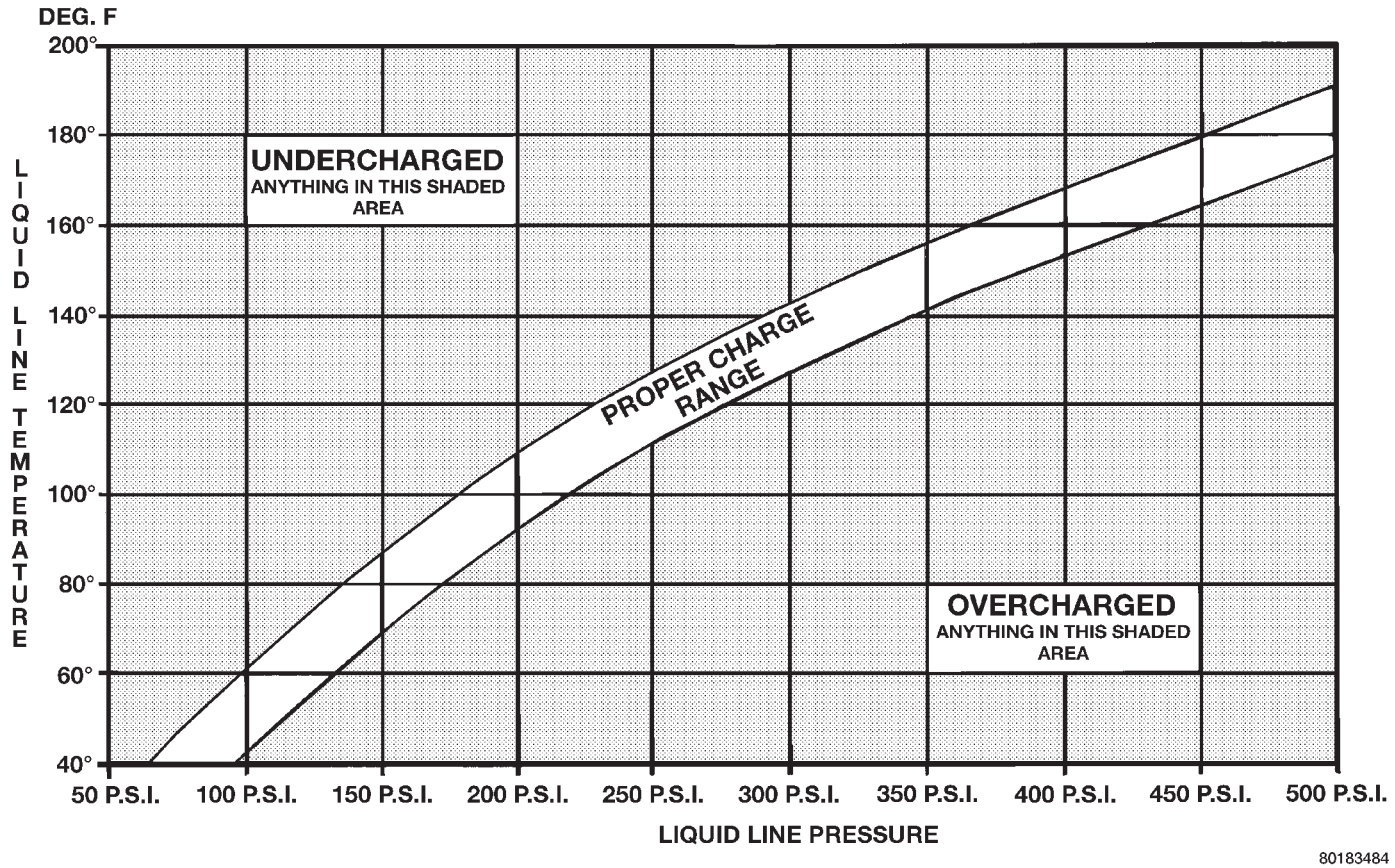

Fig. 34 Charge Determination Chart, Ambient Test Condition 85°F

REFRIGERANT (Continued)

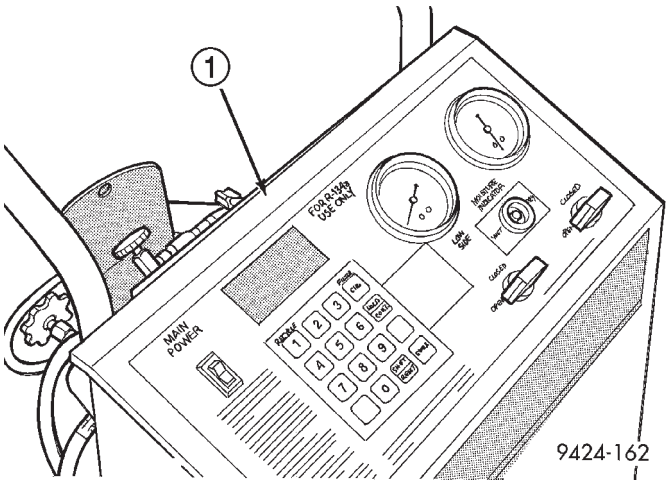

Fig. 35 Refrigerant Recovery/Recycling Station - Typical

1 - R-134 REFRIGERANT RECOVERY MACHINE

supplied by the equipment manufacturer for proper care and use of this equipment.

MANIFOLD GAUGE SET CONNECTIONS

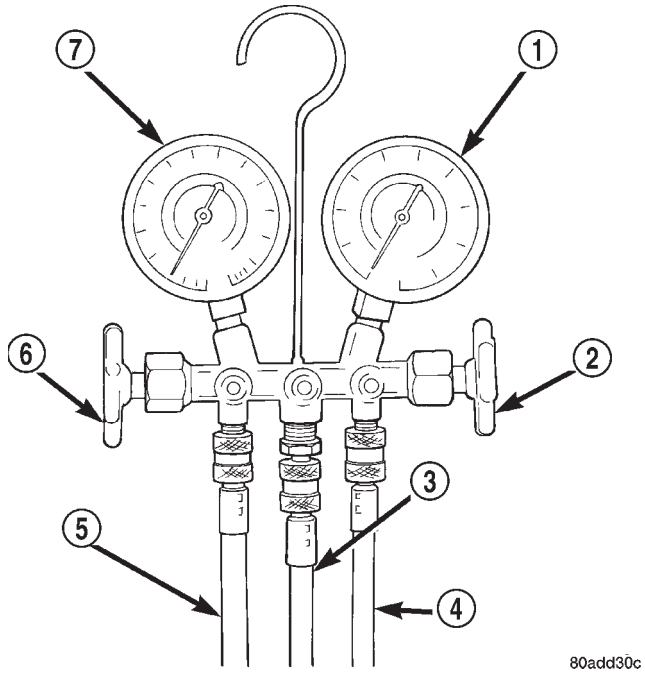

Fig. 36 Manifold Gauge Set - Typical

1 - HIGH PRESSURE GAUGE
2 - VALVE
3 - VACUUM/REFRIGERANT HOSE (YELLOW W/BLACK STRIPE)
4 - HIGH PRESSURE HOSE (RED W/BLACK STRIPE)
5 - LOW PRESSURE HOSE (BLUE W/BLACK STRIPE)
6 - VALVE
7 - LOW PRESSURE GAUGE

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 36). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

- **LOW PRESSURE GAUGE HOSE** - The low pressure hose (Blue with Black stripe) attaches to the suction (low side) service port. This port is located on the suction line, near the compressor at the front of the engine compartment.
- **HIGH PRESSURE GAUGE HOSE** - The high pressure hose (Red with Black stripe) attaches to the discharge (high side) service port. This port is located on the liquid line near the filter-drier at the rear of the engine compartment.
- **RECOVERY/RECYCLING/EVACUATION/ CHARGING HOSE** - The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. For the proper amount of the refrigerant charge, refer to REFRIGERANT CHARGE CAPACITY . A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

REFRIGERANT CHARGE CAPACITY

The R-134a refrigerant system charge capacity for this vehicle is:

REFRIGERANT (Continued)

- **Single or Dual Zone (Front Unit Only - with 2.5L Turbo Diesel)**0.91 kilograms (2.00 pounds or 32 ounces)
- **Single or Dual Zone (Front Unit Only)** - 0.96 kilograms (2.13 pounds or 34 ounces)
- **Three Zone (Front and Rear Units)** - 1.31 kilograms (2.88 pounds or 46 ounces)

CHARGING PROCEDURE

(1) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(2) A manifold gauge set and a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 should still be connected to the refrigerant system.

(3) Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.

(4) Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.

(5) When the transfer of refrigerant has stopped, close both the suction and discharge valves.

(6) If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heater-air conditioner controls so that the compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the compressor will not engage, test the compressor clutch control circuit and repair as required.

(7) Open the suction valve to allow the remaining refrigerant to transfer to the refrigerant system.

WARNING: TAKE CARE NOT TO OPEN THE DISCHARGE (HIGH PRESSURE) VALVE AT THIS TIME.

(8) Close the suction valve and test the system performance. (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - A/C PERFORMANCE TEST).

(9) Disconnect the charging station and manifold gauge set from the refrigerant system service ports.

(10) Reinstall the caps onto the refrigerant system service ports.

(11) Run the HVAC Control Cooldown test to verify proper operation(Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING).

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be charged. If moisture and air enters the system and becomes mixed with the refrigerant, the compressor head pressure will rise above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Evacuating the refrigerant system will remove the air and boil the moisture out of the system at near room temperature. A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to evacuate the refrigerant system. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment. To evacuate the refrigerant system, use the following procedure:

NOTE: When connecting the service equipment couplings to the refrigerant system service ports, be certain that the valve of each coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Remove the caps from the refrigerant system service ports and attach a manifold gauge set and a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 to the refrigerant system.

(2) Open both the suction and discharge valves and start the charging station vacuum pump.

(3) When the suction gauge has read 88 kPa (26 in. Hg.) vacuum or greater for 45 minutes, close both the suction and discharge valves and turn off the vacuum pump. If the refrigerant system fails to reach the specified vacuum, the system has a leak that must be corrected. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM LEAKS).

(4) If the refrigerant system maintains the specified vacuum for thirty minutes, restart the vacuum pump, open both the suction and discharge valves, and evacuate the system for an additional ten minutes.

(5) Close both the suction and discharge valves, and turn off the charging station vacuum pump.

(6) The refrigerant system is now ready to be charged with R-134a refrigerant. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT (Continued)

STANDARD PROCEDURE - REFRIGERANT RECOVERY

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system, whenever the refrigerant system must be opened for service. See the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT OIL

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system. There are different PAG oils available, and each contains a different additive package. The 10S20H compressor used in this vehicle are designed to use an ND-8 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance. PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

When an air conditioning system is assembled at the factory, all components except the compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the compressor is dispersed throughout the refrigerant system. The receiver/drier, evaporator, condenser, and compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of oil in the refrigerant system. This ensures proper lubrication of the compressor. Too little oil will result in damage to the compressor. Too much oil will reduce the cooling capacity of the air conditioning system.

It will not be necessary to check the oil level in the compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an receiver/ drier, evaporator or condenser is replaced. See the Refrigerant Oil Capacities chart for the proper amount of refrigerant oil to add. When a compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new compressor, then fill the new compressor with the same amount of fresh new refrigerant oil that was drained out of the old compressor.

REFRIGERANT OIL CAPACITIES				
	Front A/C		Front & Rear A/C	
COMPONENT	ml	fl oz	ml	fl oz
Compressor	150	5.0	220	7.4

SUCTION LINE

REMOVAL

The front air conditioner suction line includes the low side service port on a section of tubing located near the compressor. On models equipped with the optional rear air conditioner, the front air conditioner suction line also includes a suction line hose and tube extension that connects the front suction line to the suction line for the rear air conditioner.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Disconnect and isolate the battery negative cable.

(3) Remove the air cleaner top cover and snorkel from the air cleaner housing located on the right side of the engine compartment.

(4) Disconnect the drain tube from the wiper module drain on the right side of the engine compartment.

(5) Remove the nut that secures the suction line fitting to the top of the compressor.

(6) Disconnect the suction line fitting from the compressor suction port.

(7) Remove the seal from the suction line fitting and discard.

(8) Install plugs in, or tape over the opened suction line fitting and the compressor suction port.

(9) Disengage the retainer that secures the suction line routing clip to the filter-drier mounting bracket on the side of the right front strut tower in the engine compartment (Fig. 37).

(10) Remove the nut that secures the suction line and liquid line fittings to the expansion valve.

(11) Disconnect the suction line and liquid line fittings from the expansion valve.

(12) Remove the seals from the suction line and liquid line fittings and discard.

(13) Install plugs in, or tape over the opened suction line and liquid line fittings and both expansion valve ports.

(14) If the vehicle is equipped with the optional rear air conditioner, go to Step 15. If the vehicle does not have the optional rear air conditioner, go to Step 21.

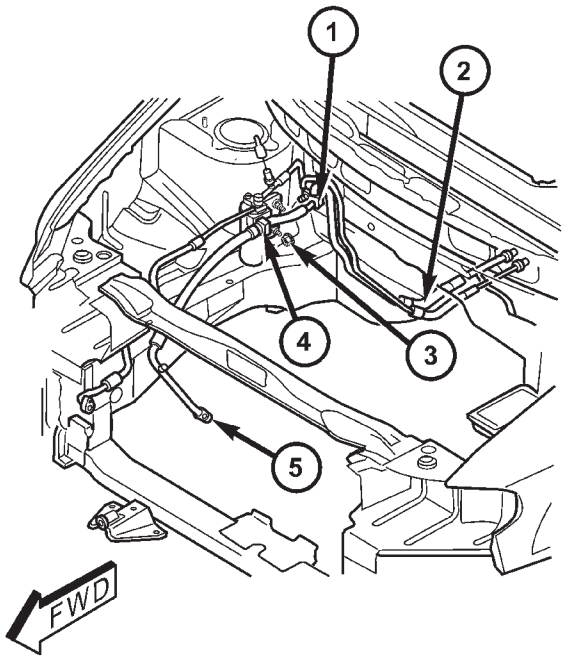

Fig. 37 Suction Line

1 - EXPANSION VALVE
2 - SUCTION LINE EXTENSION (REAR A/C ONLY)
3 - NUT
4 - ROUTING CLIP
5 - SUCTION LINE

(15) Raise and support the vehicle.

(16) Cut the tie strap located just forward of the connections between the underbody plumbing and the engine compartment plumbing for the rear heater and air conditioner (Fig. 38).

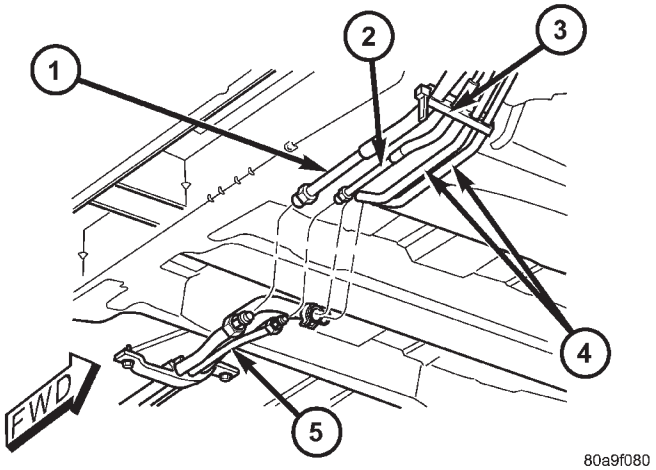

Fig. 38 Underbody Connections

1 - SUCTION LINE EXTENSION
2 - LIQUID LINE EXTENSION
3 - TIE STRAP
4- HEATER LINE EXTENSIONS
5 - UNDERBODY LINES

SUCTION LINE (Continued)

(17) Disconnect the suction line extension fitting from the underbody suction line fitting for the rear air conditioner.
(18) Remove the seal from the underbody suction line fitting and discard.
(19) Install plugs in, or tape over the opened suction line fittings.
(20) Lower the vehicle.
(21) Remove the suction line from the engine compartment.

INSTALLATION

The front air conditioner suction line includes the low side service port on a section of tubing located near the compressor. On models equipped with the optional rear air conditioner, the front air conditioner suction line also includes a suction line hose and tube extension that connects the front suction line to the suction line for the rear air conditioner.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Position the suction line into the engine compartment.
(2) Remove the tape or plugs from the suction line and liquid line fittings and both expansion valve ports.
(3) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the suction line and liquid line fittings.
(4) Reconnect the liquid line and suction line fittings to the expansion valve.
(5) Install and tighten the nut that secures the suction line and liquid line fittings to the expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
(6) Engage the retainer that secures the suction line routing clip to the filter-drier mounting bracket on the side of the right front strut tower in the engine compartment.
(7) Remove the tape or plugs from the compressor suction port and the suction line fitting.
(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the suction line fitting.
(9) Reconnect the suction line fitting to the compressor suction port.
(10) Install and tighten the nut that secures the suction line fitting to the compressor. Tighten the nut to 23 N·m (17 ft. lbs.).
(11) Reconnect the drain tube to the wiper module drain on the right side of the engine compartment.
(12) Reinstall the air cleaner top cover and snorkel onto the air cleaner housing located on the right side of the engine compartment.
(13) Reconnect the battery negative cable.
(14) If the vehicle is equipped with the optional rear air conditioner, go to Step 15. If the vehicle does not have the optional rear air conditioner, go to Step 21.
(15) Raise and support the vehicle.
(16) Remove the tape or plugs from the suction line extension fitting and the underbody suction line fitting.
(17) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the underbody suction line fitting.
(18) Reconnect the suction line extension fitting to the underbody suction line fitting. Tighten the fittings to 23 N·m (17 ft. lbs.).
(19) Install a new tie strap just forward of the connections between the underbody plumbing and the engine compartment plumbing for the rear heater and air conditioner.
(20) Lower the vehicle.
(21) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
(22) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

SERVICE PORTS

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Remove the protective cap from the A/C service port (Fig. 39).
(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).
(3) Using a standard Schrader-type valve core tool, remove the valve core from the A/C service port.
(4) Install a plug in or tape over the opened A/C service port.

SERVICE PORTS (Continued)

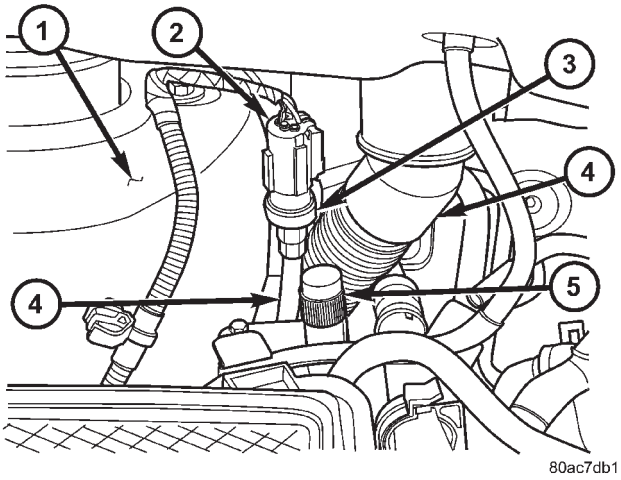

Fig. 39 A/C Service Port - Typical

1 - RIGHT FRONT STRUT TOWER
2 - CONNECTOR
3 - A/C PRESSURE TRANSDUCER
4 - RIGHT WIPER MODULE DRAIN TUBE
5 - HIGH SIDE SERVICE PORT

INSTALLATION

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Lubricate the A/C service port valve core with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(2) Remove the tape or plug from the A/C service port.

(3) Using a standard Schrader-type valve core tool, install and tighten the replacement valve core into the A/C service port.

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

(4) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(5) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

(6) Reinstall the protective cap onto the A/C service port.

EVAPORATOR

DESCRIPTION

The rear evaporator is located in the rear heater-A/C unit housing, behind the right rear wheel house. The evaporator is positioned in the rear heater-A/C housing so that all air that enters the housing must pass over the fins of the evaporator before it is distributed through the system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator tubes. The rear heater-A/C unit housing must be removed from the vehicle to access the evaporator for service. The evaporator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

Refrigerant enters the rear evaporator from the rear expansion valve as a low-temperature, low-pressure liquid. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the evaporator.

REMOVAL

REMOVAL - REAR EVAPORATOR

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - HEATER PLUMBING).

(1) Remove the rear heater-A/C unit housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER-A/C HOUSING - REMOVAL).

(2) Remove the rear evaporator line extension from the expansion valve. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/EVAPORATOR - REMOVAL - EVAPORATOR LINE EXTENSION).

(3) Remove the rear expansion valve from the rear evaporator. (Refer to 24 - HEATING & AIR CONDI-

EVAPORATOR (Continued)

TIONING/PLUMBING - REAR/EXPANSION VALVE - REMOVAL).

(4) Remove the rubber grommet that seals the evaporator inlet and outlet tubes to the rear heater-A/C housing near the expansion valve.

(5) Remove the three screws that secure the upper half of the rear heater-A/C housing to the lower half (Fig. 1).

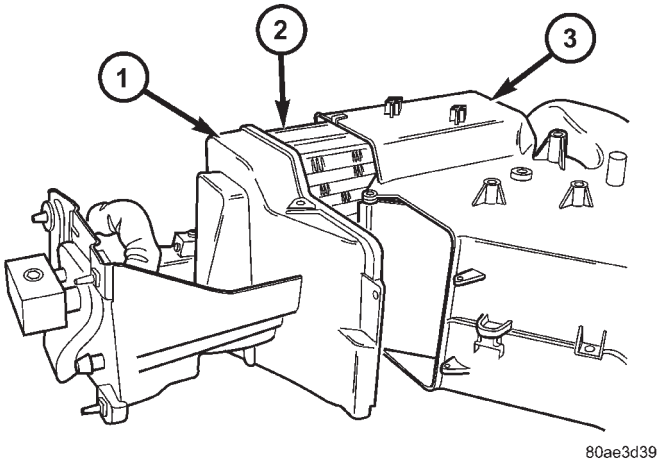

Fig. 1 Rear Evaporator

1 - UPPER REAR HEATER-A/C HOUSING
2 - EVAPORATOR
3 - LOWER REAR HEATER-A/C HOUSING

(6) Remove the three small metal spring clips that secure the upper half of the rear heater-A/C housing to the lower half.

(7) Carefully separate and remove the upper half of the rear heater-A/C housing from the lower half.

(8) Remove the evaporator from the lower half of the rear heater-A/C housing.

REMOVAL - EVAPORATOR LINE EXTENSION

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - HEATER PLUMBING).

(1) Remove the rear heater-A/C unit housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER-A/C HOUSING - REMOVAL).

(2) Remove the screw that secures the plate that captures and seals the evaporator line extension within the base of the rear heater-A/C unit housing (Fig. 2).

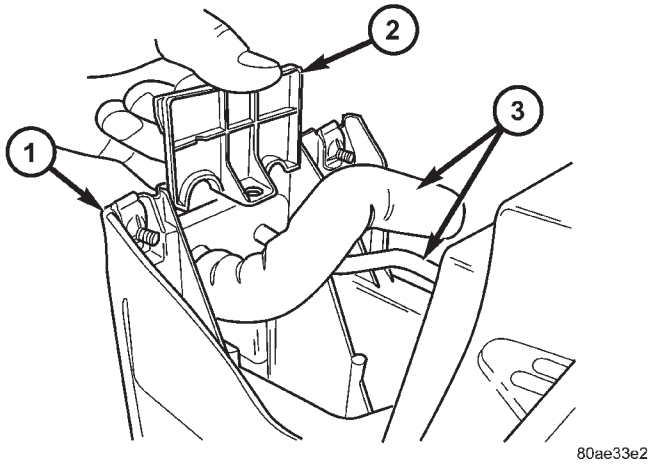

Fig. 2 Evaporator Line Extension Plate

1 - REAR HEATER-A/C HOUSING BASE
2 - PLATE
3 - EVAPORATOR LINE EXTENSION

(3) Remove the capture plate from the rear heater-A/C unit housing base.

(4) Carefully peel back the expansion valve foam insulator wrap far enough to access the evaporator line extension sealing plate on the bottom of the expansion valve (Fig. 3).

6 - INSULATOR WRAP

EVAPORATOR (Continued)

(5) Remove the two screws that secure the expansion valve bracket to the lower rear heater-A/C unit housing.

(6) Remove the nut that secures the expansion valve bracket to the expansion valve stud.

(7) Remove the expansion valve bracket from the expansion valve stud.

(8) Remove the nut that secures the evaporator line extension seal plate to the expansion valve stud.

(9) Remove the evaporator line extension seal plate from the expansion valve stud.

(10) Remove the evaporator line extension from the expansion valve and the rear heater-A/C housing base.

(11) Remove the seals from the evaporator line extension fittings and discard.

(12) Install plugs in, or tape over the opened evaporator line extension fittings and both expansion valve ports.

INSTALLATION

INSTALLATION - REAR EVAPORATOR

NOTE: If the evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Carefully lower the evaporator and its foam wrap into the lower half of the rear heater-A/C housing.

(2) Position the upper half of the rear heater-A/C housing onto the lower half.

(3) Install the three small metal spring clips that secure the upper half of the rear heater-A/C housing to the lower half.

(4) Install and tighten the three screws that secure the upper half of the rear heater-A/C housing to the lower half. Tighten the screws to 2 N·m (18 in. lbs.).

(5) Install the rubber grommet that seals the evaporator inlet and outlet tubes to the rear heater-A/C housing near the expansion valve.

(6) Reinstall the rear expansion valve onto the rear evaporator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/EXPANSION VALVE - INSTALLATION).

(7) Reinstall the rear evaporator extension line onto the expansion valve. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/EVAPORATOR - INSTALLATION - EVAPORATOR EXTENSION LINE).

(8) Reinstall the rear heater-A/C unit housing into the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER-A/C HOUSING - INSTALLATION).

INSTALLATION - EVAPORATOR LINE EXTENSION

(1) Remove the tape or plugs from the evaporator line extension fittings and both expansion valve ports.

(2) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator line extension fittings.

(3) Position the evaporator line extension to the expansion valve and the rear heater-A/C housing base.

(4) Position the evaporator line extension seal plate over the expansion valve stud.

(5) Install and tighten the nut that secures the evaporator line extension seal plate to the expansion valve stud. Tighten the nut to 23 N·m (17 ft. lbs.).

(6) Position the expansion valve bracket over the expansion valve stud.

(7) Install and tighten the two screws that secure the expansion valve bracket to the lower rear heater-A/C unit housing. Tighten the screws to 2 N·m (18 in. lbs.).

(8) Install and tighten the nut that secures the expansion valve bracket to the expansion valve stud. Tighten the nut to 23 N·m (17 ft. lbs.).

(9) Carefully restore the expansion valve foam insulator wrap back around the expansion valve.

(10) Position the plate that captures and seals the evaporator line extension onto the rear heater-A/C unit housing base.

(11) Install and tighten the screw that secures the capture plate to the base of the rear heater-A/C unit housing. Tighten the screw to 2 N·m (18 in. lbs.).

(12) Reinstall the rear heater-A/C unit housing into the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER-A/C HOUSING - INSTALLATION).

EXPANSION VALVE

DESCRIPTION

The rear “H” valve-type thermal expansion valve (TXV) is located at the rear of the rear heater-A/C unit housing between the evaporator line extension and the evaporator coil. High-pressure, low temperature liquid refrigerant from the liquid line passes through the expansion valve orifice, converting it into a low-pressure, low-temperature mixture of liquid and gas before it enters the evaporator coil. The expansion valve is a factory calibrated unit and cannot be adjusted or repaired. If faulty or damaged, the expansion valve must be replaced.

EXPANSION VALVE (Continued)

OPERATION

A mechanical sensor in the expansion valve control head monitors the temperature and pressure of the refrigerant leaving the evaporator coil through the suction line, and adjusts the orifice size at the liquid line to let the proper amount of refrigerant into the evaporator coil to meet the vehicle cooling requirements. Controlling the refrigerant flow through the evaporator ensures that none of the refrigerant leaving the evaporator is still in a liquid state, which could damage the compressor.

DIAGNOSIS AND TESTING - EXPANSION VALVE

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

NOTE: The expansion valve should only be tested following testing of the compressor.

NOTE: Liquid CO is required to test the expansion valve. This material is available from most welding supply facilities. Liquid CO is also available from companies which service and sell fire extinguishers.

When testing the expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

(1) Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.

(2) Close all doors, windows and vents to the passenger compartment.

(3) Set the heater-air conditioner controls so that the compressor is operating, the temperature control is in the highest temperature position, the mode door is directing the output to the floor outlets, and the blower is operating at the highest speed setting.

(4) Start the engine and allow it to idle at 1000 rpm. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the evaporator.

(5) If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 965 to 1655 kPa (140 to 240 psi). The suction (low pressure) gauge should read 140 kPa to 207 kPa (20 psi to 30 psi). If OK, go to Step 6. If not OK, replace the faulty expansion valve.

WARNING: PROTECT THE SKIN AND EYES FROM EXPOSURE TO LIQUID CO. PERSONAL INJURY CAN RESULT.

(6) If the suction (low pressure) gauge reads within the specified range, freeze the expansion valve control head for 30 seconds using liquid CO or another suitable super-cold material.**Do not spray R-134a or R-12 refrigerant on the expansion valve control head for this test.** The suction (low pressure) gauge reading should drop by 10 psi. If OK, go to Step 7 If not OK, replace the faulty expansion valve.

(7) Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 140 kPa to 240 kPa (20 psi to 30 psi). If not OK, replace the faulty expansion valve.

(8) When expansion valve testing is complete, test the overall air conditioner performance. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST). Remove all test equipment before returning the vehicle to service.

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING), (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING), and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - HEATER PLUMBING).

(1) Remove the rear heater-A/C unit housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER-A/C HOUSING - REMOVAL).

(2) Carefully remove the foam insulator wrap from the rear expansion valve.

(3) Remove the rear evaporator line extension from the expansion valve. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/EVAPORATOR - REMOVAL - EVAPORATOR LINE EXTENSION).

(4) Remove the two screws that secure the expansion valve to the evaporator tube sealing plate.

(5) Remove the expansion valve from the evaporator tubes.

(6) Remove the seals from the evaporator tube fittings and discard.

(7) Install plugs in, or tape over the opened evaporator tube fittings and both expansion valve ports.

EXPANSION VALVE (Continued)

INSTALLATION

(1) Remove the tape or plugs from the evaporator tube fittings and both expansion valve ports.

(2) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator tube fittings.

(3) Position the expansion valve onto the evaporator tubes.

(4) Install and tighten the two screws that secure the expansion valve to the evaporator tube sealing plate. Tighten the screws to 11 N·m (97 in. lbs.).

(5) Reinstall the rear evaporator line extension onto the expansion valve. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/EVAPORATOR - INSTALLATION - EVAPORATOR LINE EXTENSION).

(6) Install the foam insulator wrap over the rear expansion valve.

(7) Reinstall the rear heater-A/C unit housing into the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER-A/C HOUSING - INSTALLATION).

(8) Run the HVAC Cooldown Test to verify proper operation.

HEATER CORE

DESCRIPTION

The rear heater core is located near the front of the rear heater-A/C unit housing, behind the right rear wheel house. It is a heat exchanger made of rows of tubes and fins. One end of the core is fitted with a molded plastic tank that includes integral heater core inlet and outlet nipples. The heater core can be serviced without removing the rear heater-A/C unit housing from the vehicle. The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

Engine coolant is circulated through heater hoses to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend air door allows control of the heater output air temperature by controlling how much of the air flowing through the rear heater-A/C unit housing is directed through the heater core.

STANDARD PROCEDURE - HEATER CORE FILLING

In its final installed position, the rear heater core is positioned higher than the radiator fill cap. Therefore, when the cooling system is drained and refilled, gravity will not refill the heater core with coolant to the proper level. This may result in two problems: **1.** Insufficient coolant level in the engine cooling system, which may result in engine overheating. **2.** Air entrapped within the rear heater core, which may result in insufficient rear heater performance. There are two methods that may be employed to prevent these problems: **1.** Pre-filling of the rear heater core. **2.** Thermal cycling of the engine cooling system. Following are descriptions of both prevention methods, as well as a method to verify rear heater performance.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING FRONT - WARNING - HEATER PLUMBING).

PRE-FILLING

If the rear heater core or the rear heater-A/C housing have been removed from the vehicle for service, the rear heater core may be pre-filled with the proper engine coolant mixture prior to reconnecting the heater hoses to the heater core hose fittings.

(1) The heater core should be installed in the rear heater-A/C unit housing, and the rear heater-A/C unit housing should be installed in the vehicle.

(2) Take the proper precautions to protect the carpeting below the rear heater core from spilled engine coolant and have absorbent toweling readily available to mop up any spills.

(3) Insert the small end of an appropriate funnel into the upper hose fitting of the heater core (Fig. 4).

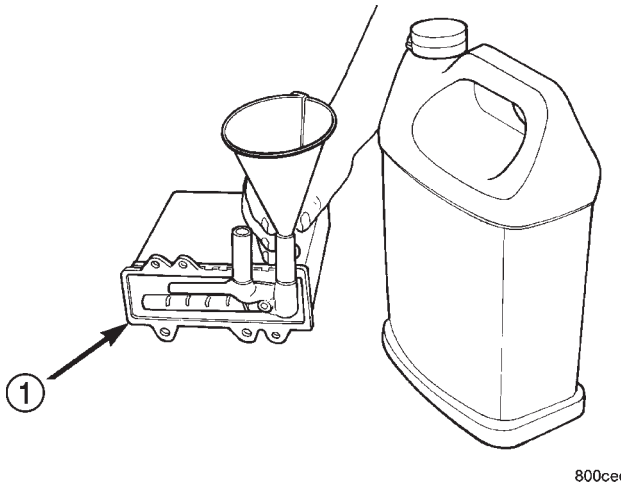

Fig. 4 Pre-Filling Heater Core - Typical

1 - REAR HEATER CORE

HEATER CORE (Continued)

(4) Carefully pour the proper pre-mixed engine coolant solution into the rear heater core through a funnel until coolant begins to appear at the lower hose fitting of the heater core.

(5) Use absorbent toweling to clean up any engine coolant spills from the preceding operation.

(6) Reconnect the heater hoses to the rear heater core. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/HEATER HOSE - INSTALLATION).

(7) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

THERMAL CYCLING

If the rear heater core was emptied and was not pre-filled, it will be necessary to thermal cycle the vehicle at least two times to ensure that the rear heater core is properly filled.

(1) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

(2) Start the engine and allow it to operate until the thermostat opens.

(3) Turn the engine off and allow it to cool.

(4) With the engine cold and not running, check and top off the engine coolant level as necessary. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLANT LEVEL CHECK) and (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLANT - ADDING).

(5) Start the engine and allow it to operate until the thermostat opens again.

(6) Turn the engine off and allow it to cool down again.

(7) With the engine cold and not running, check and top off the engine coolant level as necessary. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLANT LEVEL CHECK) and (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLANT - ADDING).

(8) Check the performance of the rear heater. Refer to REAR HEATER PERFORMANCE CHECK .

REAR HEATER PERFORMANCE CHECK

Successful completion of the rear heater performance check will confirm that the rear heater core is properly filled with engine coolant. If the check is not successful, either there is still air trapped in the rear heater core or the rear heater plumbing is restricted. This check should be performed with the vehicle in a shop where the ambient temperature is about 21° C (70° F).

(1) Start the engine and allow it to idle until it warms up to normal operating temperature.

(2) Adjust the heater-A/C controls so that the front heater is turned Off, the rear heater is set for full Heat, and the rear blower motor is at its highest speed setting.

(3) Use an accurate test thermometer to measure the temperature of the air being discharged from the rear heater outlet located at the base of the right C-pillar.

(4) Proper discharge air temperature readings should be from 57° to 63° C (135° to 145° F).

REMOVAL

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING FRONT - WARNING - HEATER PLUMBING).

(1) Drain the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).

(2) Remove the right quarter trim panel and right D-pillar trim panel from the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(3) Remove the rear heater distribution duct from the right quarter inner panel. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER DISTRIBUTION DUCT - REMOVAL).

(4) Remove the screw that secures the back of the rear heater-A/C unit housing to the right D-pillar.

(5) Remove the screw that secures the front of the rear heater-A/C unit housing to the right quarter inner panel.

(6) Take the proper precautions to protect the carpeting below the rear heater core from spilled engine coolant and have absorbent toweling readily available to mop up any spills.

(7) Disconnect the heater hoses at the rear heater core. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/HEATER HOSE - REMOVAL).

(8) Install plugs in, or tape over the opened heater core fittings and both heater hoses (Fig. 5).

(9) Use absorbent toweling to clean up any engine coolant spills from the preceding operation.

(10) Release the four latch tabs that secure the heater core in the rear heater-A/C unit housing.

(11) Carefully pull the heater core straight out of the rear heater-A/C unit housing.

(12) Use absorbent toweling to clean up any engine coolant spills from the preceding operation.

HEATER CORE (Continued)

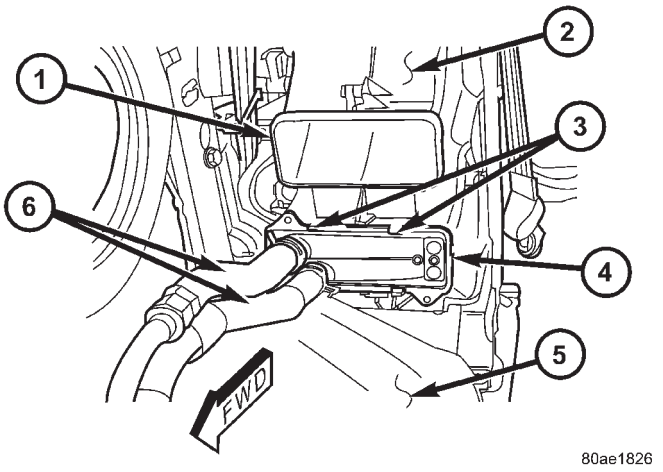

Fig. 5 Heater Core

1 - REAR HEATER-A/C HOUSING OUTLET
2 - REAR HEATER-A/C UNIT HOUSING
3 - LATCH (4)
4 - HEATER CORE
5 - RIGHT REAR WHEEL HOUSE
6 - HEATER HOSES

INSTALLATION

NOTE: If the rear heater core or the rear heater-A/C housing have been removed from the vehicle for service, the rear heater core may be pre-filled with the proper engine coolant mixture prior to reconnecting the heater hoses to the heater core hose fittings. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/HEATER CORE - STANDARD PROCEDURE - HEATER CORE FILLING).

(1) Carefully slide the heater core into the rear heater-A/C unit housing.

(2) Using hand pressure, press firmly and evenly on the heater core end plate until the four latch tabs that secure the heater core in the rear heater-A/C unit housing are fully engaged (Fig. 5).

(3) Remove the plugs or tape from the heater core fittings and both heater hoses.

(4) Reconnect the heater hoses to the rear heater core. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/HEATER HOSE - INSTALLATION).

(5) Install and tighten the screw that secures the front of the rear heater-A/C unit housing to the right quarter inner panel. Tighten the screw to 11 N·m (97 in. lbs.).

(6) Install and tighten the screw that secures the back of the rear heater-A/C unit housing to the right D-pillar. Tighten the screw to 11 N·m (97 in. lbs.).

(7) Reinstall the rear heater distribution duct onto the right quarter inner panel. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/REAR HEATER DISTRIBUTION DUCT - INSTALLATION).

(8) Remove the right quarter trim panel and right D-pillar trim panel from the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

(9) Drain the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

HEATER HOSE

REMOVAL

REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING FRONT - WARNING - HEATER PLUMBING).

(1) Partially drain engine cooling system. Refer to Group 7, Engine Cooling.

(2) Loosen clamp at the front end of the hose located at the right, outboard side of the underbody, rearward of the front crossmember. (Fig. 9)

(3) Carefully rotate hose back and forth while tugging slightly away from connector nipple. If the hose will not come off, slice the hose at the connector nipple and peel off heater hose. This method will require heater hose replacement.

CAUTION:
When removing hoses from outlet nipples, do not use excessive force. Outlet nipples may become damaged and leak engine coolant.

(4) Compress insert in rear heater hose quick connection and pull downward on hose. (Fig. 11)

(5) Remove (3) straps securing underbody lines. (Fig. 8)

(6) Separate and remove rear heater lines from vehicle.

INSTALLATION

There are several heater core plumbing configurations used on this model, depending upon the engine size and other optional equipment. One plumbing configuration is used for all 2.4L engines, while the 3.3L and 3.8L engines have unique heater return plumbing on the engine for models with or without an optional engine oil cooler. There are also unique plumbing configurations at the heater core for models with or without the optional rear heater and air conditioner. All models use a combination of formed steel tubing and rubber hoses. In most cases, the rubber hose is secured to the steel tubing with a spring tension clamp.

HEATER HOSE (Continued)

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING FRONT - WARNING - HEATER PLUMBING).

(1) Using spring tension clamp pliers, compress and slide the clamps that secure each end of the heater hose toward the center of the hose being installed. Release the clamp when it is near the center of the hose.

(2) Grasp one end of the heater hose being installed firmly and carefully twist the hose back and forth while pushing it over from the barbed end of the nipple. Repeat this procedure at the opposite end of the hose being installed.

(3) Using spring tension clamp pliers, compress and slide the clamps that secure each end of the heater hose over the tube or nipple. Release the clamp when it is over the tube or nipple.

(4) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

SUCTION LINE

REMOVAL

The front air conditioner suction line includes the low side service port on a section of tubing located near the compressor. On models equipped with the optional rear air conditioner, the front air conditioner suction line also includes a suction line hose and tube extension that connects the front suction line to the suction line for the rear air conditioner.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT RECOVERY).

(2) Disconnect and isolate the battery negative cable.

(3) Remove the air cleaner top cover and snorkel from the air cleaner housing located on the right side of the engine compartment.

(4) Disconnect the drain tube from the wiper module drain on the right side of the engine compartment.

(5) Remove the nut that secures the suction line fitting to the top of the compressor.

(6) Disconnect the suction line fitting from the compressor suction port.

(7) Remove the seal from the suction line fitting and discard.

(8) Install plugs in, or tape over the opened suction line fitting and the compressor suction port.

(9) Disengage the retainer that secures the suction line routing clip to the filter-drier mounting bracket on the side of the right front strut tower in the engine compartment (Fig. 6).

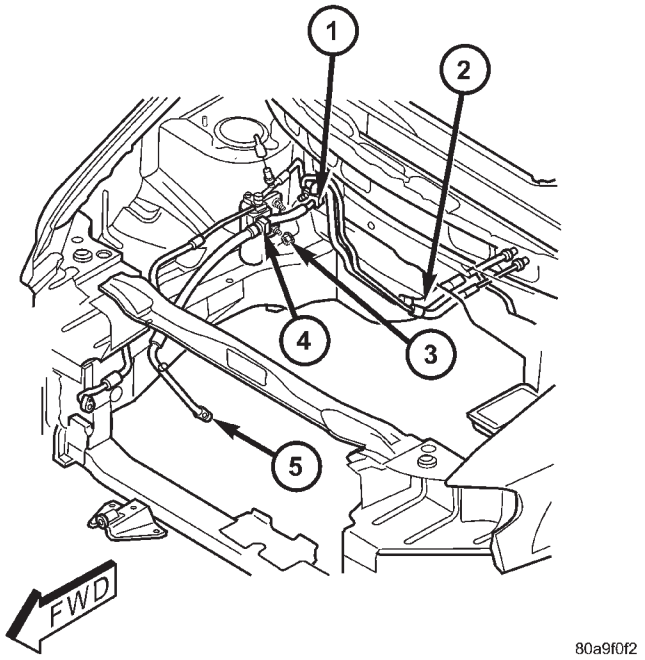

Fig. 6 Suction Line

1 - EXPANSION VALVE
2 - SUCTION LINE EXTENSION (REAR A/C ONLY)
3 - NUT
4 - ROUTING CLIP
5 - SUCTION LINE

(10) Remove the nut that secures the suction line and liquid line fittings to the expansion valve.

(11) Disconnect the suction line and liquid line fittings from the expansion valve.

(12) Remove the seals from the suction line and liquid line fittings and discard.

(13) Install plugs in, or tape over the opened suction line and liquid line fittings and both expansion valve ports.

SUCTION LINE (Continued)

(14) If the vehicle is equipped with the optional rear air conditioner, go to Step 15. If the vehicle does not have the optional rear air conditioner, go to Step 21.

(15) Raise and support the vehicle.

(16) Cut the tie strap located just forward of the connections between the underbody plumbing and the engine compartment plumbing for the rear heater and air conditioner (Fig. 7).

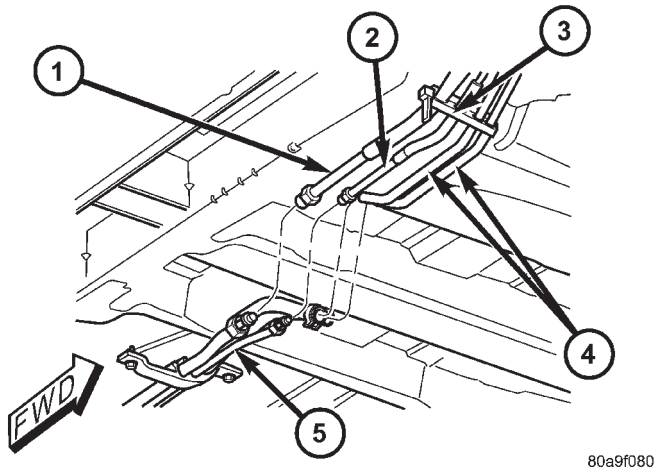

Fig. 7 Underbody Connections

1 - SUCTION LINE EXTENSION
2 - LIQUID LINE EXTENSION
3 - TIE STRAP
4- HEATER LINE EXTENSIONS
5 - UNDERBODY LINES

(17) Disconnect the suction line extension fitting from the underbody suction line fitting for the rear air conditioner.

(18) Remove the seal from the underbody suction line fitting and discard.

(19) Install plugs in, or tape over the opened suction line fittings.

(20) Lower the vehicle.

(21) Remove the suction line from the engine compartment.

INSTALLATION

The front air conditioner suction line includes the low side service port on a section of tubing located near the compressor. On models equipped with the optional rear air conditioner, the front air conditioner suction line also includes a suction line hose and tube extension that connects the front suction line to the suction line for the rear air conditioner.

WARNING: REFER TO THE APPLICABLE WARNINGS AND CAUTIONS FOR THIS SYSTEM BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - CAUTION - A/C PLUMBING).

(1) Position the suction line into the engine compartment.

(2) Remove the tape or plugs from the suction line and liquid line fittings and both expansion valve ports.

(3) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the suction line and liquid line fittings.

(4) Reconnect the liquid line and suction line fittings to the expansion valve.

(5) Install and tighten the nut that secures the suction line and liquid line fittings to the expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).

(6) Engage the retainer that secures the suction line routing clip to the filter-drier mounting bracket on the side of the right front strut tower in the engine compartment.

(7) Remove the tape or plugs from the compressor suction port and the suction line fitting.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the suction line fitting.

(9) Reconnect the suction line fitting to the compressor suction port.

(10) Install and tighten the nut that secures the suction line fitting to the compressor. Tighten the nut to 23 N·m (17 ft. lbs.).

(11) Reconnect the drain tube to the wiper module drain on the right side of the engine compartment.

(12) Reinstall the air cleaner top cover and snorkel onto the air cleaner housing located on the right side of the engine compartment.

(13) Reconnect the battery negative cable.

(14) If the vehicle is equipped with the optional rear air conditioner, go to Step 15. If the vehicle does not have the optional rear air conditioner, go to Step 21.

(15) Raise and support the vehicle.

(16) Remove the tape or plugs from the suction line extension fitting and the underbody suction line fitting (Fig. 38).

(17) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the underbody suction line fitting.

SUCTION LINE (Continued)

(18) Reconnect the suction line extension fitting to the underbody suction line fitting. Tighten the fittings to 23 N·m (17 ft. lbs.).

(19) Install a new tie strap just forward of the connections between the underbody plumbing and the engine compartment plumbing for the rear heater and air conditioner.

(20) Lower the vehicle.

(21) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(22) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

UNDERBODY LINES

DESCRIPTION

The rear heater-A/C unit plumbing is used only on models with the optional rear heater-A/C unit. The formed metal rear heater-A/C unit suction line, liquid line, and heater lines are available for separate service replacement. The molded and straight heater hoses used on the rear heater-A/C unit can be serviced in the vehicle. Refer to Group 7 - Cooling System for the heater hose service procedures.

OPERATION

The rear heater and A/C lines are all serviced as individual pieces. When disconnecting any line or block ensure that the area around it is clean of any contaminations that can get in to the system (Fig. 8), (Fig. 9), (Fig. 11), (Fig. 10) and (Fig. 12).

Any kinks or sharp bends in the rear heater-A/C unit plumbing will reduce the capacity of the entire heating and air conditioning system. Kinks and sharp bends reduce the system flow. High pressures are produced in the refrigerant system when the air conditioning compressor is operating. High temperature coolant is present in the heater plumbing when the engine is operating. Extreme care must be exercised to make sure that each of the plumbing connections is pressure-tight and leak free.

REMOVAL

REMOVAL - REAR HEATER LINES

(1) Raise and support vehicle.
(2) Pinch off rubber heater line hose.
(3) Disconnect quick connect fitting at C-pillar.
(4) Loosen one screw and remove the other screw at each of the three brackets holding the front of the line to the underbody.
(5) Lower rear of line and drain coolant into a suitable container.
(6) Loosen hose clamps at front of line and remove line from vehicle.

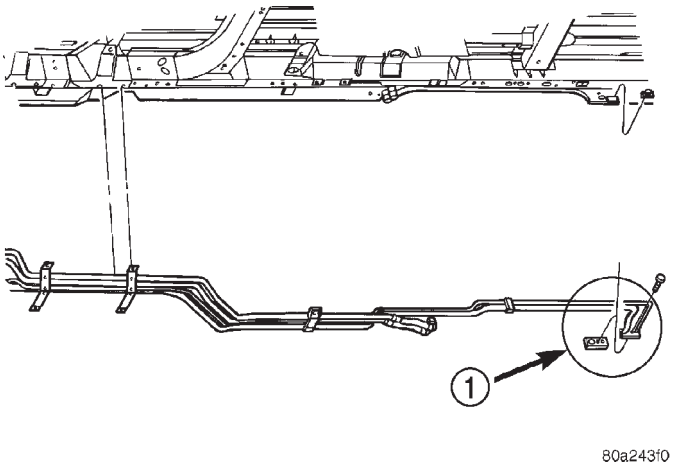

Fig. 12 Rear A/C Block Connection

1 - CLEAN AREA AROUND BLOCK BEFORE REMOVAL

REMOVAL - REAR AIR CONDITIONING LINES

(1) Recover A/C system.
(2) Hoist and support vehicle.
(3) Loosen one screw and remove the other screw at each of the three brackets holding the A/C lines to the underbody (Fig. 8).
(4) Remove both A/C lines from the two rear retaining clamps, behind rear wheel.
(5) Remove both compression fittings at front of A/C lines (Fig. 9).
(6) Remove (1) bolt securing A/C lines to block located at A/C housing, behind rear wheel, and separate block (Fig. 12).
(7) Remove rear wheel.
(8) Separate ABS harness from flex hose clamps.
(9) Remove heater lines from underbody brackets.
(10) Pinch off rubber heater line hoses at front of vehicle.
(11) Loosen hose clamps at front of heater lines and allow them to hang from vehicle.
(12) Remove rear A/C lines from vehicle.
(13) Remove nylon wedge holding lines into rear block (Fig. 13).

UNDERBODY LINES (Continued)

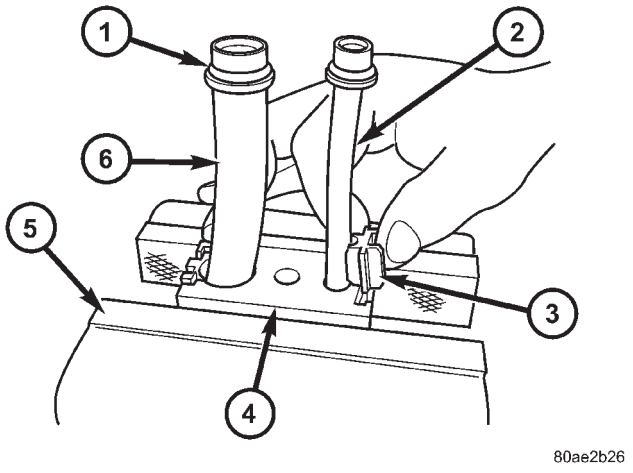

Fig. 13 UNDERBODY LINE WEDGES

1 - O-RING
2 - DISCHARGE LINE
3 - NYLON WEDGE

5 - VISE
6 - SUCTION LINE

INSTALLATION

INSTALLATION - REAR HEATER LINES

(1) Install line into underbody straps.
(2) Install line into front hose and install hose clamp.
(3) Connect quick fitting at rear of line.
(4) Lower vehicle.
(5) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

INSTALLATION - REAR AIR CONDITIONING LINES

(1) Before installation, replace all O-rings and gaskets. Coat all sealing surfaces with approved wax-free refrigerant oil.
(2) Install A/C line into rear block with nylon wedge.
(3) Install A/C lines into five underbody brackets.
(4) Connect forward compression fittings.
(5) Install bolt at sealing block to rear A/C housing.
(6) Install ABS harness into clips.
(7) Install heater hoses into underbody brackets.
(8) Install lines into front hoses and install hose clamps.
(9) Lower vehicle.
(10) Evacuate and recharge system.
(11) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

DIESEL SUPPLEMENTAL HEATER - DCHA - BUX

DESCRIPTION

Vehicles equipped with the optional diesel engine are also equipped with a supplemental heater unit. This unit is mounted under the vehicle and operates similar to an oil fired furnace. The heater burns small amounts of fuel to provide additional heat to the coolant. Coolant is routed from the engine, to the supplemental heater, and then to the front heater core. This provides additional heat to the passenger compartment. The system is interfaced to the vehicles on-board computer systems and DRB-III diagnostics.

OPERATION

The supplemental heater unit is activated via the temperature slide control or knob on the vehicle HVAC control unit. If the control slide or knob is moved to or above the upper set point the heater is activated. The unit can operate in a full or partial load range as well as an idle mode all dependent on the engine coolant temperature. The heater unit will also turn off if the HVAC temperature control is lowered to less than the lower set point. The heater unit can take up to three minutes to completely shut down when either the heater temperature is set below the lower set point or the vehicle ignition is shut down.

DIAGNOSIS AND TESTING - DIESEL SUPPLEMENTAL HEATER - DCHA

The following table lists possible fault symptoms of diesel fueled heaters.

SYMPTOM	POSSIBLE CAUSES
Smell of diesel fuel	Check heater system integration in vehicle's fuel system. Check fuel lines for leakage, kinks or obstructions. If OK, Inspect the inlet muffler, drain as necessary. Re-test the unit and re-inspect. Inspect the exhaust tube and heater unit for the presence of external fuel. If a volume is observed on the unit or in the exhaust tube or after draining and testing. Remove heater unit from vehicle and repair or replace components as required.
Heater does not achieve full load operation.	Check heater operation with DRB-III and replace components as required.
Continuous white smoke from heater exhaust during combustion operation.	Check heater operation with DRB-III and replace components as required. White smoke is typical in extreme weather conditions.
Heater can not be switched off.	Check heater operation with DRB-III and replace components as required.
Heater does not operate.	Diagnosis cabin heater ECU using the DRB-III and the procedures listed in Vehicle Performance under Cabin Heater Diagnosis in Group 18.
Loss of coolant (Leakage) or heater develops smoke during combustion operation and exhaust has an extremely sweet smell.	Inspect coolant hoses for leakage, kinks or loose hose connection. Inspect the exhaust tube assembly for continuous flow, if OK there is an internal heater leak and unit should be inspected and components should be replaced as required.
Loss of fuel (dripping).	Check heater system integration in vehicles fuel system. Check fuel line connection for leakage. If OK there is an internal leak and unit should be inspected and replaced as required.

EXHAUST TUBE

REMOVAL

WARNING: THERE IS A POTENTIAL DANGER OF SKIN BURNS AS THE HEATER AND ITS COMPONENTS MAY BE VERY HOT. MAKE SURE THE HEATER IS ALLOWED TO COOL DOWN BEFORE ANY SERVICE WORK IS ATTEMPTED.

WARNING: THERE IS A POTENTIAL DANGER OF SKIN BURNS AS THE EXHAUST SYSTEM MAY BE VERY HOT. MAKE SURE THE EXHAUST SYSTEM IS ALLOWED TO COOL DOWN BEFORE ANY SERVICE WORK IS ATTEMPTED ON THE CABIN HEATER.

(1) Elevate vehicle on a lift taking note of the exhaust tube flexible section.

(2) Remove the exhaust clamp at the flexible pipe and steel pipe connection (Fig. 1).

(3) Remove the clamp at the flexible pipe connection and the heater unit housing (if required).

(4) Remove the three screws holding the exhaust pipe to the body.

(5) Remove the steel exhaust pipe from the vehicle.

(6) Remove the flexible exhaust pipe from the vehicle (if required).

INSTALLATION

(1) Install the flexible exhaust pipe to the heater unit. Tighten mounting clamp.

(2) Position the steel exhaust pipe to the flexible exhaust and install and tighten the mounting clamp.

(3) Install the three exhaust pipe screws, adjust pipe placement as needed and tighten the screws.

(4) Install the clamp to connect the steel exhaust pipe to the flexible exhaust pipe and tighten clamp.

(5) Check exhaust pipe exhaust end placement and make any final adjustments.

(6) Lower vehicle from lift.

FUEL DOSING PUMP

DESCRIPTION

The dosing pump is a combined delivery, dosing and shut-off system for the fuel supply to the heater from the vehicles fuel tank.

OPERATION

The dosing pump is an electrically operated pump that receives its operation instructions from the supplemental heater electronic control module. The pump supplies diesel fuel from the fuel tank to the heater unit.

REMOVAL

The dosing pump is serviceable without removing the component from the vehicle.

(1) Disconnect the rubber hose at the fuel line to heater fuel pump. Leave the rubber hose on the fuel line.(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/FUEL LINE - REMOVAL) (Fig. 2).

(2) Disconnect the fuel line between the dosing pump and the heater unit.

NOTE: Position and retain heater fuel line to prevent fuel leakage while servicing dosing pump.

NOTE: Utilize an approved fuel storage container to catch any residual fuel.

(3) Disconnect the electrical connector to the fuel pump by depressing the integral spring and pulling the connector away from the pump.

(4) Remove the dosing pump from the rubber isolation.

INSTALLATION

(1) Mount the rubber isolation back onto the splash shield mounting flanges at two locations.

(2) Connect fuel lines to the dosing pump and the heater unit. The connectors should point towards the heater fuel line.

(3) Use aviation style clamps to attach the hose to the fuel pump nipples(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/FUEL LINE - INSTALLATION).

FUEL DOSING PUMP (Continued)

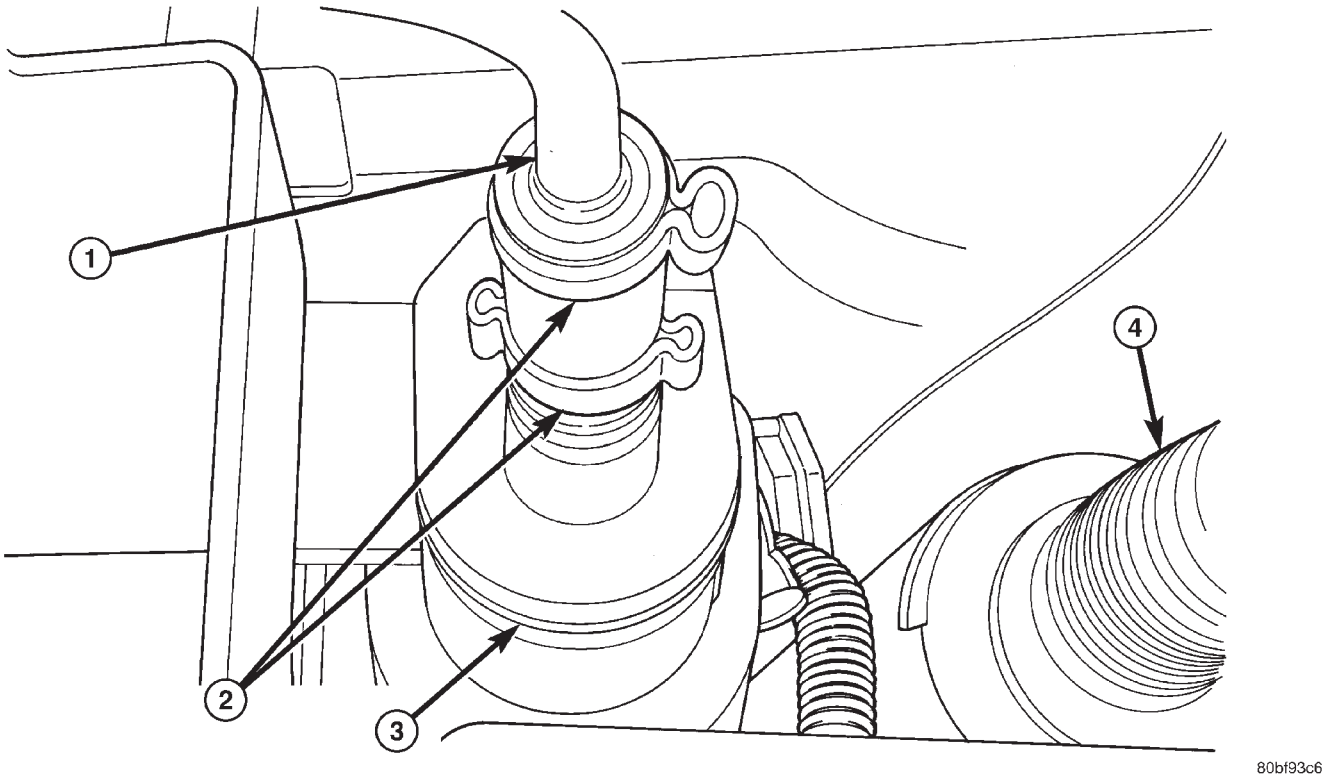

Fig. 2 Dosing Pump Fuel Line

1 - Fuel Line
2 - Retaining Clamps
3 - Dosing Pump
4 - Heater Unit Air Intake Pipe

(4) Connect the electrical connector to the fuel pump by depressing the integral spring and pushing the connector towards the dosing pump. Pull the connector towards the heater to verify the installation.

(5) Verify function of the heater.

FUEL LINE

STANDARD PROCEDURE - CLEANING

(1) Remove the cabin heater fuel line(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/FUEL LINE - REMOVAL).

(2) With cabin heater line removed from vehicle place a shop cloth on the fuel tank end of the fuel line to catch any residue, then apply a small amount of air pressure to the other end of the fuel line.

(3) Check to see if air pressure is coming from the tank end of the line. If pressure is flowing unrestricted the line is clean.

(4) If the line shows any signs of being restricted after air pressure is applied, then the fuel line should be replaced.

(5) Install the cabin heater line(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/FUEL LINE - INSTALLATION).

(6) Verify function of the heater.

REMOVAL

(1) Elevate vehicle on a lift taking note of the heater exhaust tube flexible section.

(2) Remove clamps on dosing pump end of fuel line and separate line from pump (Fig. 3).

NOTE: Have an approved fuel holding device ready to capture any diesel fuel that drains from fuel line or heater unit.

(3) Remove clamp from fuel line at fuel tank connection and separate line from tank.

(4) Remove any retaining clips and remove line from vehicle.

INSTALLATION

WARNING: DO NOT OPERATE THE DCHA IN AN ENCLOSED AREA SUCH AS A GARAGE THAT DOES NOT HAVE EXHAUST VENTILATION FACILITIES. ALWAYS VENT THE DCHA'S EXHAUST WHEN OPERATING THE DCHA. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY OR DEATH.

FUEL LINE (Continued)

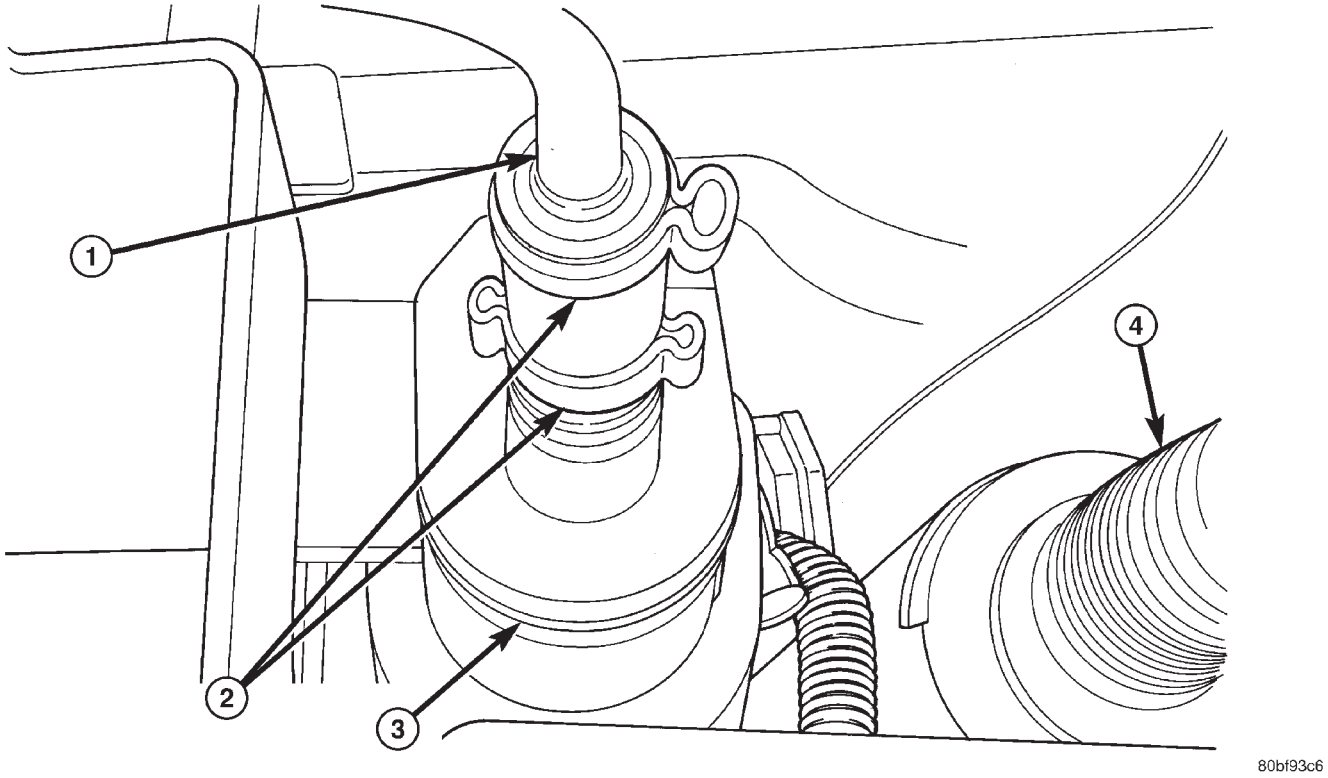

Fig. 3 Dosing Pump Fuel Line

1 - Fuel Line
2 - Retaining Clamps
3 - Dosing Pump
4 - Heater Unit Air Intake Pipe

WARNING: ALLOW THE DCHA ASSEMBLY TO COOL BEFORE PERFORMING A COMPONENT INSPECTION/REPAIR/REPLACEMENT. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

WARNING: VERIFY THAT ALL DCHA FUEL LINES ARE SECURELY FASTENED TO THEIR RESPECTIVE COMPONENTS BEFORE PERFORMING THIS PROCEDURE.

NOTE: Verify that there is more than 1/8 of a tank of fuel in the vehicle's fuel tank before performing this procedure. Add fuel, if necessary.

(1) Install heater fuel supply line to vehicle and install in fuel line retainers
(2) Install fuel line connection at fuel tank and tighten connection.
(3) Install fuel line at Dosing Pump and tighten connection.
(4) Lower vehicle from lift.

NOTE: Failure to prime the Dosing Pump after draining the DCHA fuel line will prevent DCHA heater activation during the first attempt to start the heater. This will also set a Diagnostic Trouble Code (DCT) in the DCHA Control's memory. do not perform the Dosing Pump Priming procedure if an attempt was made to start the DCHA without priming the Dosing Pump first. This will put excess fuel in the DCHA Heater Module and cause smoke to emit from the DCHA exhaust pipe when heater activation occurs.

(5) Connect the DRBIII® to the Diagnostic Link Connector.
(6) Turn the ignition to the on position.

NOTE: Do not activate the Dosing Pump Prime more than one time. This will put excess fuel in the DCHA Heater Module an cause smoke to emit from the DCHA exhaust pipe when heater activation occurs.

NOTE: A clicking noise heard coming from the Dosing Pump indicates that the pump is operational.

FUEL LINE (Continued)

(7) With the DRBIII® in Cabin Heater, select System Tests and Dosing Pump Prime. Allow the Dosing Pump to run for the full 45 second cycle time. When the 45 second cycle is complete, press Page Back on the DRBIII® key pad to exit the Dosing Pump Prime. The Dosing Pump priming procedure is now complete.

HEATER UNIT

REMOVAL

WARNING: ALLOW THE DCHA TO COOL BEFORE PERFORMING A COMPONENT INSPECTION/REPAIR OR REPLACEMENT. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

WARNING: ALLOW THE EXHAUST SYSTEM TO COOL BEFORE PERFORMING A COMPONENT INSPECTION/REPAIR OR REPLACEMENT. FAILURE TO FOLLOW THESE INSTRUCTION MAY RESULT IN PERSONAL INJURY.

(1) Elevate the vehicle on a hoist/lift taking note of heater exhaust tube flexible section.

(2) Drain cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Carefully open one hose to the underbody tube assembly and drain the remaining coolant. A salvage hose is a good idea to control the residual coolant, as flow will occur from both the heater and the hose and tube assemblies.

(4) Remove the second hose from the underbody hose and tube assembly.

(5) Loosen the hose and tube assembly from the toe-board cross member at two locations.

(6) Disconnect the electrical connector from the body harness near the toe board cross member and rail.

(7) Remove the wiring harness from the toe board cross member(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - REMOVAL).

(8) Open the fuel fill cap. Disconnect the rubber fuel hose between the body tube assembly and the fuel pump nipple at the body tube joint. A minimal amount of fuel may flow from the open port.

NOTE: Utilize an approved fuel storage container to catch any residual fuel.

(9) Loosen the two M8 fasteners at the rail. Take care to notice that the exhaust tube bracket tab is on top of the heater bracket.

(10) Remove the heater exhaust tube flex section from the exhaust tube by loosening the M6 bolt of the clamp assembly. Remove the hose from the exhaust tube. Removal of the rail tube assembly may aid in this service operation.(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/EXHAUST TUBE - REMOVAL).

(11) Remove seat hex nut at the heater mounting flange to cross member.

(12) Loosen the remaining M6 and M8 fasteners which mount the exhaust tube assembly to the vehicle.

(a) Install a suitable cabin heater support device under the cabin heater and secure the cabin heater to the device.

(13) Loosen the remaining three M6 fasteners to the cross members.

(14) Remove the loosened fasteners that support the heater while supporting the weight of the heater.

(15) Swing the unit mounting bracket from between the exhaust bracket and rail mounting location. Drain any residual coolant from the heater unit.

(16) Lower the cabin heater and remove from the supporting device and place on a suitable work area.

INSTALLATION

(1) Install the unit mounting bracket between the exhaust bracket and the rail mounting location.

(2) Install the fasteners that support the heater while supporting the weight of the heater.

(3) Install the three M6 fasteners to the cross members. Tighten the M6 fasteners to 7 Nm (5 ft. lbs.).

(4) Tighten the remaining M6 fasteners to 7 Nm (5 ft. lbs.) and the M8 fasteners to 23 Nm (17 ft. lbs.) which mount the exhaust tube assembly to the vehicle.

(5) Install the seat hex nut at the heater mounting flange to the cross members. Tighten to 60 Nm (44 ft. lbs.)

(6) Install the heater exhaust tube flex section to the exhaust tube by tightening the M6 bolt of the clamp assembly. Install the hose to the exhaust tube.

(7) Tighten the two M8 fasteners at the rail to 23 Nm (17 ft. lbs.). Taking care so that the exhaust tube bracket tab is on the top of the heater bracket.

(8) Install the wiring harness(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - INSTALLATION).

(9) Tighten the hose and tube assembly to the toe-board cross member at two locations.

(10) Install the second hose to the underbody hose and tube assembly.

(11) Connect the rubber fuel hose between the body tube assembly and the fuel pump nipple at the body tube joint. Close the fuel fill cap.

HEATER UNIT (Continued)

(12) Remove the heater unit support device from under the vehicle.
(13) Lower vehicle from lift.
(14) Refill cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
(15) Verify function of the cabin heater.

SUPPLEMENTAL DIESEL HEATER WIRING

REMOVAL

(1) Elevate vehicle on a lift taking note of the exhaust tube flexible section.
(2) Unplug connector from vehicle wiring harness to cabin heater harness.
(3) Unplug connector from cabin heater harness to dosing pump connector.
(4) Unplug two connectors from cabin heater harness to cabin heater controller connectors.
(5) Remove two wiring harness connectors from underbody.
(6) Remove two wiring harness connectors from cabin heater shield.
(7) Carefully route the cabin heater harness to the left side between the cabin heater unit and the cabin heater shield.

INSTALLATION

(1) Carefully route the cabin heater harness from the left side of the cabin heater between the cabin heater unit and the cabin heater shield.
(2) Install the two wiring harness retaining connectors to the cabin heater shield.
(3) Route the wiring harness along the underside of the vehicle and install the two wiring harness retaining connectors.
(4) Plug the two connectors from the cabin heater harness to the cabin heater controller.
(5) Plug the connector to the cabin heater harness to the dosing pump connector.
(6) Plug the connector from the vehicle wiring harness to the cabin heater harness.
(7) Lower the vehicle.
(8) Verify function of the cabin heater.

AIR INTAKE PIPE

REMOVAL

NOTE: Heater air intake tube is part of an assembly that includes the heater cooling intake and return pipes. If heater air intake tube requires removal or replacement the entire assembly will require removal/replacement.

(1) Drain cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
(2) Remove clamps from the heater tubes at the lower heater port and the lower EGR connector which are located under the hood.
(3) Remove the retaining clamp at the heater air intake muffler connection(Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/INLET MUFFLER - REMOVAL).
(4) Remove the clamp at the flexible tube to steel tube connection (Fig. 4).

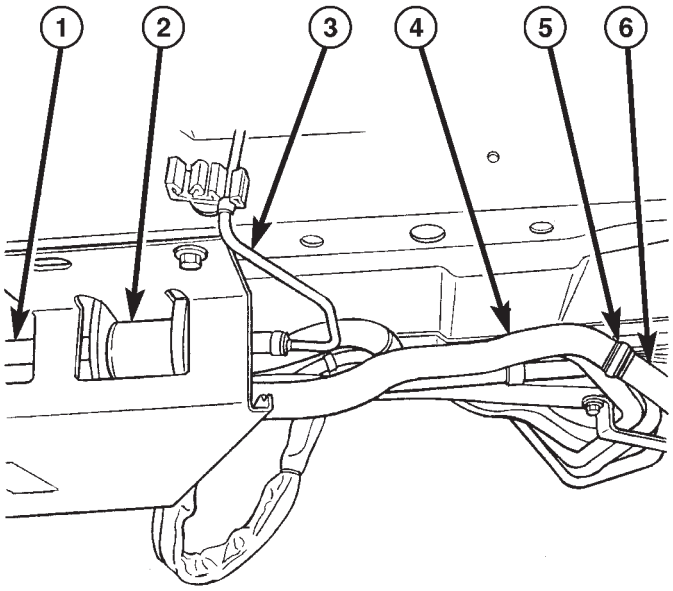

Fig. 4 FLEXIBLE AIR INTAKE LINE

1 - HEATER UNIT AND SPLASH SHIELD
2 - DOSING PUMP
3 - DOSING PUMP FUEL LINE
4 - FLEXIBLE INTAKE LINE
5 - CLAMP
6 - STEEL INTAKE PIPE

AIR INTAKE PIPE (Continued)

(5) Remove the two retaining screws and remove pipe assembly (Fig. 5).

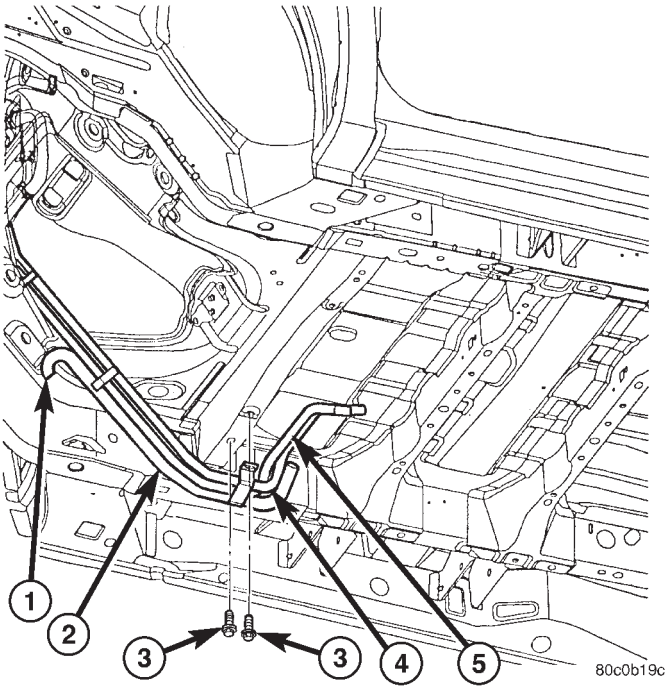

Fig. 5 AIR INTAKE AND HEATER PIPE ASSEMBLY

1 - INTAKE TUBE AIR INTAKE
2 - INTAKE PIPE
3 - RETAINING SCREWS
4 - INTAKE HEATER LINE
5 - RETURN HEATER LINE

INSTALLATION

(1) Install the air intake pipe assembly and install the two retaining screws. Tighten the screws to 7 Nm (5 ft. lbs.).

(2) Attach the steel tube to the flexible tube and position and then tighten the retaining clamp.

(3) Install the flexible tube to the heater air intake muffler and install and tighten the retaining clamp.

(4) Install the heater tubes to the lower heater connection and the lower EGR cooler connection and tighten the retaining clamps.

(5) Lower the vehicle.

(6) Refill the cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).

(7) Verify function of the heater unit.

EMISSIONS CONTROL

DESCRIPTION

DESCRIPTION - VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

DESCRIPTION - TRIP DEFINITION

A "Trip" means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 40°F in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 160°F
- A "driving cycle" that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1–good trip.

DESCRIPTION - MONITORED COMPONENT

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is low and engine rpm is 1600 or greater and the TPS indicates a small throttle opening, a DTC will be set. The same applies to low vacuum and 1600 rpm.

Any component that has an associated limp in will set a fault after 1 trip with the malfunction present.

Refer to the Diagnostic Trouble Codes Description Charts (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

EMISSIONS CONTROL (Continued)

The following is a list of the monitored components:

- Comprehensive Components
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor

COMPREHENSIVE COMPONENTS

Along with the major monitors, OBD II requires that the diagnostic system monitor any component that could affect emissions levels. In many cases, these components were being tested under OBD I. The OBD I requirements focused mainly on testing emissions-related components for electrical opens and shorts.

However, OBD II also requires that inputs from powertrain components to the PCM be tested for **rationality**, and that outputs to powertrain components from the PCM be tested for **functionality**. Methods for monitoring the various Comprehensive Component monitoring include:

(1) Circuit Continuity
- Open
- Shorted high
- Shorted to ground

(2) Rationality or Proper Functioning
- Inputs tested for rationality
- Outputs tested for functionality

NOTE: Comprehensive component monitors are continuous. Therefore, enabling conditions do not apply.

Input Rationality—While input signals to the PCM are constantly being monitored for electrical opens and shorts, they are also tested for rationality. This means that the input signal is compared against other inputs and information to see if it makes sense under the current conditions.

PCM sensor inputs that are checked for rationality include:

- Manifold Absolute Pressure (MAP) Sensor
- Oxygen Sensor (O2S)
- Engine Coolant Temperature (ECT) Sensor
- Camshaft Position (CMP) Sensor
- Vehicle Speed Sensor
- Crankshaft Position (CKP) Sensor
- Intake/inlet Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Ambient/Battery Temperature Sensors
- Power Steering Switch
- Oxygen Sensor Heater
- Engine Controller
- Brake Switch
- Leak Detection Pump Switch (if equipped)
- P/N Switch
- Trans Controls

Output Functionality—PCM outputs are tested for functionality in addition to testing for opens and shorts. When the PCM provides a voltage to an output component, it can verify that the command was carried out by monitoring specific input signals for expected changes. For example, when the PCM commands the Idle Air Control (IAC) Motor to a specific position under certain operating conditions, it expects to see a specific (target) idle speed (RPM). If it does not, it stores a DTC.

PCM outputs monitored for functionality include:

- Fuel Injectors
- Ignition Coils
- Torque Converter Clutch Solenoid
- Idle Air Control
- Purge Solenoid
- EGR Solenoid (if equipped)
- LDP Solenoid (if equipped)
- Radiator Fan Control
- Trans Controls

OXYGEN SENSOR (O2S) MONITOR

DESCRIPTION—Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. When there is a large amount of oxygen in the exhaust caused by a lean condition, the sensor produces a low voltage, below 450 mV. When the oxygen content is lower, caused by a rich condition, the sensor produces a higher voltage, above 450mV.

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate (Big Slope)
- Reduced output voltage (Half Cycle)
- Heater Performance

Slow Response Rate (Big Slope)—Response rate is the time required for the sensor to switch from lean to rich signal output once it is exposed to a richer than optimum A/F mixture or vice versa. As the PCM adjusts the air/fuel ratio, the sensor must be able to rapidly detect the change. As the sensor ages, it could take longer to detect the changes in the oxygen content of the exhaust gas. The rate of change that an oxygen sensor experiences is called

EMISSIONS CONTROL (Continued)

"Big Slope". The PCM checks the oxygen sensor voltage in increments of a few milliseconds.

Reduced Output Voltage (Half Cycle)—The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value. Each time the voltage signal surpasses the threshold, a counter is incremented by one. This is called the Half Cycle Counter.

Heater Performance—The heater is tested by a separate monitor. Refer to the Oxygen Sensor Heater Monitor.

OPERATION—As the Oxygen Sensor signal switches, the PCM monitors the half cycle and big slope signals from the oxygen sensor. If during the test neither counter reaches a predetermined value, a malfunction is entered and Freeze Frame data is stored. Only one counter reaching its predetermined value is needed for the monitor to pass.

The Oxygen Sensor Monitor is a two trip monitor that is tested only once per trip. When the Oxygen Sensor fails the test in two consecutive trips, the MIL is illuminated and a DTC is set. The MIL is extinguished when the Oxygen Sensor monitor passes in three consecutive trips. The DTC is erased from memory after 40 consecutive warm-up cycles without test failure.

Enabling Conditions—The following conditions must typically be met for the PCM to run the oxygen sensor monitor:

- Battery voltage
- Engine temperature
- Engine run time
- Engine run time at a predetermined speed
- Engine run time at a predetermined speed and throttle opening
- Transmission in gear and brake depressed (automatic only)
- Fuel system in Closed Loop
- Long Term Adaptive (within parameters)
- Power Steering Switch in low PSI (no load)
- Engine at idle
- Fuel level above 15%
- Ambient air temperature
- Barometric pressure
- Engine RPM within acceptable range of desired idle

Pending Conditions—The Task Manager typically does not run the Oxygen Sensor Monitor if overlapping monitors are running or the MIL is illuminated for any of the following:

- Misfire Monitor
- Front Oxygen Sensor and Heater Monitor
- MAP Sensor
- Vehicle Speed Sensor
- Engine Coolant Temperature Sensor
- Throttle Position Sensor
- Engine Controller Self Test Faults
- Cam or Crank Sensor
- Injector and Coil
- Idle Air Control Motor
- EVAP Electrical
- EGR Solenoid Electrical (if equipped)
- Intake/inlet Air Temperature
- 5 Volt Feed

Conflict—The Task Manager does not run the Oxygen Sensor Monitor if any of the following conditions are present:

- A/C ON (A/C clutch cycling temporarily suspends monitor)
- Purge flow in progress
- Ethanel content learn is takeng place and the ethenal used once flag is set (if equipped)

Suspend—The Task Manager suspends maturing a fault for the Oxygen Sensor Monitor if any of the following are present:

- Oxygen Sensor Heater Monitor, Priority 1
- Misfire Monitor, Priority 2

OXYGEN SENSOR HEATER MONITOR

DESCRIPTION—If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The heater element itself is not tested. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects. The resistance is normally between 100 ohms and 4.5 megaohms. When oxygen sensor temperature increases, the resistance in the internal circuit decreases. The PCM sends a 5 volts biased signal through the oxygen sensors to ground this monitoring circuit. As the temperature increases, resistance decreases and the PCM detects a lower voltage at the reference signal. Inversely, as the temperature decreases, the resistance increases and the PCM detects a higher voltage at the reference signal. The O2S circuit is monitored for a drop in voltage.

OPERATION—The Oxygen Sensor Heater Monitor begins after the ignition has been turned OFF.

EMISSIONS CONTROL (Continued)

The PCM sends a 5 volt bias to the oxygen sensor every 1.6 seconds. The PCM keeps it biased for 35 ms each time. As the sensor cools down, the resistance increases and the PCM reads the increase in voltage. Once voltage has increased to a predetermined amount, higher than when the test started, the oxygen sensor is cool enough to test heater operation.

When the oxygen sensor is cool enough, the PCM energizes the ASD relay. Voltage to the O2 sensor begins to increase the temperature. As the sensor temperature increases, the internal resistance decreases. The PCM continues biasing the 5 volt signal to the sensor. Each time the signal is biased, the PCM reads a voltage decrease. When the PCM detects a voltage decrease of a predetermined value for several biased pulses, the test passes.

The heater elements are tested each time the engine is turned OFF if all the enabling conditions are met. If the monitor fails, the PCM stores a maturing fault and a Freeze Frame is entered. If two consecutive tests fail, a DTC is stored. Because the ignition is OFF, the MIL is illuminated at the beginning of the next key cycle.

Enabling Conditions—The following conditions must be met for the PCM to run the oxygen sensor heater test:

- Engine run time of at least 3 minutes
- Engine run time at a predetermind speed and throttle opening.
- Key OFF power down
- Battery voltage of at least 10 volts
- Sufficient Oxygen Sensor cool down

Pending Conditions—There are not conditions or situations that prompt conflict or suspension of testing. The oxygen sensor heater test is not run pending resolution of MIL illumination due to oxygen sensor failure.

Suspend—There are no conditions which exist for suspending the Heater Monitor.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

Monitor Operation—To monitor catalyst efficiency, the PCM expands the rich and lean switch points of the heated oxygen sensor. With extended switch points, the air/fuel mixture runs richer and leaner to overburden the catalytic converter. Once the test is started, the air/fuel mixture runs rich and lean and the O2 switches are counted. A switch is counted when an oxygen sensor signal goes from below the lean threshold to above the rich threshold. The number of Rear O2 sensor switches is divided by the number of Front O2 sensor switches to determine the switching ratio.

The test runs for 20 seconds. As catalyst efficiency deteriorated over the life of the vehicle, the switch rate at the downstream sensor approaches that of the upstream sensor. If at any point during the test period the switch ratio reaches a predetermined value, a counter is incremented by one. The monitor

EMISSIONS CONTROL (Continued)

is enabled to run another test during that trip. When the test fails 6 times, the counter increments to 3, a malfunction is entered, and a Freeze Frame is stored, the code is matured and the MIL is illuminated. If the first test passes, no further testing is conducted during that trip.

The MIL is extinguished after three consecutive good trips. The good trip criteria for the catalyst monitor is more stringent than the failure criteria. In order to pass the test and increment one good trip, the downstream sensor switch rate must be less than 45% of the upstream rate. The failure percentages are 59% respectively.

Enabling Conditions—The following conditions must typically be met before the PCM runs the catalyst monitor. Specific times for each parameter may be different from engine to engine.

- Accumulated drive time
- Enable time
- Ambient air temperature
- Barometric pressure
- Catalyst warm-up counter
- Engine coolant temperature
- Vehicle speed
- MAP
- RPM
- Engine in closed loop
- Fuel level

Pending Conditions—

- Misfire DTC
- Front Oxygen Sensor Response
- Front Oxygen Sensor Heater Monitor
- Front Oxygen Sensor Electrical
- Rear Oxygen Sensor Rationality (middle check)
- Rear Oxygen Sensor Heater Monitor
- Rear Oxygen Sensor Electrical
- Fuel System Monitor
- All TPS faults
- All MAP faults
- All ECT sensor faults
- Purge flow solenoid functionality
- Purge flow solenoid electrical
- All PCM self test faults
- All CMP and CKP sensor faults
- All injector and ignition electrical faults
- Idle Air Control (IAC) motor functionality
- Vehicle Speed Sensor
- Brake switch (auto trans only)
- Intake air temperature

Conflict—The catalyst monitor does not run if any of the following are conditions are present:

- EGR Monitor in progress (if equipped)
- Fuel system rich intrusive test in progress
- EVAP Monitor in progress
- Time since start is less than 60 seconds
- Low fuel level-less than 15 %
- Low ambient air temperature
- Ethanel content learn is takeng place and the ethenal used once flag is set

Suspend—The Task Manager does not mature a catalyst fault if any of the following are present:

- Oxygen Sensor Monitor, Priority 1
- Oxygen Sensor Heater, Priority 1
- EGR Monitor, Priority 1 (if equipped)
- EVAP Monitor, Priority 1
- Fuel System Monitor, Priority 2
- Misfire Monitor, Priority 2

OPERATION - NON-MONITORED CIRCUITS

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failures modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also misfire detection.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O2 content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O2S fault.

EMISSIONS CONTROL (Continued)

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a DRBIII® scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor (if equipped)

Following is a description of each system monitor, and its DTC.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

EMISSIONS CONTROL (Continued)

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The O2S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects.

EGR MONITOR (if equipped)

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic check activates only during selected engine/ driving conditions. When the conditions are met, the EGR is turned off (solenoid energized) and the O2S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O2S data should indicate an increase in the O2 concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O2S data whether the EGR system is operating correctly. Because the O2S is being used, the O2S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O2S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O2S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no

EMISSIONS CONTROL (Continued)

chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

LEAK DETECTION PUMP MONITOR (if equipped)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves, a spring/diaphragm, and a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

Pump Mode: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

Test Mode: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5" water. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .020" orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the 02 control system. If fuel vapor, indicated by a shift in the 02 control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

Natural Vacuum Leak Detection (NVLD) (if equipped)

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC) starting in 2002 M.Y. This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020″ (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the ″Gas Law″. This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

A vent valve seals the canister vent during engine off conditions. If the vapor system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determi-

nation by this diagnostic. When the vacuum in the system exceeds about 1″ H2O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies (described below), utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1″ H2O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3″ to 6″ H2O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires initial 1.5 amps of current to pull the valve open but after 100 ms. will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will ″blow off″ at about 0.5″ H2O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to ″breathe″ during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

DESCRIPTION - HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

OPERATION

OPERATION - SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example** , assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, use the DRBIII® scan tool to erase all DTC's and extinguish the MIL.

EMISSIONS CONTROL (Continued)

Technicians can display stored DTC's. Refer to Diagnostic Trouble Codes (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/POWER-TRAIN CONTROL MODULE - DESCRIPTION). For obtaining the DTC information, use the Data Link Connector with the DRBIII® scan tool (Fig. 1).

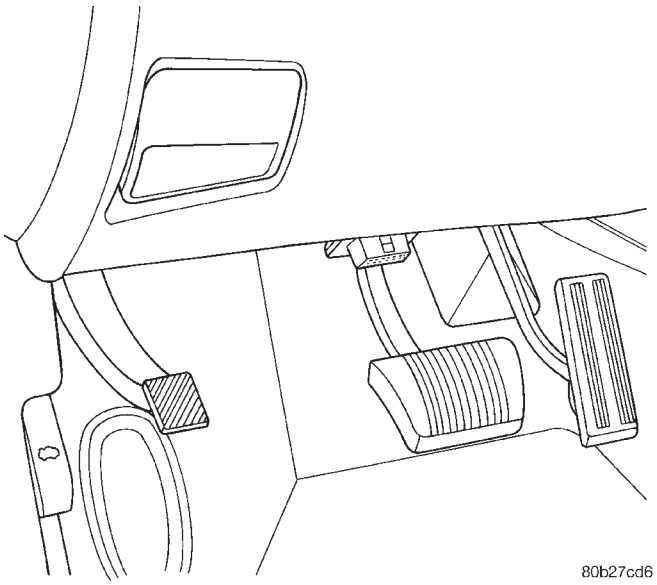

Fig. 1 Data Link Connector

DRB III® STATE DISPLAY TEST MODE

OPERATION

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. From the state display screen, access either State Display Inputs and Outputs or State Display Sensors.

EVAPORATIVE EMISSIONS

OPERATION - EVAPORATION CONTROL SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes to an activated carbon filled evaporative canister. The canister temporarily holds the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions (Fig. 1).

All engines use a proportional purge solenoid system. The PCM controls vapor flow by operating the purge solenoid. Refer to Proportional Purge Solenoid in this section.

NOTE: The evaporative system uses specially manufactured hoses. If they need replacement, only use fuel resistant hose. Also the hoses must be able to pass an Ozone compliance test.

NOTE: For more information on Onboard Refueling Vapor Recovery (ORVR), refer to the Fuel Delivery section.

EVAP/PURGE SOLENOID

DESCRIPTION

All vehicles use a proportional purge solenoid (Fig. 2). The solenoid regulates the rate of vapor flow from the EVAP canister to the throttle body. The PCM operates the solenoid.

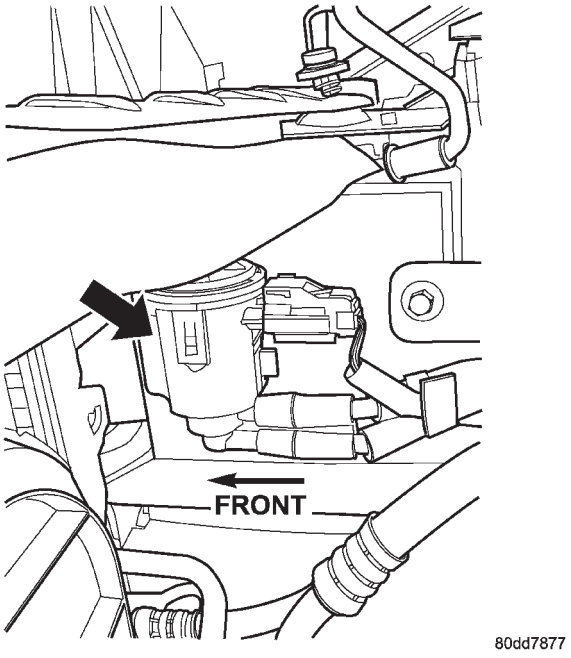

Fig. 2 Proportional Purge Solenoid

OPERATION

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged.

The proportional purge solenoid operates at a frequency of 200 hz and is controlled by an engine controller circuit that senses the current being applied to the proportional purge solenoid and then adjusts that current to achieve the desired purge flow. The proportional purge solenoid controls the purge rate of fuel vapors from the vapor canister and fuel tank to the engine intake manifold.

REMOVAL

The solenoid attaches to a bracket near the radiator on the passenger side of vehicle (Fig. 3). The solenoid will not operate unless it is installed correctly.

(1) Disconnect electrical connector from solenoid.
(2) Disconnect vacuum tubes from solenoid.
(3) Remove solenoid from bracket.

INSTALLATION

The solenoid attaches to a bracket near the radiator on the passenger side of vehicle. The solenoid will not operate unless it is installed correctly.

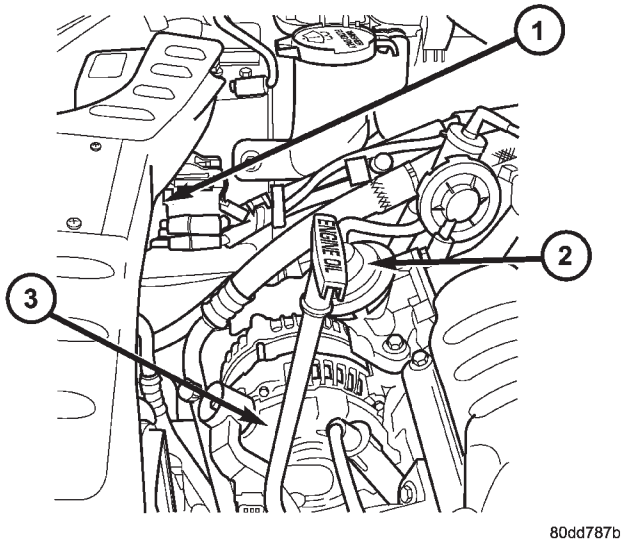

Fig. 3 EVAP PURGE SOLENOID

3 - Generator

The top of the solenoid has TOP printed on it. The solenoid will not operate unless it is installed correctly.

(1) Install solenoid on bracket.
(2) Connect vacuum tube to solenoid.
(3) Connect electrical connector to solenoid.

FUEL FILLER CAP

DESCRIPTION

The plastic fuel fill cap is threaded/quarter turn onto the end of the fuel filler tube. It's purpose is to retain vapors and fuel in the fuel tank.

OPERATION

The fuel filler cap incorporates a two-way relief valve that is closed to atmosphere during normal operating conditions. The relief valve is calibrated to open when a pressure of 17 kPa (2.5 psi) or vacuum of 2 kPa (0.6 in. Hg) occurs in the fuel tank. When the pressure or vacuum is relieved, the valve returns to the normally closed position.

CAUTION: Remove the fuel filler cap to release fuel tank pressure before disconnecting any fuel system component.

LEAK DETECTION PUMP

REMOVAL

(1) Disconnect the negative battery cable.
(2) Raise and support the vehicle.

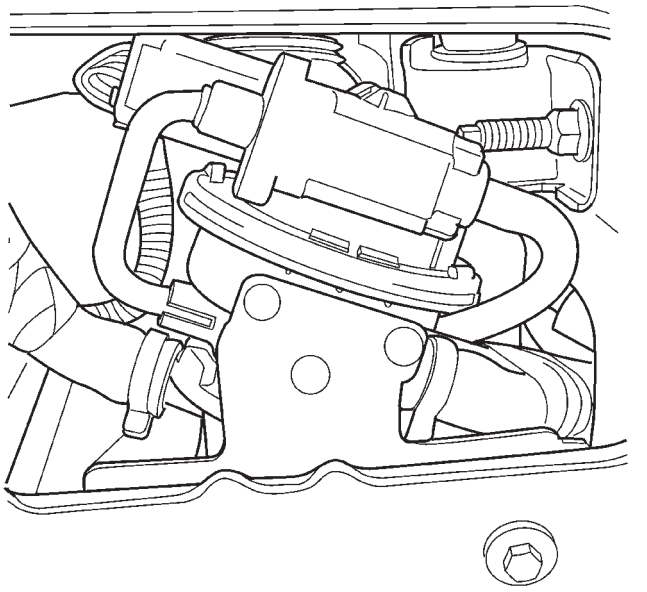

Fig. 4 LDP LOCATION

(3) Remove 3 hoses (Fig. 4).
(4) Remove the electrical connector (Fig. 5).

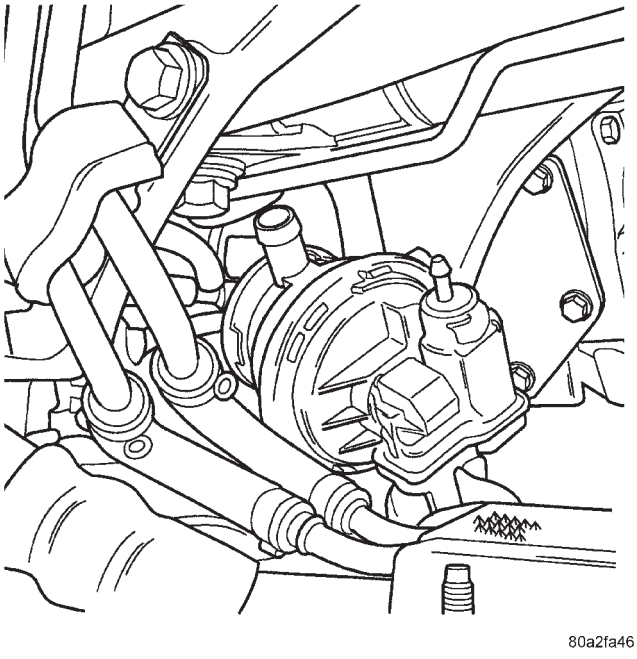

Fig. 5 LDP REMOVAL/INSTALLATION

(5) Remove the 3 screws and remove LDP pump.

INSTALLATION

(1) Install LDP.
(2) Install the 3 screws and tighten (Fig. 5).
(3) Install the electrical connector.
(4) Install the 3 hoses (Fig. 4).
(5) Lower vehicle.
(6) Connect the negative battery cable.

ORVR

OPERATION

The emission control principle used in the ORVR system is that the fuel flowing into the filler tube (appx. 1" I.D.) creates an aspiration effect which draws air into the fill tube (Fig. 6). During refueling, the fuel tank is vented to the vapor canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapors flow is metered by the purge solenoid so that there is no or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve to the vapor canister. Vapor is absorbed in the canister until vapor flow in the lines stops, either following shut-off or by having the fuel level in the tank rise high enough to close the control valve. The control valve(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - OPERATION) contains a float that rises to seal the large diameter vent path to the canister. At this point in the fueling of the vehicle, the tank pressure increases, the check valve closes (preventing tank fuel from spitting back at the operator), and fuel then rises up the filler tube to shut-off the dispensing nozzle.

If the engine is shut-off while the On-Board diagnostics test is running, low level tank pressure can be trapped in the fuel tank and fuel can not be added to the tank until the pressure is relieved. This is due to the leak detection pump closing the vapor outlet from the top of the tank and the one-way check valve not allowing the tank to vent through the fill tube to atmosphere. Therefore, when fuel is added, it will back-up in the fill tube and shut off the dispensing nozzle. The pressure can be eliminated in two ways: 1. Vehicle purge must be activated and for a long enough period to eliminate the pressure. 2. Removing the fuel cap and allowing enough time for the system to vent thru the recirulation tube.

DIAGNOSIS AND TESTING - VEHICLE DOES NOT FILL

CONDITION	POSSIBLE CAUSES	CORRECTION
Pre-Mature Nozzle Shut-Off	Defective fuel tank assembly components.	Fill tube improperly installed (sump) Fill tube hose pinched. Check valve stuck shut. Control valve stuck shut.
	Defective vapor/vent components.	Vent line from control valve to canister pinched. Vent line from canister to vent filter pinched. Canister vent valve failure (requires double failure, plugged to LDP and atmosphere). Leak detection pump failed closed. Leak detection pump filter plugged.
	On-Board diagnostics evaporative system leak test just conducted.	Canister vent valve vent plugged to atmosphere. engine still running when attempting to fill (System designed not to fill).
	Defective fill nozzle.	Try another nozzle.
Fuel Spits Out Of Filler Tube.	During fill.	See Pre-Mature Shut-Off.
	At conclusion of fill.	Defective fuel handling component. (Check valve stuck open).
		Defective vapor/vent handling component.
		Defective fill nozzle.

PCV VALVE

DESCRIPTION

The PCV valve contains a spring loaded plunger. The plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum (Fig. 7) or (Fig. 8).

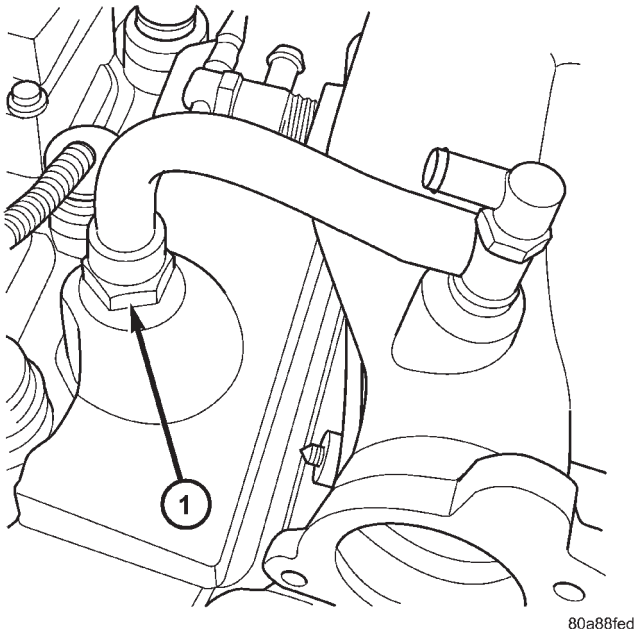

Fig. 7 PCV VALVE 2.4L

1 - PCV Valve

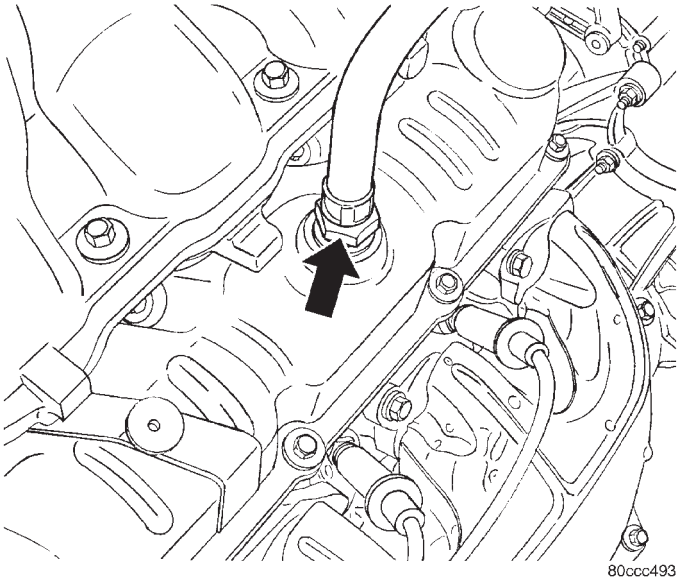

Fig. 8 PCV VALVE 3.3/3.8L

OPERATION

When the engine is not operating or during an engine backfire, the spring forces the plunger back against the seat. This prevents vapors from flowing through the valve (Fig. 9).

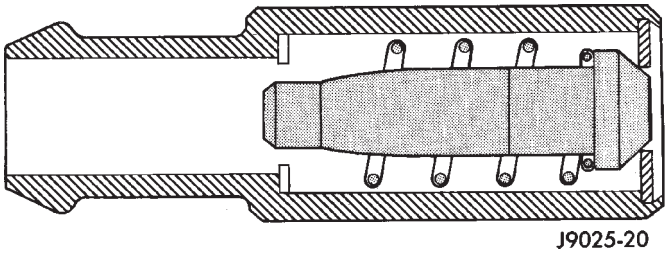

Fig. 9 Engine Off or Engine Backfire No Vapor Flow

When the engine is at idle or cruising, high manifold vacuum is present. At these times manifold vacuum is able to completely compress the spring and pull the plunger to the top of the valve (Fig. 10). In this position there is minimal vapor flow through the valve.

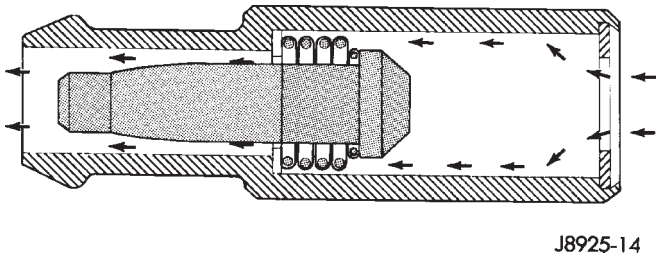

Fig. 10 High Intake Manifold Vacuum Minimal Vapor Flow

During periods of moderate intake manifold vacuum the plunger is only pulled part way back from the inlet. This results in maximum vapor flow through the valve (Fig. 11).

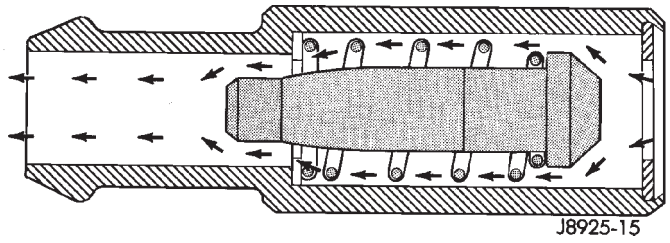

Fig. 11 Moderate Intake Manifold Vacuum Maximum Vapor Flow

DIAGNOSIS AND TESTING - PCV SYSTEM

WARNING: APPLY PARKING BRAKE AND/OR BLOCK WHEELS BEFORE PERFORMING ANY TEST OR ADJUSTMENT WITH THE ENGINE OPERATING.

(1) With engine idling, remove the hose from the PCV valve. If the valve is not plugged, a hissing

PCV VALVE (Continued)

noise will be heard as air passes through the valve. A strong vacuum should also be felt when a finger is placed over the valve inlet.

(2) Install hose on PCV valve. Remove the make-up air hose from the air plenum at the rear of the engine. Hold a piece of stiff paper (parts tag) loosely over the end of the make-up air hose.

(3) After allowing approximately one minute for crankcase pressure to reduce, the paper should draw up against the hose with noticeable force. If the engine does not draw the paper against the grommet after installing a new valve, replace the PCV valve hose.

(4) Turn the engine off. Remove the PCV valve from intake manifold. The valve should rattle when shaken.

(5) Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.** If the valve rattles, apply a light coating of Loctite® Pipe Sealant With Teflon to the threads. Thread the PCV valve into the manifold plenum and tighten to 7 N·m (60 in. lbs.) torque.

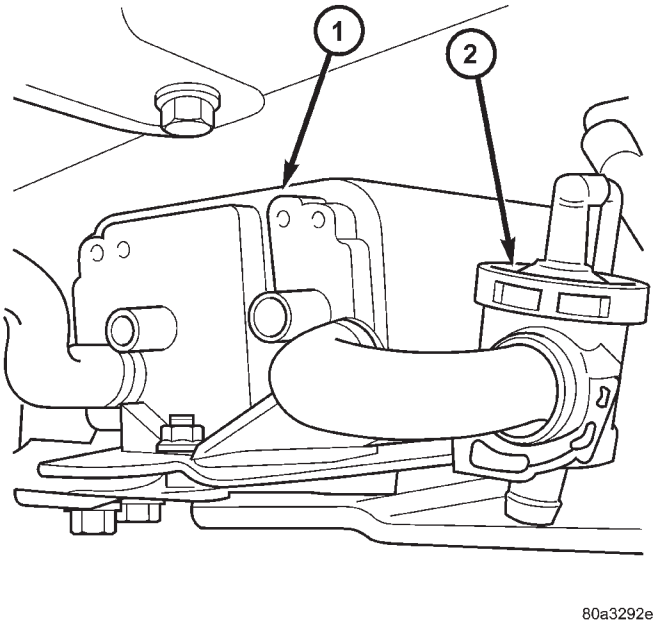

Fig. 12 FRONT EVAP CANISTER

1 - Front EVAP Canister
2 - Vent Valve

VAPOR CANISTER

DESCRIPTION

There are 2 EVAP canisters on the vehicle. The vacuum and vapor tubes connect to the top of the canister. It is a charcoal canister (Fig. 12) or (Fig. 13).

OPERATION

All vehicles use a maintenance free, evaporative (EVAP) canister. Fuel tank vapors vent into the canister. The canister temporarily holds the fuel vapors until intake manifold vacuum draws them into the combustion chamber. The Powertrain Control Module (PCM) purges the canister through the proportional purge solenoid. The PCM purges the canister at predetermined intervals and engine conditions.

Purge Free Cells

Purge-free memory cells are used to identify the fuel vapor content of the evaporative canister. Since the evaporative canister is not purged 100% of the time, the PCM stores information about the evaporative canister's vapor content in a memory cell.

The purge-free cells are constructed similar to certain purge-normal cells. The purge-free cells can be monitored by the DRB III® Scan Tool. The only difference between the purge-free cells and normal adaptive cells is that in purge-free, the purge is completely turned off. This gives the PCM the ability to compare purge and purge-free operation.

REMOVAL - 2.4L

(1) Remove EGR tube attaching bolts at intake manifold.

(2) Remove EGR tube attaching bolts at EGR valve.

(3) Check for signs of leakage or cracked surfaces on either the manifold or tube. Repair or replace as necessary.

REMOVAL - FRONT TUBE- 3.5L

(1) Disconnect the negative battery cable.

TUBE (Continued)

(2) Disconnect the fresh air makeup hose on rear valve cover.
(3) Remove the air box bolt.
(4) Remove the hose clamp at throttle body.
(5) Unlatch 2 clamps for air box cover.
(6) Remove air box cover.
(7) Disconnect the washer fluid fill hose.
(8) Remove air box.
(9) Remove the 2 bolts at the EGR valve.
(10) Remove the 2 bolts at the intake manifold.
(11) Remove front EGR tube.

REMOVAL - REAR TUBE - 3.5L

(1) Remove the battery, refer to the Battery section.
(2) Remove the Battery tray/vacuum reservoir.
(3) Remove the speed control servo and bracket and relocate.
(4) Remove the 2 bolts from the EGR valve.
(5) Remove the 2 bolts from the rear cylinder head.
(6) Remove the EGR rear tube.

INSTALLATION

INSTALLATION - 2.4L

(1) Loose install EGR tube and gasket with attaching bolts at intake manifold.
(2) Loose install EGR tube and gasket with attaching bolts at EGR valve.
(3) Tighten bolts to EGR valve to 11.9 N·m (105 ±20 ins. lbs.).
(4) Tighten bolts to Intake manifold to 11.9 N·m (105 ±20 ins. lbs.).

INSTALLATION - FRONT TUBE - 3.5L

(1) Install front EGR tube and gaskets.
(2) Install the 2 bolts at the EGR valve.
(3) Install the 2 bolts at the intake manifold.
(4) Tighten all 4 bolts.
(5) Install air box.
(6) Connect the washer fluid fill hose.
(7) Install air box cover.
(8) Latch 2 clamps for air box cover.
(9) Install the hose clamp at throttle body.
(10) Install the air box bolt.
(11) Connect the fresh air makeup hose on rear valve cover.
(12) Connect the negative battery cable.

INSTALLATION - REAR TUBE - 3.5L

(1) Install the EGR rear tube.
(2) Install the 2 bolts to the rear cylinder head.
(3) Install the 2 bolts to the EGR valve.
(4) Tighten the 4 bolts.
(5) Install the speed control servo and bracket, refer to the speed control section.
(6) Install the Battery tray/vacuum reservoir refer to the battery section.
(7) Install the battery, refer to the Battery section.

VALVE

DESCRIPTION

The EGR system consists of:
- EGR tube (connects a passage in the intake manifold to the exhaust port in the cylinder head)
- EGR valve
- Electronic EGR Transducer
- Connecting hoses

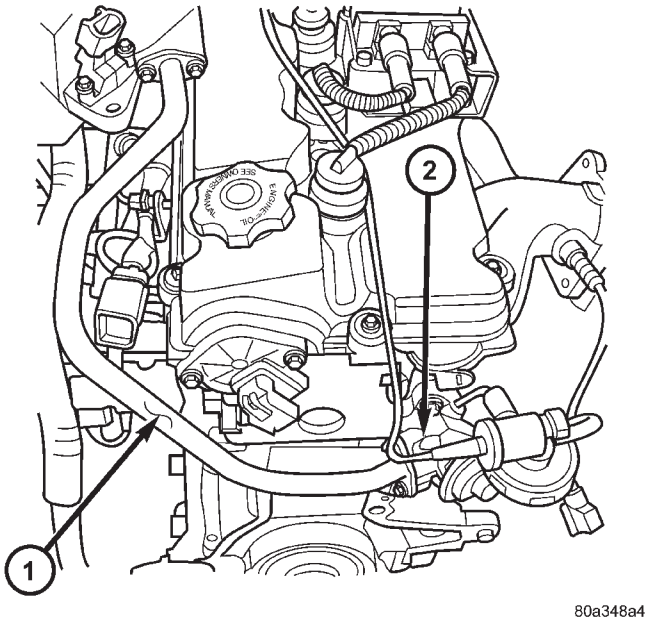

Fig. 1 EGR VALVE AND TUBE 2.4L

1 - EGR Tube
2 - EGR Valve

OPERATION

Refer to Monitored Systems - EGR Monitor in this group for more information.

The engines use Exhaust Gas Recirculation (EGR) systems. The EGR system reduces oxides of nitrogen (NOx) in engine exhaust and helps prevent detonation (engine knock). Under normal operating conditions, engine cylinder temperature can reach more than 3000°F. Formation of NOx increases proportionally with combustion temperature. To reduce the emission of these oxides, the cylinder temperature must be lowered. The system allows a predetermined amount of hot exhaust gas to recirculate and dilute

VALVE (Continued)

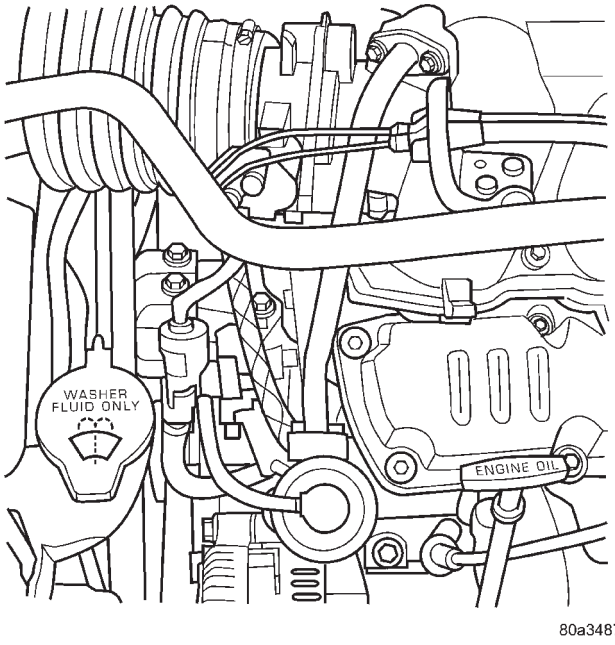

Fig. 2 EGR VALVE AND TUBE 3.3/3.8L

the incoming air/fuel mixture. The diluted air/fuel mixture reduces peak flame temperature during combustion.

The electric EGR transducer contains an electrically operated solenoid and a back-pressure transducer (Fig. 3). The Powertrain Control Module (PCM) operates the solenoid. The PCM determines when to energize the solenoid. Exhaust system back-pressure controls the transducer.

When the PCM energizes the solenoid, vacuum does not reach the transducer. Vacuum flows to the transducer when the PCM de-energizes the solenoid.

When exhaust system back-pressure becomes high enough, it fully closes a bleed valve in the transducer. When the PCM de-energizes the solenoid and back-pressure closes the transducer bleed valve, vacuum flows through the transducer to operate the EGR valve.

De-energizing the solenoid, but not fully closing the transducer bleed hole (because of low back-pressure), varies the strength of vacuum applied to the EGR valve. Varying the strength of the vacuum changes the amount of EGR supplied to the engine. This provides the correct amount of exhaust gas recirculation for different operating conditions.

This system does not allow EGR at idle.

A failed or malfunctioning EGR system can cause engine spark knock, sags or hesitation, rough idle, engine stalling and increased emissions.

VALVE (Continued)

REMOVAL

REMOVAL - 2.4L

The EGR valve and Electrical EGR Transducer are serviced as an assembly (Fig. 1).

(1) Disconnect vacuum tube from electric EGR transducer. Inspect vacuum tube for damage.

(2) Remove electrical connector from solenoid.

(3) Remove EGR tube bolts from EGR valve.

(4) Remove EGR valve from cylinder head adaptor.

(5) Clean gasket surface and discard old gasket. Check for any signs of leakage or cracked surfaces. Repair or replace as necessary.

REMOVAL - 3.5L

(1) Disconnect the negative battery cable.

(2) Disconnect the fresh air makeup hose on rear valve cover.

(3) Remove the air box bolt.

(4) Remove the hose clamp at throttle body.

(5) Unlatch 2 clamps for air box cover.

(6) Remove air box cover.

(7) Unlock the electrical connector.

(8) Disconnect the electrical connector from the EGR valve.

(9) Remove the 2 bolts for the front EGR tube

(10) Remove the 2 bolts for the rear EGR tube

(11) Remove the 2 EGR valve mounting bolts.

(12) Remove the EGR valve.

INSTALLATION

INSTALLATION - 2.4L

The EGR valve and Electrical EGR Transducer are serviced as an assembly (Fig. 1).

(1) Assemble EGR valve with new gasket onto the cylinder head adaptor.

(2) Loose assemble the bolts from EGR valve to EGR tube.

(3) Loose assemble the bolts from EGR valve to cylinder head.

(4) Tighten bolts from EGR valve to cylinder head to 22.8 N·m (200 ±25 in. lbs.) torque.

(5) Tighten bolts from EGR valve to EGR tube to 11.9 N·m (105 ±20 in. lbs.) torque.

(6) Reconnect vacuum hose and electrical connector to electrical EGR transducer.

INSTALLATION - 3.5L

(1) Install the EGR valve.

(2) Install the 2 bolts for the rear EGR tube

(3) Install the 2 bolts for the front EGR tube

(4) Tighten the EGR tube bolts.

(5) Tighten the EGR valve mounting bolts.

(6) Connect the electrical connector to the EGR valve.

(7) Lock the electrical connector.

(8) Install air box cover.

(9) Latch 2 clamps for air box cover.

(10) Install the hose clamp at throttle body.

(11) Connect the fresh air makeup hose on rear valve cover.

(12) Connect the negative battery cable.

TASK MANAGER
DESCRIPTION 24
OPERATION 24

TASK MANAGER

DESCRIPTION

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the “Task Manager”.

OPERATION

The Task Manager determines when tests happen and when functions occur. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are know as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the catalyst Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the catalyst monitor, the Task Manager may still run the catalyst Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the catalyst system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

TASK MANAGER (Continued)

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a good trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 —Non-emissions related trouble codes.
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire. (MIL Off)
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire. (MIL Off)
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault. (MIL On)
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire. Catalyst damage misfire is a 2 trip MIL. The MIL flashes on the first trip when catalyst damage misfire levels are present. (MIL On)

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ±375 RPM and load is within ±20% of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRBIII®. Erasing the DTC with the DRBIII® erases all OBD II information. The DRBIII® automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Global Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRBIII®)
  - Comprehensive Components
  - Major Monitor
- Warm-Up Cycles

Global Good Trip

To increment a Global Good Trip, the Oxygen sensor and Catalyst efficiency monitors must have run and passed, and 2 minutes of engine run time.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Alternate Good Trip

TASK MANAGER (Continued)

Alternate Good Trips are used in place of Global Good Trips for Comprehensive Components and Major Monitors. If the Task Manager cannot run a Global Good Trip because a component fault is stopping the monitor from running, it will attempt to count an Alternate Good Trip.

The Task Manager counts an Alternate Good Trip for Comprehensive components when the following conditions are met:

- Two minutes of engine run time, idle or driving
- No other faults occur

The Task Manager counts an Alternate Good Trip for a Major Monitor when the monitor runs and passes. Only the Major Monitor that failed needs to pass to count an Alternate Good Trip.

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRBIII®. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the DRBIII®; or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).
- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

TASK MANAGER (Continued)

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

EMISSIONS CONTROL 2.5L TURBO DIESEL

DESCRIPTION

The 2.5L diesel Engine Control Module (ECM) controls many different circuits in the fuel injection pump and engine systems. If the ECM senses a problem with a monitored circuit that indicates an actual problem, a Diagnostic Trouble Code (DTC) will be stored in the ECM's memory, and eventually may illuminate the MIL (Malfunction Indicator Lamp) constantly while the key is on. If the problem is repaired, or is intermittent, the ECM will erase the DTC after 40 warm-up cycles without the the fault detected. A warm-up cycle consists of starting the vehicle when the engine is cold, then the engine is warmed up to a certain temperature, and finally, the engine temperature falls to a normal operating temperature, then the key is turned off.

Certain criteria must be met for a DTC to be entered into ECM memory. The criteria may be a specific range of engine rpm, engine or fuel temperature and/or input voltage to the ECM. A DTC indicates that the ECM has identified an abnormal signal in a circuit or the system.

There are several operating conditions that the ECM does not monitor and set a DTC for. Refer to the following Monitored Circuits and Non–Monitored Circuits in this section.

ECM MONITORED SYSTEMS

The ECM can detect certain problems in the electrical system.

Open or Shorted Circuit – The ECM will not distinguish between an open or a short to ground, however the ECM can determine if there is excessive current on a circuit, such as a short to voltage or a decrease in component resistance.

Output Device Current Flow – The ECM senses whether the output devices are electrically connected.

If there is a problem with the circuit, the ECM senses whether the circuit is open, shorted to ground (–), or shorted to (+) voltage.

Fuel Pressure: Fuel pressure is controlled by the fuel injection pump and fuel pressure solenoid. The ECM uses a fuel pressure sensor to determine if a fuel pressure problem exists.

Fuel Injector Malfunctions: The ECM can determine if a fuel injector has an electrical problem. The fuel injectors on the diesel engine are **controlled** by the ECM.

ECM NON–MONITORED SYSTEMS

The ECM does not monitor the following circuits, systems or conditions that could have malfunctions that result in driveability problems. A DTC will not be displayed for these conditions.

Cylinder Compression: The ECM cannot detect uneven, low, or high engine cylinder compression.

Exhaust System: The ECM cannot detect a plugged, restricted or leaking exhaust system.

Vacuum Assist: Leaks or restrictions in the vacuum circuits of the Exhaust Gas Recirculation System (EGR) are not monitored by the ECM.

ECM System Ground: The ECM cannot determine a poor system ground. However, a DTC may be generated as a result of this condition.

ECM/PCM Connector Engagement: The ECM cannot determine spread or damaged connector pins. However, a DTC may be generated as a result of this condition.

HIGH AND LOW LIMITS

The ECM compares input signals from each input device. It has high and low limits that are programmed into it for that device. If the inputs are not within specifications and other DTC criteria are met, a DTC will be stored in memory. Other DTC criteria might include engine rpm limits or input voltages from other sensors or switches. The other inputs might have to be sensed by the ECM when it senses a high or low input voltage from the control system device in question.

EXHAUST GAS RECIRCULATION

DESCRIPTION

The EGR system reduces oxides of nitrogen (NOx) in the engine exhaust. This is accomplished by allowing a predetermined amount of hot exhaust gas to recirculate and dilute the incoming fuel/air mixture.

A malfunctioning EGR system can cause engine stumble, sags, or hesitation, rough idle, engine stalling and poor driveability.

OPERATION

The system consists of:

- An EGR valve assembly. The valve is located on the rear of the engine above the exhaust manfiold.
- An EGR solenoid.The EGR solenoid controls the “on time” of the EGR valve.
- The ECM operates the EGR solenoid. The ECM is located inside the vehicle under the instrument panel.
- An EGR tube connects a passage in the EGR valve to the rear of the exhaust manifold.
- The vacuum pump supplies vacuum for the EGR solenoid and the EGR valve. This pump also supplies vacuum for operation of the power brake boosterb and the heating and air conditioning system. The pump is located internally in the front of the engine block and is driven by the crankshaft gear.
- Vacuum lines and hoses connect the various components.

When the ECM supplies a variable ground signal to the EGR solenoid, EGR system operation starts to occur. The ECM will monitor and determine when to supply and remove this variable ground signal. This will depend on inputs from the engine coolant temperature, throttle position and engine speed sensors.

When the variable ground signal is supplied to the EGR solenoid, vacuum from the vacuum pump will be allowed to pass through the EGR solenoid and on to the EGR valve with a connecting hose.

Exhaust gas recirculation will begin in this order when:

- The ECM determines that EGR system operation is necessary.
- The engine is running to operate the vacuum pump.
- A variable ground signal is supplied to the EGR solenoid.
- Variable vacuum passes through the EGR solenoid to the EGR valve.
- The inlet seat (poppet valve) at the bottom of the EGR valve opens to dilute and recirculate exhaust gas back into the intake manifold.

The EGR system will be shut down by the ECM after 60 seconds of continuous engine idling to improve idle quality.

VALVE

DESCRIPTION

The EGR system consists of (Fig. 1):

- EGR valve
- EGR tube
- Vacuum hoses
- EGR cooler
- EGR solenoid

OPERATION

The engines use Exhaust Gas Recirculation (EGR) systems. The EGR system reduces oxides of nitrogen (NOx) in engine exhaust and helps prevent detonation (engine knock). Under normal operating conditions, engine cylinder temperature can reach more than 3000°F. Formation of NOx increases proportionally with combustion temperature. To reduce the emission of these oxides, the cylinder temperature must be lowered. The system allows a predetermined amount of hot exhaust gas to recirculate and dilute the incoming air/fuel mixture. The diluted air/fuel mixture reduces peak flame temperature during combustion.

REMOVAL

(1) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(2) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(3) Disconnect EGR valve vacuum line.

(4) Remove EGR cooler to EGR valve retaining bolts (Fig. 1).

(5) Remove EGR valve retaining nuts (Fig. 1) and EGR valve.

INSTALLATION

(1) Clean gasket mating surfaces.

(2) Install EGR valve (Fig. 1). Torque nuts to 32.4N·m.

(3) Connect EGR cooler to EGR valve (Fig. 1). Torque bolts to 32.4N·m

(4) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(5) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

VALVE COOLER

DESCRIPTION

The EGR valve on this engine uses a cooler to cool the exhaust gases before the returned to the intake manifold (Fig. 2). The EGR cooler attaches to the EGR valve and is cooled with engine coolant.

REMOVAL

(1) Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

(2) Partially drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(3) Remove front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

(4) Disconnect coolant supply and return lines at EGR cooler (Fig. 2).

(5) Remove EGR cooler to exhaust manifold retaining bolt (Fig. 2).

(6) Remove EGR cooler to EGR valve retaining bolts (Fig. 2) and remove cooler.

INSTALLATION

(1) Clean gasket sealing surfaces.

(2) Connect EGR valve cooler and new gasket to EGR valve (Fig. 2). Torque bolts to 32.4N·m.

(3) Install EGR valve cooler to exhaust manifold attaching bolt (Fig. 2). Torque bolt to 32.4N·m.

(4) Connect EGR cooler coolant supply and return hoses to cooler (Fig. 2).

(5) Install front wiper unit (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

(6) Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(7) Install engine cover (Refer to 9 - ENGINE - INSTALLATION).

ON-BOARD DIAGNOSTICS
DESCRIPTION - DIAGNOSTIC TROUBLE CODES 6

ON-BOARD DIAGNOSTICS

DESCRIPTION - DIAGNOSTIC TROUBLE CODES

On the following pages, a list of DTC's is provided for the 2.5L diesel engine. A DTC indicates that the ECM has recognized an abnormal signal in a circuit or the system. A DTC may indicate the result of a failure, but most likely will not identify the failed component directly. Refer to the appropriate diagnostic manual for more information on diagnosis of trouble codes.

ACCESSING DIAGNOSTIC TROUBLE CODES

A stored DTC can be displayed through the use of the DRB III® scan tool. The DRB III® connects to the data link connector. The data link connector is located under the instrument panel near bottom of the steering column (Fig. 1).

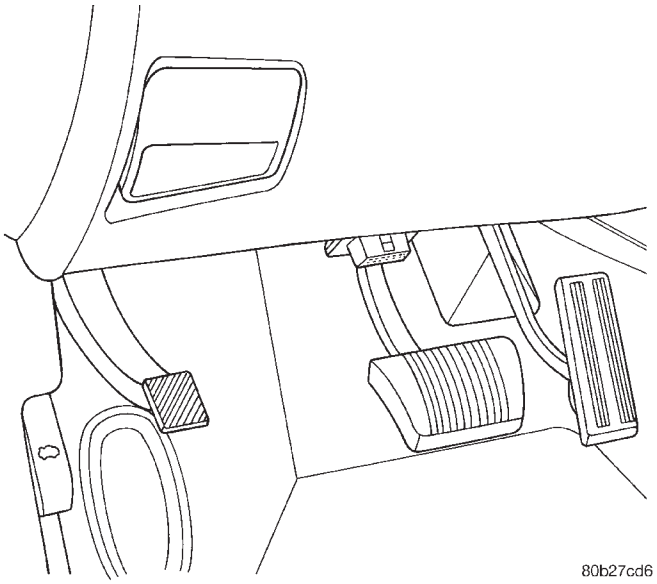

Fig. 1 DATA LINK CONNECTOR

ERASING TROUBLE CODES

After the problem has been repaired, use the DRB III® scan tool to erase a DTC.

ON-BOARD DIAGNOSTICS (Continued)

Generic Scan Tool Code	DRB III® Scan Tool Display
P1680	EEPROM Plausibility Checksum Error EEPROM Plausibility Code Word Incorrect Or Missing EEPROM Plausibility Communication Error EEPROM Plausibility Variation Number Error EEPROM Plausibility VIN Checksum Error EEPROM Plausibility VIN Write Error
P1685	SKIM System Invalid Key Code Received SKIM System Invalid Secret Key In EEPROM SKIM System Key Communication Timed Out SKIM System SKIM Error SKIM System Write Access To EEPROM Failure
P1696	EEPROM Communication Error EEPROM Communication Not Verified EEPROM Quanity Stop EEPROM Recovery Occured EEPROM Redundant Overrun Monitoring
P1703	Brake Switch Signal CKTS Plaus. With Redundant Contact After Initialization
P2120	Acc. Pedal Position Sensor 1 CKT Plausibility Acc. Pedal Position Sensor 1 CKT Plausibility With Brake Switch Acc. Pedal Position Sensor 1 CKT Plausibility With Potentiometer Acc. Pedal Position Sensor 1 CKT Signal Voltage Too High Acc. Pedal Position Sensor 1 CKT Signal Voltage Too Low Acc. Pedal Position Sensor 1 CKT Signal Voltage Too High or Low

SERVICE MANUAL COMMENTS

What errors(s) have you found?

_____

_____

_____

_____

In order for us to assist you, please include as much details as possible when reporting an error
